<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary &gt; 4000 and job_id = ''SA_MAN'' ' Note: The quotation marks in the preceding example are all single quotation marks.</td>
</tr>
</tbody>
</table>
| streams_type    | The type of Oracle Streams client:  
  • Specify capture for a capture process.  
  • Specify sync_capture for a synchronous capture.  
  • Specify apply for an apply process.  
  • Specify dequeue for a messaging client. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| streams_name | The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:
• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.
• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.
If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.
If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name. |
| queue_name   | The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert_rule_name</td>
<td>Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.</td>
</tr>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes</td>
</tr>
</tbody>
</table>

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.
Note:
Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:
- “Procedures That Create Rules for Oracle Streams Clients and XStream Clients”
- “Security Model”

Examples
The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

165.6.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
  table_name              IN   VARCHAR2,
  streams_name            IN   VARCHAR2  DEFAULT NULL,
  source_queue_name       IN   VARCHAR2,
  destination_queue_name  IN   VARCHAR2,
  include_dml             IN   BOOLEAN   DEFAULT TRUE,
  include_ddl             IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
  source_database         IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name           OUT  VARCHAR2,
  ddl_rule_name           OUT  VARCHAR2,
  inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
  and_condition           IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
  table_name IN VARCHAR2,
  streams_name IN VARCHAR2 DEFAULT NULL,
  source_queue_name IN VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml IN BOOLEAN DEFAULT TRUE,
  include_ddl IN BOOLEAN DEFAULT FALSE,
  include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
  source_database IN VARCHAR2 DEFAULT NULL,
  inclusion_rule IN BOOLEAN DEFAULT TRUE,
  and_condition IN VARCHAR2 DEFAULT NULL,
  queue_to_queue IN BOOLEAN DEFAULT NULL);

Parameters

Table 165-12  ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.].table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.].queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a source queue named streams_queue in the strmadmin Schema, enter strmadmin.streams_queue for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.].queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter</td>
</tr>
<tr>
<td></td>
<td><a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
</tbody>
</table>
Table 165-12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. <strong>See Also:</strong> Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
</tbody>
</table>
### Table 165-12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  

\[
\text{(system_condition)} \text{ AND } (\text{and_condition})
\]

The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

\[
:lcr\.get\_tag() = \text{HEXTORAW(''02'')}
\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

Table 165-12  (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_to_queue</td>
<td>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation. See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

• “Procedures That Create Rules for Oracle Streams Clients and XStream Clients”
• “Security Model”

Examples

The following is an example of a table rule condition created for filtering DML statements:
165.6.11 ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set for Oracle Streams clients.

It adds rules to a rule set of one of the following types of Oracle Streams clients:

• When the \texttt{streams\_type} parameter is set to \texttt{capture}, this procedure adds capture process rules for capturing changes to a specified table.

• When the \texttt{streams\_type} parameter is set to \texttt{sync\_capture}, this procedure adds rules for capturing changes to a specified table.

• When the \texttt{streams\_type} parameter is set to \texttt{apply} and the \texttt{streams\_name} parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

• When the \texttt{streams\_type} parameter is set to \texttt{dequeue}, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two \texttt{OUT} parameters, and the other does not.

\textbf{Note:}

• Currently, messaging clients cannot dequeue buffered messages.

• The invoking user must be granted the \texttt{DBA} role to create a synchronous capture.

\textbf{Syntax}

\begin{verbatim}
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
  table_name          IN   VARCHAR2,
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN  DEFAULT TRUE,
  include_ddl         IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name       OUT  VARCHAR2,
  ddl_rule_name       OUT  VARCHAR2,
  inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
\end{verbatim}

</table>
### Table 165-13  (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</td>
</tr>
</tbody>
</table>
Table 165-13 (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| include_tagged_lcr   | If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag:  
  • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.  
  • A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag.  
  • An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag.  
If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag.  
If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL:  
  • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.  
  • A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag.  
  • An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag.  
If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag.  
A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.  
Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.  
See Also: Oracle Streams Replication Administrator's Guide for more information about tags.

<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name.</td>
</tr>
<tr>
<td></td>
<td>If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name.</td>
</tr>
<tr>
<td></td>
<td>If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</td>
</tr>
<tr>
<td></td>
<td>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error.</td>
</tr>
<tr>
<td></td>
<td>In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
Table 165-13  (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</td>
</tr>
<tr>
<td></td>
<td>(system_condition) AND (and_condition)</td>
</tr>
<tr>
<td></td>
<td>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</td>
</tr>
<tr>
<td></td>
<td>:lcr.get_tag() = HEXTORAW('02')</td>
</tr>
<tr>
<td></td>
<td>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</td>
</tr>
<tr>
<td></td>
<td>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

See Also: Logical Change Record TYPEs

Examples

The following is an example of a table rule condition created for DML changes:

```
(((dml.get_object_owner() = 'HR' and dml.get_object_name() = 'LOCATIONS'))
and dml.is_null_tag() = 'Y' and dml.get_source_database_name() = 'DBS1.NET')
```
165.6.12 CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

**Note:**

When the CLEANUP_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures were run, except for the values of the following parameters: perform_actions, script_name, and script_directory_object.

**See Also:**

- "PRE_INSTANTIATION_SETUP Procedure"
- "POST_INSTANTIATION_SETUP Procedure"
- "Procedures That Configure an Oracle Streams Environment" for more information about this procedure

**Syntax**

```sql
DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(
    maintain_mode IN VARCHAR2,
    tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_database IN VARCHAR2,
    destination_database IN VARCHAR2,
    perform_actions IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT NULL,
    capture_queue_table IN VARCHAR2 DEFAULT NULL,
    capture_queue_name IN VARCHAR2 DEFAULT NULL,
    capture_queue_user IN VARCHAR2 DEFAULT NULL,
    propagation_name IN VARCHAR2 DEFAULT NULL,
    apply_name IN VARCHAR2 DEFAULT NULL,
    apply_queue_table IN VARCHAR2 DEFAULT NULL,
    apply_queue_name IN VARCHAR2 DEFAULT NULL,
    apply_queue_user IN VARCHAR2 DEFAULT NULL,
    bi_directional IN BOOLEAN DEFAULT FALSE,
    change_global_name IN VARCHAR2 DEFAULT NULL);
```
### Parameters

Table 165-14  CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maintain_mode</td>
<td>Specify one of the following:</td>
</tr>
</tbody>
</table>
|                      | • GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases  
|                      | • TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database                                                                                                                                                                                                 |
| tablespace_names     | If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.  
|                      | The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.  
|                      | A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.  
|                      | If maintain_mode is set to GLOBAL, then specify an empty tablespace set.  
|                      | Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.                                                                                                                                                                                                            |
| See Also:            | TABLESPACE_SET Table Type                                                                                                                                                                                                                                                                                                                 |
| source_database      | The global name of the source database.  
|                      | If NULL, then the procedure uses the global name of the local database.                                                                                                                                                                                                                                                                 |
| destination_database | The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.  
|                      | If NULL, then the procedure raises an error.                                                                                                                                                                                                                                                                                               |
| perform_actions      | If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly.  
|                      | If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly.  
|                      | Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
|                      | • script_name  
|                      | • script_directory_object
Table 165-14  (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| script_name             | If non-NULL and the `perform_actions` parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the `script_directory_object` parameter, then the statements are appended to the existing file.  
                        | If non-NULL and the `perform_actions` parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly.  
                        | If NULL and the `perform_actions` parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script.  
                        | If NULL and the `perform_actions` parameter is FALSE, then the procedure raises an error.                                                                                                                     |
| script_directory_object | The directory object for the directory on the local computer system into which the generated script is placed.                                                                                               |
|                        | If the `script_name` parameter is NULL, then this parameter is ignored, and this procedure does not generate a script.                                                                                         |
|                        | If NULL and the `script_name` parameter is non-NULL, then the procedure raises an error.                                                                                                                      |
|                        | **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.                                                                                             |
| capture_name           | The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner.                                                                               |
|                        | If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures. |
| capture_queue_table    | The name of the queue table for each queue used by a capture process, specified as `schema_name.queue_table_name`. For example, `strmadmin.streams_queue_table`. If the schema is not specified, then the current user is the default. |
|                        | If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures. |
### Table 165-14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bi_directional</td>
<td>Specify <strong>TRUE</strong> if the Oracle Streams replication configuration is bi-directional between the database specified in <strong>source_database</strong> and the database specified in <strong>destination_database</strong>. Specify <strong>FALSE</strong> if the Oracle Streams replication configuration is one way replication from the current database to the database specified in <strong>destination_database</strong>.</td>
</tr>
<tr>
<td>change_global_name</td>
<td>If <strong>TRUE</strong>, then the procedure changes the global name of the database specified in <strong>destination_database</strong> to match the global name of the current database. If <strong>FALSE</strong>, then the procedure does not change the global name of the database specified in <strong>destination_database</strong>.</td>
</tr>
</tbody>
</table>

165.6.13 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to **TRUE**, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

**Note:**

- The **DELETE_COLUMN** procedure supports the same data types supported by Oracle Streams capture processes.
- The **DELETE_COLUMN** procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the **KEEP_COLUMNS** procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
See Also:

- Oracle Streams Concepts and Administration for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "KEEP_COLUMNS Procedure"

Syntax

```sql
DBMS_STREAMS_ADM.DELETE_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    value_type    IN  VARCHAR2   DEFAULT '*',
    step_number   IN  NUMBER     DEFAULT 0,
    operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 165-15  DELETE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table from which the column is deleted in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column deleted from each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL.

165.6.14 GET_MESSAGE_TRACKING Function

The GET_MESSAGE_TRACKING Function returns the tracking label for the current session.

See Also:

SET_MESSAGE_TRACKING Procedure

Syntax

```sql
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

165.6.15 GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment.

This information can be used for the following purposes:
To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment

To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

See Also:

- Oracle Streams Replication Administrator’s Guide for information about point-in-time recovery in an Oracle Streams replication environment
- Oracle Streams Replication Administrator’s Guide for information about flashback queries in an Oracle Streams replication environment

Syntax

DBMS_STREAMS_ADM.GET_SCN_MAPPING(
  apply_name IN VARCHAR2,
  src_pit_scn IN NUMBER,
  dest_instantiation_scn OUT NUMBER,
  dest_start_scn OUT NUMBER,
  dest_skip_txn_ids OUT DBMS_UTILITY.NAME_ARRAY);

Parameters

Table 165-16  GET_SCN_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.</td>
</tr>
<tr>
<td>src_pit_scn</td>
<td>The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.</td>
</tr>
<tr>
<td>dest_instantiation_scn</td>
<td>The SCN at the destination database that corresponds to the specified src_pit_scn at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.</td>
</tr>
<tr>
<td>dest_start_scn</td>
<td>For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.</td>
</tr>
</tbody>
</table>
### Table 165-16  (Cont.) GET_SCN_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| dest_skip_txn_ids  | Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying nondependent transactions out of order.  
For point in time recovery, these transaction IDs should be ignored by the recovery apply process.  
This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to DEPENDENT_TRANSACTIONS, and the transactions were applied out of order. |

### 165.6.16 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

**See Also:**
- "SET_TAG Procedure"
- *Oracle Streams Replication Administrator's Guide* for more information about tags

**Syntax**

```sql
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

**Examples**

The following example illustrates how to display the current logical change record (LCR) tag as output:

```sql
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```sql
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```
165.6.17 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to \texttt{TRUE}, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The \texttt{column_list} parameter is type \texttt{VARCHAR2} and the \texttt{column_table} parameter is type \texttt{DBMS_UTILITY.LNAME_ARRAY}. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

\begin{quote}
\textbf{Note:}
\begin{itemize}
\item The \texttt{KEEP_COLUMNS} procedure supports the same data types supported by Oracle Streams capture processes.
\item The \texttt{KEEP_COLUMNS} procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the \texttt{DELETE_COLUMN} procedure in this package.
\item Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
\end{itemize}
\end{quote}

\begin{quote}
\textbf{See Also:}
\begin{itemize}

\item \textit{Oracle Streams Concepts and Administration} for more information about the data types supported by Oracle Streams capture processes
\item "\texttt{DELETE_COLUMN} Procedure"
\end{itemize}
\end{quote}

Syntax

\begin{verbatim}
DBMS_STREAMS_ADM.KEEP_COLUMNS(
  rule_name     IN  VARCHAR2,
  table_name    IN  VARCHAR2,
  column_list   IN  VARCHAR2,
  value_type    IN  VARCHAR2 DEFAULT '*',
  step_number   IN  NUMBER DEFAULT 0,
  operation     IN  VARCHAR2 DEFAULT 'ADD');
\end{verbatim}

\begin{verbatim}
DBMS_STREAMS_ADM.KEEP_COLUMNS(
  rule_name     IN  VARCHAR2,
  table_name    IN  VARCHAR2,
  column_list   IN  VARCHAR2,
  value_type    IN  VARCHAR2 DEFAULT '*',
  step_number   IN  NUMBER DEFAULT 0,
  operation     IN  VARCHAR2 DEFAULT 'ADD');
\end{verbatim}
Parameters

Table 165-17  KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table for which the columns are kept in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>column_table</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMSUTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL.
<table>
<thead>
<tr>
<th>table_name</th>
<th>column_list/column_table</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all keep columns transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all keep columns transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all keep columns transformations with the specified column_list/column_table and step_number for the specified rule.</td>
</tr>
<tr>

### 165.6.18 MAINTAIN_CHANGE_TABLE Procedure

This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.

This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this **MAINTAIN_CHANGE_TABLE** procedure or the **DBMS_APPLY_ADM.SET_CHANGE_HANDLER** procedure. Information about change handlers is stored in the **ALL_APPLY_CHANGE_HANDLERS** and **DBA_APPLY_CHANGE_HANDLERS** views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.
The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

See Also:
"Procedures That Configure an Oracle Streams Environment" for more information about this procedure.

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
    change_table_name        IN VARCHAR2,
    source_table_name        IN VARCHAR2,
    column_type_list         IN VARCHAR2,
    extra_column_list        IN VARCHAR2  DEFAULT 'command_type, value_type',
    capture_values           IN VARCHAR2,
    options_string           IN VARCHAR2  DEFAULT NULL,
    script_name              IN VARCHAR2  DEFAULT NULL,
    script_directory_object  IN VARCHAR2  DEFAULT NULL,
    perform_actions          IN BOOLEAN   DEFAULT TRUE,
    capture_name             IN VARCHAR2  DEFAULT NULL,
    propagation_name         IN VARCHAR2  DEFAULT NULL,
    apply_name               IN VARCHAR2  DEFAULT NULL,
    source_database          IN VARCHAR2  DEFAULT NULL,
    destination_database     IN VARCHAR2  DEFAULT NULL,
    keep_change_columns_only IN BOOLEAN   DEFAULT TRUE,
    execute_lcr              IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 165-18  MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_table_name</td>
<td>The table that records changes to the source table. This table is maintained by Oracle Streams after configuration. Specify the table as <code>[schema_name.]table_name</code>. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_table_name</td>
<td>The table at the source database for which changes are recorded. Specify the table as <code>[schema_name.]table_name</code>. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 165-18  (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_type_list</td>
<td>A list of the columns in the source table for which changes are recorded. Specify a comma-delimited list of each column and its datatype.</td>
</tr>
<tr>
<td></td>
<td>For example, specify the following for the hr.jobs table:</td>
</tr>
<tr>
<td></td>
<td>job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6)</td>
</tr>
<tr>
<td></td>
<td>The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 165-18  (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| extra_column_list | A comma-delimited list of metadata attributes to include in the change table. The column name for a metadata attribute is in the format of attribute name followed by a $ symbol. For example, the source_database_name attribute is stored in the source_database_name$ column in the change table. The following metadata attributes can be included:  
  • value_type  
  • source_database_name  
  • command_type  
  • object_owner  
  • object_name  
  • tag  
  • transaction_id  
  • scn  
  • commit_scn  
  • compatible  
  • instance_number  
  • message_number  
  • row_text  
  • row_id  
  • serial#  
  • session#  
  • source_time  
  • thread#  
  • tx_name  
  • username  
  All of these metadata attributes, except for value_type and message_number, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see Oracle Streams Concepts and Administration.  
  The value_type$ column in the change table contains either OLD or NEW, depending on whether the column value is the original column value or the new column value, respectively.  
  The message_number$ column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction.  
  The procedure automatically configures the source database to place information about extra attributes, such as serial#, into the redo log so that the information can be captured and recorded. |
Table 165-18  (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_values</td>
<td>Specify which values to capture when update operations are performed on the source table:</td>
</tr>
<tr>
<td></td>
<td>• old - To capture the original values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>• new - To capture the new values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>• * - To capture both the original and the new values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For insert operations, only new column values can be captured. For delete operations, only old column values can be captured.</td>
</tr>
<tr>
<td>options_string</td>
<td>String of options passed to the CREATE TABLE statement that creates the change table. The string is appended to the generated CREATE TABLE statement after the closing parenthesis that defines the columns of the table. The string must be syntactically correct.</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed.</td>
</tr>
<tr>
<td></td>
<td>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to configure the environment directly.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not perform the necessary actions to configure the environment directly.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>• script_name</td>
</tr>
<tr>
<td></td>
<td>• script_directory_object</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of each capture process configured to capture changes. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. Note: The capture process name cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for the propagation. If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed. Note: The propagation name cannot be altered after the propagation is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. Note: The apply process name cannot be altered after the apply process is created.</td>
</tr>
</tbody>
</table>
### Table 165-18  (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>keep_change_columns_only</td>
<td>If TRUE, then this procedure adds a declarative rule-based transformation which keeps the list of columns specified in the column_type_list parameter. The columns that are not specified in the column_type_list parameter are removed from each row LCR captured by the capture process. If FALSE, then this procedure does not create a declarative rule-based transformation, and all of the columns in the row LCRs are kept. Specify FALSE when information about columns that are not included in the column_type_list parameter is needed at the destination database. For example, if the execute_lcr parameter is set to TRUE and the configuration will replicate all of the columns in a source table, but the column_type_list parameter includes a subset of these columns, then the keep_change_columns_only parameter should be set to FALSE. <strong>Note:</strong> When this parameter is set to TRUE, a declarative rule-based transformation is always created, even if the column_type_list includes all of the columns in the source table.</td>
</tr>
<tr>
<td>execute_lcr</td>
<td>If TRUE, then this procedure creates a change handler that executes each row LCR at the destination database. If FALSE, then the row LCRs are not executed at the destination database.</td>
</tr>
</tbody>
</table>

### Usage Notes

The following are usage notes for this procedure:

#### Types of Oracle Streams Environments Configured by the Procedure

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database**: Specify the same global name for the `source_database` and the `destination_database` parameter.
- **Local capture and remote apply**: Specify the global name of the local database for the `source_database` parameter and a remote database for the `destination_database` parameter.
- **Downstream capture and local apply**: Specify a remote database for the `source_database` parameter and the local database for the `destination_database` parameter.
- **Downstream capture and remote apply**: Specify a remote database for the `source_database` parameter and a remote database for the `destination_database` parameter.

Optional One-Way Replication With This Procedure

To configure one-way replication of the table, in addition to recording changes to the table, set the `execute_lcr` parameter to `TRUE`. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, usually, the source table replica table should be consistent.

**See Also:**

*Oracle Streams Replication Administrator's Guide*

Statement DML Handlers, the Change Table, and Row LCR Execution

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the `execute_lcr` parameter is set to `TRUE`.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the `capture_type_list`, `extra_column_list`, and `capture_values` parameters. The procedure adds the statement DML handlers to the apply process specified in the `apply_name` parameter.

**See Also:**

*DBMS_STREAMS_HANDLER_ADM*
165.6.19 MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the `MAINTAIN_GLOBAL` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

See Also:

“Procedures That Configure an Oracle Streams Environment” for more information about this procedure.

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_GLOBAL(
    source_directory_object     IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN DEFAULT TRUE,
    script_name                  IN VARCHAR2 DEFAULT NULL,
    script_directory_object      IN VARCHAR2 DEFAULT NULL,
    dump_file_name               IN VARCHAR2 DEFAULT NULL,
    capture_name                 IN VARCHAR2 DEFAULT NULL,
    capture_queue_table          IN VARCHAR2 DEFAULT NULL,
    capture_queue_name           IN VARCHAR2 DEFAULT NULL,
    capture_queue_user           IN VARCHAR2 DEFAULT NULL,
    propagation_name             IN VARCHAR2 DEFAULT NULL,
    apply_name                   IN VARCHAR2 DEFAULT NULL,
    apply_queue_table            IN VARCHAR2 DEFAULT NULL,
)
```

</tbody>
</table>
Table 165-19  (Cont.) MAINTAIN_GLOBAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| instantiation | Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:  
DBMS_STREAMS_ADM.INSTANTIATION_FULL performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.  

DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.  

DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database.  

If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database.  

If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. |
165.6.20 MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases.

This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

**Note:**

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the MAINTAIN_SCHEMAS procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

**See Also:**

If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>
Table 165-20  (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| instantiation     | Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:  
                     - DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.  
                     - DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.  
                     - DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.  
                     If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database, and the tablespaces that contain the schemas must exist at the destination database.  
                     If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. |
165.6.21 MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases.

This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note:
This procedure is deprecated. It is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also:
- “Deprecated Subprograms”
- `MAINTAIN_SIMPLE_TTS` Procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
    tablespace_name              IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database         IN VARCHAR2,
    setup_streams                IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_directory_object  | The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error.  
  **Note:** The specified directory object cannot point to an Oracle ASM disk group. |
| destination_directory_object | The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error.  
  **Note:** The specified directory object cannot point to an Oracle ASM disk group. |
| destination_database     | The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error. |
| setup_streams            | If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
  * script_name  
  * script_directory_object |
Table 165-21  (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
</tbody>
</table>

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.
DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_SIMPLE_TABLESPACE procedure:

• "* Procedures That Create Rules for Oracle Streams Clients and XStream Clients" for information about automatic platform conversion
• Oracle Streams Replication Administrator’s Guide

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_SIMPLE_TABLESPACE procedure:

• Run the procedure at the source database.
• Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
• Grant the user who runs this procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  – Create ANYDATA queues, capture processes, propagations, and apply processes.
  – Specify supplemental logging
  – Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  – Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  – Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  – The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure for the list of required privileges.
  – The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator’s schema.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.
• If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source
database. This database link should have the same name as the global name of
the source database.

- Each specified directory object must be created using the SQL statement `CREATE
DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE`
privilege on each one.

- The databases configured by this procedure must be Oracle Database 10g
Release 2 or later databases when this procedure is run under the following
conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams
    replication environment directly.

- The databases configured by this procedure must be Oracle Database 10g
Release 1 or later databases when this procedure is run under the following
conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the
    replication environment is configured with a generated script.

  If the script configures an Oracle Database 10g Release 1 database, then the
  script must be modified so that it does not configure features that are available
  only in Oracle Database 10g Release 2 or later, such as queue-to-queue
  propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the
databases configured by the procedure must be Oracle Database 10g Release 1
or later databases.

See Also:

*Oracle Streams Replication Administrator's Guide* for information about
configuring an Oracle Streams administrator

Default Values for Parameters Excluded From the
MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the `MAINTAIN_TABLESPACES`
procedure that do not exist in the `MAINTAIN_SIMPLE_TABLESPACE` procedure. For example,
this procedure creates a capture process at the source database named `capture`,
because that is the default value for the `capture_name` parameter in the
`MAINTAIN_TABLESPACES` procedure.

See Also:

`MAINTAIN_TABLESPACES` Procedure

Configuration Progress and Recoverability
When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

**Note:**

When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

**See Also:**

"RECOVER_OPERATION Procedure"

### 165.6.22 MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases.

This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

**Note:**

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_SIMPLE_TABLESPACE` procedure.
See Also:

"Procedures That Configure an Oracle Streams Environment" for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
    tablespace_name              IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

**DDL Changes Not Maintained**

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate `ALTER TABLESPACE` statements on the tablespace, nor is it configured to replicate `ALTER TABLE` statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.
Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Procedures That Configure an Oracle Streams Environment", the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also:

MAINTAIN_TTS Procedure

165.6.23 MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases.

This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

Note:

If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the MAINTAIN_TABLES procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
Syntax

"Procedures That Configure an Oracle Streams Environment" for descriptions of the common procedure parameters that are not in Table 165-23

Table 165-23  MAINTAIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_names</td>
<td>The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Comma-delimited list of type VARCHAR2</td>
</tr>
<tr>
<td></td>
<td>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td></td>
<td>Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>This procedure raises an error in any of the following cases:</td>
</tr>
<tr>
<td></td>
<td>• When a specified table does not exist at the source database</td>
</tr>
<tr>
<td></td>
<td>• When the table_names parameter is set to NULL</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes.</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter.</td>
</tr>
<tr>
<td></td>
<td>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
</tbody>
</table>
**Table 165-23 (Cont.) MAINTAIN_TABLES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_directory_object</td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.                                                                                                                         If the source database and destination database run on the same computer system, then the source and destination directories must be different.   This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database.                                                                                                                                                                                                                                                                                                                                                                                                                                         If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database.                                                                                                                                                                                                                                                                                                                                                                                                                                    If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 165-23  (Cont.) MAINTAIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the export dump file name is generated by the system. In this case, the export dump file name is expat.nn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>instantiation</td>
<td>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: &lt;br&gt;DBMS_STREAMS_ADM.INSTANTIATION_TABLE performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. &lt;br&gt;DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. &lt;br&gt;DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. &lt;br&gt; If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE or DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK, then the tables being instantiated must exist at the source database, and the tablespaces that contain the tables must exist at the destination database. &lt;br&gt; If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. &lt;br&gt; Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.</td>
</tr>
</tbody>
</table>
165.6.24 MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases.

This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note:
This procedure is deprecated. It is replaced by the MAINTAIN_TTS procedure.

See Also:
- “Deprecated Subprograms”
- MAINTAIN_TTS Procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
    tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database IN VARCHAR2,
    setup_streams IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    dump_file_name IN VARCHAR2 DEFAULT NULL,
    source_queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    source_queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    source_queue_user IN VARCHAR2 DEFAULT NULL,
    destination_queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    destination_queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    destination_queue_user IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT 'capture',
    propagation_name IN VARCHAR2 DEFAULT NULL,
    apply_name IN VARCHAR2 DEFAULT NULL,
    log_file IN VARCHAR2 DEFAULT NULL,
    bi_directional IN BOOLEAN DEFAULT FALSE,
    include_ddl IN BOOLEAN DEFAULT FALSE);
```
## Parameters

### Table 165-24  MAINTAIN_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| tablespace_names     | The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.  
                        The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.  
                        A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have `READ` privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.  
                        If `NULL`, then the procedure raises an error.  
                        **See Also:** TABLESPACE_SET Table Type |
| source_directory_object | The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.  
                        If `NULL`, then the procedure raises an error.  
                        **Note:** The specified directory object cannot point to an Oracle ASM disk group. |
| destination_directory_object | The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.  
                        If the source database and destination database run on the same computer system, then the source and destination directories must be different.  
                        If `NULL`, then the procedure raises an error.  
                        **Note:** The specified directory object cannot point to an Oracle ASM disk group. |
| destination_database | The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.  
                        If `NULL`, then the procedure raises an error. |
### Table 165-24  (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_streams</td>
<td>If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat.nn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>

Table 165-24  (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bi_directional</td>
<td>Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.</td>
</tr>
</tbody>
</table>

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also:

Oracle Database Administrator's Guide for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_TABLESPACES procedure:

- "Procedures That Configure an Oracle Streams Environment " for information about automatic platform conversion
- Oracle Streams Replication Administrator's Guide

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_TABLESPACES procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter

Chapter 165
Summary of DBMS_STREAMS_ADM Subprograms
does not need to be open when you run the procedure, but both databases must be open when you run the generated script.

• The user who runs this procedure should be granted the **dba** role. This user must have the necessary privileges to complete the following actions:
  - Create **anydata** queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the **DBMS_STREAMS_ADM** and **DBMS_AQADM** packages.
  - Access the database specified in the **destination_database** parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the **DBMS_STREAMS_TABLESPACES_ADM** package
  - The necessary privileges to run the **clone_tablespaces** procedure in the **DBMS_STREAMS_TABLESPACES_ADM** package at the source database. See **CLONE_TABLESPACES Procedure** for the list of required privileges.
  - The necessary privileges to run the **attach_tablespaces** procedure in the **DBMS_STREAMS_TABLESPACES_ADM** package at the destination database. See **ATTACH_TABLESPACES Procedure** for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator’s schema.

• If the **bi_directional** parameter is set to **true**, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

• Each specified directory object must be created using the SQL statement **CREATE DIRECTORY**, and the user who invokes this procedure must have **READ** and **WRITE** privilege on each one.

• The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The **setup_streams** parameter is set to **true** to configure the Oracle Streams replication environment directly.

• The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The **setup_streams** parameter is set to **false** in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.
• If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

See Also:

*Oracle Streams Replication Administrator’s Guide* for information about configuring an Oracle Streams administrator

### Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and  `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note:

When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

"RECOVER_OPERATION Procedure"

### 165.6.25 MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases.

This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.
Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.

See Also:

"Procedures That Configure an Oracle Streams Environment" for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_TTS(
    tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT NULL,
    capture_queue_table          IN VARCHAR2  DEFAULT NULL,
    capture_queue_name           IN VARCHAR2  DEFAULT NULL,
    capture_queue_user           IN VARCHAR2  DEFAULT NULL,
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                   IN VARCHAR2  DEFAULT NULL,
    apply_queue_table            IN VARCHAR2  DEFAULT NULL,
    apply_queue_name             IN VARCHAR2  DEFAULT NULL,
    apply_queue_user             IN VARCHAR2  DEFAULT NULL,
    log_file                     IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also:

"Procedures That Configure an Oracle Streams Environment" for descriptions of the common procedure parameters that are not in Table 165-25
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_names</td>
<td>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</td>
</tr>
<tr>
<td></td>
<td>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</td>
</tr>
<tr>
<td></td>
<td>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have <code>READ</code> privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> <code>TABLESPACE_SET Table Type</code></td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.</td>
</tr>
<tr>
<td></td>
<td>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure uses the global name of the local database.</td>
</tr>
</tbody>
</table>
Table 165-25  (Cont.) MAINTAIN_TTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat.nn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

* See Also:  

Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "* Procedures That Configure an Oracle Streams Environment", the user who runs the MAINTAIN_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_TABLESPACES Procedure for the list of required privileges.
• The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_TABLESPACES Procedure for the list of required privileges.

165.6.26 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

• The stream before it was split off has the original queue, original capture process, and original propagation.
• The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

• The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
• The cloned capture process used by the split stream is started and is capturing changes.
• The apply process at the destination database is applying the changes captured by the cloned capture process.
• The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   • The acknowledged SCN of the cloned propagation.
   • The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.
When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- MERGE_STREAMS_JOB Procedure
- SPLIT_STREAMS Procedure

Syntax

```sql
DBMS_STREAMS_ADM.MERGE_STREAMS(
    cloned_propagation_name  IN  VARCHAR2,
    propagation_name         IN  VARCHAR2  DEFAULT NULL,
    queue_name               IN  VARCHAR2  DEFAULT NULL,
    perform_actions          IN  BOOLEAN   DEFAULT TRUE,
    script_name              IN  VARCHAR2  DEFAULT NULL,
    script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 165-26  MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>name</td>
<td></td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See &quot;Usage Notes&quot; for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions:</td>
</tr>
<tr>
<td>queue_name</td>
<td></td>
</tr>
<tr>
<td>perform_actions</td>
<td></td>
</tr>
<tr>
<td>script_name</td>
<td></td>
</tr>
<tr>
<td>script_directory_object</td>
<td></td>
</tr>
</tbody>
</table>
### Table 165-26  (Cont.) MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>
| perform_actions | If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
  - script_name
  - script_directory_object

| script_name     | If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error. |
| script_directory_object | The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. |

### Usage Notes
You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.
165.6.27 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:
- MERGE_STREAMS Procedure
- SPLIT_STREAMS Procedure
- Oracle Streams Replication Administrator's Guide for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name        IN VARCHAR2,
   propagation_name               IN VARCHAR2 DEFAULT NULL,
   queue_name                     IN VARCHAR2 DEFAULT NULL,
   merge_threshold                IN NUMBER,
   schedule_name                  IN VARCHAR2 DEFAULT NULL,
   merge_job_name                 IN VARCHAR2 DEFAULT NULL);
### Parameters

#### Table 165-27  MERGE_STREAMS_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
| propagation_name        | The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See “Usage Notes” for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions:  
  - The queue specified in the queue_name parameter does not exist.  
  - The queue specified in the queue_name parameter exists but is not used by a capture process. |
| queue_name              | The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See “Usage Notes” for more information. |
| merge_threshold         | The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing. |
Table 165-27  (Cont.) MERGE_STREAMS_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.</td>
</tr>
<tr>
<td>merge_job_name</td>
<td>The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

165.6.28 POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the PRE_INSTANTIATION_SETUP procedure at the source database.

2. Perform any necessary instantiation actions.

3. Run the POST_INSTANTIATION_SETUP procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
• Replicates changes to database objects during a database maintenance operation, such as migrating a database to a different platform. In this case, use the CLEANUP_INSTANTIATION_SETUP procedure to remove the replication environment after the maintenance operation is complete.

**Note:**

When the POST_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP procedure was run, except for the values of the following parameters: perform_actions, script_name, script_directory_object, and start_processes.

**Note:**

A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.

**See Also:**

• "PRE_INSTANTIATION_SETUP Procedure"
• "CLEANUP_INSTANTIATION_SETUP Procedure"
• "Procedures That Configure an Oracle Streams Environment" for more information about this procedure
• Oracle Streams Replication Administrator's Guide for information about setting up an Oracle Streams replication environment
• Oracle Streams Concepts and Administration for information about completing database maintenance operations

**Syntax**

```sql
DBMS_STREAMS_ADM.POST_INSTANTIATION_SETUP(
  maintain_mode IN VARCHAR2,
  tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
  source_database IN VARCHAR2,
  destination_database IN VARCHAR2,
  perform_actions IN BOOLEAN DEFAULT TRUE,
  script_name IN VARCHAR2 DEFAULT NULL,
  script_directory_object IN VARCHAR2 DEFAULT NULL,
  capture_name IN VARCHAR2 DEFAULT NULL,
  capture_queue_table IN VARCHAR2 DEFAULT NULL,
  capture_queue_name IN VARCHAR2 DEFAULT NULL,
  capture_queue_user IN VARCHAR2 DEFAULT NULL,
  propagation_name IN VARCHAR2 DEFAULT NULL,
  apply_name IN VARCHAR2 DEFAULT NULL,
  apply_queue_table IN VARCHAR2 DEFAULT NULL,
  apply_queue_name IN VARCHAR2 DEFAULT NULL,
)
```
apply_queue_user IN VARCHAR2 DEFAULT NULL,
bi_directional IN BOOLEAN DEFAULT FALSE,
include_ddl IN BOOLEAN DEFAULT FALSE,
start_processes IN BOOLEAN DEFAULT FALSE,
instantiation_scn IN NUMBER DEFAULT NULL,
exclude_schemas IN VARCHAR2 DEFAULT NULL,
exclude_flags IN BINARY_INTEGER DEFAULT NULL);

<tr>
<td></td>
<td>This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See “Usage Notes” for the PRE_INSTANTIATION_SETUP procedure for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also:

Oracle Database Administrator's Guide for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. If the RMAN DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST_INSTANTIATION_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the destination_database parameter.

2. At the destination database, drop and re-create any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database dbs1.net has a database link that refers to itself. Suppose the destination database is dbs2.net. At the destination database, drop and re-create this database link as a loopback database link that refers to itself (dbs2.net).

3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is dbs1.net and the destination database is dbs2.net, then drop any database links on the destination database that are from dbs1.net to dbs2.net.

4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link
must be accessible to the Oracle Streams administrator at the destination database.

This database link is required because the POST_INSTANTIATION_SETUP procedure runs the SET_GLOBAL_INSTANTIATION_SCN procedure in the DBMS_APPLY_ADM package at the destination database, and the SET_GLOBAL_INSTANTIATION_SCN procedure requires the database link. The instantiation SCN is set to the value specified in the instantiation_scn parameter of the POST_INSTANTIATION_SETUP procedure.

**Note:**

When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

**Note:**

The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.

165.6.29 PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the PRE_INSTANTIATION_SETUP procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.

3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.

- Replicates changes to database objects during a database maintenance operation, such as migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

**Note:**

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

- When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.

**See Also:**

- "`POST_INSTANTIATION_SETUP Procedure`"
- "`CLEANUP_INSTANTIATION_SETUP Procedure`"
- "Procedures That Configure an Oracle Streams Environment" for more information about this procedure
- *Oracle Streams Replication Administrator's Guide* for information about setting up an Oracle Streams replication environment
- *Oracle Streams Concepts and Administration* for information about completing database maintenance operations

**Syntax**

```sql
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
    maintain_mode IN VARCHAR2,
    tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_database IN VARCHAR2,
    destination_database IN VARCHAR2,
    perform_actions IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT NULL,
    capture_queue_table IN VARCHAR2 DEFAULT NULL,
    capture_queue_name IN VARCHAR2 DEFAULT NULL,
    capture_queue_user IN VARCHAR2 DEFAULT NULL,
    propagation_name IN VARCHAR2 DEFAULT NULL,
)"
```
Parameters

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>capture_queue_table</td>
<td>The name of the queue table for each queue used by a capture process, specified as [\text{schema}_\text{name}.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</td>
</tr>
<tr>
<td>start_processes</td>
<td>If TRUE, then the procedure starts each capture process and apply process. If FALSE, then the procedure does not start any capture processes or apply processes.</td>
</tr>
<tr>
<td>exclude_schemas</td>
<td>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the maintain_mode parameter is set to GLOBAL. If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</td>
</tr>
<tr>
<td>exclude_flags</td>
<td>Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>
Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also:

Oracle Database Administrator's Guide for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude changes to the schemas and all of the database objects in the schemas
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL or DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED, specify one or both of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML to exclude data manipulation language (DML) changes made to the excluded database objects
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the exclude_schemas parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the exclude_schemas parameter, specify the following for this parameter:

DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a non-NULL value. If the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a NULL, then the procedure ignores this parameter. If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the `exclude_schemas` parameter, but the `exclude_flags` parameter is set to NULL, then the procedure does not add any rules to the negative rule set of any capture process, and the procedure includes the schemas specified in the `exclude_schemas` parameter in the replication environment.

### 165.6.30 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object.

You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

#### Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database containing the object. If you do not</td>
</tr>
<tr>
<td></td>
<td>include the domain name, then the procedure appends it to the database name</td>
</tr>
<tr>
<td></td>
<td>automatically. For example, if you specify DBS1 and the domain is .NET, then</td>
</tr>
<tr>
<td></td>
<td>the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>source_object_name</td>
<td>The name of the object specified as [schema_name.]object_name. For example,</td>
</tr>
<tr>
<td></td>
<td>hr.employees. If the schema is not specified, then the current user is the</td>
</tr>
<tr>
<td></td>
<td>default.</td>
</tr>
<tr>
<td>source_object_type</td>
<td>Type of the object. Currently, TABLE is the only possible object type.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.
For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

**Note:**

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

165.6.31 RECOVER_OPERATION Procedure

This procedure provides options for operations that stopped because they encountered an errors.

These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge
  - `SPLIT_STREAMS Procedure`
  - `MERGE_STREAMS_JOB Procedure`
- Change table configuration operations performed by the `MAINTAIN_CHANGE_TABLE Procedure`
- Replication configuration operations performed by the following procedures:
  - `MAINTAIN_GLOBAL Procedure`
  - `MAINTAIN_SCHEMAS Procedure`
  - `MAINTAIN_SIMPLE_TABLESPACE Procedure`
  - `MAINTAIN_SIMPLE_TTS Procedure`
  - `MAINTAIN_TABLES Procedure`
  - `MAINTAIN_TABLESPACES Procedure`
– MAINTAIN_TTS Procedure
– PRE_INSTANTIATION_SETUP Procedure
– POST_INSTANTIATION_SETUP Procedure

Information about the operation is stored in the following data dictionary views when the operation is in process:

• DBA_RECOVERABLE_SCRIPT
• DBA_RECOVERABLE_SCRIPT_PARAMS
• DBA_RECOVERABLE_SCRIPT_BLOCKS
• DBA_RECOVERABLE_SCRIPT_ERRORS

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

For split and merge operations, run the RECOVER_OPERATION procedure at the database that contains the capture process. For the configuration operations, run the RECOVER_OPERATION procedure at the database where the replication configuration procedure was run.

Note:

• Regarding the configuration operations, the procedure must configure the environment directly (perform_actions => TRUE), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the RECOVER_OPERATION procedure.

• To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10g Release 2 or later databases.

See Also:

Oracle Streams Replication Administrator's Guide
Syntax

DBMS_STREAMS_ADM.RECOVER_OPERATION(
    script_id       IN  RAW,
    operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');

Parameters

Table 165-31  RECOVER_OPERATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_id</td>
<td>The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.</td>
</tr>
<tr>
<td>operation_mode</td>
<td>If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days.</td>
</tr>
<tr>
<td></td>
<td>If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.</td>
</tr>
</tbody>
</table>

165.6.32 REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

Note:

The specified queue must be a ANYDATA queue.

Syntax

DBMS_STREAMS_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
Parameters

Table 165-32  REMOVE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.</td>
</tr>
<tr>
<td>drop_unused_queue_table</td>
<td>If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.</td>
</tr>
</tbody>
</table>

165.6.33 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

Note:

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the DBMS_RULE_ADM.DROP_RULE procedure. If you use the DBMS_RULE_ADM.DROP_RULE procedure, then some metadata about the rule might remain.

Syntax

```sql
DBMS_STREAMS_ADM.REMOVE_RULE(
    rule_name         IN  VARCHAR2,
    streams_type      IN  VARCHAR2,
    streams_name      IN  VARCHAR2,
    drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```
Parameters

Table 165-33 REMOVE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule to remove, specified as [schema_name.]rule_name. If NULL, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| streams_type | The type of Oracle Streams client:  
  • Specify capture for a capture process.  
  • Specify sync_capture for a synchronous capture.  
  • Specify propagation for a propagation.  
  • Specify apply for an apply process.  
  • Specify dequeue for a messaging client. |
| streams_name | The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error. |
| drop_unused_rule | If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database.  
  If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database.  
  If FALSE, then the procedure does not drop the rule from the database. |
| inclusion_rule | If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the Oracle Streams client.  
  If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the Oracle Streams client. |

165.6.34 REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;

Usage Notes

Specifically, this procedure performs the following actions at the local database:

• Drops all capture processes
• If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package

• If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package

• If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package

• Drops propagations that were created using either the DBMS_STREAMS_ADM package or the DBMS_PROPAGATION_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS_AQADM package.

• Disables all propagation jobs used by propagations

• Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.

• Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers

• Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers

• Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers

• Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database

• Removes messaging clients

• Unsets message notification specifications that were set using the SET_MESSAGE_NOTIFICATION procedure in the DBMS_STREAMS_ADM package

• Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers

• Removes update conflict handlers

• Removes specifications for substitute key columns for apply tables

• Drops rule sets and rules that were created using the DBMS_STREAMS_ADM package.

• Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

• The rule sets or rules were created using the DBMS_RULE_ADM package.

• The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.
Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

Note:

Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.

• This procedure commits multiple times.

See Also:

• STOP_CAPTURE Procedure in the DBMS_CAPTURE_ADM package
• STOP_APPLY Procedure in the DBMS_APPLY_ADM package
• REMOVE_RULE Procedure in the DBMS_STREAMS_ADM package

165.6.35 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

• The RENAME_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.

• Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
See Also:

• *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

• *Oracle Streams Concepts and Administration* for more information about the data types supported by Oracle Streams capture processes

Syntax

```sql
DBMS_STREAMS_ADM.RENAME_COLUMN(
    rule_name         IN  VARCHAR2,
    table_name        IN  VARCHAR2,
    from_column_name  IN  VARCHAR2,
    to_column_name    IN  VARCHAR2,
    value_type        IN  VARCHAR2  DEFAULT '*',
    step_number       IN  NUMBER    DEFAULT 0,
    operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

**Table 165-34  RENAME_COLUMN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <em>[schema_name.]rule_name</em>. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table in which the column is renamed in the row LCR, specified as <em>[schema_name.]object_name</em>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_column_name</td>
<td>The name of the column to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new name of the column in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to rename the column in the new values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify 'OLD' to rename the column in the old values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify '*' to rename the column in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule.</td>
</tr>
<tr>
<td></td>
<td>Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>
Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>from_column_name</th>
<th>to_column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>

<td>NULL</td>
<td>Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
165.6.36 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

Syntax

```sql
DBMS_STREAMS_ADM.RENAME_SCHEMA(
    rule_name         IN  VARCHAR2,
    from_schema_name  IN  VARCHAR2,
    to_schema_name    IN  VARCHAR2,
    step_number       IN  NUMBER    DEFAULT 0,
    operation         IN  VARCHAR2  DEFAULT 'ADD');
```
Parameters

Table 165-35 RENAME_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_schema_name</td>
<td>The name of the schema to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_schema_name</td>
<td>The new name of the schema in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified from_schema_name, to_schema_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_schema_name</th>
<th>to_schema_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name for the specified rule.</td>
</tr>
</tbody>
</table>
### 165.6.37 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

#### Note:

Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

#### See Also:

*Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

#### Syntax

```sql
DBMS_STREAMS_ADM.RENAME_TABLE(
    rule_name        IN  VARCHAR2,
    from_table_name  IN  VARCHAR2,
    to_table_name    IN  VARCHAR2,
    step_number      IN  NUMBER    DEFAULT 0,
    operation        IN  VARCHAR2  DEFAULT 'ADD');
```
Parameters

Table 165-36  RENAME_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If <code>NULL</code>, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code>, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>from_table_name</code></td>
<td>The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>to_table_name</code></td>
<td>The new name of the table in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code>. For example, <code>humres.staff</code>. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>step_number</code></td>
<td>The order of execution of the transformation. See Also: Oracle Streams Concepts and Administration for more information about transformation ordering</td>
</tr>
<tr>
<td><code>operation</code></td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is `NULL`:

<table>
<thead>
<tr>
<th><code>from_table_name</code></th>
<th><code>to_table_name</code></th>
<th><code>step_number</code></th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NULL</code></td>
<td><code>NULL</code></td>
<td><code>NULL</code></td>
<td>Remove all rename table transformations for the specified rule.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td><code>NULL</code></td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified <code>step_number</code> for the specified rule.</td>
</tr>
<tr>
<td><code>NULL</code></td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified <code>to_table_name</code> and <code>step_number</code> for the specified rule.</td>
</tr>
</tbody>
</table>
165.6.38 SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue.

A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

Syntax

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
    streams_name          IN  VARCHAR2,
    notification_action   IN  VARCHAR2,
    notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
    notification_context  IN  ANYDATA      DEFAULT NULL,
    step_number           IN  NUMBER)
```
include_notification IN BOOLEAN DEFAULT TRUE,
queue_name IN VARCHAR2 DEFAULT 'streams_queue');

Parameters

Table 165-37  SET_MESSAGE_NOTIFICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>For example, if the user strmadmin is the messaging client, then specify strmadmin.</td>
</tr>
<tr>
<td>notification_action</td>
<td>The action to be performed on message notification. Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>• For URL notifications, specify a URL without the prefix http://.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify the URL <a href="http://www.company.com:8080">http://www.company.com:8080</a>, enter the following:</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.company.com:8080">www.company.com:8080</a></td>
</tr>
<tr>
<td></td>
<td>• For email notifications, specify an email address.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify an email address <a href="mailto:xyz@company.com">xyz@company.com</a>, enter the following:</td>
</tr>
<tr>
<td></td>
<td><a href="mailto:xyz@company.com">xyz@company.com</a></td>
</tr>
<tr>
<td></td>
<td>• For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [schema_name.]procedure_name. If the schema_name is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQL_CALLBACK data structure.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a procedure named notify_orders in the oe schema, enter the following:</td>
</tr>
<tr>
<td></td>
<td>oe.notify_orders</td>
</tr>
<tr>
<td>See Also: Examples</td>
<td>for more information about message notification procedures.</td>
</tr>
<tr>
<td></td>
<td>notification_type</td>
</tr>
<tr>
<td></td>
<td>The type of notification. Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>• HTTP if you specified a URL for notification_action</td>
</tr>
<tr>
<td></td>
<td>• MAIL if you specified an email address for notification_action</td>
</tr>
<tr>
<td></td>
<td>• PROCEDURE if you specified a user-defined procedure for notification_action</td>
</tr>
<tr>
<td></td>
<td>The type must match the specification for the notification_action parameter.</td>
</tr>
<tr>
<td>notification_context</td>
<td>The context of the notification. The context must be specified using RAW datatype information. For example, to specify the hexadecimal equivalent of 'FF', enter the following:</td>
</tr>
<tr>
<td></td>
<td>ANYDATA.ConvertRaw(HEXTORAW('FF'))</td>
</tr>
<tr>
<td></td>
<td>The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.</td>
</tr>
</tbody>
</table>
Table 165-37  (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| include_notification | If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name.  
If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters. |
| queue_name     | The name of a local ANYDATA queue, specified as [schema_name.]queue_name. The current database must contain the queue. The specified queue must be a ANYDATA queue.  
For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |

Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the DBMS_AQELM package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the DBMS_AQELM package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an AQXmlNotification, which includes the following:

- notification_options, which includes the following:
  - destination - The destination queue from which the message was dequeued
  - consumer_name - The name of the messaging client that dequeued the message
- message_set - The set of message properties
See Also:

- The documentation for the DBMS_AQELM package for more information on email notifications and HTTP notifications
- Oracle Streams Concepts and Administration for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
    context  IN  ANYDATA,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR);
```

Here, `procedure_name` stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
    object_name    VARCHAR2(30),
    object_owner   VARCHAR2(30),
    message        VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
    context  ANYDATA,
    reginfo  SYS.AQ$_REG_INFO,
    descr    SYS.AQ$_DESCRIPTOR)
AS
    dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
    message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
    message_handle      RAW(16);
    message             ANYDATA;
    oe_message          oe.user_msg;
    rc                  PLS_INTEGER;
BEGIN
    -- Get the message identifier and consumer name from the descriptor
    dequeue_options.msgid := descr.msg_id;
    dequeue_options.consumer_name := descr.consumer_name;
    -- Dequeue the message
    DBMS_AQ.DEQUEUE(
        queue_name   => descr.queue_name,
        dequeue_options => dequeue_options,
        message_properties => message_properties,
        ...)
165.6.39 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note:
The tracking label set by this procedure does not track non-LCR messages.

See Also:
GET_MESSAGE_TRACKING Function

Syntax

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
    actions IN NUMBER DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

Table 165-38  SET_MESSAGE_TRACKING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracking_label</td>
<td>The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session.</td>
</tr>
<tr>
<td></td>
<td>The size limit for a label is 4,000 bytes.</td>
</tr>
</tbody>
</table>
Table 165-38  (Cont.) SET_MESSAGE_TRACKING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actions</td>
<td>When DBMS_STREAMS_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_STREAMS_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</td>
</tr>
</tbody>
</table>

165.6.40 SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
    rule_name           IN  VARCHAR2,
    transform_function  IN  VARCHAR2);
```

Parameters

Table 165-39  SET_RULE_TRANSFORM_FUNCTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule whose rule-based transformation function you are setting or removing, specified as [schema_name.]rule_name. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| transform_function | Either the name of the transformation function to be used in the rule-based transformation for the rule or NULL. If you specify a transformation function name, then specify an existing function in one of the following forms:  
  * [schema_name.]function_name
  * [schema_name.]package_name.function_name
  
  If the function is in a package, then you must specify the package_name. For example, to specify a function in the transform_pkg package in the hr schema named executive_to_management, enter hr.transform_pkg.executive_to_management. An error is returned if the specified procedure does not exist. If the schema_name is not specified, then the user who invokes the rule-based transformation function is the default. If you specify NULL, then the SET_RULE_TRANSFORM_FUNCTION procedure removes the current custom rule-based transformation from the rule. |
Usage Notes

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (parameter_name IN ANYDATA)
RETURN ANYDATA;
```

Here, `user_function` stands for the name of the function and `parameter_name` stands for the name of the parameter passed to the function. The parameter passed to the function is an `ANYDATA` encapsulation of a message, and the function must return an `ANYDATA` encapsulation of a message.

A custom rule-based transformation function that can return multiple messages is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (parameter_name IN ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, `user_function` stands for the name of the function and `parameter_name` stands for the name of the parameter passed to the function. The parameter passed to the function is an `ANYDATA` encapsulation of a message, and the function must return an array that contains zero or more `ANYDATA` encapsulations of a message. If the array contains zero `ANYDATA` encapsulations of a message, then the original message is discarded.

The `STREAMS$_ANYDATA_ARRAY` type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
• Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.

• The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

Note:

• An error is raised if a one-to-one or one-to-many transformation function returns NULL.

• Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.

• For any LCR constructed and returned by a custom rule-based transformation, the source_database_name, transaction_id, and scn parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

• If the function is a one-to-one transformation function, then the name is STREAMS$TRANSFORM_FUNCTION. If the function is a one-to-many transformation function, then the name is STREAMS$ARRAY_TRANS_FUNCTION.

• The value is a ANYDATA instance containing a PL/SQL function name specified as a VARCHAR2. This function performs the transformation.

User Who Calls the Transformation Function

The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

• If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
• If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.

• If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.

• If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.

• If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Function Verification

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

165.6.41 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

```
DBMS_STREAMS_ADM.SET_TAG(
    tag  IN RAW  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of ‘17’ in the current session, run the following procedure:
The following are considerations for the `SET_TAG` procedure:

- This procedure is not transactional. That is, the effects of `SET_TAG` cannot be rolled back.
- If the `SET_TAG` procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the `SET_TAG` procedure in a session. A data dictionary build happens when the `DBMS_CAPTURE_ADM.BUILD` procedure is run. The `BUILD` procedure can be run automatically when a capture process is created.

See Also:

`BUILD Procedure`

### 165.6.42 SET_UP_QUEUE Procedure

This procedure creates a queue table and a `ANYDATA` queue.

**Syntax**

```sql
DBMS STREAMS_ADM.SET_UP_QUEUE(
    queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    storage_clause IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    queue_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 165-41  SET_UP_QUEUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as <code>[schema_name.]queue_table_name</code>. For example, <code>stradmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.</td>
</tr>
</tbody>
</table>
### Table 165-41  (Cont.) SET_UP_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table</td>
</tr>
<tr>
<td></td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</td>
</tr>
<tr>
<td></td>
<td>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Database SQL Language Reference for more information about storage clauses</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>Queue names can be a maximum of 24 bytes.</td>
</tr>
<tr>
<td>queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment for the queue</td>
</tr>
</tbody>
</table>

### Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10g release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release before Oracle Database 10g release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
• If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.

• This procedure starts the queue.

• If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

**Note:**

• To enqueue messages into and dequeue messages from a queue, a queue user must have `EXECUTE` privilege on the `DBMS_STREAMS_MESSAGING` package or the `DBMS_AQ` package. The `SET_UP_QUEUE` procedure does not grant this privilege.

• If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

See Also:

*Oracle Streams Concepts and Administration* for more information about secure queue users

165.6.43 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.

3. Stops the capture process.

4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.

7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.

8. If the auto_merge_threshold parameter is set to a positive number, then creates an Oracle Scheduler job to run the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the MERGE_STREAMS_JOB procedure runs the MERGE_STREAMS procedure to merge the streams automatically.

After the SPLIT_STREAMS procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the START_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

The DBA_STREAMS_SPLIT_MERGE view contains the name of each cloned component and information about the split and merge operation.

**Note:**

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

**See Also:**

- "MERGE_STREAMS_JOB Procedure"
- Oracle Streams Replication Administrator's Guide for instructions on using the SPLIT_STREAMS procedure
Syntax

DBMS_STREAMS_ADM.SPLIT_STREAMS(
    propagation_name         IN      VARCHAR2,
    cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
    cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
    cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
    perform_actions          IN      BOOLEAN   DEFAULT TRUE,
    script_name              IN      VARCHAR2  DEFAULT NULL,
    script_directory_object  IN     VARCHAR2  DEFAULT NULL,
    auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
    schedule_name            IN OUT  VARCHAR2,
    merge_job_name           IN OUT  VARCHAR2);

Parameters

Table 165-42  SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.</td>
</tr>
<tr>
<td>cloned_queue_name</td>
<td>The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.</td>
</tr>
<tr>
<td>cloned_capture_name</td>
<td>The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>* script_name</td>
</tr>
<tr>
<td></td>
<td>* script_directory_object</td>
</tr>
</tbody>
</table>
### Table 165-42  (Cont.) SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `script_name`              | If non-NULL and the `perform_actions` parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the `script_directory_object` parameter, then the procedure appends the statements to the existing file.  
  If non-NULL and the `perform_actions` parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.  
  If NULL and the `perform_actions` parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.  
  If NULL and the `perform_actions` parameter is FALSE, then the procedure raises an error. |
| `script_directory_object` | The directory object for the directory on the local computer system into which the generated script is placed.  
  If the `script_name` parameter is NULL, then the procedure ignores this parameter and does not generate a script.  
  If NULL and the `script_name` parameter is non-NULL, then the procedure raises an error.  
  **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. |
| `auto_merge_threshold`     | If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. The value of the `CAPTURE_MESSAGE_CREATE_TIME` column for each capture process in the `GV$STREAMS_CAPTURE` dynamic performance view determines when the streams are merged.  
  Specifically, if the difference, in seconds, between `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process and the original capture process is less than or equal to the value specified for the `auto_merge_threshold` parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.  
  If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the `MERGE_STREAM` procedure manually when the `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process catches up to, or nearly catches up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process.  
  The `CAPTURE_MESSAGE_CREATE_TIME` records the time when a captured change was recorded in the redo log. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The Oracle Scheduler schedule name, specified as [schema_name.]schedule_name. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</td>
</tr>
<tr>
<td></td>
<td>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.</td>
</tr>
<tr>
<td></td>
<td>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</td>
</tr>
<tr>
<td></td>
<td>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</td>
</tr>
<tr>
<td></td>
<td>If an existing schedule name is specified, an error is raised.</td>
</tr>
<tr>
<td>merge_job_name</td>
<td>The Oracle Scheduler job name, specified as [schema_name.]merge_job_name. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</td>
</tr>
<tr>
<td></td>
<td>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name.</td>
</tr>
<tr>
<td></td>
<td>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</td>

*Oracle Database Administrator's Guide* for information about Oracle Scheduler
The DBMS_STREAMS_ADVISOR_ADM package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered.

This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

• Overview
• Security Model
• Constants
• Views
• Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

See Also:
Oracle Streams Concepts and Administration for instructions about using this package

166.1 DBMS_STREAMS_ADVISOR_ADM Overview

The DBMS_STREAMS_ADVISOR_ADM package enables you to gather and analyze information about an Oracle Streams environment.

You can use this information in the following ways:

• To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
• To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
• To analyze the performance of the Oracle Streams components in your environment
• To detect performance problems with Oracle Streams components and correct these problems

See Also:
Oracle Streams Concepts and Administration for instructions about using this package
166.2 DBMS_STREAMS_ADVISOR_ADM Security Model

Security on this package can be controlled by either granting execute on this package to selected users or roles, or granting execute_catalog_role to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted execute privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also:
Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator

166.3 DBMS_STREAMS_ADVISOR_ADM Constants

The DBMS_STREAMS_ADVISOR_ADM package defines several enumerated constants for specifying parameter values.

Enumerated constants must be prefixed with the package name. For example, DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE.

Table 166-1 DBMS_STREAMS_ADVISOR_ADM Parameters With Enumerated Constants

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_type</td>
<td>•  CAPTURE_TYPE</td>
<td>NUMBER</td>
<td>CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1.</td>
</tr>
<tr>
<td></td>
<td>•  PROPAGATION_SENDER_TYPE</td>
<td></td>
<td>PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2.</td>
</tr>
<tr>
<td></td>
<td>•  PROPAGATION_RECEIVER_TYPE</td>
<td></td>
<td>PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3.</td>
</tr>
<tr>
<td></td>
<td>•  APPLY_TYPE</td>
<td></td>
<td>APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4.</td>
</tr>
<tr>
<td></td>
<td>•  QUEUE_TYPE</td>
<td></td>
<td>QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.</td>
</tr>
</tbody>
</table>
166.4 DBMS_STREAMS_ADVISOR_ADM Views

The views in the package contain information about Oracle Streams components and performance.

**DBMS_STREAMS_ADVISOR_ADM** uses the following views:

- **DBA_STREAMS_TP_COMPONENT** contains information about each Oracle Streams component at each database.
- **DBA_STREAMS_TP_COMPONENT_LINK** contains information about how messages flow between Oracle Streams components.
- **DBA_STREAMS_TP_COMPONENT_STAT** contains temporary performance statistics about each Oracle Streams component.
- **DBA_STREAMS_TP_DATABASE** contains information about each database that contains Oracle Streams components.
- **DBA_STREAMS_TP_PATH_BOTTLENECK** contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- **DBA_STREAMS_TP_PATH_STAT** contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: **DBA_STREAMS_TP_DATABASE**, **DBA_STREAMS_TP_COMPONENT**, and **DBA_STREAMS_TP_COMPONENT_LINK**.

However, the following views contain temporary information:
**DBA_STREAMS_TP_COMPONENT_STAT**, **DBA_STREAMS_TP_PATH_BOTTLENECK**, and **DBA_STREAMS_TP_PATH_STAT**. Some of the data in these views is retained only for the user session that runs the **ANALYZE_CURRENT_PERFORMANCE** procedure. When this user session ends, this temporary information is purged.

See Also:

- Oracle Database Reference
- Oracle Streams Concepts and Administration for sample queries that use these views

166.5 DBMS_STREAMS_ADVISOR_ADM Operational Notes

This section contains operational notes for the **DBMS_STREAMS_ADVISOR_ADM** package.

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The **DBMS_STREAMS_ADVISOR_ADM** analyzes the following Oracle Streams components at the specified databases:
• Capture processes
• Propagations
• Apply processes
• Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:
• Synchronous captures
• Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.
   An administrative user at this database must meet the following requirements:
   • The user must have access to a database link to each database that contains Oracle Streams components.
   • The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   In an Oracle Streams environment, the Oracle Streams administrator uses this package.

   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.

2. Connect as the administrative user to the database you identified previously, and remain connected to the session while you complete the remaining steps.

3. Run the ANALYZE_CURRENT_PERFORMANCE procedure.

4. Optionally, allow messages to flow in the environment for some time.

5. Optionally, rerun the ANALYZE_CURRENT_PERFORMANCE procedure one or more times.

6. Query the data dictionary views listed in "Views" to analyze the Oracle Streams environment.

7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat these steps.

Note:
When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.
166.6 Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

This table lists the DBMS_STREAMS_ADVISOR_ADM subprograms and briefly describes them.

Table 166-2  DBMS_STREAMS_ADVISOR_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE_CURRENT_PERFORMANCE Procedure</td>
<td>Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.</td>
</tr>
</tbody>
</table>

166.6.1 ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

• Calculating bottleneck components for each separate stream
• Calculating the throughput of each Oracle Streams component
• Calculating the latency of each Oracle Streams component
• Calculating the top wait event of each Oracle Streams component
• Calculating the message rate of each stream
• Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

Note:

The parameters in this procedure must all be either non-NULL or NULL.

See Also:

• Oracle Streams Concepts and Administration for instructions on using this procedure
• “Views”

Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE (
    component_name  IN  VARCHAR2  DEFAULT NULL,
```
Parameters

</table>
The `DBMS_STREAMS_AUTH` package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of `DBMS_STREAMS_AUTH` Subprograms

### 167.1 DBMS_STREAMS_AUTH Overview

This package provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

### 167.2 DBMS_STREAMS_AUTH Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

### 167.3 Summary of DBMS_STREAMS_AUTH Subprograms

This table lists the `DBMS_STREAMS_AUTH` subprograms and briefly describes them.
Table 167-1  DBMS_STREAMS_AUTH Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_ADMIN_PRIVILEGE Procedure</td>
<td>Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges</td>
</tr>
<tr>
<td>GRANT_REMOTE_ADMIN_ACCESS Procedure</td>
<td>Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link</td>

<tr>
<td>REVOKE_ADMIN_PRIVILEGE Procedure</td>
<td>Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges</td>
</tr>
<tr>
<td>REVOKE_REMOTE_ADMIN_ACCESS Procedure</td>
<td>Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link</td>
</tr>
</tbody>
</table>

Note:
All subprograms commit unless specified otherwise.

167.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
  grantee            IN  VARCHAR2,
  grant_privileges   IN  BOOLEAN   DEFAULT TRUE,
  file_name          IN  VARCHAR2  DEFAULT NULL,
  directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-2  GRANT_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
</tbody>
</table>
Table 167-2  (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grant_privileges</td>
<td>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBASTREAMSADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBASTREAMSADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
Privileges to enqueue messages into and dequeue messages from any queue

Privileges to manage any queue

Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:

- Evaluation contexts
- Rule sets
- Rules

In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE

- SELECT or READ privilege on data dictionary views related to Oracle Streams

- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the \texttt{GRANT_REMOTE_ADMIN_ACCESS} procedure in this package.

\textbf{Note:}

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.

\textbf{See Also:}

- \texttt{GRANT_REMOTE_ADMIN_ACCESS} Procedure
- \textit{Oracle Streams Replication Administrator's Guide} for more information about configuring an Oracle Streams administrator
167.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

Note:

The `GRANT_ADMIN_PRIVILEGE` procedure runs this procedure.

See Also:

`GRANT_ADMIN_PRIVILEGE` Procedure

167.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
    grantee IN VARCHAR2,
```
revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
file_name          IN  VARCHAR2  DEFAULT NULL,
directory_name     IN  VARCHAR2  DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>revoke_privileges</td>
<td>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
167.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note:
The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also:
REVOKE_ADMIN_PRIVILEGE Procedure

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

Parameters

Table 167-5  REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote Oracle Streams administrator is disabled. If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.</td>
</tr>
</tbody>
</table>
The `DBMS_STREAMS_HANDLER_ADM` package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

- Overview
- Security Model
- Views
- Operational Notes
- Summary of `DBMS_STREAMS_HANDLER_ADM` Subprograms

### 168.1 DBMS_STREAMS_HANDLER_ADM Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process.

A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of `ANYDATA` values to access the information in row LCRs. Typically, procedure DML handlers must manipulate `ANYDATA` values.
- A statement DML handler can coexist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.
**Note:**

You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

**See Also:**

*Oracle Streams Concepts and Administration*

### 168.2 DBMS_STREAMS_HANDLER_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:**

*Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

### 168.3 DBMS_STREAMS_HANDLER_ADM Views

The `DBMS_STREAMS_HANDLER_ADM` package uses these views.

- `DBA_APPLY_DML_HANDLERS`
- `DBA_STREAMS_STMTS`
- `DBA_STREAMS_STMT_HANDLERS`

They are described in detail in the *Oracle Database Reference*. 
168.4 DBMS_STREAMS_HANDLER_ADM Operational Notes

This section contains operational notes about the DBMS_STREAMS_HANDLER_ADM package.

Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- INSERT
- UPDATE
- DELETE
- MERGE

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (LCR$_ROW_RECORD), such as ADD_COLUMN, DELETE_COLUMN, KEEP_COLUMNS, and RENAME_COLUMN.

Note:

A statement DML handler cannot modify the value of a column in a row LCR.

See Also:

"LCR$_ROW_RECORD Type"

Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in the following table.
Table 168-1  Row LCR Column Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new</td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.</td>
</tr>
<tr>
<td>new_exists</td>
<td>Returns $\text{TRUE}$ if a new column value exists in a row LCR. Returns $\text{FALSE}$ if a new column value does not exist in a row LCR.</td>
</tr>
<tr>
<td>new_only</td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns $\text{NULL}$ and does not return the old column value.</td>
</tr>
<tr>
<td>old</td>
<td>Returns the old column value in a row LCR.</td>
</tr>
<tr>
<td>old_exists</td>
<td>Returns $\text{TRUE}$ if an old column value exists in a row LCR. Returns $\text{FALSE}$ if an old column value does not exist in a row LCR.</td>
</tr>
</tbody>
</table>

Specify these attributes in the following way in a statement:

\[:\text{attribute}.\text{column}\_name:\]

For example, to specify the new_only attribute for the salary column, enter the following in a statement:

\[:\text{new}\_\text{only}.\text{salary}:\]

**Supported Row LCR Attributes**

Statements in statement DML handlers can contain the row LCR attributes described in the following table.

Table 168-2  Row LCR Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command_type</td>
<td>Returns the type of DML statement that produced the change, either INSERT, UPDATE, or DELETE. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.</td>
</tr>
<tr>
<td>commit_scn</td>
<td>Returns the commit system change number (SCN) of the transaction to which the LCR belongs.</td>
</tr>
<tr>
<td>compatible</td>
<td>Returns the minimal database compatibility required to support the LCR.</td>
</tr>
<tr>
<td>instance_number</td>
<td>Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.</td>
</tr>
<tr>
<td>object_owner</td>
<td>Returns the schema name that contains the table with the changed row.</td>
</tr>
<tr>
<td>object_name</td>
<td>Returns the name of the table that contains the changed row.</td>
</tr>
<tr>
<td>scn</td>
<td>Returns the SCN at the time when the change was made.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>Returns the name of the source database where the row change occurred.</td>
</tr>
</tbody>
</table>
### Table 168-2  (Cont.) Row LCR Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_time</td>
<td>Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.</td>
</tr>
<tr>
<td>tag</td>
<td>Returns a raw tag that can be used to track the LCR.</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Returns the identifier of the transaction in which the DML statement was run.</td>
</tr>
</tbody>
</table>

Specify these attributes in the following way in a statement:

`:attribute_name`

For example, to specify the `source_database_name` attribute for a row LCR, enter the following in a statement:

`:source_database_name`

### Supported Row LCR Extra Attributes

Statements in statement DML handlers can contain the row LCR extra attributes described in the following table.

### Table 168-3  Row LCR Extra Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>Returns the rowid of the row changed in a row LCR.</td>
</tr>
<tr>
<td>serial#</td>
<td>Returns the serial number of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td>session#</td>
<td>Returns the identifier of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td>thread#</td>
<td>Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.</td>
</tr>
<tr>
<td>tx_name</td>
<td>Returns the name of the transaction that includes the LCR.</td>
</tr>
<tr>
<td>username</td>
<td>Returns the name of the current user who performed the change captured in the LCR.</td>
</tr>
</tbody>
</table>

Specify these attributes in the following way in a statement:

`:extra_attribute.attribute_name`

For example, to specify the `row_id` extra attribute for a row LCR, enter the following in a statement:

`:extra_attribute.row_id`

### Supported Row LCR Method

A statement in a statement DML handler can include a call to the `EXECUTE` member procedure for row LCRs. The `EXECUTE` member procedure executes the row LCR under the security domain of the current user.
A statement that runs the `EXECUTE` member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the `EXECUTE` member procedure in a statement, the `conflict_resolution` parameter controls whether any conflict resolution defined for the table using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR:

```
:lcr.execute TRUE|FALSE
```

A `TRUE` argument indicates that conflict resolution is used. A `FALSE` argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to `NULL`.

---

#### 168.5 Summary of DBMS_STREAMS_HANDLER_ADM Subprograms

This table lists the `DBMS_STREAMS_HANDLER_ADM` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ADD_STMT_TO_HANDLER Procedure</code></td>
<td>Adds a statement to a statement DML handler</td>
</tr>
<tr>
<td><code>CREATE_STMT_HANDLER Procedure</code></td>
<td>Creates a statement DML handler</td>
</tr>
<tr>
<td><code>DROP_STMT_HANDLER Procedure</code></td>
<td>Drops a statement DML handler</td>
</tr>
<tr>
<td><code>REMOVE_STMT_FROM_HANDLER Procedure</code></td>
<td>Removes a statement from a statement DML handler</td>
</tr>
</tbody>
</table>

---

**Note:**

The subprograms in this package do not commit.
168.5.1 ADD_STMT_TO_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

Syntax

DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER(
    handler_name       IN VARCHAR2,
    statement          IN CLOB,
    execution_sequence IN NUMBER  DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>statement</td>
<td>The text of the SQL statement to add to the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement in the statement DML handler at which a</td>
</tr>
<tr>
<td></td>
<td>SQL statement is to be set to execute. Statements are executed in</td>
</tr>
<tr>
<td></td>
<td>order from the lowest execution sequence number to the highest execution</td>
</tr>
<tr>
<td></td>
<td>sequence number.</td>
</tr>
<tr>
<td></td>
<td>You can specify a positive or negative integer or decimal, or you can</td>
</tr>
<tr>
<td></td>
<td>specify 0 (zero).</td>
</tr>
<tr>
<td></td>
<td>If you specify an execution sequence number that is used by an</td>
</tr>
<tr>
<td></td>
<td>existing statement in the statement DML handler, then the statement in</td>
</tr>
<tr>
<td></td>
<td>the statement parameter replaces the existing statement.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the statement is added to the statement DML handler with</td>
</tr>
<tr>
<td></td>
<td>an execution sequence number that is larger than the execution sequence</td>
</tr>
<tr>
<td></td>
<td>number for any statement in the statement DML handler.</td>
</tr>
</tbody>
</table>

168.5.2 CREATE_STMT_HANDLER Procedure

This procedure creates a statement DML handler.

Syntax

DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(
    handler_name IN VARCHAR2,
    comment      IN VARCHAR2  DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>comment</td>
<td>A comment for the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then no comment is recorded for the statement DML handler.</td>
</tr>
</tbody>
</table>
168.5.3 DROP_STMT_HANDLER Procedure

This procedure drops a statement DML handler.

Syntax

```sql
DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(
    handler_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
</tbody>
</table>

168.5.4 REMOVE_STMT_FROM_HANDLER Procedure

This procedure removes a statement from a statement DML handler.

Syntax

```sql
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(
    handler_name       IN VARCHAR2,
    execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement to remove. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If NULL, the procedure removes the last statement in the statement DML handler. If the specified execution sequence number does not exist for the statement DML handler, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
The `DBMS_STREAMS_MESSAGING` package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a `ANYDATA` queue.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of `DBMS_STREAMS_MESSAGING` Subprograms

**169.1 DBMS_STREAMS_MESSAGING Overview**

This package provides interfaces to enqueue messages into and dequeue messages from a `ANYDATA` queue.

**Note:**
Currently, messaging clients cannot dequeue buffered messages. In addition, the `DBMS_STREAMS_MESSAGING` package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, you can use the `DBMS_AQ` package to enqueue and dequeue buffered messages.

**See Also:**
`Oracle Database Advanced Queuing User’s Guide` for more information about queues, messaging, and the `DBMS_AQ` package

**169.2 DBMS_STREAMS_MESSAGING Security Model**

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.
169.3 Summary of DBMS_STREAMS_MESSAGING Subprograms

This table lists the DBMS_STREAMS_MESSAGING subprograms and briefly describes them.

Table 169-1  DBMS_STREAMS_MESSAGING Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEQUEUE Procedure</td>
<td>Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedure</td>
<td>The current user enqueues a message into the specified queue</td>
</tr>
</tbody>
</table>

**Note:**

The subprograms in this package do not commit.

169.3.1 DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_MESSAGING.DEQUEUE(
  queue_name    IN   VARCHAR2,
  streams_name  IN   VARCHAR2,
  payload       OUT  ANYDATA,
  dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
  navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
  wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
  msgid         OUT  RAW);

DBMS_STREAMS_MESSAGING.DEQUEUE(
  queue_name    IN   VARCHAR2,
  streams_name  IN   VARCHAR2,
  payload       OUT  ANYDATA,
  dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
  navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
  wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```
Parameters

Table 169-2  DEQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If NULL and multiple relevant messaging clients for the queue exist, then the procedure raises an error.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is dequeued</td>
</tr>
<tr>
<td>dequeue_mode</td>
<td>Specify one of the following settings: REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</td>
</tr>
<tr>
<td>navigation</td>
<td>The position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Specify one of the following settings: NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue. FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. Note: Each message group contains the messages in a single transaction. See Also: Oracle Database Advanced Queuing User's Guide for more information about dequeue options</td>
</tr>
</tbody>
</table>
Table 169-2  **(Cont.**) DEQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wait</td>
<td>Either <strong>FOREVER</strong> or <strong>NO_WAIT</strong>&lt;br&gt; If <strong>FOREVER</strong>, then the dequeue call is blocked without a time out until a message is available in the queue.&lt;br&gt; If <strong>NO_WAIT</strong>, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.</td>
</tr>
<tr>
<td>msgid</td>
<td>The message identifier of the message that is dequeued</td>
</tr>
</tbody>
</table>

**Exceptions**

Table 169-3  **DEQUEUE Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENDOFCURTRANS</td>
<td>Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:&lt;br&gt; SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS</td>
</tr>
<tr>
<td></td>
<td>Every dequeue procedure should include an exception handler that handles this exception.</td>
</tr>
<tr>
<td>NOMOREMSGS</td>
<td>There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:&lt;br&gt; SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS</td>
</tr>
<tr>
<td></td>
<td>A dequeue procedure that specifies <strong>NO_WAIT</strong> for the <strong>wait</strong> parameter should include an exception handler that handles this exception.</td>
</tr>
</tbody>
</table>

### 169.3.2 ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the **msgid** OUT parameter, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA,
    msgid       OUT  RAW);
```

```sql
DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA);
```
Parameters

Table 169-4  ENQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue into which messages will be enqueued, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is enqueued</td>
</tr>
<tr>
<td>msgid</td>
<td>The message identifier of the message that is enqueued</td>
</tr>
</tbody>
</table>

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the DBMS_STREAMSADM.SET_UP_QUEUE procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run SET_UP_QUEUE and specify a queue user.

See Also:

SET_UP_QUEUE Procedure
The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another.

This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

This chapter contains the following topics:

- Overview
- Security Model
- Data Structures
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

See Also:
Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator's Guide for more information about this package and Oracle Streams

170.1 DBMS_STREAMS_TABLESPACE_ADM Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A simple tablespace is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A self-contained tablespace set has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

### See Also:

*Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

---

### 170.2 DBMS_STREAMS_TABLESPACE_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

### 170.3 DBMS_STREAMS_TABLESPACE_ADM Data Structures

The `DBMS_STREAMS_TABLESPACE_ADM` package defines **record types** and **table types**.

#### DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

**Syntax**

```sql
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
    INDEX BY BINARY_INTEGER;
```

#### FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

**Syntax**

```sql
TYPE FILE_SET IS TABLE OF FILE
    INDEX BY BINARY_INTEGER;
```

**Fields**
Table 170-1  FILE Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The name of a directory object. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file in the corresponding directory associated with the directory object</td>
</tr>
</tbody>
</table>

**FILE_SET Table Type**

Contains one or more files.

**Syntax**

TYPE FILE_SET IS TABLE OF FILE
    INDEX BY BINARY_INTEGER;

**TABLESPACE_SET Table Type**

Contains the names of one or more tablespaces.

**Syntax**

TYPE TABLESPACE_SET IS TABLE OF VARCHAR2 (32)
    INDEX BY BINARY_INTEGER;

170.3.1 DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement CREATE DIRECTORY.

170.3.2 FILE Record Type

This record type contains the directory object associated with a directory and the name of the file in the directory.

170.3.3 FILE_SET Table Type

This table type contains one or more files.

170.3.4 TABLESPACE_SET Table Type

This type contains the names of one or more tablespaces.

170.4 Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

This table lists the DBMS_STREAMS_TABLESPACE_ADM subprograms and briefly describes them.
Table 170-2  DBMS_STREAMS_TABLESPACE_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

**Note:**

All subprograms commit unless specified otherwise.

170.4.1 ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
    directory_object     IN  VARCHAR2,
    tablespace_file_name IN  VARCHAR2,
    converted_file_name  IN  VARCHAR2  DEFAULT NULL,
    datafile_platform    IN  VARCHAR2  DEFAULT NULL,
    tablespace_name      OUT VARCHAR2);
```
Parameters

Table 170-3  ATTACH_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an .alg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>The name of the datafile for the tablespace being imported. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>converted_file_name</td>
<td>If the datafile_platform parameter is non-NULL and is different from the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted. If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>datafile_platform</td>
<td>Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
• Have **READ** and **WRITE** privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the `directory_object` parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

### 170.4.2 ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

#### Syntax

**DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES** (  
`datapump_job_name` IN OUT VARCHAR2,  
dump_file IN FILE,  
tablespace_files IN FILE_SET,  
converted_files IN FILE_SET,  
datafiles_platform IN VARCHAR2 DEFAULT NULL,  
log_file IN FILE DEFAULT NULL,  
tablespace_names OUT TABLESPACE_SET);  

**DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES** (  
`file_group_name` IN VARCHAR2,  
`version_name` IN VARCHAR2 DEFAULT NULL,  
datafiles_directory_object IN VARCHAR2 DEFAULT NULL,  
logfile_directory_object IN VARCHAR2 DEFAULT NULL,  
repository_db_link IN VARCHAR2 DEFAULT NULL,  
tablespace_names OUT TABLESPACE_SET);
### Parameters

#### Table 170-4  ATTACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>converted_files</td>
<td>If the datafiles_platform parameter is non-NULL and is different from the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>datafiles_platform</td>
<td>Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
<tr>
<td>datafiles_directory_object</td>
<td>The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory. If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the version_name parameter consists of the files in the original directory, not in the directory specified by this datafiles_directory_object parameter. If NULL, then the procedure does not copy the datafiles and dump file.</td>
</tr>
<tr>
<td>logfile_directory_object</td>
<td>The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension .alg. If NULL, then the procedure places the import log file in the same directory as the dump file.</td>
</tr>
</tbody>
</table>
| repository_db_link        | If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then meet the following requirements:  
  • Each directory object that contains files in the version being attached must exist on both databases.  
  • The corresponding directory objects must have the same names on both databases. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database. |
| tablespace_names          | Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use ALTER TABLESPACE statements to make the tablespaces read/write if necessary. |

**Usage Notes**

The following sections contain usage notes for this procedure:

- User Requirements
- Procedures Used to Clone or Detach a Tablespace Set
• When the Attach Database Is Different Than the Clone or Detach Database
• Automatic Storage Management Directories

See Also:
  • Overview
  • Oracle Streams Concepts and Administration

User Requirements
To run either version of this procedure, a user must meet the following requirements:

• Have IMP_FULL_DATABASE role
• Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file and tablespace_files parameters, or by the datafiles_directory_object parameter
• Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter or logfile_directory_object parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set
After a tablespace set is cloned or detached using the CLONE_TABLESPACES or DETACH_TABLESPACES procedure, respectively, the tablespace set can be attached to a database using the ATTACH_TABLESPACES procedure. If the Data Pump job version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the Data Pump job version of the ATTACH_TABLESPACES procedure. If the file group version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the file group version of the ATTACH_TABLESPACES procedure.

See Also:
  • CLONE_TABLESPACES Procedure
  • DETACH_TABLESPACES Procedure

When the Attach Database Is Different Than the Clone or Detach Database
You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must
transfer the dump file and datafiles to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the ATTACH_TABLESPACES procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the repository_db_link parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

See Also:

- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- DBMS_FILE_GROUP for more information about file groups

Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also:

Oracle Database Utilities for information about specifying ASM directories for directory objects

170.4.3 CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online. Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.
Syntax

DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
  tablespace_name IN VARCHAR2,
  directory_object IN VARCHAR2,
  destination_platform IN VARCHAR2 DEFAULT NULL,
  tablespace_file_name OUT VARCHAR2);

Parameters

Table 170-5  CLONE_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace to be cloned.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>directory_object</td>
<td>The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>destination_platform</td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the $DATABASE dynamic performance view. The $TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter directory_object.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have **EXP_FULL_DATABASE** role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include **DBA_TABLESPACES** and **USER_TABLESPACES**.
- Have **MANAGE TABLESPACE** or **ALTER TABLESPACE** on a **tablespace** if the tablespace must be made read-only
Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

- Overview
- `ATTACH_SIMPLE_TABLESPACE Procedure` and `PULL_SIMPLE_TABLESPACE Procedure`

### 170.4.4 CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
• The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the file_group_name and version_name parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the ATTACH_TABLESPACES procedure.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
    datapump_job_name            IN OUT VARCHAR2,
    tablespace_names             IN     TABLESPACE_SET,
    dump_file                    IN     FILE,
    tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
    destination_platform         IN     VARCHAR2  DEFAULT NULL,
    log_file                     IN     FILE      DEFAULT NULL,
    tablespace_files             OUT    FILE_SET);
```

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
    tablespace_names             IN  TABLESPACE_SET,
    tablespace_directory_object  IN  VARCHAR2  DEFAULT NULL,
    log_file_directory_object    IN  VARCHAR2  DEFAULT NULL,
    file_group_name              IN  VARCHAR2,
    version_name                 IN  VARCHAR2  DEFAULT NULL,
    repository_db_link           IN  VARCHAR2  DEFAULT NULL);
```

</tr>
</thead>
<tbody>
<tr>
<td>version_name</td>
<td>The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.</td>
</tr>
<tr>
<td>repository_db_link</td>
<td>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in <code>tablespace_directory_object</code> must exist on the local database and on the remote database. If <code>tablespace_directory_object</code> is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter <code>tablespace_directory_objects</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- **Have** `EXP_FULL_DATABASE` role
- **Have** access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- **Have** `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- **Have** `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- **Have** `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `tablespace_directory_object` parameter
• Have WRITE privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter if non-NULL or the `tablespace_directory_object` parameter

• Have WRITE privilege on the directory object that will contain the Data Pump export log file, specified by the `log_file` parameter if non-NULL or the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

### 170.4.5 DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
    tablespace_name       IN  VARCHAR2,
    directory_object      OUT VARCHAR2,
    tablespace_file_name  OUT VARCHAR2);
```
## Parameters

### Table 170-7  DETACH_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>directory_object</td>
<td>Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>Contains the name of the detached tablespace datafile.</td>
</tr>
</tbody>
</table>

### Usage Notes

To run this procedure, a user must meet the following requirements:

- **Have** `EXP_FULL_DATABASE` role
- **Have** access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- **Have** `DROP TABLESPACE` privilege
- **Have** `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- **Have** `READ` and `WRITE` privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can use the two `OUT` parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.
**Note:**

Do not use the DETACH_SIMPLE_TABLESPACE procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

**See Also:**

- Overview
- ATTACH_SIMPLE_TABLESPACE Procedure and PULL_SIMPLE_TABLESPACE Procedure
- Oracle Database Administrator's Guide for more information about the Oracle-managed files feature

### 170.4.6 DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the file_group_name and version_name parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform.
when it is attached at the destination database using the file group version of the ATTACH_TABLESPACES procedure.

Note:

Do not use the DETACH_TABLESPACES procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
  datapump_job_name         IN OUT VARCHAR2,
  tablespace_names          IN     TABLESPACE_SET,
  dump_file                 IN     FILE,
  log_file                  IN     FILE  DEFAULT NULL,
  tablespace_files          OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
  tablespace_names          IN TABLESPACE_SET,
  export_directory_object   IN VARCHAR2  DEFAULT NULL,
  log_file_directory_object IN VARCHAR2  DEFAULT NULL,
  file_group_name           IN VARCHAR2,
  version_name              IN VARCHAR2  DEFAULT NULL,
  repository_db_link        IN VARCHAR2  DEFAULT NULL);

Parameters

Table 170-8  DETACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be detached. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file exists, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>Contains the names of the datafiles for the detached tablespace set.</td>
</tr>
</tbody>
</table>
### Table 170-8  (Cont.) DETACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>export_directory_object</td>
<td>The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file_directory_object</td>
<td>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure places the export log file in the same directory as the export dump file.</td>
</tr>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the specified file group does not exist, then the procedure creates it.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer.</td>
</tr>
<tr>
<td></td>
<td>If the specified version does not exist, then the procedure creates it.</td>
</tr>
<tr>
<td></td>
<td>If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure creates a new version, and the version number can be used to manage the version.</td>
</tr>
<tr>
<td>repository_db_link</td>
<td>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is non-NULL, then the directory object specified in export_directory_object must exist on the local database and on the remote database. If export_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `DROP TABLESPACE` privilege
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `export_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL or by the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

170.4.7 PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database.

The specified tablespace at the remote database must be online.
Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
  tablespace_name          IN VARCHAR2,
  database_link            IN VARCHAR2,
  directory_object         IN VARCHAR2  DEFAULT NULL,
  conversion_extension     IN VARCHAR2  DEFAULT NULL,
  convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tablespace_name</code></td>
<td>The tablespace to be pulled. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>database_link</code></td>
<td>The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>directory_object</code></td>
<td>The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a <code>.plg</code> extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 170-9  (Cont.) PULL_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conversion_extension</td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.</td>
</tr>
<tr>
<td>convert_directory_object</td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the **EXP_FULL_DATABASE** role
- Have **EXECUTE** privilege on the **DBMS_STREAMS_TABLESPACE_ADM** package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include **DBA_TABLESPACES** and **USER_TABLESPACES**.
- Have **MANAGE_TABLESPACE** or **ALTER_TABLESPACE** privilege on a tablespace if the tablespace must be made read-only
- Have **READ** privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the **tablespace_name** parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles **IMP_FULL_DATABASE** and **EXECUTE_CATALOG_ROLE**
- Have **WRITE** privilege on the directory object that will contain the Data Pump export the log file, specified by the **log_file** parameter if non-NULL
- Have **WRITE** privilege on the directory object that will hold the datafile for the tablespace, specified by the **directory_object** parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.
170.4.8 PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database.

All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
    datapump_job_name            IN OUT VARCHAR2,
    database_link                IN     VARCHAR2,
    tablespace_names             IN     TABLESPACE_SET,
    tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
    log_file                     IN     FILE,
    conversion_extension         IN     VARCHAR2 DEFAULT NULL,
    convert_directory_object     IN     VARCHAR2 DEFAULT NULL);
```
### Parameters

#### Table 170-10  PULL_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>database_link</td>
<td>The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be pulled. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_directory_objects</td>
<td>The set of directory objects to which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>conversion_extension</td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.</td>
</tr>
<tr>
<td>convert_directory_object</td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- **Have the** `EXP_FULL_DATABASE` **role**
- **Have** `EXECUTE` **privilege on the** `DBMS_STREAMS_TABLESPACE_ADM` **package**
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- **Have** `MANAGE TABLESPACE` or `ALTER TABLESPACE` **privilege on a tablespace** if the tablespace must be made read-only
- **Have** `READ` **privilege on the directory objects** for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- **Have the roles** `IMP_FULL_DATABASE` **and** `EXECUTE_CATALOG_ROLE`
- **Have** `WRITE` **privilege on the directory object** that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- **Have** `WRITE` **privilege on the directory objects** that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

- See Also:
  - Overview
The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.

See Also:

Oracle Database Data Warehousing Guide for more information on using DBMS_SYNC_REFRESH

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_SYNC_REFRESH Subprograms

171.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

See Also:

Oracle Database Data Warehousing Guide for more information about using synchronous refresh

171.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to PUBLIC, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the DBA privilege wants to use synchronous refresh on another user’s table, he must complete privileges to read from and write to that table, that is, the user must have the SELECT or READ, INSERT, UPDATE, and DELETE privileges on that table or materialized view. A couple of exceptions are:

- PURGE_REFRESH_STATS and ALTER_REFRESH_STATS RETENTION Functions
These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The CAN_SYNCREF_TABLE Function
  This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the SELECT or READ privilege on all materialized views associated with the specified table.

# 171.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the DBMS_SYNC_REFRESH package subprograms.

## Table 171-1  DBMS_SYNC_REFRESH Package Subprograms

<td>Unregisters a partition maintenance operation on a partition of a base table.</td>
</tr>
</tbody>
</table>

## 171.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by PREPARE_REFRESH or EXECUTE_REFRESH for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.
Syntax

DBMS_SYNC_REFRESH.ABORT_REFRESH (group_id IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);

Parameters

Table 171-2  ABORT_REFRESH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The group ID of a sync refresh group.</td>
</tr>
<tr>
<td>group_id_list</td>
<td>An array of group IDs of the sync refresh groups to be aborted for sync refresh.</td>
</tr>
</tbody>
</table>

Usage Notes

If called after PREPARE_REFRESH, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after EXECUTE_REFRESH fails, this procedure restores the state of tables to before EXECUTE_REFRESH by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks.

ABORT_REFRESH will work only if a PREPARE_REFRESH or EXECUTE_REFRESH statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

171.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with PURGE_REFRESH_HISTORY. It also requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (retention IN NUMBER);
### Parameters

#### Table 171-3  ALTER_REFRESH_STATS_RETENTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| retention   | The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000. You can use the following values for special purposes:  
  • -1 - Refresh history is never purged by PREPARE_REFRESH.  
  • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history.  
  • NULL - Change refresh history retention to default value. |

---

### 171.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke `CAN_SYNCREF_TABLE` in two ways. The first is to use a table, while the second is to create a `VARRAY`.

#### Syntax

```sql
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (    
  schema_name    IN VARCHAR2,    
  table_name     IN VARCHAR2,    
  statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (    
  schema_name    IN VARCHAR2,    
  table_name     IN VARCHAR2,    
  output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of `statement_id` or `output_array` need be provided to `CAN_SYNCREF_TABLE`.

#### Parameters

#### Table 171-4  CAN_SYNCREF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the base table.</td>
</tr>
</tbody>
</table>
Table 171-4  (Cont.) CAN_SYNCREF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statement_id</td>
<td>A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.</td>
</tr>
<tr>
<td>output_array</td>
<td>The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.</td>
</tr>
</tbody>
</table>

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```sql
CREATE TABLE SYNCREF_TABLE (
    statement_id VARCHAR2(30),
    schema_name VARCHAR2(30),
    table_name VARCHAR2(30),
    mv_schema_name VARCHAR2(30),
    mv_name VARCHAR2(30),
    eligible VARCHAR2(1),
    seq_num NUMBER,
    msg_number NUMBER,
    message VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```sql
TYPE CanSyncRefMessage IS OBJECT (
    schema_name VARCHAR2(30),
    table_name VARCHAR2(30),
    mv_schema_name VARCHAR2(30),
    mv_name VARCHAR2(30),
    eligible VARCHAR2(1),
    seq_num NUMBER,
    msg_number NUMBER,
    message VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```sql
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.
171.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by DBMS_SYNC_REFRESH.PREPARE_REFRESH. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in Oracle Database Data Warehousing Guide.

This procedure is overloaded.

Syntax

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id   IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);

Parameters

Table 171-5  EXECUTE_REFRESH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The group ID of a sync refresh group.</td>
</tr>
<tr>
<td>group_id_list</td>
<td>An array of group IDs of the sync refresh groups to be executed for sync refresh.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks and Oracle Database Reference for information regarding the status of the refresh operation after DBMS_SYNC_REFRESH.EXECUTE_REFRESH.

171.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
    RETURN DBMS_UTILITY.NUMBER_ARRAY;
Parameters

Table 171-6  GET_ALL_GROUP_IDS Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_all_group_ids</td>
<td>Returns the group IDs of all the sync refresh groups in the database.</td>
</tr>
</tbody>
</table>

171.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

DBMS_SYNC_REFRESH.GET_GROUP_ID (  
   object_name_list IN VARCHAR2)  
RETURN DBMS_UTILITY.NUMBER_ARRAY;

Parameters

Table 171-7  GET_GROUP_ID Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name_list</td>
<td>The name of the materialized view. The name can be schema-qualified.</td>
</tr>
</tbody>
</table>

171.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (  
    object_name_list IN VARCHAR2)  
RETURN DBMS_UTILITY.NUMBER_ARRAY;

Parameters

Table 171-8  GET_GROUP_ID_LIST Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name_list</td>
<td>A comma-separated list of object names (materialized views). Each name can be schema-qualified.</td>
</tr>
</tbody>
</table>
171.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to “Trouble-Shooting Synchronous Refresh Operations” in Oracle Database Data Warehousing Guide.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
    group_id   IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

**Table 171-9  PREPARE_REFRESH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The group ID of the sync refresh group to be prepared for sync refresh.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the EXECUTE_REFRESH.

Before running this procedure, the user must run PREPARE_STAGING_LOG on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the REGISTER_PARTITION_OPERATION.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an EXECUTE_REFRESH statement. Alternatively, you can issue an ABORT_REFRESH operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an ALTER SESSION statement.
The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

### 171.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$` is `'D'`), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$` is `'UO'` or `'UN'`), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$` is `'UO'`), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$` is `'UN'`), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$` is `'UN'`), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows `'UO'` and `'UN'`; multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.
The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows ($DMLTYPE$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows ($DMLTYPE$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows ($DMLTYPE$ is 'U' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

Syntax

```sql
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode         IN NUMBER DEFAULT 
                     DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

**Table 171-10  PREPARE_STAGING_LOG Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td><code>base_table_name</code></td>
<td>The name of the base table.</td>
</tr>
<tr>
<td><code>psl_mode</code></td>
<td>The mode in which staging log preparation should be done. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default)</td>
</tr>
<tr>
<td></td>
<td>• <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td>• <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td>• <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td>• <code>DBMS_SYNC_REFRESH.TRUSTED</code></td>
</tr>
</tbody>
</table>

**171.3.10 PURGE_REFRESH_STATS Procedure**

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```sql
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```
Parameters

Table 171-11  PURGE_REFRESH_STATS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using ALTER_REFRESH_STATS_RETENTION. The default is 31 days.</td>
</tr>
</tbody>
</table>

171.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in Oracle Database Data Warehousing Guide. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the USING TRUSTED CONSTRAINTS clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view’s refresh policy must be specified as ON DEMAND.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (mv_list), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

DBMS_SYNC_REFRESH.REGISTER_MVIEWS (   mv_list   IN VARCHAR2);

Parameter

Table 171-12  REGISTER_MVIEWS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>A comma-delimited list of materialized views to register. These names are optionally schema-qualified.</td>
</tr>
</tbody>
</table>
171.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```sql
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION(
    partition_op                IN VARCHAR2,
    schema_name                 IN VARCHAR2,
    base_table_name             IN VARCHAR2,
    partition_name              IN VARCHAR2,
    outside_partn_table_schema  IN VARCHAR2,
    outside_partn_table_name    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_op</td>
<td>The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>The name of the base table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.</td>
</tr>
<tr>
<td>outside_partn_table_schema</td>
<td>The name of the schema of the outside partition table (required for EXCHANGE only).</td>
</tr>
<tr>
<td>outside_partn_table_name</td>
<td>The name of the outside partition table (required for EXCHANGE only).</td>
</tr>
</tbody>
</table>

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.
171.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```sql
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
    mv_list   IN VARCHAR20;
)
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.</td>
</tr>
</tbody>
</table>

171.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with `REGISTER_PARTITION_OPERATION` on a base table. The three kinds of change operations that can be specified on partitions are `DROP`, `TRUNCATE`, and `EXCHANGE`.

Syntax

```sql
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
    partition_op     IN VARCHAR2,
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    partition_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_op</td>
<td>The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>The name of the base table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.</td>
</tr>
</tbody>
</table>
The **DBMS_TDB** package reports whether a database can be transported between platforms using the RMAN `CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

### See Also:

*Oracle Database Backup and Recovery User's Guide* regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- **Overview**
- **DBMS_TDB Security Model**
- **Constants**
- **Views**
- **Operational Notes**
- **Summary of DBMS_TDB Subprograms**

### 172.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The **DBMS_TDB** package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the **DBMS_TDB** subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.
172.2 DBMS_TDB Security Model

Use of this package requires the DBA privilege.

172.3 DBMS_TDB Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 172-1.

Table 172-1    DBMS_TDB Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKIP_NONE</td>
<td>NUMBER</td>
<td>0</td>
<td>Check all files when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_OFFLINE</td>
<td>NUMBER</td>
<td>2</td>
<td>Skip files in offline tablespaces when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_READONLY</td>
<td>NUMBER</td>
<td>3</td>
<td>Skip files in read-only tablespaces when checking whether a database is ready for transport.</td>
</tr>
</tbody>
</table>

172.4 DBMS_TDB Views

The DBMS_TDB package uses the V$DB_TRANSPORTABLE_PLATFORM view.

This view is described in Oracle Database Reference.

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

172.5 DBMS_TDB Operational Notes

The following notes apply to DBMS_TDB.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See Oracle Database Backup and Recovery User’s Guide for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple TRUE or FALSE results to indicate whether database transport is possible. Use the subprograms with SERVEROUTPUT ON for informative messages about why transport is not possible.

172.6 Summary of DBMS_TDB Subprograms

This table lists the DBMS_TDB subprograms and briefly describes them.
### Table 172-2  DBMS_TDB Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECK_DB Function</td>
<td>Checks whether a database can be transported to a target platform</td>
</tr>
<tr>
<td>CHECK_EXTERNAL Function</td>
<td>Checks whether a database has external tables, directory or BFILEs</td>
</tr>
</tbody>
</table>

### 172.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

#### Syntax

```sql
DBMS_TDB.CHECK_DB (
    target_platform_name   IN VARCHAR2,
    skip_option            IN  NUMBER)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
    target_platform_name   IN VARCHAR2)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_platform_name</td>
<td>The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.</td>
</tr>
<tr>
<td>skip_option</td>
<td>Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 172-1.</td>
</tr>
</tbody>
</table>

#### Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`. 
Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 172-4.

### Table 172-4 Reasons for CHECK_DB Function to Return FALSE

<table>
<thead>
<tr>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unrecognized target platform name.</td>
<td>Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.</td>
</tr>
<tr>
<td>Target platform has a different endian format.</td>
<td>Conversion is not supported.</td>
</tr>
<tr>
<td>Database is not open read-only.</td>
<td>Open database read-only and retry.</td>
</tr>
<tr>
<td>There are active or in-doubt transactions in the database.</td>
<td>Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.</td>
</tr>
<tr>
<td>Deferred transaction rollback needs to be done.</td>
<td>Open the database read-write and bring online the necessary tablespace. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.</td>
</tr>
<tr>
<td>Database compatibility version is below 10.0.0.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.</td>
</tr>
<tr>
<td>Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespace read-write. Shut down the database, open it read-only, and retry the operation.</td>
</tr>
</tbody>
</table>

### Examples

This example illustrates the use of CHECK_DB with a database that is open read-write:

```sql
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
   db_ready BOOLEAN;
BEGIN
   db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

```
Database is not open READ ONLY. Please open database READ ONLY and retry.
```

```
PL/SQL procedure successfully completed.
```
172.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

DBMS_TDB.CHECK_EXTERNAL
RETURN BOOLEAN;

Return Values

If the database has external tables, directories, or BFILEs, return TRUE. Otherwise, return FALSE.

Usage Notes

- If SERVEROUTPUT is on, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of CHECK_EXTERNAL with a database that has several external tables, directories, and BFILEs:

```sql
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    2      external BOOLEAN;
    3  BEGIN
    4      external := DBMS_TDB.CHECK_EXTERNAL;
    5    END;
    6 /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```
The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
- *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- DBMS_TF Overview
- DBMS_TF Security Model
- DBMS_TF Constants
- DBMS_TF Operational Notes
- DBMS_TF Execution Flow
- DBMS_TF Restrictions
- DBMS_TF Examples
- DBMS_TF Data Structures
- Summary of DBMS_TF Subprograms

### 173.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.
173.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker’s rights privileges.

173.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The DBMS_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS_TF.TYPE_DATE.

Table 173-1  DBMS_TF Supported Types

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_BINARY_DOUBLE</td>
<td>Type code for BINARY_DOUBLE</td>
</tr>
<tr>
<td>TYPE_BINARY_FLOAT</td>
<td>Type code for BINARY_FLOAT</td>
</tr>
<tr>
<td>TYPE_BLOB</td>
<td>Type code for BLOB</td>
</tr>
<tr>
<td>TYPE_CHAR</td>
<td>Type code for CHAR</td>
</tr>
<tr>
<td>TYPE_CLOB</td>
<td>Type code for CLOB</td>
</tr>
<tr>
<td>TYPE_DATE</td>
<td>Type code for DATE</td>
</tr>
<tr>
<td>TYPE_INTERVAL_DS</td>
<td>Type code for INTERVAL_DS</td>
</tr>
<tr>
<td>TYPE_INTERVAL_YM</td>
<td>Type code for INTERVAL_YM</td>
</tr>
<tr>
<td>TYPE_NUMBER</td>
<td>Type code for NUMBER</td>
</tr>
<tr>
<td>TYPE_ROWID</td>
<td>Type code for ROWID</td>
</tr>
<tr>
<td>TYPE_RAW</td>
<td>Type code for RAW</td>
</tr>
<tr>
<td>TYPE_TIMESTAMP</td>
<td>Type code for TIMESTAMP</td>
</tr>
<tr>
<td>TYPE_TIMESTAMP_TZ</td>
<td>Type code for TIMESTAMP_TZ</td>
</tr>
<tr>
<td>TYPE_VARCHAR2</td>
<td>Type code for VARCHAR2</td>
</tr>
</tbody>
</table>

Additional constants are defined for use with specific subprograms.

173.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

173.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow:

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as NULL values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).
Finally, the DESCRIBE function returns the list of any new columns that the PTF will create (or NULL if no new columns are being produced) using the DBMS_TF.DESCRIBE_T descriptor.

OPEN Procedure

The OPEN procedure purpose is to initialize and allocate any execution specific state. The OPEN procedure is most useful when you implement a Table Semantics PTF. The function typically calls the GET_XID function to get a unique ID for managing the execution state.

OPEN procedure is generally invoked before calling the FETCH_ROWS procedure.

FETCH_ROWS Procedure

The FETCH_ROWS procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The CLOSE procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 173-1  Noop Polymorphic Table Function Example

This example creates a PTF called noop. This PTF returns the input rows as the output rows without any modification or filtering. Noop is one of the smallest PTF you can write.

To implement the noop PTF, you first create the implementation package noop_package.

CREATE PACKAGE noop_package AS
    FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
        RETURN DBMS_TF.DESCRIBE_T;

    PROCEDURE fetch_rows;
END noop_package;

The DESCRIBE function does not produce any new columns and hence, returns NULL. Executing FETCH_ROWS also results in NULL.

CREATE PACKAGE BODY noop_package AS
    FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
        RETURN DBMS_TF.DESCRIBE_T AS
    BEGIN
        RETURN NULL;
    END;

    PROCEDURE fetch_rows AS
BEGIN

RETURN;
END;
END noop_package;

The noop PTF is defined to execute the noop_package when it is invoked.

CREATE FUNCTION noop (t TABLE)
  RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;

The PTF can be invoked in queries. For example:

```
SELECT *
FROM   NOOP(emp)
WHERE deptno = 10;
```

```
7782 CLARK MANAGER 7839 09-JUN-81 2450 10
7839 KING PRESIDENT 17-NOV-81 5000 10
7934 MILLER CLERK 7782 23-JAN-82 1300 10
```

WITH e
AS (SELECT *
FROM   emp
NATURAL JOIN dept
WHERE dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

```
30 7499 ALLEN SALESMAN 7698 20-FEB-81 1600 300
SALES CHICAGO
30 7521 WARD SALESMAN 7698 22-FEB-81 1250 500
SALES CHICAGO
30 7654 MARTIN SALESMAN 7698 28-SEP-81 1250 1400
SALES CHICAGO
30 7698 BLAKE MANAGER 7839 01-MAY-81 2850
SALES CHICAGO
30 7844 TURNER SALESMAN 7698 08-SEP-81 1500 0
SALES CHICAGO
30 7900 JAMES CLERK 7698 03-DEC-81 950
SALES CHICAGO
```

### 173.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

### 173.4.2 PTF Server Side Interface

The DBMS_TF package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.
Table 173-2  Summary of Commonly Used Types and Subprograms in PTF
Server Side Interface

173.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T` `FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.
173.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the Row Semantics PTF are marked as pass-through by default. For Table Semantics PTF, the default value for pass-through is set to false. For the Table Semantics PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

173.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. Compilation State: This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. Execution State: This is the state used by the execution time procedures (OPEN, FETCH_ROWS, and CLOSE) of a Table semantics PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a Table Semantics PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

173.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.
The compilation state information is retrieved during execution procedures such as OPEN, FETCH_ROWS and CLOSE.

CSTORE Subprograms
The CSTORE interface consists of the following subprograms.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSTORE_GET procedure</td>
<td>Fetches item of specified type. If not found, the OUT value remains unchanged.</td>
</tr>
<tr>
<td>CSTORE_EXISTS function</td>
<td>If an item with the given key exists in the CSTORE, this function returns TRUE.</td>
</tr>
</tbody>
</table>

CSTORE Supported Types
The DBMS_TF.DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Table 173-3   DBMS_TF CSTORE Scalar Supported Types

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSTORE_TYPE_VARCHAR2</td>
<td>CSTORE VARCHAR2 type code</td>
</tr>
<tr>
<td>CSTORE_TYPE_NUMBER</td>
<td>CSTORE NUMBER type code</td>
</tr>
<tr>
<td>CSTORE_TYPE_DATE</td>
<td>CSTORE DATE type code</td>
</tr>
<tr>
<td>CSTORE_TYPE_BOOLEAN</td>
<td>CSTORE BOOLEAN type code</td>
</tr>
</tbody>
</table>

Collections For Compilation Storage
These predefined collection types are used for compilation state management.

- TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
- TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
- TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
- TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);

DBMS_TF Method Names
The method names are also stored in the DBMS_TF.DESCRIBE_T record. These predefined values for the method names can be customized by the PTF author.

See Method Name Overrides for more information about changing the default method names.

Table 173-4   DBMS_TF Method Names Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSE</td>
<td>DBMS_QUOTED_ID</td>
<td>'CLOSE'</td>
<td>Predefined index value for the method named CLOSE</td>
</tr>
</tbody>
</table>
Table 173-4  (Cont.) DBMS_TF Method Names Constants

<table>

</tr>
<tr>
<td>OPEN</td>
<td>DBMS_QUOTED_ID</td>
<td>‘OPEN’</td>
<td>Predefined index value for the method named OPEN</td>
</tr>
</tbody>
</table>

173.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 173-5  DBMS_TF XSTORE Subprograms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSTORE_CLEAR</td>
<td>Removes all key-value pairs from the XSTORE execution state</td>
</tr>
<tr>
<td>XSTORE_EXISTS</td>
<td>Returns TRUE if an item with a given key exists in the XSTORE</td>
</tr>
<tr>
<td>XSTORE_GET</td>
<td>Gets the associated value for a given key stored in the XSTORE</td>
</tr>
<tr>
<td>XSTORE_REMOVE</td>
<td>Removes an item associated with the given key and key_type</td>
</tr>
<tr>
<td>XSTORE_SET</td>
<td>Sets the value for the given key for PTF Execution State Management</td>
</tr>
</tbody>
</table>

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

Table 173-6  DBMS_TF XSTORE Scalar Supported Types

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSTORE_TYPEVARCHAR2</td>
<td>XSTORE VARCHAR2 type code</td>
</tr>
<tr>
<td>XSTORE_TYPENUMBER</td>
<td>XSTORE NUMBER type code</td>
</tr>
</tbody>
</table>
### 173.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF` METHOD_NAMES collection (see **DESCRIBE_T Record Type**).

**See Also:**
Table 173-4

**Example 173-2 DBMS_TF Method Name Overrides**

This example shows how to change the default method name of the noop_p PTF `fetch_rows` method to `noop_fetch`.

**Live SQL:**
You can view and run this example on Oracle Live SQL at [DBMS_TF Method Name Overrides](https://oracle-live-sql.comardless.com).
RETURN DBMS_TF.describe_t(method_names => methods);
END;

PROCEDURE noop_fetch AS
BEGIN
    RETURN;
END;
END noop_p;

The noop PTF is defined to execute the noop_p when it is invoked.

CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_p;

The PTF is invoked in the FROM clause of a query block.

SELECT *
FROM noop(scott.emp)
WHERE deptno = 10;

173.4.7 Using the COLUMNS Pseudo-Operator

The COLUMNS pseudo-operator is an addition to the SQL expression language.

Use the COLUMNS pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the FROM clause. The COLUMNS pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

See Also:
Oracle Database PL/SQL Language Reference for more information about the COLUMNS pseudo-operator syntax and semantics

173.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the PARTITION BY key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

Example 173-3  Query Transformations

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the echo PTF created in Echo Polymorphic Table Function Example.

SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))
WHERE deptno = 30
AND echo_sal > 1000;

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>SAL</th>
<th>COMM</th>
<th>ECHO_SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>7499</td>
<td>ALLEN</td>
<td>1600</td>
<td>300</td>
<td>1600</td>
</tr>
<tr>
<td>7521</td>
<td>WARD</td>
<td>1250</td>
<td>500</td>
<td>1250</td>
</tr>
<tr>
<td>7654</td>
<td>MARTIN</td>
<td>1250</td>
<td>1400</td>
<td>1250</td>
</tr>
</tbody>
</table>
Conceptually, this query will get rewritten as:

```sql
WITH t AS (SELECT empno, ename, sal, comm
            FROM emp
            WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

173.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

**Row Semantics PTF**

Under Row Semantics PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table emp has been set to 5, the following is an example that shows this parallelization:

```sql
EXPLAIN PLAN FOR
SElECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
```

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>PX COORDINATOR</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>PX SEND QC (RANDOM)</td>
<td>:TQ10000</td>
</tr>
<tr>
<td>3</td>
<td>POLYMORPHIC TABLE FUNCTION</td>
<td>ECHO</td>
</tr>
<tr>
<td>6</td>
<td>PX BLOCK ITERATOR</td>
<td></td>
</tr>
<tr>
<td>* 7</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

5 - filter("EMP"."DEPTNO"<20)

**Table Semantics PTF**

Table Semantics PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

173.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (OPEN, FETCH_ROWS and CLOSE) are called by the database during query execution.
The PTF execution follows this flow:

1. OPEN (if present)
2. FETCH_ROWS (can be invoked multiple times)
3. CLOSE (if present)
The **FETCH_ROWS** procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to **FETCH_ROWS** is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The **GET_ROW_SET** or **GET_COL** is used to read the input rowset.

The **PUT_ROW_SET** or **PUT_COL** is used to produce an output rowset, that is written back to the database.

**PUT_ROW_SET** is used to set all the new columns in a single call.

The **ROWSET_T** record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use **PUT_COL** to produce a single column. A given column can only be produced once within a call to **FETCH_ROWS**.

For a Row Semantics PTF, the **FETCH_ROWS** procedure will return the new rows using the PTF Server interface before returning back to the database.

### 173.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the DBMS_TF package.

**Type Restrictions**

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the **PUT_ROW_SET**, **PUT_COL**, **GET_ROW_SET** and **GET_COL** procedures. All SQL types can be used with pass-through columns. The **DESCRIBE** function can determine the supported types using the **DBMS_TF.SUPPORTED_TYPE** function.

**PTF Invocation and Execution Restrictions**

Polymorphic table functions cannot be nested in the **FROM** clause of a query. Nesting PTF is only allowed using **WITH** clause.

Nesting table function with polymorphic table function is only allowed using **CURSOR** expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The **PARTITION BY** and the **ORDER BY** clause can only be specified on an argument of a Table Semantics PTF.

The **PTF execution methods** **OPEN**, **FETCH_ROWS**, and **CLOSE** must be invoked in the polymorphic table function execution context only.

You cannot invoke the **DESCRIBE** method directly.

This example shows ten PTF nested invocation.

```sql
WITH t0
AS (SELECT /*+ parallel */ *
FROM   noop(dept)),
t1
173.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

- Example 173-1, "Noop Polymorphic Table Function"
- Echo Polymorphic Table Function Example
- Example 173-2, "DBMS_TF Method Name Overrides"
- Example 173-3, "Query Transformations"
- Example 173-5, "DBMS_TF.COLUMN_TYPE_NAME Example"
- Example 173-6, "DBMS_TF.COL_TO_CHAR Example"
- Example 173-7, "DBMS_TF.CSTORE_EXISTS Example"
- Example 173-8, "DBMS_TF.GET_COL Example"
- Example 173-9, "DBMS_TF.GET_ENV Example"
- Example 173-10, "DBMS_TF.GET_ROW_SET Example"
- Example 173-12, "DBMS_TF.GET_XID Example"
- Rand_col Polymorphic Table Function Example, (DBMS_TF.PUT_COL Example)
173.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with the same values.

This PTF returns all the columns in the input table tab, and adds to it the columns listed in cols but with the column names prefixed with "ECHO_".

Live SQL:
You can view and run this example on Oracle Live SQL at Echo Polymorphic Table Function

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>ECHO_DNAME</th>
<th>ECHO_LOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
<td>SALES</td>
<td>CHICAGO</td>
</tr>
<tr>
<td>40</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
</tr>
</tbody>
</table>

A PTF consists of the following:

- PTF implementation package specification: The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.
- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```sql
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab  IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```sql
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab  IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id   PLS_INTEGER := 1;
    BEGIN
      FOR I IN 1 .. tab.COLUMN.COUNT LOOP
        FOR J IN 1 .. cols.COUNT LOOP
          IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
            IF ( NOT DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) ) THEN
              RAISE_APPLICATION_ERROR(-20102, 'Unsupported column type [' ||
                TAB.COLUMN(i).description.TYPE||']');
            END IF;
            TAB.COLUMN(i).for_read := TRUE;
            NEW_COLS(col_id) := TAB.COLUMN(i).description;
            NEW_COLS(col_id).name := prefix || TAB.COLUMN(i).description.name;
            col_id := col_id + 1;
            EXIT;
          END IF;
        END LOOP;
      END LOOP;
      /* Verify all columns were found */
      IF ( col_id - 1 != cols.COUNT ) THEN
        RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id - 1||'], ['||
          cols.COUNT||']');
      END IF;
      RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
    END;
PROCEDURE FETCH_ROWS
AS
  ROWSET DBMS_TF.ROW_SET_T;
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  DBMS_TF.PUT_ROW_SET(rowset);
END;
END echo_package;
```
The PTF echo references the implementation package `echo_package`.

```sql
CREATE FUNCTION echo(tab TABLE,
         cols COLUMNS)
  RETURN TABLE
  PIPELINED ROW POLYMORPHIC USING echo_package;
```

**Example 173-4  Using the Echo PTF in Queries**

This example selects all employees in department 20. The resulting rows have three new columns `ECHO_ENAME`, `ECHO_HIREDATE`, and `ECHO_SAL`.

```sql
SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;
```

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>MGR</th>
<th>HIREDATE</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPTNO</th>
<th>ECHO_ENAME</th>
<th>ECHO_HIREDATE</th>
<th>ECHO_SAL</th>
</tr>
</thead>
<tbody>

</table>

Using subquery `w`, display `ENAME`, `ECHO_LOC` and `DNAME` columns for all employees in department 30 with a salary greater than 1000.

```sql
WITH w
  AS (SELECT e.*,
       dname,
       loc
  FROM  scott.emp e,
       scott.dept d
  WHERE  e.deptno = d.deptno)
SELECT ename,
       echo_loc,
       dname
FROM   echo(w, COLUMNS(sal, dname, loc, hiredate))
WHERE  deptno = 30
       AND echo_sal > 1000;
```

### 173.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

**RECORD Types**

- COLUMN_DATA_T Record Type
- COLUMN_METADATA_T Record Type
- COLUMN_T Record Type
- DESCRIBE_T Record Type
- ENV_T Record Type
- PARALLEL_ENV_T Record Type
- TABLE_T Record Type

**TABLE Types**

- Supported Types Collections (TAB_<typ>_T)
- COLUMNS_NEW_T Table Type
- COLUMNS_T Table Type
- COLUMNS_WITH_TYPE_T Table Type
- TABLE_COLUMNS_T Table Type
- ROW_SET_T Table Type

**Types**

- XID_T Subtype

**CSTORE and XSTORE Data Structures**

The compilation and execution state management interfaces use data structures internally.
See Collections For Compilation Storage for more information.

173.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```
TYPE TAB_BOOLEAN_T       IS TABLE OF BOOLEAN       INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_FLOAT_T  IS TABLE OF BINARY_FLOAT  INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_DOUBLE_T IS TABLE OF BINARY_DOUBLE INDEX BY PLS_INTEGER;
TYPE TAB_BLOB_T          IS TABLE OF BLOB          INDEX BY PLS_INTEGER;
TYPE TAB_CHAR_T          IS TABLE OF CHAR(32767)   INDEX BY PLS_INTEGER;
TYPE TAB_CLOB_T          IS TABLE OF CLOB          INDEX BY PLS_INTEGER;
TYPE TAB_DATE_T          IS TABLE OF DATE          INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_YM_T   IS TABLE OF YMINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_DS_T   IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_NATURALN_T      IS TABLE OF NATURALN      INDEX BY PLS_INTEGER;
TYPE TAB_NUMBER_T        IS TABLE OF NUMBER        INDEX BY PLS_INTEGER;
TYPE TAB_RAW_T           IS TABLE OF RAW(32767)    INDEX BY PLS_INTEGER;
TYPE TAB_ROWID_T         IS TABLE OF ROWID         INDEX BY PLS_INTEGER;
TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;
TYPE TAB_TIMESTAMP_T     IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_TIMESTAMP_TZ_T  IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY PLS_INTEGER;
```

See Also:

Table 173-1 for more information about the DBMS_TF supported types

173.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See Table 173-1 for the list of supported types.
Syntax

```
TYPE COLUMN_DATA_T IS RECORD
    ( description COLUMN_METADATA_T,
      tab_varchar2 TAB_VARCHAR2_T,
      tab_number TAB_NUMBER_T,
      tab_date TAB_DATE_T,
      tab_binary_float TAB_BINARY_FLOAT_T,
      tab_binary_double TAB_BINARY_DOUBLE_T,
      tab_raw TAB_RAW_T,
      tab_char TAB_CHAR_T,
      tab_clob TAB_CLOB_T,
      tab_blob TAB_BLOB_T,
      tab_timestamp TAB_TIMESTAMP_T,
      tab_timestamp_tz TAB_TIMESTAMP_TZ_T,
      tab_interval_ym TAB_INTERVAL_YM_T,
      tab_interval_ds TAB_INTERVAL_DS_T,
      tab_timestamp_ltz TAB_TIMESTAMP_LTZ_T,
      tab_rowid TAB_ROWID_T);
```

</tbody>
</table>

173.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.
Syntax

TYPE COLUMN_METADATA_T IS RECORD
  ( type               PLS_INTEGER,
    max_len            PLS_integer DEFAULT -1,
    name               VARCHAR2(32767),
    name_len           PLS_INTEGER,
    precision          PLS_INTEGER,
    scale              PLS_INTEGER,
    charsetid          PLS_INTEGER,
    charsetform        PLS_INTEGER,
    collation          PLS_INTEGER );

Fields

Table 173-8  COLUMN_METADATA_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Internal Oracle typecode for the column's type</td>
</tr>
<tr>
<td>max_len</td>
<td>Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date, float), does not care about length, then this value will be ignored.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the column</td>
</tr>
<tr>
<td>name_len</td>
<td>Length of the name</td>
</tr>
<tr>
<td>precision</td>
<td>The precision, or the maximum number of significant decimal digits (for numeric data types)</td>
</tr>
<tr>
<td>scale</td>
<td>Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)</td>
</tr>
<tr>
<td>charsetid</td>
<td>Character set id (internal Oracle code, applies to string types)</td>
</tr>
<tr>
<td>charsetform</td>
<td>Character set form (internal Oracle code, applies to string types)</td>
</tr>
<tr>
<td>collation</td>
<td>Collation id (internal Oracle code, applies to string types)</td>
</tr>
</tbody>
</table>

173.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

TYPE column_t IS RECORD
  ( description            COLUMN_METADATA_T,
    pass_through           BOOLEAN,
    for_read               BOOLEAN );
**Fields**

### Table 173-9  COLUMN_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Column metadata</td>
</tr>
<tr>
<td>pass_through</td>
<td>Is this a pass through column</td>
</tr>
<tr>
<td>for_read</td>
<td>Is this column read by the PTF</td>
</tr>
</tbody>
</table>

#### 173.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

**Syntax**

```sql
TYPE DESCRIBE_T IS RECORD
( NEW_COLUMNS COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
  CSTORE_CHR CSTORE_CHR_T DEFAULT CSTORE_CHR_T(),
  CSTORE_NUM CSTORE_NUM_T DEFAULT CSTORE_NUM_T(),
  CSTORE_BOL CSTORE_BOL_T DEFAULT CSTORE_BOL_T(),
  CSTORE_DAT CSTORE_DAT_T DEFAULT CSTORE_DAT_T(),
  METHOD_NAMES METHODS_T DEFAULT METHODS_T());
```

### Fields

#### Table 173-10  DESCRIBE_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW_COLUMNS</td>
<td>New columns description that will be produced by the PTF</td>
</tr>
<tr>
<td>CSTORE_CHR</td>
<td>CStore array key type : VARCHAR2 (optional)</td>
</tr>
<tr>
<td>CSTORE_NUM</td>
<td>CStore array key type : NUMBER (optional)</td>
</tr>
<tr>
<td>CSTORE_BOL</td>
<td>CStore array key type : BOOLEAN (optional)</td>
</tr>
<tr>
<td>CSTORE_DAT</td>
<td>CStore array key type : DATE (optional)</td>
</tr>
<tr>
<td>METHOD_NAMES</td>
<td>Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods</td>
</tr>
</tbody>
</table>

#### 173.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

**Syntax**

```sql
TYPE ENV_T IS RECORD
( get_columns   TABLE_METADATA_T,
  put_columns   TABLE_METADATA_T,
  ref_put_col   REFERENCED_COLS_T,
  parallel_env  PARALLEL_ENV_T,
  query_optim   BOOLEAN,
  row_count     PLS_INTEGER,
  row_replication BOOLEAN,
  row_insertion BOOLEAN);```
### Fields

#### Table 173-11  ENV_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_columns</td>
<td>Metadata about the columns read by PTF GET_COL procedure</td>
</tr>
<tr>
<td>put_columns</td>
<td>Metadata about columns sent back to database by PUT_COL procedure</td>
</tr>
<tr>
<td>ref_put_col</td>
<td>TRUE if the put column was referenced in the query</td>
</tr>
<tr>
<td>parallel_env</td>
<td>Parallel execution information (when a query runs in parallel)</td>
</tr>
<tr>
<td>query_optim</td>
<td>Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer</td>
</tr>
<tr>
<td>row_count</td>
<td>Number of rows in current row set</td>
</tr>
<tr>
<td>row_replication</td>
<td>Is Row Replication Enabled?</td>
</tr>
<tr>
<td>row_insertion</td>
<td>Is Row Insertion Enabled?</td>
</tr>
</tbody>
</table>

### 173.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

#### Syntax

```
TYPE PARALLEL_ENV_T         IS RECORD
( instance_id      PLS_INTEGER,
  session_id       PLS_INTEGER,
  slave_svr_grp    PLS_INTEGER,
  slave_set_no     PLS_INTEGER,
  no_slocal_slaves PLS_INTEGER,
  global_slave_no  PLS_INTEGER,
  no_local_slaves  PLS_INTEGER,
  local_slave_no   PLS_INTEGER );
```

#### Fields

#### Table 173-12  PARALLEL_ENV_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_id</td>
<td>QC instance ID</td>
</tr>
<tr>
<td>session_id</td>
<td>QC session ID</td>
</tr>
<tr>
<td>slave_svr_grp</td>
<td>Slave server group</td>
</tr>
<tr>
<td>slave_set_no</td>
<td>Slave server set number</td>
</tr>
<tr>
<td>no_slocal_slaves</td>
<td>Number of sibling slaves (including self)</td>
</tr>
<tr>
<td>global_slave_no</td>
<td>Global slave number (base 0)</td>
</tr>
<tr>
<td>no_local_slaves</td>
<td>Number of sibling slaves running on instance</td>
</tr>
<tr>
<td>local_slave_no</td>
<td>Local slave number (base 0)</td>
</tr>
</tbody>
</table>
173.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```plaintext
TYPE TABLE_T IS RECORD(
    column                TABLE_COLUMNS_T,
    schema_name           DBMS_id,
    package_name          DBMS_id,
    ptf_name              DBMS_id);
```

Fields

**Table 173-13  TABLE_T Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td>Column information</td>
</tr>
<tr>
<td>schema_name</td>
<td>The PTF schema name</td>
</tr>
<tr>
<td>package_name</td>
<td>The PTF implementation package name</td>
</tr>
<tr>
<td>ptf_name</td>
<td>The PTF name invoked</td>
</tr>
</tbody>
</table>

173.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```plaintext
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

173.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```plaintext
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

173.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```plaintext
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

173.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)
Syntax

TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;

173.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;

173.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

SUBTYPE XID_T IS VARCHAR2(1024);

173.9 Summary of DBMS_TF Subprograms

This summary briefly describes the DBMS_TF package subprograms.

Table 173-14  DBMS_TF Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_TYPE_NAME</td>
<td>Function Returns the type name of the specified column type</td>
</tr>
<tr>
<td>COL_TO_CHAR</td>
<td>Function Returns the string representation of the specified column</td>
</tr>
<tr>
<td>CSTORE_EXISTS</td>
<td>Function Returns TRUE if an item with a given key exists in the PTF Compilation State management Store</td>
</tr>
<tr>
<td>CSTORE_GET</td>
<td>Procedure Gets item(s) of specified type from the PTF Compilation State management Store</td>
</tr>
<tr>
<td>GET_COL</td>
<td>Procedure Gets read column values</td>
</tr>
<tr>
<td>GET_ENV</td>
<td>Function Returns information about the PTF runtime environment</td>
</tr>
<tr>
<td>GET_ROW_SET</td>
<td>Procedure Gets read set of column values in the collection</td>
</tr>
<tr>
<td>GET_XID</td>
<td>Function Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state</td>
</tr>
<tr>
<td>PUT_COL</td>
<td>Procedure Puts column values in the database</td>
</tr>
<tr>
<td>PUT_ROW_SET</td>
<td>Procedure Puts the collection read set of column values in the database</td>
</tr>
<tr>
<td>ROW_REPLICATION</td>
<td>Procedure Sets the row replication factor</td>
</tr>
</tbody>
</table>
Table 173-14  (Cont.) DBMS_TF Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROW_TO_CHAR Function</td>
<td>Returns the string representation of a row in a rowset</td>
</tr>
<tr>
<td>SUPPORTED_TYPE Function</td>
<td>Returns TRUE if a specified type is supported by PTF infrastructure</td>
</tr>
<tr>
<td>TRACE Procedure</td>
<td>Prints data structures to help development and problem diagnosis</td>
</tr>
<tr>
<td>XSTORE_CLEAR Procedure</td>
<td>Removes all key-value pairs from XStore</td>
</tr>
<tr>
<td>XSTORE_EXISTS Procedure</td>
<td>Returns TRUE if the key has an associated value</td>
</tr>
<tr>
<td>XSTORE_GET Procedure</td>
<td>Gets a key-value store for PTF Execution State Management</td>
</tr>
<tr>
<td>XSTORE_REMOVE Procedure</td>
<td>Removes any value associated with the given key</td>
</tr>
<tr>
<td>XSTORE_SET Procedure</td>
<td>Sets the value for the given key store for PTF Execution State Management</td>
</tr>
</tbody>
</table>

173.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

FUNCTION COLUMN_TYPE_NAME(
    col COLUMN_METADATA_T)
RETURN VARCHAR2;

Parameters

Table 173-15  DBMS_TF.COLUMN_TYPE_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>The column metadata. See COLUMN_METADATA_T Record Type</td>
</tr>
</tbody>
</table>

Return Values

Returns the column type converted as text.

Example 173-5  DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes COLUMN_TYPE_NAME to compare the column type and raise an application error if the column type is not VARCHAR2.

FUNCTION describe(
    tab IN OUT DBMS_TF.table_t,
    cols IN DBMS_TF.columns_t)
RETURN DBMS_TF.describe_t
AS
new_cols DBMS_TF.columns_new_t;
col_id PLS_INTEGER := 1;
BEGIN
FOR i IN 1 .. tab.count LOOP
    FOR j IN 1 .. cols.count LOOP
        IF (tab(i).description.name = cols(j)) THEN
            IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2') THEN
                raise_application_error(-20102, 'Unsupported column type ['||tab(i).description.type||']');
                END IF;
                tab(i).for_read := true;
                new_cols(col_id) := tab(i).description;
                new_cols(col_id).name := 'ECHO_'|| tab(i).description.name;
                col_id := col_id + 1;
                EXIT;
            END IF;
        END LOOP;
    END LOOP;
    EXIT;
END IF;
END LOOP;
-- Verify all columns were found
IF (col_id - 1 != cols.count) THEN
    raise_application_error(-20101, 'Column mismatch ['||col_id-1||'], ['||cols.count||']');
END IF;
RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;

173.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

FUNCTION COL_TO_CHAR(
col COLUMN_DATA_T,
rid PLS_INTEGER,
quote VARCHAR2 DEFAULT '"')
RETURN VARCHAR2;

Parameters

Table 173-16  DBMS_TF.COL_TO_CHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>The column whose value is to be converted</td>
</tr>
<tr>
<td>rid</td>
<td>Row number</td>
</tr>
<tr>
<td>quote</td>
<td>Quotation mark to use for non-numeric values</td>
</tr>
</tbody>
</table>

Return Values

The string representation of a column data value.
**Example 173-6  DBMS_TF.COL_TO_CHAR Example**

```sql
PROCEDURE Fetch_Rows AS
   rowset DBMS_TF.rROW_SET_T;
   str VARCHAR2(32000);
BEGIN
   DBMS_TF.GET_ROW_SET(rowset);
   str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
END;
```

**173.9.3 CSTORE_EXISTS Function**

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

**Syntax**

```sql
FUNCTION CSTORE_EXISTS
   (key      IN VARCHAR2,
   key_type IN PLS_INTEGER default NULL)
return BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>key_type</td>
<td>The type of key (optional) Default : NULL</td>
</tr>
</tbody>
</table>

**Return Values**

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

**Example 173-7  DBMS_TF.CSTORE_EXISTS Example**

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```sql
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
   DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

**173.9.4 CSTORE_GET Procedure**

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE` function.
You can get the PTF compilation state during runtime procedures such as \texttt{OPEN}, \texttt{FETCH_ROWS} and \texttt{CLOSE}.

This procedure is overloaded. The \texttt{DESCRIBE_T} supports specifying key-value pairs for these scalar types: \texttt{VARCHAR2}, \texttt{NUMBER}, \texttt{DATE}, \texttt{BOOLEAN}.

See Table 173-3 for more information.

**Syntax**

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

\begin{verbatim}
PROCEDURE CSTORE_GET(
    key   IN     VARCHAR2,
    value IN OUT VARCHAR2);

PROCEDURE CSTORE_GET(
    key   IN     VARCHAR2,
    value IN OUT NUMBER);

PROCEDURE CSTORE_GET(
    key   IN     VARCHAR2,
    value IN OUT DATE);

PROCEDURE CSTORE_GET(
    key   IN     VARCHAR2,
    value IN OUT BOOLEAN);
\end{verbatim}

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

\begin{verbatim}
PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);
\end{verbatim}

**Parameters**

Table 173-18  DBMS_TF.CSTORE_GET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>value</td>
<td>Value corresponding to the key for supported types</td>
</tr>
<tr>
<td>key_value</td>
<td>Key value</td>
</tr>
</tbody>
</table>

173.9.5 \texttt{GET\_COL} Procedure

Get Read Column Values
Syntax

PROCEDURE GET_COL(
    columnId NUMBER,
    collection IN OUT NOCOPY <datatype>);

Where <datatype> can be any one of the supported types.

See Table 173-1 for the list of supported types.

Parameters

Table 173-19  GET_COL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnid</td>
<td>The id for the column</td>
</tr>
<tr>
<td>collection</td>
<td>The data for the column</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET_COL and PUT_COL may correspond to different column.

Example 173-8  DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

PROCEDURE fetch_rows
IS
    col1 DBMS_TF.TAB_CLOB_T;
    col2 DBMS_TF.TAB_CLOB_T;
    out1 DBMS_TF.TAB_CLOB_T;
    out2 DBMS_TF.TAB_CLOB_T;
BEGIN
    DBMS_TF.GET_COL(1, col1);
    DBMS_TF.GET_COL(2, col2);
    FOR I IN 1 .. col1.COUNT LOOP
        out1(i) := 'ECHO-' || col1(i);
    END LOOP;
    FOR I IN 1 .. col2.COUNT LOOP
        out2(i) := 'ECHO-' || col2(i);
    END LOOP;
    DBMS_TF.PUT_COL(1, out1);
    DBMS_TF.PUT_COL(2, out2);
END;

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.
exec fetch_rows

ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.

173.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

FUNCTION GET_ENV
  RETURN ENV_T;

Return Values

Returns information about the PTF runtime environment.

Example 173-9  DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable env of type ENV_T with the
PTF execution information in a FETCH_ROWS implementation procedure.

env         DBMS_TF.ENV_T  := DBMS_TF.GET_ENV();

173.9.7 GET_ROW_SET Procedure

Get Read Column Values

The FETCH_ROW procedure can call the GET_ROW_SET procedure to read the input rowset
set of column values in the collection of supported scalar type. This procedure is
overloaded.

Syntax

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER,
  col_count OUT        PLS_INTEGER);

Parameters

Table 173-20  GET_ROW_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowset</td>
<td>The collection of data and metadata</td>
</tr>
<tr>
<td>row_count</td>
<td>The number of rows in the columns</td>
</tr>
<tr>
<td>col_count</td>
<td>The number of columns</td>
</tr>
</tbody>
</table>
Example 173-10  DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
  rowset      DBMS_TF.ROW_SET_T;
  accumulator DBMS_TF.TAB_VARCHAR2_T;
  row_count   PLS_INTEGER;

  FUNCTION get_value(col  PLS_INTEGER,
                      ROW  PLS_INTEGER)
  RETURN VARCHAR2
  AS
    col_type  PLS_INTEGER := rowset(col).description.TYPE;
    BEGIN
      CASE col_type
        WHEN DBMS_TF.TYPE_VARCHAR2 THEN
          RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
        ELSE
          RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
        END CASE;
    END;
    BEGIN
      DBMS_TF.GET_ROW_SET(rowset, row_count);
      IF ( rowset.count = 0 ) THEN
        RETURN;
      END IF;
      FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
      END LOOP;
      FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
          accumulator(row_num) := accumulator(row_num) || get_value(col_num,
                                          row_num);
        END LOOP;
      END LOOP;
      -- Pushout the accumulator
      DBMS_TF.PUT_COL(1, accumulator);
    END;
```

173.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 173-11  Stack Polymorphic Table Function Example

ıldığı SQL:

You can view and run this example on Oracle Live SQL at Stack Polymorphic Table Function
Create the PTF implementation package stack_p.

The parameters are:

- tab - Input table
- col - The names of numeric (input) table columns to stack

CREATE PACKAGE stack_p AS

FUNCTION describe(tab IN OUT dbms_tf.table_t,
col         dbms_tf.columns_t)
RETURN dbms_tf.describe_t;

PROCEDURE fetch_rows;
END stack_p;

Create the PTF implementation package body stack_p.

This PTF produces two new columns, COLUMN_NAME and COLUMN_VALUE, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

CREATE PACKAGE BODY stack_p AS

FUNCTION describe(tab IN OUT dbms_tf.table_t,
col         dbms_tf.columns_t)
RETURN dbms_tf.describe_t AS
BEGIN
FOR i IN 1 .. tab.column.count LOOP
  FOR j IN 1 .. col.count LOOP
    IF (tab.column(i).description.name = col(j) AND
        tab.column(i).description.TYPE = dbms_tf.type_number) THEN
      tab.column(i).pass_through := false;
      tab.column(i).for_read     := true;
    END IF;
  END LOOP;
END LOOP;
RETURN dbms_tf.describe_t(
  new_columns => dbms_tf.columns_new_t(
    1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                   TYPE => dbms_tf.type_varchar2),
    2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                   TYPE => dbms_tf.type_number)),
  row_replication => true);
END;

PROCEDURE fetch_rows AS
  env    dbms_tf.env_t := dbms_tf.get_env();
  rowset dbms_tf.row_set_t;
  colcnt PLS_INTEGER;
  rowcnt PLS_INTEGER;
  repfac dbms_tf.tab_naturaln_t;
  namcol dbms_tf.tab_varchar2_t;
  valcol dbms_tf.tab_number_t;
BEGIN
  dbms_tf.get_row_set(rowset, rowcnt, colcnt);
  FOR i IN 1 .. rowcnt LOOP

Chapter 173

Summary of DBMS_TF Subprograms

repfac(i) := 0;
END LOOP;
FOR r IN 1 .. rowcnt LOOP
FOR c IN 1 .. colcnt LOOP
IF rowset(c).tab_number(r) IS NOT NULL THEN
repfac(r)
:= repfac(r) + 1;
namcol(nvl(namcol.last+1,1)) :=
INITCAP(regexp_replace(env.get_columns(c).name, '^"|"$'));
valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
END IF;
END LOOP;
END LOOP;
dbms_tf.row_replication(replication_factor => repfac);
dbms_tf.put_col(1, namcol);
dbms_tf.put_col(2, valcol);
END;
END stack_p;

Create the standalone PTF named stack. Specify exactly one formal argument of type
TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type,

and indicate the PTF implementation package to use is stack_p.
CREATE FUNCTION stack(tab TABLE,
col columns)

173.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```java
FUNCTION GET_XID
    RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 173-12  DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```java
PROCEDURE open IS
    BEGIN
        xst(DBMS_TF.GET_XID()) := 0;
    END;
```

173.9.9 PUT_COL Procedure

Put Column Values

Syntax

```java
PROCEDURE PUT_COL(
    columnid NUMBER,
    collection IN <datatype>);
```

Where `<datatype>` can be any one of the supported types.

See Table 173-1 for the list of supported types.

Parameters

Table 173-21  PUT_COL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnid</td>
<td>The id for the column</td>
</tr>
<tr>
<td>collection</td>
<td>The data for the column</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.
The column numbers are in the get column order as created in \texttt{DESCRIBE} method of PTF.

For the same columnid, \texttt{GET\_COL} and \texttt{PUT\_COL} may correspond to different column.

### 173.9.9.1 Rand\_col Polymorphic Table Function Example

The \texttt{Rand\_col} PTF appends specified number of random-valued columns to the output.

#### Example 173-13  Rand\_col Polymorphic Table Function Example

\begin{quote}
\textbf{Live SQL:}
You can view and run this example on Oracle Live SQL at \texttt{Rand\_col Polymorphic Table Function}
\end{quote}

This \texttt{Rand\_col} PTF example appends \texttt{col\_count} number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND\_<n>"

Create the PTF implementation package \texttt{rand\_col\_p}.

The parameters are:

- \texttt{tab} : Input table
- \texttt{col\_count} (optional) : Number of random-valued columns to generate [Default = 1]
- \texttt{low} (optional) : Lower bound for the random numbers [Default = \texttt{Null}]
- \texttt{high} (optional) : Upper bound for the random numbers [Default = \texttt{Null}]

\begin{verbatim}
CREATE PACKAGE rand_col_p AS
    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                       col_count NATURALN DEFAULT 1,
                       low NUMBER DEFAULT NULL,
                       high NUMBER DEFAULT NULL)
        RETURN DBMS_TF.describe_t;
    PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                           low NUMBER DEFAULT NULL,
                           high NUMBER DEFAULT NULL);
END rand_col_p;
\end{verbatim}

Create the PTF implementation package body \texttt{rand\_col\_p}.

The parameter \texttt{col\_count} is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of \texttt{col\_count} to be \texttt{NATURALN}, which has an implicit \texttt{NOT NULL} constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

\begin{verbatim}
CREATE PACKAGE BODY rand_col_p AS
    col_name_prefix CONSTANT dbms_id := 'RAND_';

    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                       col_count NATURALN DEFAULT 1,
                       low NUMBER DEFAULT NULL,
                       high NUMBER DEFAULT NULL);
END rand_col_p;
\end{verbatim}
Create the standalone rand_col PTF. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is rand_col_p.

CREATE FUNCTION rand_col(tab TABLE,
  col_count NATURALN DEFAULT 1,
  low       NUMBER   DEFAULT NULL,
  high      NUMBER   DEFAULT NULL)
RETURN TABLE PIPELINED ROW POLYMORPHIC USING rand_col_p;

Invoke the rand_col PTF to display all columns of table SCOTT.DEPT with one produced RAND_1 column.

```
SELECT *
FROM rand_col(scott.dept);
```

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>RAND_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>.738666262</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
<td>.093256312</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
<td>.992944835</td>
</tr>
<tr>
<td>40</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
<td>.397948124</td>
</tr>
</tbody>
</table>

Invoke the rand_col PTF to display all columns of table SCOTT.DEPT with two produced RAND_1 and RAND_2 columns.

```
SELECT *
    FROM rand_col(scott.dept, col_count => 2);

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>RAND_1</th>
<th>RAND_2</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>.976521361</td>

### 173.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the ROW_REPLICATION procedure to set the replication factor.

#### Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T,
    replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T,
    replication_factor IN TAB_NATURALN_T);
```
Parameters

Table 173-22  PUT_ROW_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowset</td>
<td>The collection of data and metadata</td>
</tr>
<tr>
<td>replication_factor</td>
<td>The replication factor per row</td>
</tr>
</tbody>
</table>

Example 173-14  DBMS_TF.PUT_ROW_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```sql
PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

173.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 173-15  Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

Live SQL:

You can view and run this example on Oracle Live SQL at Split Polymorphic Table Function

Create the PTF implementation package split_p.

The parameters are:

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```sql
CREATE PACKAGE split_p AS

    FUNCTION describe(tab  IN OUT DBMS_TF.table_t,
                       col   DBMS_TF.columns_t,
                       cnt   NATURALN)
        RETURN DBMS_TF.describe_t;

    PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```
Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

CREATE PACKAGE BODY split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.Table_t, col DBMS_TF.COLUMNS_t, cnt NATURAL) RETURN DBMS_TF.describe_t AS
        new_cols DBMS_TF.columns_new_t;
        col_id PLS_INTEGER := 1;
        BEGIN
            FOR i IN 1 .. tab.column.count LOOP
                FOR j IN 1 .. col.count LOOP
                    IF (tab.column(i).description.name = col(j) AND tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
                        tab.column(i).pass_through := FALSE;
                        tab.column(i).for_read := TRUE;
                        new_cols(col_id) := tab.column(i).description;
                        col_id := col_id + 1;
                    END IF;
                END LOOP;
            END LOOP;
            RETURN DBMS_TF.describe_t(new_columns=>new_cols, row_replication=>true);
        END;

    PROCEDURE fetch_rows(cnt NATURAL) AS
        inp_rs DBMS_TF.row_set_t;
        out_rs DBMS_TF.row_set_t;
        rows PLS_INTEGER;
        BEGIN
            DBMS_TF.get_row_set(inp_rs, rows);
            FOR c IN 1 .. inp_rs.count LOOP
                FOR r IN 1 .. rows LOOP
                    FOR i IN 1 .. cnt LOOP
                        out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/cnt;
                    END LOOP;
                END LOOP;
            END LOOP;
            DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
        END;
    END split_p;

Create the standalone PTF named split. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is split_p.

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURAL) RETURN TABLE PIPELINED ROW POLYMORPHIC USING split_p;

For all employees in department 30, display the ENAME, SAL, and COMM columns. Invoke the split PTF with the COLUMNS pseudo-operator to divide the value of SAL and COMM by 2 for each replicated row returned by the query. Each row is replicated twice.
SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;

<table>

</table>

**173.9.11 ROW_REPLICATION Procedure**

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A Row Semantics polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

**Syntax**

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN TAB_NATURALN_T);
```

**Parameters**

Table 173-23  ROW_REPLICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replication_factor</td>
<td>The replication factor per row</td>
</tr>
</tbody>
</table>

**Example 173-16  Replicate Polymorphic Table Function Example**

This example creates a PTF that replicates each input row by the replication_factor that is given as a parameter.
Create the PTF implementation package `replicate_p`.

```sql
CREATE PACKAGE replicate_p
AS

  FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
                     replication_factor NATURAL)
    RETURN DBMS_TF.describe_t;

  PROCEDURE Fetch_Rows(replication_factor NATURAL);

END replicate_p;
```

Create the PTF implementation package body `replicate_p`. The PTF replicates each input row by the `replication_factor` that is given as a parameter.

```sql
CREATE PACKAGE body replicate_p
AS

  FUNCTION Describe(tab IN OUT DBMS_TF.Table_t,
                    replication_factor NATURAL)
    RETURN DBMS_TF.describe_t AS
  BEGIN
    RETURN DBMS_TF.describe_t(row_replication => True);
  END;

  PROCEDURE Fetch_Rows(replication_factor NATURAL)
  AS
  BEGIN
    DBMS_TF.ROW_REPLICATION(replication_factor);
  END;

END replicate_p;
```

Create a standalone PTF named `replicate`. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `replicate_p`.

```sql
CREATE FUNCTION replicate(tab TABLE,
                          replication_factor NATURAL)
  RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;
```

This example sets the `replication_factor` to 2 which results in doubling the number of rows.

```sql
SELECT *
FROM replicate(dept, replication_factor => 2);
```

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
</tbody>
</table>
This example sets the replication_factor to zero.

```sql
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the `scott.emp` table to set the replication_factor to 1000000.

```sql
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>6000000</td>
</tr>
<tr>
<td>10</td>
<td>3000000</td>
</tr>
<tr>
<td>20</td>
<td>5000000</td>
</tr>
</tbody>
</table>

This sets the replication_factor to 1000000000.

```sql
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

<table>
<thead>
<tr>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000000000</td>
</tr>
</tbody>
</table>

173.9.12 ROW_TO_CHAR Function

The `ROW_TO_CHAR` function converts a row data value to a string representation.

**Syntax**

```sql
FUNCTION ROW_TO_CHAR(
    rowset ROW_SET_T,
    rid    PLS_INTEGER,
    format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowset</td>
<td>The rowset whose value is to be converted</td>
</tr>
<tr>
<td>rid</td>
<td>Row number</td>
</tr>
<tr>
<td>format</td>
<td>The string format (default is FORMAT_JSON)</td>
</tr>
</tbody>
</table>

Chapter 173

Summary of DBMS_TF Subprograms

173-45
Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 173-17  DBMS_TF.ROW_TO_CHAR Example

PROCEDURE Fetch_Rows as
   rowset DBMS_TF.ROW_SET_T;
   str    VARCHAR2(32000);
BEGIN
   DBMS_TF.GET_ROW_SET(rowset);
   str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;

173.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

FUNCTION SUPPORTED_TYPE(
   type_id PLS_INTEGER)
RETURN BOOLEAN;

Parameters

Table 173-25  DBMS_TF.SUPPORTED_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type_id</td>
<td>The type</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if the type_id is a scalar supported by PUT_COL and GET_COL.

See Also:

Echo Polymorphic Table Function Example for an example of DBMS_TF.SUPPORTED_TYPE use.

173.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

PROCEDURE TRACE{
   msg    VARCHAR2,
with_id BOOLEAN DEFAULT FALSE,
separator VARCHAR2 DEFAULT NULL,
prefix VARCHAR2 DEFAULT NULL);

PROCEDURE TRACE(
  rowset IN ROW_SET_T);

PROCEDURE TRACE(
  env IN ENV_T);

PROCEDURE TRACE(
  columns_new IN COLUMNS_NEW_T);

PROCEDURE trace(
  cols IN COLUMNS_T);

PROCEDURE trace(
  columns_with_type IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
  tab IN TABLE_T);

PROCEDURE trace(
  col IN COLUMN_METADATA_T);

Parameters

Table 173-26 TRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>Custom user tracing message</td>
</tr>
<tr>
<td>with_id</td>
<td>Include the unique execution ID in the trace?</td>
</tr>
<tr>
<td>separator</td>
<td>Specify a string to use to separate values</td>
</tr>
<tr>
<td>prefix</td>
<td>Specify a string to prefix the actual values</td>
</tr>
<tr>
<td>rowset</td>
<td>Data for a rowset</td>
</tr>
<tr>
<td>env</td>
<td>Metadata about the polymorphic table function execution state</td>
</tr>
<tr>
<td>columns_new</td>
<td>Collection for new columns</td>
</tr>
<tr>
<td>cols</td>
<td>Collection containing column names</td>
</tr>
<tr>
<td>columns_with_type</td>
<td>Collection containing columns metadata</td>
</tr>
<tr>
<td>tab</td>
<td>Table descriptor</td>
</tr>
<tr>
<td>col</td>
<td>Metadata about an existing table column or a new column produced</td>
</tr>
</tbody>
</table>

Example 173-18 DBMS_TF.TRACE Example

This example adds tracing to a fetch_rows procedure.

PROCEDURE fetch_rows
AS
  rowset DBMS_TF.ROW_SET_T;
BEGIN
  DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
  DBMS_TF.TRACE(rowset);
173.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

PROCEDURE XSTORE_CLEAR;

173.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

FUNCTION XSTORE_EXISTS(
  key      IN VARCHAR2,
  key_type IN PLS_INTEGER DEFAULT NULL)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>key_type</td>
<td>The type of key (optional). Default : NULL</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

See Also:

Table 173-6 for more information about supported key types.
173.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See Table 173-6 for more information about supported key types.

Syntax

PROCEDURE XSTORE_GET(
    key   IN VARCHAR2,
    value IN OUT VARCHAR2);

PROCEDURE XSTORE_GET(
    key   IN VARCHAR2,
    value IN OUT NUMBER);

PROCEDURE XSTORE_GET(
    key   IN VARCHAR2,
    value IN OUT DATE);

PROCEDURE XSTORE_GET(
    key   IN VARCHAR2,
    value IN OUT BOOLEAN);

Parameters

Table 173-28  DBMS_TF.XSTORE_GET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>value</td>
<td>Value corresponding to the key for supported types</td>
</tr>
</tbody>
</table>

Usage Notes

If the key is not found, the value is unchanged.

173.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 173-19  Row_num Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at Row_num Polymorphic Table Function
Create the PTF implementation package row_num_p.

The parameters are:
- **tab** - The input table
- **ini** - The initial value (Default = 1)
- **inc** - The amount to increment (Default = 1)

CREATE PACKAGE row_num_p IS

FUNCTION describe(tab IN OUT dbms_tf.table_t, 
ini NUMBER DEFAULT 1, 
inc NUMBER DEFAULT 1) 
RETURN dbms_tf.describe_t;

PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;

This PTF accepts any input table and appends the sequence column **ROW_ID** to the table. The sequence values start with the specified value (ini) and each time it is incremented by the specified value (inc).

CREATE PACKAGE BODY row_num_p IS

FUNCTION describe(tab IN OUT dbms_tf.table_t, 
ini NUMBER DEFAULT 1, 
inc NUMBER DEFAULT 1) 
RETURN dbms_tf.describe_t AS
BEGIN
RETURN dbms_tf.describe_t(new_columns =>
  dbms_tf.columns_new_t(1 =>
    dbms_tf.column_metadata_t(name => 'ROW_ID',
                                TYPE => dbms_tf.type_number)));
END;

PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
  row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
  rid NUMBER := ini;
  col dbms_tf.tab_number_t;
BEGIN
  dbms_tf.xstore_get('rid', rid);
  FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
  dbms_tf.put_col(1, col);
  dbms_tf.xstore_set('rid', rid + inc*row_cnt);
END;
END;

Create a standalone polymorphic table function named row_num. Specify exactly one formal argument of type **TABLE**, specify the return type of the PTF as **TABLE**, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is row_num_p.

CREATE FUNCTION row_num(tab TABLE, 
ini NUMBER DEFAULT 1, 
inc NUMBER DEFAULT 1) 
RETURN TABLE PIPELINED TABLE POLYMORPHIC USING row_num_p;

The row_num PTF invocation reporting from the **SCOTT.DEPT** table produces a new column **ROW_ID** with value starting at 1 and incremented by 1 in the row set.
SELECT * FROM row_num(scott.dept);

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>ROW_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>1</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
<td>2</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
<td>3</td>
</tr>
<tr>
<td>40</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
<td>4</td>
</tr>
</tbody>
</table>

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 100 and incremented by 1 in the row set.

SELECT * FROM row_num(scott.dept, 100);

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>ROW_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>100</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
<td>101</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
<td>102</td>
</tr>
<tr>
<td>40</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
<td>103</td>
</tr>
</tbody>
</table>

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 0 and decremented by 1 in the row set.

SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
<th>ROW_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
<td>0</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
<td>-1</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
<td>-2</td>
</tr>
<tr>
<td>40</td>
<td>OPERATIONS</td>
<td>BOSTON</td>
<td>-3</td>
</tr>
</tbody>
</table>

The row_num PTF invocation reporting from the SCOTT.EMP table produces a new column ROW_ID with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

SELECT deptno, ename, job, sal, row_id
FROM   row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc => 0.25)
WHERE  deptno IN (10, 30);

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>SAL</th>
<th>ROW_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>CLARK</td>
<td>MANAGER</td>
<td>2450</td>
<td>0</td>
</tr>
<tr>
<td>10</td>
<td>KING</td>
<td>PRESIDENT</td>
<td>5000</td>
<td>.25</td>
</tr>
<tr>
<td>10</td>
<td>MILLER</td>
<td>CLERK</td>
<td>1300</td>
<td>.5</td>
</tr>
<tr>
<td>30</td>
<td>ALLEN</td>
<td>SALESMAN</td>
<td>1600</td>
<td>0</td>
</tr>
<tr>
<td>30</td>
<td>BLAKE</td>
<td>MANAGER</td>
<td>2850</td>
<td>.25</td>
</tr>
<tr>
<td>30</td>
<td>JAMES</td>
<td>CLERK</td>
<td>950</td>
<td>.5</td>
</tr>
<tr>
<td>30</td>
<td>MARTIN</td>
<td>SALESMAN</td>
<td>1250</td>
<td>.75</td>
</tr>
<tr>
<td>30</td>
<td>TURNER</td>
<td>SALESMAN</td>
<td>1500</td>
<td>1</td>
</tr>
<tr>
<td>30</td>
<td>WARD</td>
<td>SALESMAN</td>
<td>1250</td>
<td>1.25</td>
</tr>
</tbody>
</table>

173.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.
Syntax

```sql
PROCEDURE XSTORE_REMOVE(
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>key_type</td>
<td>The type of key to remove (optional)</td>
</tr>
</tbody>
</table>

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

173.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store and item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```sql
PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN VARCHAR2);
```

```sql
PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN NUMBER);
```

```sql
PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN DATE);
```

```sql
PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>A unique character key</td>
</tr>
<tr>
<td>value</td>
<td>Value corresponding to the key for supported types</td>
</tr>
</tbody>
</table>
Usage Notes

If an item for a given key already exists, the value is replaced.
DBMS_TNS

The **DBMS_TNS** package provides the **RESOLVE_TNSNAME** function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- DBMS_TNS Overview
- DBMS_TNS Security Model
- Summary of DBMS_TNS Subprograms

### 174.1 DBMS_TNS Overview

The **DBMS_TNS** package contains one function, **RESOLVE_TNSNAME**, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The **RESOLVE_TNSNAME** function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

**See Also:**

- *Oracle Database Administrator’s Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

### 174.2 DBMS_TNS Security Model

You must be granted the `EXECUTE` privilege on the **DBMS_TNS** package.

### 174.3 Summary of DBMS_TNS Subprograms

This table lists the **DBMS_TNS** subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RESOLVE_TNSNAME Function</strong></td>
<td>Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> names.directory_path parameter</td>
</tr>
</tbody>
</table>
174.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the sqlnet.ora names.directory_path parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
    tns_name VARCHAR2)
RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tns_name</td>
<td>Database address for establishing the connection</td>
</tr>
</tbody>
</table>

Usage Notes

- Database administrators and system management tools can explicitly call the DBMS_TNS.RESOLVE_TNSNAME function to resolve a tns_name.
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the DBMS_TNS.RESOLVE_TNSNAME function to resolve TNS names that were referred to by other data dictionary views such as ALL_DB_LINKS and USER_DB_LINKS. In addition, you can use it to find any TNS name entry in the tnsnames.ora file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;
```

```
DB_LINK
--------------------------------------------------------------------------------
DBMS_TNS.RESOLVE_TNSNAME(HOST)
--------------------------------------------------------------------------------
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
 (CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)(HOST=juno)
 (USER=psmith)))
)```
The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes
- Summary of `DBMS_TRACE` Subprograms

### 175.1 DBMS_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.  
   Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.

2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).

3. Running an application to be traced.

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

### 175.2 DBMS_TRACE Security Model

This package must be created under `SYS`.

### 175.3 DBMS_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.
### Table 175-1  DBMS_TRACE Event Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE_ALL_CALLS</td>
<td>INTEGER</td>
<td>1</td>
<td>Traces calls or returns</td>
</tr>
<tr>
<td>TRACE_ENABLED_CALLS</td>
<td>INTEGER</td>
<td>2</td>
<td>Traces exceptions</td>
</tr>
<tr>
<td>TRACE_ALL_EXCEPTIONS</td>
<td>INTEGER</td>
<td>4</td>
<td>Traces exceptions and handlers</td>
</tr>
<tr>
<td>TRACE_ENABLED_EXCEPTIONS</td>
<td>INTEGER</td>
<td>8</td>
<td>Traces exceptions and handlers</td>
</tr>
<tr>
<td>TRACE_LIMIT</td>
<td>INTEGER</td>
<td>16</td>
<td>Save only the last few records. This allows tracing up to a problem area,</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>without filling the database up with masses of irrelevant information. If</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>event 10940 is set, the limit is 1023*(the value of event 10940). This can</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>be overridden by the use of &quot;TRACE_LIMIT&quot; flag.</td>
</tr>
<tr>
<td>TRACE_ALL_SQL</td>
<td>INTEGER</td>
<td>32</td>
<td>Traces SQL statements</td>
</tr>
<tr>
<td>TRACE_ENABLED_SQL</td>
<td>INTEGER</td>
<td>64</td>
<td>Traces SQL statements at PL/SQL level. This does not invoke SQL Trace</td>
</tr>
<tr>
<td>TRACE_ALL_LINES</td>
<td>INTEGER</td>
<td>128</td>
<td>Traces each line</td>
</tr>
<tr>
<td>TRACE_ENABLED_LINES</td>
<td>INTEGER</td>
<td>256</td>
<td></td>
</tr>
<tr>
<td>TRACE_PAUSE</td>
<td>INTEGER</td>
<td>4096</td>
<td>Pauses tracing</td>
</tr>
<tr>
<td>TRACE_RESUME</td>
<td>INTEGER</td>
<td>8192</td>
<td>Resume tracing</td>
</tr>
<tr>
<td>TRACE_STOP</td>
<td>INTEGER</td>
<td>16384</td>
<td>Stops tracing</td>
</tr>
<tr>
<td>NO_TRACE_ADMINISTRATIVE</td>
<td>INTEGER</td>
<td>32768</td>
<td>Prevents tracing of administrative events such as:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• PL/SQL Trace Tool started</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Trace flags changed</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• PL/SQL Virtual Machine started</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• PL/SQL Virtual Machine stopped</td>
</tr>
<tr>
<td>NO_TRACE_HANDLED_EXCEPTIONS</td>
<td>INTEGER</td>
<td>65536</td>
<td>Prevents tracing of handled exceptions</td>
</tr>
</tbody>
</table>

### Table 175-2  DBMS_TRACE Version Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE_MINOR_VERSION</td>
<td>INTEGER</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>TRACE_MAJOR_VERSION</td>
<td>INTEGER</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

Oracle recommends using the symbolic form for all these constants.
175.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

175.5 DBMS_TRACE Operational Notes

Certain operational notes apply to DBMS_TRACE. These are described in the following sections:

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by enabling specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:
Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

**Tracing Calls**

Two levels of call tracing are available:

- **Level 1**: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- **Level 2**: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

**Tracing Exceptions**

Two levels of exception tracing are available:

- **Level 1**: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- **Level 2**: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

**Tracing SQL**

Two levels of SQL tracing are available:

- **Level 1**: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- **Level 2**: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

**Tracing Lines**

Two levels of line tracing are available:

- **Level 1**: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- **Level 2**: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

---

**Note:**

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.
Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling NO_TRACE_HANDLED_EXCEPTIONS limits data collection to unhandled exceptions.

All calls to DBMS_TRACE.SET_PLSQL_TRACE and DBMS_TRACE.CLEAR_PLSQL_TRACE place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants TRACE_PAUSE and TRACE_RESUME are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant TRACE_LIMIT. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level n changes the record limit to 1024 * n.

Enabling NO_TRACE_ADMINISTRATIVE prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

175.6 Summary of DBMS_TRACE Subprograms

This table lists the DBMS_TRACE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_PLSQL_TRACE Procedure</td>
<td>Stops trace data dumping in session</td>
</tr>
</tbody>
</table>
Table 175-3  (Cont.) DBMS_TRACE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_PLSQL_TRACE_LEVEL Function</td>
<td>Gets the trace level</td>
</tr>
<tr>
<td>PLSQL_TRACE_VERSION Procedure</td>
<td>Gets the version number of the trace package</td>
</tr>
<tr>
<td>SET_PLSQL_TRACE Procedure</td>
<td>Starts tracing in the current session</td>
</tr>
</tbody>
</table>

175.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

175.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS_TRACE constants.

See Table 175-1 for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
RETURN BINARY_INTEGER;
```

175.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
    major OUT BINARY_INTEGER,
    minor OUT BINARY_INTEGER);
```

Parameters

Table 175-4  PLSQL_TRACE_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number of DBMS_TRACE.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number of DBMS_TRACE.</td>
</tr>
</tbody>
</table>
175.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```sql
DBMS_TRACE.SET_PLSQL_TRACE (
    trace_level INTEGER);
```

Parameters

Table 175-5  SET_PLSQL_TRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>You must supply one or more of the constants as listed in Table 175-1. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants &quot;TRACE_PAUSE&quot;, &quot;TRACE_RESUME&quot; and &quot;TRACE_STOP&quot; should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information.</td>
</tr>
</tbody>
</table>
DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

See Also:
Oracle Database SQL Language Reference

This chapter contains the following topics:
- DBMS_TRANSACTION Security Model
- Summary of DBMS_TRANSACTION Subprograms

176.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of the calling user, rather than the package owner, SYS.

176.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the DBMS_TRANSACTION subprograms and briefly describes them.

Table 176-1  DBMS_TRANSACTION Package Subprograms

#### 176.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:  
ALTER SESSION ADVISE COMMIT

**Syntax**

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

#### 176.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement:  
ALTER SESSION ADVISE NOTHING

**Syntax**

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```
176.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

Syntax

DBMS_TRANSACTION.ADVISE_ROLLBACK;

176.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.COMMIT;

176.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: COMMIT COMMENT <text>

Syntax

DBMS_TRANSACTION.COMMIT_COMMENT (cmnt VARCHAR2);

Parameters

Table 176-2  COMMIT_COMMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmnt</td>
<td>Comment to associate with this commit.</td>
</tr>
</tbody>
</table>

176.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: COMMIT FORCE <text>, <number>"

Syntax

DBMS_TRANSACTION.COMMIT_FORCE (xid VARCHAR2,
  scn VARCHAR2 DEFAULT NULL);

Parameters

Table 176-3  COMMIT_FORCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
<tr>
<td>scn</td>
<td>System change number.</td>
</tr>
</tbody>
</table>
176.2.7 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```sql
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (  
    create_transaction BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_transaction</td>
<td>If true, then start a transaction if one is not currently active.</td>
</tr>
</tbody>
</table>

176.2.8 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```sql
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (  
    xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.</td>
</tr>
</tbody>
</table>

Usage Notes

**WARNING:**

`PURGE_LOST_DB_ENTRY` should only be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.
Before automatic recovery runs, the transaction may show up in `DBA_2PC_PENDING` as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the `MIXED` column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is `ORA-02062`). In this case, the DBA may use the procedure `PURGE_LOST_DB_ENTRY` to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

### Table 176-6  `PURGE_LOST_DB_ENTRY` Procedure States

<table>
<thead>
<tr>
<th>State of Column</th>
<th>State of Global Transaction</th>
<th>State of Local Transaction</th>
<th>Normal DBA Action</th>
<th>Alternative DBA Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collecting</td>
<td>Rolled back</td>
<td>Rolled back</td>
<td>None</td>
<td><code>PURGE_LOST_DB_ENTRY</code> (See Note 1)</td>
</tr>
<tr>
<td>Committed</td>
<td>Committed</td>
<td>Committed</td>
<td>None</td>
<td><code>PURGE_LOST_DB_ENTRY</code> (See Note 1)</td>
</tr>
<tr>
<td>Prepared</td>
<td>Unknown</td>
<td>Prepared</td>
<td>None</td>
<td><code>FORCE COMMIT</code> or <code>ROLLBACK</code></td>
</tr>
<tr>
<td>Forced commit</td>
<td>Unknown</td>
<td>Committed</td>
<td>None</td>
<td><code>PURGE_LOST_DB_ENTRY</code> (See Note 1)</td>
</tr>
<tr>
<td>Forced rollback</td>
<td>Unknown</td>
<td>Rolled back</td>
<td>None</td>
<td><code>PURGE_LOST_DB_ENTRY</code> (See Note 1)</td>
</tr>
<tr>
<td>Forced commit</td>
<td>Mixed</td>
<td>Committed</td>
<td>(See Note 2)</td>
<td></td>
</tr>
<tr>
<td>Forced rollback</td>
<td>Mixed</td>
<td>Rolled back</td>
<td>(See Note 2)</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.
176.2.9 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```sql
DBMS_TRANSACTION.PURGE_MIXED (xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.</td>
</tr>
</tbody>
</table>

176.2.10 READ_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

Syntax

```sql
DBMS_TRANSACTION.READ_ONLY;
```

176.2.11 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```sql
DBMS_TRANSACTION.READ_WRITE;
```
176.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```sql
DBMS_TRANSACTION.ROLLBACK;
```

176.2.13 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```sql
DBMS_TRANSACTION.ROLLBACK_FORCE (
    xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
</tbody>
</table>

176.2.14 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```sql
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
    savept VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
176.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

**Syntax**

```
DBMS_TRANSACTION.SAVEPOINT (
    savept VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>

176.2.16 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

**Syntax**

```
DBMS_TRANSACTION.STEP_ID
    RETURN NUMBER;
```

176.2.17 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

**Syntax**

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
    rb_name VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rb_name</td>
<td>Name of rollback segment to use.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

See Also:
Oracle Database Advanced Queuing User's Guide for more on message format transformations.

177.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the DBMS_TRANSFORM subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TRANSFORMATION Procedure</td>
<td>Creates a transformation that maps an object of the source type to an object of the destination type</td>
</tr>
<tr>
<td>DROP_TRANSFORMATION Procedure</td>
<td>Drops the given transformation</td>
</tr>
<tr>
<td>MODIFY_TRANSFORMATION Procedure</td>
<td>Modifies an existing transformation</td>
</tr>
</tbody>
</table>

177.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```sql
DBMS_TRANSFORM.CREATE_TRANSFORMATION (  
  schema     VARCHAR2(30),  
  name       VARCHAR2(30),  
  from_schema VARCHAR2(30),  
  from_type  VARCHAR2(30),  
  to_schema  VARCHAR2(30),  
  to_type    VARCHAR2(30),  
  transformation VARCHAR2(4000));
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>from_schema</td>
<td>Specifies the schema of the source type.</td>
</tr>
<tr>
<td>from_type</td>
<td>Specifies the source type.</td>
</tr>
<tr>
<td>to_schema</td>
<td>Specifies the target type schema.</td>
</tr>
<tr>
<td>to_type</td>
<td>Specifies the target type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.</td>
</tr>
</tbody>
</table>

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form source.user_data.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

177.1.2 DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```sql
DBMS_TRANSFORM.DROP_TRANSFORMATION ( schema VARCHAR2(30),
```
Parameters

Table 177-3  DROP_TRANSFORMATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
</tbody>
</table>

177.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```sql
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
    schema VARCHAR2(30),
    name VARCHAR2(30),
    attribute_number INTEGER,
    transformation VARCHAR2(4000));
```

Parameters

Table 177-4  MODIFY_TRANSFORMATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>attribute_number</td>
<td>The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.</td>
</tr>
<tr>
<td>transformation</td>
<td>The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.
The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies.

DBMS_TSDP_MANAGE is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_TSDP_MANAGE Subprograms

Related Topics

- DBMS_TSDP_PROTECT
  The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package.

See Also:
Oracle Database Security Guide

178.1 DBMS_TSDP_MANAGE Overview

The DBMS_TSDP_MANAGE package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the DBMS_TSDP_PROTECT package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.
178.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker’s rights. The DBMS_TSDP_MANAGE package is owned by SYS.

The EXECUTE privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the EXECUTE privilege for this package, while the DBMS_TSDP_PROTECT package would be governed by a security administrator.

178.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the DBMS_TSDP_MANAGE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDSENSITIVECOLUMN Procedure</td>
<td>Adds a column to the sensitive column list</td>
</tr>
<tr>
<td>ADDSENSITIVETYPE Procedure</td>
<td>Creates and adds a sensitive column type to the list of sensitive column types in the database</td>
</tr>
<tr>
<td>ALTSENSITIVECOLUMN Procedure</td>
<td>Alters the sensitive type and/or the comment of a column in the sensitive column list.</td>
</tr>
<tr>
<td>DROPSENSITIVECOLUMN Procedure</td>
<td>Removes columns from the sensitive column list</td>
</tr>
<tr>
<td>DROPSENSITIVETYPE SOURCE Procedure</td>
<td>Drops a sensitive column type from the list sensitive column types in the database</td>
</tr>
<tr>
<td>IMPORT_DISCOVERYRESULT Procedure</td>
<td>Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance</td>
</tr>
<tr>
<td>IMPORTSENSITIVETYPES Procedure</td>
<td>Imports a list of sensitive column types from a source</td>
</tr>
<tr>
<td>REMOVE_DISCOVERYRESULT Procedure</td>
<td>Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance</td>
</tr>
</tbody>
</table>

178.3.1 ADDSENSITIVECOLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADDSENSITIVECOLUMN (
    schema_name        IN VARCHAR2,
    table_name         IN VARCHAR2,
    column_name        IN VARCHAR2,
    sensitive_type     IN VARCHAR2,
    user_comment       IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 178-2  ADD_SENSITIVE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Identifier of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Add a column SAL in SCOTT.EMP:

DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (schema_name        => 'SCOTT',
                                      table_name         => 'EMP',
                                      column_name        => 'SAL',
                                      sensitive_type     => 'SALARY_TYPE',
                                      user_comment       => 'Salary column');

178.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (schema_name        IN VARCHAR2,
                                          table_name         IN VARCHAR2,
                                          column_name        IN VARCHAR2,
                                          sensitive_type     IN VARCHAR2,
                                          user_comment       IN VARCHAR2 DEFAULT NULL);

Parameters

Table 178-3  ALTER_SENSITIVE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Identifier of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:
178.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type  IN  VARCHAR2,
  user_comment    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Add a sensitive column type called `SALARY_TYPE` that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type  => 'SALARY_TYPE',
  user_comment    => 'Salary data');
```

178.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name    IN  VARCHAR2 DEFAULT '%',
  table_name     IN  VARCHAR2 DEFAULT '%',
  column_name    IN  VARCHAR2 DEFAULT '%',
  column_name    IN  VARCHAR2 DEFAULT '%');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
</tbody>
</table>
Table 178-5  (Cont.) DROP_SENSITIVE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
</tbody>
</table>

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
    schema_name => 'SCOTT',
    table_name  => 'EMP',
    column_name => 'SAL');

178.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
    sensitive_type IN VARCHAR2);

Parameters

Table 178-6  DROP_SENSITIVE_TYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type to be dropped</td>
</tr>
</tbody>
</table>

Examples

To drop SALARY_TYPE:

DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
    sensitive_type => 'SALARY_TYPE');

178.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
    source IN VARCHAR2);
### Parameters

**Table 178-7  DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Name of the source</td>
</tr>
</tbody>
</table>

**Examples**

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, `ADM_DEMO`:

```sql
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (source => 'ADM_DEMO');
```

### 178.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

**Syntax**

```sql
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (discovery_result => T, discovery_source => S, force => F);
```

**Parameters**

**Table 178-8  IMPORT_DISCOVERY_RESULT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_result</td>
<td>List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).</td>
</tr>
<tr>
<td>discovery_source</td>
<td>Source of the import. The discovery_source name identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.</td>
</tr>
</tbody>
</table>
Table 178-8  (Cont.) IMPORT_DISCOVERY_RESULT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</td>
</tr>
<tr>
<td></td>
<td>• FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported.</td>
</tr>
<tr>
<td></td>
<td>• TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result</td>
</tr>
</tbody>
</table>

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (discovery_results => xml_adm_result, discovery_source => 'ADM_Demo');

178.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (sensitive_types => sensitive_types, source => source);

Parameters

Table 178-9  IMPORT_SENSITIVE_TYPES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_types</td>
<td>List of sensitive column types in XML Format (possibly as a CLOB)</td>
</tr>
<tr>
<td>source</td>
<td>Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.</td>
</tr>
</tbody>
</table>

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (sensitive_types => xml_adm_result, source => 'ADM_Demo');
178.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```sql
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT(
    discovery_source IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_source</td>
<td>Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.</td>
</tr>
</tbody>
</table>

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```sql
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT(
    discovery_source => 'ADM_Demo');
```
The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of `DBMS_TSDP_PROTECT` Subprograms

Related Topics

- `DBMS_TSDP_MANAGE`
  The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

See Also:

*Oracle Database Security Guide*

179.1 DBMS_TSDP_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the `DBMS_TSDP_MANAGE` package.

179.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.
179.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TSDP_PARAM_MAX</td>
<td>INTEGER</td>
<td>4000</td>
<td>Maximum length of the parameter value that can be specified in FEATURE_OPTIONS</td>
</tr>
</tbody>
</table>

179.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- FEATURE_OPTIONS Table Type
- POLICY_CONDITIONS Table Type

179.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by VARCHAR2(M_IDEN).

Syntax

```sql
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```

179.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```sql
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

179.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.
Table 179-2  DBMS_TSDP_PROTECT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_POLICY Procedure</td>
<td>Creates a TSDP policy</td>
</tr>
<tr>
<td>ALTER_POLICY Procedure</td>
<td>Alters a TSDP policy</td>
</tr>
<tr>
<td>ASSOCIATE_POLICY Procedure</td>
<td>Associates or disassociates a TSDP policy with a sensitive column type</td>
</tr>
<tr>
<td>DISABLE_PROTECTION_COLUMN Procedure</td>
<td>Disables protection for columns</td>
</tr>
<tr>
<td>DISABLE_PROTECTION_SOURCE Procedure</td>
<td>Disables protection based on the source of truth for the sensitive columns</td>
</tr>
<tr>
<td>DISABLE_PROTECTION_TYPE Procedure</td>
<td>Disables protection for a sensitive column type</td>
</tr>
<tr>
<td>DROP_POLICY Procedure</td>
<td>Removes a TSDP policy</td>
</tr>
<tr>
<td>ENABLE_PROTECTION_COLUMN Procedure</td>
<td>Enables protection for columns</td>
</tr>
<tr>
<td>ENABLE_PROTECTION_SOURCE Procedure</td>
<td>Enables protection based on the source of truth for the sensitive columns</td>
</tr>
<tr>
<td>ENABLE_PROTECTION_TYPE Procedure</td>
<td>Enables protection for a sensitive column type</td>
</tr>
</tbody>
</table>

179.5.1 ADD_POLICY Procedure

This procedure creates a TSDP policy.

Syntax

```sql
DBMS_TSDP_PROTECT.ADD_POLICY (  
    policy_name              IN VARCHAR2,  
    security_feature         IN PLS_INTEGER,  
    policy_enable_options    IN FEATURE_OPTIONS,  
    policy_apply_condition   IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 179-3  ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy being created. The maximum length for this identifier is M_IDEN. This follows the Oracle naming convention.</td>
</tr>
</tbody>
</table>
| security_feature| Oracle security feature with which the policy is associated. Allowed values:  
  • DBMS_TSDP_PROTECT.REDACT  
  • DBMS_TSDP_PROTECT.VPD  
  • DBMS_TSDP_PROTECT.UNIFIED_AUDIT  
  • DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT  
  • DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION |
Table 179-3  (Cont.) ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_enable_options</td>
<td>Initialized with the parameter-value pairs corresponding to the security_feature setting</td>
</tr>
<tr>
<td>policy_apply_condition</td>
<td>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(Property)=property_value. Permissible values for Property: • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE</td>
</tr>
</tbody>
</table>

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see Oracle Database Security Guide.

Examples

Create a policy PARTIAL_MASK_POLICY:

DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'',''SESSION_USER'')      =''APPUSER''';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV,VVVVVVVVV, *, 1, 6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ADD_POLICY
    ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options, policy_conditions);
END;

179.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

DBMS_TSDP_PROTECT.ALTER_POLICY {
  policy_name           IN VARCHAR2,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);
Parameters

Table 179-4  ALTER_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy to alter</td>
</tr>
<tr>
<td>policy_enable_options</td>
<td>Initialized with the parameter-value pairs corresponding to the security feature</td>
</tr>
<tr>
<td>policy_apply_condition</td>
<td>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(Property)=property_value. Permissible values for Property: • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE</td>
</tr>
</tbody>
</table>

Usage Notes

• If the policy_apply_condition matches an existing condition for the policy, then the corresponding enable options are updated with policy_enable_options.

• If the policy_apply_condition does not match any existing condition for the policy, the combination of policy_enable_options and policy_apply_condition is added to the policy.

Examples

Add a new combination of policy_apply_condition and policy_enable_options to an existing policy PARTIAL_MASK_POLICY:

```
DECLARE
    redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
    redact_feature_options ('expression') := 'SYS_CONTEXT(''USERENV'',''SESSION_USER'')=''APPUSER''';
    redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
    redact_feature_options ('function_parameters') := 'STR, VVVVVVVV,VVVVVVVV, *, 1, 6';
    policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
    DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options, policy_conditions);
END;
```

179.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY {
    policy_name IN VARCHAR2,  
```
sensitive_type IN VARCHAR2,
associate IN BOOLEAN DEFAULT TRUE);

Parameters

Table 179-5  ASSOCIATE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the TDSP policy</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type:</td>
</tr>
<tr>
<td>associate</td>
<td>Associate or Disassociate. TRUE implies Associate</td>
</tr>
</tbody>
</table>

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');

179.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (  
schema_name IN VARCHAR2 DEFAULT '%',  
table_name IN VARCHAR2 DEFAULT '%',  
column_name IN VARCHAR2 DEFAULT '%',  
policy_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 179-6  DISABLE_PROTECTION_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema containing the column</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
<tr>
<td>policy_name</td>
<td>Optional policy name. If given, only this policy is disabled.</td>
</tr>
</tbody>
</table>

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
179.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
    discovery_sourcename  IN  VARCHAR2);

Parameters

Table 179-7  DISABLE_PROTECTION_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_sourcename</td>
<td>Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.</td>
</tr>
</tbody>
</table>

Examples

Disable protection for all columns corresponding to ADM_Demo:

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');

179.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
    sensitive_type  IN  VARCHAR2);

Parameters

Table 179-8  DISABLE_PROTECTION_TYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
</tbody>
</table>

Examples

Disable protection for all columns identified by SSN_TYPE:

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
179.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```sql
DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name IN VARCHAR2,  
    policy_apply_condition IN POLICY_CONDITIONS);
```

```
DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name IN VARCHAR2);
```

Parameters

Table 179-9  DROP_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy to drop</td>
</tr>
<tr>
<td>policy_apply_condition</td>
<td>To be initialized with the relevant condition</td>
</tr>
</tbody>
</table>

Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```sql
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN  
    policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';  
    DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```sql
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
```
BEGIN
    DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;

Dropping a TSDP policy:
BEGIN
    DBMS_TSDP_PROTECT.DROP_POLICY(
        policy_name => 'PARTIAL_MASK_POLICY');
END;

179.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
    schema_name        IN  VARCHAR2 DEFAULT '%',
    table_name         IN  VARCHAR2 DEFAULT '%',
    column_name        IN  VARCHAR2 DEFAULT '%',
    policy_name        IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 179-10   ENABLE_PROTECTION_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema containing the column</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
<tr>
<td>policy_name</td>
<td>Optional policy name. If given, only this policy is enabled.</td>
</tr>
</tbody>
</table>

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
179.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (discovery_sourcename IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_sourcename</td>
<td>Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.</td>
</tr>
</tbody>
</table>

Examples

Enable protection for all columns corresponding to ADM Demo:

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');

179.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (sensitive_type IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
</tbody>
</table>

Examples

Enable protection for all columns identified by SSN_TYPE:

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

This chapter contains the following topics:

- Security Model
- Exceptions
- Operational Notes
- Summary of DBMS_TTS Subprograms

See Also:

- Oracle Database Administrator's Guide
- Oracle Database Upgrade Guide

### 180.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

### 180.2 DBMS_TTS Exceptions

The DBMS_TTS package creates exceptions for missing or invalid transportable tablespaces.

```sql
ts_not_found   EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts   EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```
180.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

180.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 180-1  DBMS_TTS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNGRADE Procedure</td>
<td>Downgrades transportable tablespace-related data</td>
</tr>
<tr>
<td>TRANSPORT_SET_CHECK Procedure</td>
<td>Checks if a set of tablespaces (to be transported) is self-contained</td>
</tr>
</tbody>
</table>

180.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

DBMS_TTS.DOWNGRADE;

180.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

DBMS_TTS.TRANSPORT_SET_CHECK ( 
   ts_list IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check IN BOOLEAN DEFAULT FALSE);

Parameters

Table 180-2  TRANSPORT_SET_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ts_list</td>
<td>List of one or more tablespaces, separated by comma.</td>
</tr>
</tbody>
</table>
Table 180-2  (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incl_constraints</td>
<td>TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)</td>
</tr>
<tr>
<td>full_check</td>
<td>Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.</td>
</tr>
</tbody>
</table>

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```
181 DBMS_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Constants
- Exceptions

181.1 DBMS_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_DATA</td>
<td>Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>The operation succeeded</td>
</tr>
<tr>
<td>TYPECODE_BDOUBLE</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BFILE</td>
<td>A BFILE type</td>
</tr>
<tr>
<td>TYPECODE_BFLOAT</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BLOB</td>
<td>A BLOB type</td>
</tr>
<tr>
<td>TYPECODE_CFILE</td>
<td>A CFILE type</td>
</tr>
<tr>
<td>TYPECODE_CHAR</td>
<td>A CHAR type</td>
</tr>
<tr>
<td>TYPECODE_CLOB</td>
<td>A CLOB type</td>
</tr>
<tr>
<td>TYPECODE_DATE</td>
<td>A DATE type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_DS</td>
<td>An INTERVAL_DS type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_YM</td>
<td>A INTERVAL_YM type</td>
</tr>
<tr>
<td>TYPECODE_MLSLABEL</td>
<td>An MLSLABEL type</td>
</tr>
<tr>
<td>TYPECODE_NAMEDCOLLECTION</td>
<td>A named collection (VARRAY/nested table) type</td>
</tr>
<tr>
<td>TYPECODE_NCHAR</td>
<td>A NCHAR type</td>
</tr>
<tr>
<td>TYPECODE_NCLOB</td>
<td>A NCLOB type</td>
</tr>
<tr>
<td>TYPECODE_NUMBER</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_NVARCHAR2</td>
<td>A NVARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_OBJECT</td>
<td>An OBJECT type</td>
</tr>
</tbody>
</table>
Table 181-1  (Cont.) DBMS_TYPES Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPECODE_OPAQUE</td>
<td>An OPAQUE type</td>
</tr>
<tr>
<td>TYPECODE_RAW</td>
<td>A RAW type</td>
</tr>
<tr>
<td>TYPECODE_REF</td>
<td>A REF type</td>
</tr>
<tr>
<td>TYPECODE_TABLE</td>
<td>A nested table collection type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP</td>
<td>A TIMESTAMP type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_LTZ</td>
<td>A TIMESTAMP_LTZ type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_TZ</td>
<td>A TIMESTAMP_TZ type</td>
</tr>
<tr>
<td>TYPECODE_UROWID</td>
<td>A UROWID type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR2</td>
<td>A VARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR</td>
<td>A VARCHAR type</td>
</tr>
<tr>
<td>TYPECODE_VARRAY</td>
<td>A VARRAY collection type</td>
</tr>
</tbody>
</table>

181.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH
The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

See Also:

Oracle Database Performance Tuning Guide for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- Summary of DBMS_UMF Subprograms

182.1 Summary of DBMS_UMF Subprograms

This topic lists the DBMS_UMF subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGURE_NODE Procedure</td>
<td>Configures a node in the RMF topology</td>
</tr>
<tr>
<td>CREATE_LINK Procedure</td>
<td>Creates a database link between two nodes in the RMF topology</td>
</tr>
<tr>
<td>CREATE_TOPOLOGY Procedure</td>
<td>Creates the RMF topology</td>
</tr>
<tr>
<td>DROP_LINK Procedure</td>
<td>Removes a database link between two nodes in the RMF topology</td>
</tr>
<tr>
<td>DROP_TOPOLOGY Procedure</td>
<td>Deletes the RMF topology</td>
</tr>
<tr>
<td>ENABLE_SERVICE Procedure</td>
<td>Enables a service on a node in the RMF topology</td>
</tr>
<tr>
<td>GET_NODE_ID_LOCAL Function</td>
<td>Returns the node ID of a node in the RMF topology</td>
</tr>
<tr>
<td>GET_NODE_NAME_LOCAL Function</td>
<td>Returns the node name of a node in the RMF topology</td>
</tr>
<tr>
<td>GET_TARGET_ID Function</td>
<td>Returns the destination ID in the RMF topology</td>
</tr>
<tr>
<td>GET_TOPOLOGY_NAME_LOCAL Function</td>
<td>Returns the RMF topology name of the local node</td>
</tr>
<tr>
<td>QUERY_LINK_INFO Procedure</td>
<td>Returns the information about a database link in the RMF topology</td>
</tr>
</tbody>
</table>
Table 182-1  (Cont.) DBMS_UMF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY_NODE_INFO Procedures</td>
<td>Returns the information about a node in the RMF topology</td>
</tr>
<tr>
<td>REGISTER_NODE Function and Procedure</td>
<td>Registers a node in the RMF topology</td>
</tr>
<tr>
<td>SWITCH_DESTINATION Procedure</td>
<td>Designates a source node as a destination node in the RMF topology</td>
</tr>
<tr>
<td>UNCONFIGURE_NODE Procedure</td>
<td>Resets the configuration of a node in the RMF topology</td>
</tr>
<tr>
<td>UNREGISTER_NODE Procedure</td>
<td>Removes the registration of a node in the RMF topology</td>
</tr>
</tbody>
</table>

182.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```sql
DBMS_UMF.CONFIGURE_NODE(
    node_name          IN VARCHAR2 DEFAULT NULL,
    dblink_to_target   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 182-2  CONFIGURE_NODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_name</td>
<td>Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter DB_UNIQUE_NAME is assigned as the name for the node by default.</td>
</tr>
<tr>
<td>dblink_to_target</td>
<td>Database link from this node to the destination node.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.
182.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK(
    topology_name      IN VARCHAR2,
    node_a_name        IN VARCHAR2,
    node_b_name        IN VARCHAR2,
    dblink_a_to_b      IN VARCHAR2,
    dblink_b_to_a      IN VARCHAR2);
```

Parameters

Table 182-3  CREATE_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
<tr>
<td>node_a_name</td>
<td>Name of the first node.</td>
</tr>
<tr>
<td>node_b_name</td>
<td>Name of the second node.</td>
</tr>
<tr>
<td>dblink_a_to_b</td>
<td>Database link from the first node to the second node.</td>
</tr>
<tr>
<td>dblink_b_to_a</td>
<td>Database link from the second node to the first node.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

182.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```
DBMS_UMF.CREATE_TOPOLOGY(
    topology_name IN VARCHAR2);
```

Parameters

Table 182-4  CREATE_TOPOLOGY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.
182.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```sql
DBMS_UMF.DROP_LINK(
    topology_name   IN VARCHAR2,
    node_a_name     IN VARCHAR2,
    node_b_name     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
<tr>
<td>node_a_name</td>
<td>Name of the first node.</td>
</tr>
<tr>
<td>node_b_name</td>
<td>Name of the second node.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

182.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```sql
DBMS_UMF.DROP_TOPOLOGY(
    topology_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the topology to delete.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.
182.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```sql
DBMS_UMF.ENABLE_SERVICE(
    topology_name      IN VARCHAR2,
    node_name          IN VARCHAR2,
    service_type       IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
<tr>
<td>node_name</td>
<td>Name of the node on which a specific service needs to be enabled.</td>
</tr>
<tr>
<td>service_type</td>
<td>Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

182.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```sql
DBMS_UMF.GET_NODE_ID_LOCAL(
    topology_name  IN  VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology with which the node is registered.</td>
</tr>
</tbody>
</table>

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.
Security Model

Only the database users SYS and SYS$UMF can execute this function.

182.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

182.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(
    topology_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

**Table 182-9  GET_TARGET_ID Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
</tbody>
</table>

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

182.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```
Return Value
Returns the name of the active RMF topology of the node on which this function is executed.

Security Model
Only the database users SYS and SYS$UMF can execute this procedure.

182.1.11 QUERY_LINK_INFO Procedure
This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax
```sql
DBMS_UMF.QUERY_LINK_INFO(
    topology_name      IN   VARCHAR2,
    from_node_id       IN   NUMBER,
    to_node_id         IN   NUMBER,
    link_name          OUT  VARCHAR2);
```

Parameters

### Table 182-10  QUERY_LINK_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
<tr>
<td>from_node_id</td>
<td>Node ID of the first node.</td>
</tr>
<tr>
<td>to_node_id</td>
<td>Node ID of the second node.</td>
</tr>
<tr>
<td>link_name</td>
<td>Name of the database link from the first node to the second node returned by the procedure.</td>
</tr>
</tbody>
</table>

Security Model
Only the database users SYS and SYS$UMF can execute this procedure.

182.1.12 QUERY_NODE_INFO Procedures
This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax
```sql
DBMS_UMF.QUERY_NODE_INFO(
    topology_name      IN   VARCHAR2 DEFAULT NULL,
    node_name          IN    VARCHAR2,
    node_id            OUT   NUMBER);
```

```sql
DBMS_UMF.QUERY_NODE_INFO(
    node_id            IN   NUMBER,
    topology_name      OUT  VARCHAR2,
    node_name          OUT  VARCHAR2);
```
Parameters

Table 182-11  QUERY_NODE_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology with which the node is registered.</td>
</tr>
<tr>
<td>node_name</td>
<td>Name of the node.</td>
</tr>
<tr>
<td>node_id</td>
<td>Identifier of the node.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

182.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE(
  topology_name          IN  VARCHAR2,
  node_name              IN  VARCHAR2,
  dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
  dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
  as_source              IN  VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE(
  topology_name          IN  VARCHAR2,
  node_name              IN  VARCHAR2,
  dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
  dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
  as_source              IN  VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE(
  topology_name          IN  VARCHAR2,
  node_name              IN  VARCHAR2,
  dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
  dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
  as_source              IN  VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE(
  topology_name          IN  VARCHAR2,
  node_name              IN  VARCHAR2,
  dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
  dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
  as_source              IN  VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');
```

```
RETURN NUMBER;
```

Parameters

Table 182-12  REGISTER_NODE Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
</tbody>
</table>
### Table 182-12 (Cont.) REGISTER_NODE Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_name</td>
<td>Name of the node to register.</td>
</tr>
<tr>
<td>dblink_to_node</td>
<td>Name for the database link from the destination to the node.</td>
</tr>
<tr>
<td>dblink_from_node</td>
<td>Name for the database link from the node to the destination.</td>
</tr>
<tr>
<td>as_source</td>
<td>Set to <code>TRUE</code>, if the node is a source, else set to <code>FALSE</code>.</td>
</tr>
<tr>
<td>as_candidate_target</td>
<td>Set to <code>TRUE</code>, if the node is a candidate destination, else set to <code>FALSE</code>.</td>
</tr>
<tr>
<td>node_id</td>
<td>Node ID returned by the procedure.</td>
</tr>
</tbody>
</table>

#### Return Value

Returns the node ID of the registered node.

#### Security Model

Only the database users `SYS` and `SYSS$UMF` can execute this procedure.

### 182.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

#### Syntax

```
DBMS_UMF.SWITCH_DESTINATION(
    topology_name IN VARCHAR2,
    force_switch  IN BOOLEAN DEFAULT TRUE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
</tbody>
</table>
Table 182-13  (Cont.) SWITCH_DESTINATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force_switch</td>
<td>If set to \texttt{FALSE}, the execution of this procedure fails in the following situations:</td>
</tr>
<tr>
<td></td>
<td>• Candidate destination is a read-only database, and hence it cannot become the new destination.</td>
</tr>
<tr>
<td></td>
<td>• Candidate destination does not have database links to one or more sources in the topology.</td>
</tr>
<tr>
<td></td>
<td>• Candidate destination is unable to get the latest AWR data from the old destination.</td>
</tr>
<tr>
<td></td>
<td>If set to \texttt{TRUE}, the execution of this procedure fails in the following situation:</td>
</tr>
<tr>
<td></td>
<td>• Candidate destination is a read-only database, and hence it cannot become the new destination.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users \texttt{SYS} and \texttt{SYS$UMF} can execute this procedure.

182.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

\begin{verbatim}
DBMS_UMF.UNCONFIGURE_NODE;
\end{verbatim}

Security Model

Only the database users \texttt{SYS} and \texttt{SYS$UMF} can execute this procedure.

182.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

\begin{verbatim}
DBMS_UMF.UNREGISTER_NODE(
    topology_name IN VARCHAR2,
    node_name    IN VARCHAR2);
\end{verbatim}

Parameters

Table 182-14  UNREGISTER_NODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>topology_name</td>
<td>Name of the RMF topology.</td>
</tr>
</tbody>
</table>
Table 182-14  (Cont.) UNREGISTER_NODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_name</td>
<td>Name of the node which needs to be removed from the topology.</td>
</tr>
</tbody>
</table>

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.
DBMS_UTILITY

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- DBMS_UTILITY Deprecated Subprograms
- Security Model
- Constants
- Exceptions
- Data Structures
- Summary of DBMS_UTILITY Subprograms

183.1 DBMS_UTILITY Deprecated Subprograms

These DBMS_UTILITY subprograms are deprecated in Oracle Database 12c release 12.2.

Note:
Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- GET_PARAMETER_VALUE Function
  Query v$_parameter directly to find the value of an init.ora parameter.
- ANALYZE_PART_OBJECT Procedure
  Use DBMS_STATS to gather statistics.
- GET_DEPENDENCY Procedure
  There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

183.2 DBMS_UTILITY Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE procedure and the COMPILER_SCHEMA procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.
Related Topics

- **NAME_RESOLVE Procedure**
  This procedure resolves the given name, including synonym translation and authorization checking as necessary.

- **COMPILE_SCHEMA Procedure**
  This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

### 183.3 DBMS_UTILITY Constants

The **DBMS_UTILITY** package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

**Table 183-1   DBMS_UTILITY Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_ERROR_ON_RESTRICTIONS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>This constant is the only legal value for the p_option_flags parameter of the INVALIDATE subprogram</td>
</tr>
</tbody>
</table>

### 183.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by **DBMS_UTILITY**.

**Table 183-2   Exceptions Raised by DBMS_UTILITY**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>-24237</td>
<td>Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>-24238</td>
<td>Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>-24239</td>
<td>Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened</td>
</tr>
</tbody>
</table>

### 183.5 DBMS_UTILITY Data Structures

The **DBMS_UTILITY** package defines a single RECORD type and TABLE types.

**Record Types**

- **INSTANCE_RECORD Record Type**
Table Types

- DBLINK_ARRAY TABLE Type
- INDEX_TABLE_TYPE Table Type
- INSTANCE_TABLE Table Type
- LNAME_ARRAY Table Type
- NAME_ARRAY Table Type
- NUMBER_ARRAY Table Type
- UNCL_ARRAY Table Type

183.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```sql
TYPE INSTANCE_RECORD IS RECORD (
  inst_number   NUMBER,
  inst_name     VARCHAR2(60));
```

Fields

**Table 183-3   INSTANCE_RECORD Record Type Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inst_number</td>
<td>Active instance number</td>
</tr>
<tr>
<td>inst_name</td>
<td>Instance name</td>
</tr>
</tbody>
</table>

183.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```sql
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

183.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```sql
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```
183.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of INSTANCE_RECORD Record Type.

Syntax

TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;

Usage Notes

The starting index of INSTANCE_TABLE is 1; INSTANCE_TABLE is Dense.

Related Topics

• DBMS_UTILITY INSTANCE_RECORD Record Type
  This type describes a list of active instance number-name pairs.

183.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

Syntax

TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;

183.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of NAME.

Syntax

TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;

183.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

183.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

Syntax

TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;

183.6 Summary of DBMS_UTILITY Subprograms

This table lists the DBMS_UTILITY subprograms and briefly describes them.
### Table 183-4  DBMS_UTILITY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE_INSTANCES Procedure</td>
<td>Returns the active instance</td>
</tr>
<tr>
<td>ANALYZE_DATABASE Procedure</td>
<td>Analyzes all the tables, clusters and indexes in a database</td>
</tr>
<tr>
<td>ANALYZE_PART_OBJECT Procedure</td>
<td>Analyzes the given tables and indexes This procedure is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. Use DBMS_STATS to gather statistics.</td>
</tr>
<tr>
<td>ANALYZE_SCHEMA Procedure</td>
<td>Analyzes all the tables, clusters and indexes in a schema</td>
</tr>
<tr>
<td>CANONICALIZE Procedure</td>
<td>Canonicalizes a given string</td>
</tr>
<tr>
<td>COMMA_TO_TABLE Procedures</td>
<td>Converts a comma-delimited list of names into a PL/SQL table of names</td>
</tr>
<tr>
<td>COMPILE_SCHEMA Procedure</td>
<td>Compiles all procedures, functions, packages, views and triggers in the specified schema</td>
</tr>
<tr>
<td>CREATE_ALTER_TYPE_ERROR_TABLE Procedure</td>
<td>Creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement</td>
</tr>
<tr>
<td>CURRENT_INSTANCE Function</td>
<td>Returns the current connected instance number</td>
</tr>
<tr>
<td>DATA_BLOCK_ADDRESS_BLOCK Function</td>
<td>Gets the block number part of a data block address</td>
</tr>
<tr>
<td>DATA_BLOCK_ADDRESS_FILE Function</td>
<td>Gets the file number part of a data block address</td>
</tr>
<tr>
<td>DB_VERSION Procedure</td>
<td>Returns version information for the database</td>
</tr>
<tr>
<td>EXEC_DDL_STATEMENT Procedure</td>
<td>Executes the DDL statement in parse_string</td>
</tr>
<tr>
<td>EXPAND_SQL_TEXT Procedure</td>
<td>Recursively replaces any view references in the input SQL query with the corresponding view subquery</td>
</tr>
<tr>
<td>FORMAT_CALL_STACK Function</td>
<td>Formats the current call stack</td>
</tr>
<tr>
<td>FORMAT_ERROR_BACKTRACE Function</td>
<td>Formats the backtrace from the point of the current error to the exception handler where the error has been caught</td>
</tr>
<tr>
<td>FORMAT_ERROR_STACK Function</td>
<td>Formats the current error stack</td>
</tr>
<tr>
<td>GET_CPU_TIME Function</td>
<td>Returns the current CPU time in 100th's of a second</td>
</tr>
<tr>
<td>GET_DEPENDENCY Procedure</td>
<td>Shows the dependencies on the object passed in. This procedure is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.</td>
</tr>
<tr>
<td>GET_ENDIANNESS Function</td>
<td>Gets the endianness of the database platform</td>
</tr>
<tr>
<td>GET_HASH_VALUE Function</td>
<td>Computes a hash value for the given string</td>
</tr>
<tr>
<td>GET_PARAMETER_VALUE Function</td>
<td>Gets the value of specified init.ora parameter. This function is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. You can query v$parameter directly.</td>
</tr>
<tr>
<td>GET_SQL_HASH Function</td>
<td>Computes a hash value for the given string using MD5 algorithm</td>
</tr>
</tbody>
</table>
Table 183-4  (Cont.) DBMS_UTILITY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_TIME Function</td>
<td>Returns the current time in 100th's of a second</td>
</tr>
<tr>
<td>GET_TZ_TRANSITIONS Procedure</td>
<td>Returns time zone transitions by regionid from the timezone.dat file</td>
</tr>
<tr>
<td>INVALIDATE Procedure</td>
<td>Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings</td>
</tr>
<tr>
<td>IS_BIT_SET Function</td>
<td>Checks the bit setting for the given bit in the given RAW value</td>
</tr>
<tr>
<td>IS_CLUSTER_DATABASE Function</td>
<td>Determines if the database is running in cluster database mode</td>
</tr>
<tr>
<td>MAKE_DATA_BLOCK_ADDRESS Function</td>
<td>Creates a data block address given a file number and a block number</td>
</tr>
<tr>
<td>NAME_RESOLVE Procedure</td>
<td>Resolves the given name</td>
</tr>
<tr>
<td>NAME_TOKENIZE Procedure</td>
<td>Calls the parser to parse the given name</td>
</tr>
<tr>
<td>OLD_CURRENT_SCHEMA Function</td>
<td>Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')</td>
</tr>
<tr>
<td>OLD_CURRENT_USER Function</td>
<td>Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')</td>
</tr>
<tr>
<td>PORT_STRING Function</td>
<td>Returns a string that uniquely identifies the version of Oracle and the operating system</td>
</tr>
<tr>
<td>SQLID_TO_SQLHASH Function</td>
<td>Converts a SQL ID into a hash value</td>
</tr>
<tr>
<td>TABLE_TO_COMMA Procedures</td>
<td>Converts a PL/SQL table of names into a comma-delimited list of names</td>
</tr>
<tr>
<td>VALIDATE Procedure</td>
<td>Makes invalid database objects valid</td>
</tr>
<tr>
<td>WAIT_ON_PENDING_DML Function</td>
<td>Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back</td>
</tr>
</tbody>
</table>

183.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```sql
DBMS_UTILITY.ACTIVE_INSTANCES (  
    instance_table  OUT INSTANCE_TABLE,  
    instance_count  OUT NUMBER);
```

Parameters

Table 183-5  ACTIVE_INSTANCES Procedure Parameters

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_table</td>
<td>Contains a list of the active instance numbers and names. When no instance is up, the list is empty.</td>
</tr>
<tr>
<td>instance_count</td>
<td>Number of active instances</td>
</tr>
</tbody>
</table>
183.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (    
    method           IN  VARCHAR2,    
    estimate_rows    IN  NUMBER DEFAULT NULL,    
    estimate_percent IN  NUMBER DEFAULT NULL,    
    method_opt       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 183-6  ANALYZE_DATABASE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges for some object in this database

183.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]

**Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use DBMS_STATS to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (    
    schema_name     IN VARCHAR2 DEFAULT NULL,    
    object_name     IN VARCHAR2 DEFAULT NULL,    
    object_type     IN CHAR DEFAULT 'T',    
    command_type    IN CHAR DEFAULT 'E',    
    command_opt     IN VARCHAR2 DEFAULT NULL);
```
command_opt   IN VARCHAR2 DEFAULT NULL,
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');

Parameters

Table 183-7  ANALYZE_PART_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Schema of the object_name</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of object to be analyzed, must be partitioned</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of object, must be T (table) or I (index)</td>
</tr>
<tr>
<td>command_type</td>
<td>Must be V (validate structure)</td>
</tr>
<tr>
<td>command_opt</td>
<td>Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.</td>
</tr>
<tr>
<td>sample_clause</td>
<td>Sample clause to use when command_type is 'E'</td>
</tr>
</tbody>
</table>

Usage Notes

For each partition of the object, run in parallel using job queues.

183.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```sql
DBMS_UTILITY.ANALYZE_SCHEMA (  
schema             IN  VARCHAR2,  
method             IN  VARCHAR2,  
estimate_rows      IN  NUMBER DEFAULT NULL,  
estimate_percent   IN  NUMBER DEFAULT NULL,  
method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-8  ANALYZE_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Insufficient privileges for some object in this schema

183.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that 'table' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
    name       IN    VARCHAR2,
    canon_name OUT   VARCHAR2,
    canon_len  IN    BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be canonicalized</td>
</tr>
<tr>
<td>canon_name</td>
<td>Canonicalized string</td>
</tr>
<tr>
<td>canon_len</td>
<td>Length of the string (in bytes) to canonicalize</td>
</tr>
</tbody>
</table>

Return Values

Returns the first `canon_len` bytes in `canon_name`.

Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- `a` becomes `A`
- `"a"` becomes `a`
- `"a".b becomes "a"."b"`
"a".b,c.f becomes "a"."B" with",c.f" ignored.

183.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list   IN  VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab    OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list   IN  VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab    OUT lname_array);
```

Parameters

**Table 183-10  COMMA_TO_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Comma separated list of list of 'names', where a name should have the following format for the first overloading: [ a \ [ b \ [ c ] ] [ @ d ] ] and the following format for the second overloading: [ a \ [ b ] ]*where a, b, c, d are simple identifiers (quoted or unquoted).</td>
</tr>
<tr>
<td>tablen</td>
<td>Number of tables in the PL/SQL table</td>
</tr>
<tr>
<td>tab</td>
<td>PL/SQL table which contains list of names</td>
</tr>
</tbody>
</table>

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in tab are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

183.6.7 COMPIL\_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
    schema   IN VARCHAR2,
```
Parameters

Table 183-11  COMPILÉ_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>compile_all</td>
<td>If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects</td>
</tr>
<tr>
<td>reuse_settings</td>
<td>Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead</td>
</tr>
</tbody>
</table>

Exceptions

Table 183-12  COMPILÉ_SCHEMA Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this schema</td>
</tr>
<tr>
<td>ORA-20001</td>
<td>Cannot recompile SYS objects</td>
</tr>
<tr>
<td>ORA-20002</td>
<td>Maximum iterations exceeded. Some objects may not have been recompiled.</td>
</tr>
</tbody>
</table>

Usage Notes

- Note that this subprogram is a wrapper for the RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:
  
  SHOW ERRORS <type> <schema>.<name>

183.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement.

Syntax

DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
  schema_name IN VARCHAR2,
  table_name IN VARCHAR2);
Parameters

Table 183-13  CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table created</td>
</tr>
</tbody>
</table>

Exceptions

An error is returned if the table already exists.

183.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
RETURN NUMBER;
```

183.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (dba NUMBER)
RETURN NUMBER;
```

Parameters

Table 183-14  DATA_BLOCK_ADDRESS_BLOCK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
183.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (dba NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

183.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (version OUT VARCHAR2,
                          compatibility OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.</td>
</tr>
<tr>
<td>compatibility</td>
<td>The compatibility setting of the database determined by the &quot;compatible&quot; init.ora parameter. If the parameter is not specified in the init.ora file, then NULL is returned.</td>
</tr>
</tbody>
</table>
183.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

**Syntax**

```sql
DBMS_UTILITY.EXEC_DDL_STATEMENT (  
   parse_string IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parse_string</td>
<td>DDL statement to be executed</td>
</tr>
</tbody>
</table>

183.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

**Syntax**

```sql
DBMS_UTILITY.EXPAND_SQL_TEXT (  
   input_sql_text IN CLOB,  
   output_sql_text OUT NOCOPY CLOB);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input_sql_text</td>
<td>Input SQL query text</td>
</tr>
<tr>
<td>output_sql_text</td>
<td>View-expanded query text</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-00942</td>
<td>Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code></td>
</tr>
<tr>
<td>ORA-24251</td>
<td><code>input_sql_text</code> is not a SELECT statement</td>
</tr>
<tr>
<td>ORA-00900</td>
<td>Input is not valid</td>
</tr>
<tr>
<td>ORA-29477</td>
<td>Input LOB size exceeds maximum size of 4GB -1</td>
</tr>
</tbody>
</table>
Usage Notes

The expanded and merged SQL statement text is copied to output_sql_text on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic WHERE clause. This function would return differently, for example, if the userid caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

183.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

183.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
```
BEGIN
  g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

  CASE g_end_pos > 0
    WHEN true THEN
      DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos, 
        g_end_pos-g_start_pos ) );
      g_start_pos := g_end_pos+1;
      RETURN TRUE;
    WHEN FALSE THEN
      DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos, 
        (Length(i_buff)-g_start_pos)+1 ) );
      RETURN FALSE;
    END CASE;
  END Output_One_Line;

BEGIN
  WHILE Output_One_Line() LOOP NULL;
  END LOOP;
END Log_Errors;
/

CREATE OR REPLACE PROCEDURE P0 IS
  e_01476 EXCEPTION; pragma exception_init ( e_01476, -1476 );
BEGIN
  RAISE e_01476;
END P0;
/

CREATE OR REPLACE PROCEDURE P1 IS
BEGIN
  P0();
END P1;
/
SHOW ERRORS

CREATE OR REPLACE PROCEDURE P2 IS
BEGIN
  P1();
END P2;
/
SHOW ERRORS

CREATE OR REPLACE PROCEDURE P3 IS
BEGIN
  P2();
END P3;
/
SHOW ERRORS

CREATE OR REPLACE PROCEDURE P4 IS
BEGIN
  P3(); END P4;
/
CREATE OR REPLACE PROCEDURE P5 IS
BEGIN P4(); END P5;
SHOW ERRORS

CREATE OR REPLACE PROCEDURE Top_Naive IS
BEGIN
P5();
END Top_Naive;
/
SHOW ERRORS

;
The error stack message is the stack unwound by unhandled exceptions. Fix the problem causing the exception or write an exception handler for this condition. Or you may need to contact your application administrator or database administrator.

183.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```sql
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

183.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```sql
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.
183.6.19 GET_DEPENDENCY Procedure

This deprecated procedure shows the dependencies on the object passed in.

**Note:**

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

**Syntax**

```sql
DBMS_UTILITY.GET_DEPENDENCY
    type IN VARCHAR2,
    schema IN VARCHAR2,
    name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of the object, for example if the object is a table give the type as 'TABLE'</td>
</tr>
<tr>
<td>schema</td>
<td>Schema name of the object</td>
</tr>
<tr>
<td>name</td>
<td>Name of the object</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure uses the DBMS_OUTPUT package to display results, and so you must declare SET SERVEROUTPUT ON if you wish to view dependencies. Alternatively, any application that checks the DBMS_OUTPUT output buffers can invoke this subprogram and then retrieve the output by means of DBMS_OUTPUT subprograms such as GET_LINES.

183.6.20 GET_ENDIANANNESS Function

This function gets the endianness of the database platform.

**Syntax**

```sql
DBMS_UTILITY.GET_ENDIANANNESS
    RETURN NUMBER;
```

**Return Values**

A NUMBER value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.
183.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```sql
DBMS_UTILITY.GET_HASH_VALUE (  
    name      VARCHAR2,  
    base      NUMBER,  
    hash_size NUMBER)  
RETURN NUMBER;
```

Parameters

Table 183-21  GET_HASH_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed.</td>
</tr>
<tr>
<td>base</td>
<td>Base value for the returned hash value at which to start</td>
</tr>
<tr>
<td>hash_size</td>
<td>Desired size of the hash table</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references(get_hash_value, WNDs, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.

183.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v$parameter` directly.

Syntax

```sql
DBMS_UTILITY.GET_PARAMETER_VALUE (  
    parnam     IN        VARCHAR2,  
    intval     IN OUT    BINARY_INTEGER,  
    strval     IN OUT    VARCHAR2,  
    listno     IN        BINARY_INTEGER DEFAULT 1)  
RETURN BINARY_INTEGER;
```
Parameters

Table 183-22  GET_PARAMETER_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parnam</td>
<td>Parameter name</td>
</tr>
<tr>
<td>intval</td>
<td>Value of an integer parameter or the value length of a string parameter</td>
</tr>
<tr>
<td>strval</td>
<td>Value of a string parameter</td>
</tr>
<tr>
<td>listno</td>
<td>List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.</td>
</tr>
</tbody>
</table>

Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute this function, you must have the SELECT privilege on the V$PARAMETER dynamic view.

Examples

```sql
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size', intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```
183.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```sql
Dbms_utility.get_sql_hash (  
   name          IN   VARCHAR2,  
   hash          OUT  RAW,  
   pre10ihash    OUT  NUMBER)  
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);

Parameters

Table 183-23  GET_SQL_HASH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed</td>
</tr>
<tr>
<td>hash</td>
<td>Optional field to store all 16 bytes of returned hash value</td>
</tr>
<tr>
<td>pre10ihash</td>
<td>Optional field to store the pre 10i database version hash value</td>
</tr>
</tbody>
</table>

Return Values

A hash value (last 4 bytes) based on the input string, the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10i hash optional parameter.

183.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```sql
DBMS_UTILITY.GET_TIME  
RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,
application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

183.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by regionid from the timezone.dat file.

Syntax

```sql
DBMS_UTILITY.GET_TZ_TRANSITIONS
    regionid      IN     NUMBER,
    transitions   OUT    MAXRAW);
```

Parameters

**Table 183-24 GET_TZ_TRANSITIONS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regionid</td>
<td>Number corresponding to the region</td>
</tr>
<tr>
<td>transitions</td>
<td>Raw bytes from the timezone.dat file</td>
</tr>
</tbody>
</table>

Exceptions

**Table 183-25 GET_TZ_TRANSITIONS Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR</td>
<td>For an invalid regionid</td>
</tr>
</tbody>
</table>

183.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```sql
DBMS_UTILITY.INVALIDATE (  
    p_object_id              NUMBER,  
    p_plsql_object_settings  VARCHAR2 DEFAULT NULL,  
    p_option_flags           PLS_INTEGER DEFAULT 0);  
```
Parameters

Table 183-26  INVALIDATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_object_id</td>
<td>ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.</td>
</tr>
<tr>
<td>p_plsql_object_settings</td>
<td>Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.</td>
</tr>
<tr>
<td>p_option_flags</td>
<td>Optional parameter defaults to zero (no flags). Option flags supported by invalidate.</td>
</tr>
<tr>
<td></td>
<td>• inv_error_on_restrictions (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.</td>
</tr>
</tbody>
</table>

Exceptions

Table 183-27  INVALIDATE Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened</td>
</tr>
</tbody>
</table>
Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change its PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

DBMS_UTILITY.INVALIDATE (40796);

Assume that the object_id 40796 refers to the view oc_orders in the OE schema. Then the above call will mark the oc_orders view invalid.

Objects that depend on oe.oc_orders will also get marked invalid.
183.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```sql
DBMS_UTILITY.IS_BIT_SET (
    r     IN    RAW,   n     IN    NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW source</td>
</tr>
<tr>
<td>n</td>
<td>Bit in r to check</td>
</tr>
</tbody>
</table>

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

183.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```sql
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

183.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```sql
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
    file   NUMBER,
    block NUMBER)
RETURN NUMBER;
```
Parameters

Table 183-29  MAKE_DATA_BLOCK_ADDRESS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File that contains the block</td>
</tr>
<tr>
<td>block</td>
<td>Offset of the block within the file in terms of block increments</td>
</tr>
</tbody>
</table>

Pragmas

`pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);`

Return Values

Data block address.

183.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```sql
DBMS_UTILITY.NAME_RESOLVE (  
    name          IN  VARCHAR2,  
    context       IN  NUMBER,  
    schema        OUT VARCHAR2,  
    part1         OUT VARCHAR2,  
    part2         OUT VARCHAR2,  
    dblink        OUT VARCHAR2,  
    part1_type    OUT NUMBER,  
    object_number OUT NUMBER);
```

Parameters

Table 183-30  NAME_RESOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| name      | Name of the object.  
            This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier  
            and d is a dblink. No syntax checking is performed on the dblink. If a  
            dblink is specified, or if the name resolves to something with a dblink,  
            then object is not resolved, but the `schema`, `part1`, `part2` and `dblink`  
            `OUT` parameters are filled in.  
            a, b and c may be delimited identifiers, and may contain Globalization  
            Support (NLS) characters (single and multibyte). |
### Table 183-30  (Cont.) NAME_RESOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| context   | Must be an integer between 0 and 9.  
|           | • 0 - table  
|           | • 1 - PL/SQL (for 2 part names)  
|           | • 2 - sequences  
|           | • 3 - trigger  
|           | • 4 - Java Source  
|           | • 5 - Java resource  
|           | • 6 - Java class  
|           | • 7 - type  
|           | • 8 - Java shared data  
|           | • 9 - index  
| schema    | Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.  
| part1     | First part of the name. The type of this name is specified part1_type (synonym or package).  
| part2     | If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.  
| dblink    | If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.  
| part1_type| Type of part1 is:  
|           | • 5 - synonym  
|           | • 7 - procedure (top level)  
|           | • 8 - function (top level)  
|           | • 9 - package  
| object_number | Object identifier  

#### Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

### 183.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as `a [. b [. c ]]@ dblink`.

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

#### Syntax

```sql
DBMS_UTILITY.NAME_TOKENIZE (  
    name    IN  VARCHAR2,  
    a       OUT VARCHAR2,  
    b       OUT VARCHAR2,  
    c       OUT VARCHAR2,  
)```

Parameters

Table 183-31 NAME_RESOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Input name, consisting of SQL identifiers (for example, scott.foo@dblink)</td>
</tr>
<tr>
<td>a</td>
<td>Output for the first token of the name</td>
</tr>
<tr>
<td>b</td>
<td>Output for the second token of the name (if applicable)</td>
</tr>
<tr>
<td>c</td>
<td>Output for the third token of the name (if applicable)</td>
</tr>
<tr>
<td>dblink</td>
<td>Output for the dblink of the name</td>
</tr>
<tr>
<td>nextpos</td>
<td>Next position after parsing the input name</td>
</tr>
</tbody>
</table>

183.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context('userenv','current_schema')`.

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;
```

183.6.33 OLD_CURRENT_USER Function

This function returns the session value from `sys_context('userenv','current_user')`.

Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;
```

183.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WND5, RNDS, WNPS, RNPS);
```
183.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```sql
DBMS_UTILITY.SQLID_TO_SQLHASH (sql_id IN VARCHAR2) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL ID of a SQL statement. Must be VARCHAR2(13).</td>
</tr>
</tbody>
</table>

183.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```sql
DBMS_UTILITY.TABLE_TO_COMMA (tab IN UNCL_ARRAY, tablen OUT BINARY_INTEGER, list OUT VARCHAR2);
```

```sql
DBMS_UTILITY.TABLE_TO_COMMA (tab IN lname_array, tablen OUT BINARY_INTEGER, list OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>PL/SQL table which contains list of table names</td>
</tr>
<tr>
<td>tablen</td>
<td>Number of tables in the PL/SQL table</td>
</tr>
<tr>
<td>list</td>
<td>Comma separated list of tables</td>
</tr>
</tbody>
</table>

Return Values

A comma-delimited list and the number of elements found in the table.
183.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```sql
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,   edition_name := SYS_CONTEXT ('USERENV',
    'CURRENT_EDITION'));
```

Parameters

Table 183-34  VALIDATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• 1 — TABLE/PROCEDURE/TYPE</td>
</tr>
<tr>
<td></td>
<td>• 2 — BODY</td>
</tr>
<tr>
<td></td>
<td>• 3 — TRIGGER</td>
</tr>
<tr>
<td></td>
<td>• 4 — INDEX</td>
</tr>
<tr>
<td></td>
<td>• 5 — CLUSTER</td>
</tr>
<tr>
<td></td>
<td>• 8 — LOB</td>
</tr>
<tr>
<td></td>
<td>• 9 — DIRECTORY</td>
</tr>
<tr>
<td></td>
<td>• 10 — QUEUE</td>
</tr>
<tr>
<td></td>
<td>• 11 — REPLICATION OBJECT GROUP</td>
</tr>
<tr>
<td></td>
<td>• 12 — REPLICATION PROPAGATOR</td>
</tr>
<tr>
<td></td>
<td>• 13 — JAVA SOURCE</td>
</tr>
<tr>
<td></td>
<td>• 14 — JAVA RESOURCE</td>
</tr>
<tr>
<td></td>
<td>• 58 — (Data Mining) MODEL</td>
</tr>
<tr>
<td>edition_name</td>
<td>[Note: Currently not operable. Reserved for future use]</td>
</tr>
</tbody>
</table>

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified
by its object_id. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.

183.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

Syntax

```sql
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables     IN       VARCHAR2,
    timeout    IN       BINARY_INTEGER,
    scn        IN OUT   NUMBER)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tables</td>
<td>Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.</td>
</tr>
<tr>
<td>scn</td>
<td>SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.</td>
</tr>
</tbody>
</table>

Return Values

**TRUE** if all relevant transactions have committed or been rolled back, **FALSE** if the timeout occurred prior to all relevant transactions committing or being rolled back.
The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_WARNING Subprograms

184.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.

184.2 Summary of DBMS_WARNING Subprograms

This table lists the DBMS_WARNING subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_WARNING_SETTING_CAT Procedure</td>
<td>Modifies the current session or system warning settings of the warning_category previously supplied</td>
</tr>
<tr>
<td>ADD_WARNING_SETTING_NUM Procedure</td>
<td>Modifies the current session or system warning settings of the warning_number previously supplied</td>
</tr>
<tr>
<td>GET_CATEGORY Function</td>
<td>Returns the category name, given the message number</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_CAT Function</td>
<td>Returns the specific warning category in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_NUM Function</td>
<td>Returns the specific warning number in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_STRING Function</td>
<td>Returns the entire warning string for the current session</td>
</tr>
<tr>
<td>SET_WARNING_SETTING_STRING Procedure</td>
<td>Replaces previous settings with the new value</td>
</tr>
</tbody>
</table>

184.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if
the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

**Syntax**

```sql
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category    IN    VARCHAR2,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

**Parameters**

A table is provided with details on the parameters of the procedure:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>warning_category</code></td>
<td>Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.</td>
</tr>
<tr>
<td><code>warning_value</code></td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td><code>scope</code></td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>

### 184.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current session or system warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (ENABLE / DISABLE / ERROR) on the category specified to the end of the current session or system setting.

**Syntax**

```sql
DBMS_WARNING.ADD_WARNING_SETTING_NUM ( 
    warning_number      IN    NUMBER,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

**Parameters**

A table is provided with details on the parameters of the procedure:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>warning_number</code></td>
<td>The warning number. Allowed values are all valid warning numbers.</td>
</tr>
<tr>
<td><code>warning_value</code></td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td><code>scope</code></td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
Example 184-1  Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

BEGIN
    DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                           'ENABLE',
                                           'SESSION');

    DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                           'ENABLE',
                                           'SESSION');

    DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                           'ENABLE',
                                           'SESSION');

    DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                           'ENABLE',
                                           'SESSION');

END;

184.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

DBMS_WARNING.GET_CATEGORY (    
       warning_number  IN   pls_integer)  
RETURN VARCHAR2;

Parameters

Table 184-4  GET_CATEGORY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning message number.</td>
</tr>
</tbody>
</table>

184.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

DBMS_WARNING.GET_WARNING_SETTING_CAT (    
       warning_category IN  VARCHAR2)  
RETURN warning_value;
Parameters

Table 184-5  GET_WARNING_SETTING_CAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_category</td>
<td>Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).</td>
</tr>
</tbody>
</table>

184.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number  IN    NUMBER)  
RETURN warning_value;
```

Parameters

Table 184-6  GET_WARNING_SETTING_NUM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>Warning number. Allowed values are all valid warning numbers.</td>
</tr>
</tbody>
</table>

184.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have SELECT or READ privilege on v$parameter or v$parameter2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.

184.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of ‘=’ when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION or ALTER SYSTEM command.
Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
    warning_value  IN   VARCHAR2,
    scope          IN   VARCHAR2);
```

Parameters

**Table 184-7**  SET_WARNING_SETTING_STRING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_value</td>
<td>The new string that will constitute the new value.</td>
</tr>
<tr>
<td>scope</td>
<td>This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the `DBMS_WORKLOAD_REPLAY` package.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Summary of DBMS_WORKLOAD_CAPTURE Subprograms**

*See Also:*

*Oracle Database Testing Guide* for more information about database replay

### 186.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

### 186.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```sql
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
```
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

### 186.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the DBMS_WORKLOAD_CAPTURE package subprograms in alphabetical order.

**Table 186-1   DBMS_WORKLOAD_CAPTURE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_FILTER Procedures</td>
<td>Adds a specified filter</td>
</tr>
<tr>
<td>DECRYPT_CAPTURE Procedure</td>
<td>This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.</td>
</tr>
<tr>
<td>DELETE_CAPTURE_INF O Procedure</td>
<td>Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID</td>
</tr>
<tr>
<td>DELETE_FILTER Procedure</td>
<td>Deletes a specified filter</td>
</tr>
<tr>
<td>ENCRYPT_CAPTURE Procedure</td>
<td>This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.</td>
</tr>
<tr>
<td>EXPORT_AWR Procedure</td>
<td>Exports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>FINISH_CAPTURE Procedure</td>
<td>Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured</td>
</tr>
<tr>
<td>GET_CAPTURE_INFO Function</td>
<td>Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID</td>
</tr>
<tr>
<td>IMPORT_AWR Function</td>
<td>Imports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>REPORT Function</td>
<td>Returns a report on the workload capture under consideration using one or more different sources</td>
</tr>
<tr>
<td>START_CAPTURE Procedure</td>
<td>Initiates workload capture on all instances</td>
</tr>
</tbody>
</table>
186.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (  
    fname           IN   VARCHAR2 NOT NULL,  
    fattribute      IN   VARCHAR2 NOT NULL,  
    fvalue          IN   VARCHAR2 NOT NULL);
```

```sql
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (  
    fname           IN   VARCHAR2 NOT NULL,  
    fattribute      IN   VARCHAR2 NOT NULL,  
    fvalue          IN   NUMBER NOT NULL);
```

Parameters

Table 186-2  ADD_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)</td>
</tr>
<tr>
<td>fattribute</td>
<td>Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• INSTANCE_NUMBER - type NUMBER</td>
</tr>
<tr>
<td></td>
<td>• USER - type STRING</td>
</tr>
<tr>
<td></td>
<td>• MODULE - type STRING</td>
</tr>
<tr>
<td></td>
<td>• ACTION - type STRING</td>
</tr>
<tr>
<td></td>
<td>• PROGRAM - type STRING</td>
</tr>
<tr>
<td></td>
<td>• SERVICE - type STRING</td>
</tr>
<tr>
<td></td>
<td>• PDB_NAME - type STRING</td>
</tr>
<tr>
<td>fvalue</td>
<td>Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable</td>
</tr>
<tr>
<td></td>
<td>for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as &quot;attribute = value&quot;, with the filter for a STRING attribute parsed as &quot;attribute like value&quot; (Mandatory).</td>
</tr>
</tbody>
</table>

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.
• You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

• By default, a capture works in an INCLUSION mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from SCOTT, you can add the following filter before starting a capture.

  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');

• Multiple filters are evaluated according to the logical disjunction operator OR. Therefore, if you want to record workload for both SCOTT and JOHN, you add an additional filter:

  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');

• In a CDB, you exclude the workload of a particular PDB by the filter:

  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME', 'CDB1_PDB1');

• To use DBMS_APPLICATION_INFO to identify workload that is issued to the database:

  DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
  -- run some SQL here
  DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
  -- run logging SQL

• If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

  DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_ENTRY_LOG');

• To filter out the full order entry transaction, define a filter:

  DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');

186.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (  
  src_dir               IN   VARCHAR2,  
  dst_dir               IN   VARCHAR2);

Parameters

Table 186-3  DECRYPT_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_dir</td>
<td>A directory object pointing to the workload capture to be decrypted.</td>
</tr>
<tr>
<td></td>
<td>This parameter is case sensitive.</td>
</tr>
</tbody>
</table>
### 186.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

**Syntax**

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
    capture_id IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture that needs to be deleted. Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code>. (Mandatory)</td>
</tr>
</tbody>
</table>

**Usage Notes**

Passing the ID of a capture that is in progress will first automatically stop that capture.

### 186.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

**Syntax**

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
    filter_name IN VARCHAR2(40) NOT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_name</td>
<td>Filter to be deleted</td>
</tr>
</tbody>
</table>
Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the `ADD_FILTER Procedures` after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

186.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in `START_CAPTURE` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
src_dir     IN VARCHAR2,
dst_dir     IN VARCHAR2,
enryption  IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

**Table 186-6  ENCRYPT_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_dir</td>
<td>A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.</td>
</tr>
<tr>
<td>dst_dir</td>
<td>A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive.</td>
</tr>
<tr>
<td>encryption</td>
<td>Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256.</td>
</tr>
</tbody>
</table>

Usage Notes

For encrypted capture, the `ENCRYPT_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

186.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (capture_id IN NUMBER);
```
Parameters

Table 186-7  EXPORT_AWR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots are to be exported. (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

186.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
    timeout    IN   NUMBER  DEFAULT 30
    reason     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 186-8  FINISH_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds</td>
</tr>
<tr>
<td>reason</td>
<td>Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.</td>
</tr>
</tbody>
</table>

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send it's acknowledgement to FINISH_CAPTURE.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s)
before running FINISH_CAPTURE or send new database requests to those sessions
during FINISH_CAPTURE.

186.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the
stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and
DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
    dir   IN   VARCHAR2)
RETURN NUMBER;

Parameters

Table 186-9  GET_CAPTURE_INFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in
DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function simply returns that row's
DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the
stipulated directory a new row is inserted to DBA_WORKLOAD_CAPTURES and that row's ID is returned.

186.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID
provided those AWR snapshots were exported earlier from the original capture system
using the EXPORT_AWR procedure.

Syntax

DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (  
capture_id       IN   NUMBER,  
staging_schema   IN   VARCHAR2,  
force_cleanup    IN   BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;

Parameters

Table 186-10  IMPORT_AWR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots should be imported. (Mandatory)</td>
</tr>
</tbody>
</table>
Table 186-10  (Cont.) IMPORT_AWR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>staging_schema</td>
<td>Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).</td>
</tr>
<tr>
<td>force_cleanup</td>
<td>Values:</td>
</tr>
<tr>
<td></td>
<td>• TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:</td>
</tr>
<tr>
<td></td>
<td>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_$%';</td>
</tr>
<tr>
<td></td>
<td>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</td>
</tr>
<tr>
<td></td>
<td>• FALSE - (default) no tables dropped from the staging_schema prior to the import operation</td>
</tr>
</tbody>
</table>

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRMS$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

• EXPORT_AWR Procedure
  This procedure exports the AWR snapshots associated with a given capture ID.

186.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

DBMS_WORKLOAD_CAPTURE.REPORT (  
capture_id IN NUMBER,  
format IN VARCHAR2)  
RETURN CLOB;
Parameters

Table 186-11  REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture whose capture report is required. (Mandatory)</td>
</tr>
<tr>
<td></td>
<td>This relates to the directory that contains the workload capture on which</td>
</tr>
<tr>
<td></td>
<td>the Report needs to be generated. Should be a valid DIRECTORY object that</td>
</tr>
<tr>
<td></td>
<td>points to a valid directory in the host system that contains a workload</td>
</tr>
<tr>
<td></td>
<td>capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_</td>
</tr>
<tr>
<td></td>
<td>TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML. (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a CLOB.

Table 186-12  Constants Used by Report Function

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_HTML</td>
<td>VARCHAR2(4)</td>
<td>'HTML'</td>
<td>Generates the HTML version of the report</td>
</tr>
<tr>
<td>TYPE_TEXT</td>
<td>VARCHAR2(4)</td>
<td>'TEXT'</td>
<td>Used as input to the format argument to generate the text</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>version of the report</td>
</tr>
</tbody>
</table>

186.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.START_CAPTURE ( |
  name              IN  VARCHAR2, |
  dir               IN  VARCHAR2, |
  duration          IN  NUMBER   DEFAULT NULL, |
  default_action    IN  VARCHAR2 DEFAULT 'INCLUDE', |
  auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE, |
  capture_sts       IN  BOOLEAN  DEFAULT FALSE, |
  sts_cap_interval  IN  NUMBER   DEFAULT 300, |
  plsql_mode        IN  VARCHAR2 DEFAULT 'TOP_LEVEL', |
  encryption        IN  VARCHAR2 DEFAULT NULL); |
```
### Parameters

#### Table 186-13  START_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the workload capture. Allows the workload capture to be given a label, such as &quot;Thanksgiving weekend&quot; or &quot;Christmas peak workload&quot; for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)</td>
</tr>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)</td>
</tr>
<tr>
<td>duration</td>
<td>Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters.</td>
</tr>
<tr>
<td></td>
<td>• If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</td>
</tr>
<tr>
<td></td>
<td>• If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.</td>
</tr>
<tr>
<td>auto_unrestrict</td>
<td>Can be either TRUE or FALSE.</td>
</tr>
<tr>
<td></td>
<td>• If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</td>
</tr>
<tr>
<td></td>
<td>• If FALSE, no database instance is automatically unrestricted.</td>
</tr>
<tr>
<td>capture_sts</td>
<td>If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET').</td>
</tr>
<tr>
<td></td>
<td>If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.</td>
</tr>
<tr>
<td>sts_cap_interval</td>

<td>The default value is NULL.</td>
</tr>
</tbody>
</table>

### Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the `FINISH_CAPTURE` Procedure is executed.

- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.

- One can use workload filters (as described with regard to the `ADD_FILTER Procedures`) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.

- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the `DBMS_SCHEDULER` package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.

- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.

- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.

- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

- You must configure a software keystore in auto-login mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.
The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture.

This chapter contains the following topics:

• Overview
• Security Model
• Summary of DBMS_WORKLOAD_REPLAY Subprograms

See Also:
Oracle Database Testing Guide for more information about database replay

187.1 DBMS_WORKLOAD_REPLAY Overview

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package.

Typically, the DBMS_WORKLOAD_CAPTURE package is used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics
• DBMS_WORKLOAD_CAPTURE
  The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data.

187.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using DBMS_WORKLOAD_REPLAY.

The following code sample shows the minimum set of privileges required to:

• Create directory objects
• Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
• Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named wrc located in the $ORACLE_HOME/bin directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

187.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the DBMS_WORKLOAD_REPLAY package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_CAPTURE Function</td>
<td>Adds the given capture to the current schedule</td>
</tr>
<tr>
<td>ADD_FILTER Procedure</td>
<td>Adds a filter to replay only a subset of the captured workload</td>
</tr>
<tr>
<td>ADD_SCHEDULE_ORDERING Function</td>
<td>Adds a schedule order between two captures</td>
</tr>
<tr>
<td>ASSIGN_GROUP_TO_INSTANCE Procedure</td>
<td>Modifies the view DBA_WORKLOAD_GROUP_ASSIGNMENTS</td>
</tr>
<tr>
<td>BEGIN_REPLAY_SCHEDULE Procedure</td>
<td>Initiates the creation of a reusable replay schedule</td>
</tr>
<tr>
<td>CALIBRATE Function</td>

<tr>
<td>COMPARARE_SQLSET_REPORT Function</td>
<td>Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture</td>
</tr>
<tr>
<td>CREATE_FILTER_SET Procedure</td>
<td>Uses the replay filters added to create a set of filters to use against the replay in replay_dir</td>
</tr>
<tr>
<td>DELETE_FILTER Procedure</td>
<td>Deletes the named filter</td>
</tr>
<tr>
<td>DELETE_REPLAY_INFO Procedure</td>
<td>Deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID</td>
</tr>
<tr>
<td>END_REPLAY_SCHEDULE Procedure</td>
<td>Wraps up the creation of the current schedule</td>
</tr>
</tbody>
</table>
### Table 187-1  DBMS_WORKLOAD_REPLAY Package Subprograms (Cont.)

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT_AWR Procedure</td>
<td>Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>GENERATE_CAPTURE_SUBSET Procedure</td>
<td>Creates a new capture from an existing workload capture</td>
</tr>
<tr>
<td>GET_DIVERGING_STATEMENT Function</td>
<td>Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>GET_REPLAY_DIRECTORY Function</td>
<td>Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure.</td>
</tr>
<tr>
<td>GET_REPLAY_INFO Function</td>
<td>Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory</td>
</tr>
<tr>
<td>GET_REPLAY_TIMEOUT Procedure</td>
<td>Retrieves the replay timeout setting</td>
</tr>
<tr>
<td>IMPORT_AWR Function</td>
<td>Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>INITIALIZE_CONsolidated_REplay Procedure</td>
<td>Puts the database state in INIT for a multiple-capture replay</td>
</tr>
<tr>
<td>INITIALIZE_REPLAY Procedure</td>
<td>Initializes replay, and loads specific data produced during processing into the database</td>
</tr>
<tr>
<td>IS_REPLAY_PAUSED Function</td>
<td>Reports whether the replay is currently paused</td>
</tr>
<tr>
<td>LOAD_LONG_SQLTEXT Procedure</td>
<td>Loads the captured SQL statements that are longer than 1000 characters to the DBA_WORKLOAD_LONG_SQLTEXT view</td>
</tr>
<tr>
<td>PAUSE_REPLAY Procedure</td>
<td>Pauses the in-progress workload replay</td>
</tr>
<tr>
<td>POPULATE_DIVERGENCE Procedure</td>
<td>Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls</td>
</tr>
<tr>
<td>PREPARE_CONsolidated_REplay Procedure</td>
<td>Puts the database in a special “Prepare” mode for a multiple-capture replay</td>
</tr>
<tr>
<td>PREPARE_REPLAY Procedure</td>
<td>Puts the database in a special “Prepare” mode</td>
</tr>
<tr>
<td>PROCESS_CAPTURE Procedure</td>
<td>Processes the workload capture found in capture_dir in place</td>
</tr>
<tr>
<td>REMAP_CONNECTION Procedure</td>
<td>Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay</td>
</tr>
<tr>
<td>REMOVE_CAPTURE Procedure</td>
<td>Removes the given capture from the current schedule</td>
</tr>
<tr>
<td>REMOVE_SCHEDULE_ORDERING Procedure</td>
<td>Removes an existing schedule order from the current replay schedule</td>
</tr>
<tr>
<td>REPORT Function</td>
<td>Generates a report on the given workload replay</td>
</tr>
<tr>
<td>RESUME_REPLAY Procedure</td>
<td>Resumes a paused workload replay</td>
</tr>
<tr>
<td>REUSE_REPLAY_FILTER_SET Procedure</td>
<td>Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function</td>
</tr>
<tr>
<td>SET_ADVANCED_PARAMETER Procedure</td>
<td>Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure</td>
</tr>
</tbody>
</table>
Table 187-1  (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td>SET_REPLAYDIRECTORY Procedure</td>
<td>Sets a directory that contains multiple workload captures as the current replay directory</td>
</tr>
<tr>
<td>SET_REPLAY_TIMEOUT Procedure</td>
<td>Sets the replay timeout setting</td>
</tr>
<tr>
<td>SET_SQL_MAPPING Procedure</td>
<td>Specifies SQL statements to be skipped or replaced during a database replay operation</td>
</tr>
<tr>
<td>SET_USER_MAPPING Procedure</td>
<td>Sets a new schema or user name to be used during replay instead of the captured user</td>
</tr>
<tr>
<td>START_CONsolidated_REPLAy Procedure</td>
<td>Starts the replay of a multiple-capture capture</td>
</tr>
<tr>
<td>START_REPLAY Procedure</td>
<td>Starts the workload replay</td>
</tr>
<tr>
<td>USE_FILTER_SET Procedure</td>
<td>Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay</td>
</tr>
</tbody>
</table>

187.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database’s version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (  
capture_dir_name      IN    VARCHAR2,  
start_delay_seconds   IN    NUMBER  DEFAULT 0,  
stop_replay           IN    BOOLEAN FALSE,  
take_begin_snapshot   IN    BOOLEAN TRUE,  
take_end_snapshot     IN    BOOLEAN TRUE,  
query_only            IN    BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

```sql
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (  
capture_dir_name      IN    VARCHAR2,  
start_delay_seconds   IN    NUMBER  DEFAULT 0,  
stop_replay           IN    BOOLEAN FALSE,  
take_begin_snapshot   IN    BOOLEAN TRUE,  
take_end_snapshot     IN    BOOLEAN TRUE,  
query_only            IN    VARCHAR2 DEFAULT 'N')  
RETURN NUMBER;
```

Parameters

Table 187-2  ADD_CAPTURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir_name</td>
<td>Name of the OS directory containing the capture under the replay top-level directory</td>
</tr>
<tr>
<td>start_delay_seconds</td>
<td>Delay time in seconds before the replay of this capture starts</td>
</tr>
</tbody>
</table>
Table 187-2  (Cont.) ADD_CAPTURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop_replay</td>
<td>Stop the replay after it finishes</td>
</tr>
<tr>
<td>take_begin_snapshot</td>
<td>Take an AWR snapshot when the replay of this capture starts</td>
</tr>
<tr>
<td>take_end_snapshot</td>
<td>Take an AWR snapshot when the replay of this capture finishes</td>
</tr>
<tr>
<td>query_only</td>
<td>Replay only the read-only queries of this workload capture</td>
</tr>
</tbody>
</table>

Usage Notes
The SET_REPLAY_DIRECTORY Procedure must have already been called.

187.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.ADD_FILTER (  
    fname          IN VARCHAR2,  
    fattribute     IN VARCHAR2,  
    fvalue         IN VARCHAR2);  

DBMS_WORKLOAD_REPLAY.ADD_FILTER (  
    fname          IN VARCHAR2,  
    fattribute     IN VARCHAR2,  
    fvalue         IN NUMBER);  
```

Parameters

Table 187-3  ADD_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.</td>
</tr>
<tr>
<td>fattribute</td>
<td>(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING:</td>
</tr>
<tr>
<td></td>
<td>• USER</td>
</tr>
<tr>
<td></td>
<td>• MODULE</td>
</tr>
<tr>
<td></td>
<td>• ACTION</td>
</tr>
<tr>
<td></td>
<td>• PROGRAM</td>
</tr>
<tr>
<td></td>
<td>• SERVICE</td>
</tr>
<tr>
<td></td>
<td>• CONNECTION_STRING</td>
</tr>
</tbody>
</table>

Chapter 187  Summary of DBMS_WORKLOAD_REPLAY Subprograms
### ADD_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fvalue</td>
<td>(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture.</td>
</tr>
</tbody>
</table>

### ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, schedule_capture_id and waitfor_capture_id form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function. The order is that replay of capture indicated by schedule_capture_id will not start unless the replay of capture indicated by waiting_for_capture_id finishes.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (    
    schedule_capture_id IN VARCHAR2,    
    waitfor_capture_id IN VARCHAR2) 
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by waitfor_capture_id runs to completion.</td>
</tr>
<tr>
<td>waitfor_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by schedule_capture_id will not start until the replay of this capture runs to completion.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a non-zero error code if the constraint cannot be added

**Usage Notes**

The two captures must have already been added to the replay schedule.
187.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
    group_id          IN INTEGER,
    instance_number   IN INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The identifier of the specified group of capture files</td>
</tr>
<tr>
<td>instance_number</td>
<td>The number used for instance registration. It is equivalent to the INSTANCE_NUMBER column in V$INSTANCE.</td>
</tr>
</tbody>
</table>

See Also:

- `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in Oracle Database Reference
- `V$INSTANCE` in Oracle Database Reference

187.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE  (
    replay_dir_obj     IN     VARCHAR2,
    schedule_name      IN     VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir_obj</td>
<td>Directory object that points to the replay directory that contains all the capture directories involved in the schedule</td>
</tr>
<tr>
<td>schedule_name</td>
<td>Name of the schedule to be replayed</td>
</tr>
</tbody>
</table>

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
187.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CALIBRATE (  
capture_dir          IN VARCHAR2,  
process_per_cpu      IN BINARY_INTEGER DEFAULT 4,  
threads_per_process  IN BINARY_INTEGER DEFAULT 50)  
RETURN CLOB;
```

Parameters

**Table 187-7 CALIBRATE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data</td>
</tr>
<tr>
<td>process_per_cpu</td>
<td>Maximum number of processes allowed for each CPU (default is 4)</td>
</tr>
<tr>
<td>threads_per_process</td>
<td>Maximum number of threads allowed for each process (default is 50)</td>
</tr>
</tbody>
</table>

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the `PROCESS_CAPTURE Procedure` in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```bash
$ wrc mode=calibrate replaydir=
```
187.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY
  (error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_msg</td>
<td>An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.</td>
</tr>
</tbody>
</table>

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

187.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```sql
DBMS_WORKLOAD_REPLAYCOMPARE_PERIOD_REPORT
  (replay_id1   IN   NUMBER,
   replay_id2   IN   NUMBER,
   format       IN   VARCHAR2,
   result       OUT  CLOB );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay whose report is requested</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>
187.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (  
  replay_id1    IN NUMBER,  
  replay_id2    IN NUMBER,  
  format        IN VARCHAR2,  
  r_level       IN VARCHAR2 DEFAULT 'ALL',  
  r_sections    IN VARCHAR2 DEFAULT 'ALL',  
  result        OUT CLOB  
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay after a change</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.</td>
</tr>
<tr>
<td>r_level</td>
<td>See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>r_sections</td>
<td>See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>

187.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at replay_dir.

It includes all the replay filters that have already been added by the ADD_FILTER Procedure. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in replay_dir by calling the USE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(  
  replay_dir       IN  VARCHAR2,  
  filter_set       IN  VARCHAR2,  
  default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```
Parameters

Table 187-11  CREATE_FILTER_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Object directory of the replay to be filtered</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to create (to use in USE_FILTER_SET Procedure)</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as INCLUSION filters or EXCLUSION filters.</td>
</tr>
<tr>
<td></td>
<td>If it is INCLUDE, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as EXCLUSION filters, and will determine the workload that will not be replayed.</td>
</tr>
<tr>
<td></td>
<td>If it is EXCLUDE, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as INCLUSION filters, and will determine the workload that is replayed.</td>
</tr>
<tr>
<td></td>
<td>Default: INCLUDE and all the filters specified are assumed to be EXCLUSION filters</td>
</tr>
</tbody>
</table>

Usage Notes
This operation must be invoked when no replay is initialized, prepared, or in progress.

187.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
    fname    IN  VARCHAR2);
```

Parameters

Table 187-12  DELETE_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>(Mandatory) Name of the filter that must be deleted</td>
</tr>
</tbody>
</table>
187.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
    replay_id    IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the workload replay that must be deleted.</td>
</tr>
<tr>
<td></td>
<td>Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code>.</td>
</tr>
</tbody>
</table>

187.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The `BEGIN_REPLAY_SCHEDULE Procedure` must have already been called.

187.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the replay whose AWR snapshots are to be exported</td>
</tr>
</tbody>
</table>

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
• This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

187.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (input_capture_dir          IN   VARCHAR2,
output_capture_dir         IN   VARCHAR2,
new_capture_name           IN   VARCHAR2,
begin_time                 IN   NUMBER,
begin_include_incomplete   IN   BOOLEAN DEFAULT TRUE,
end_time                   IN   NUMBER,
end_include_incomplete     IN   BOOLEAN DEFAULT FALSE,
parallel_level             IN   NUMBER DEFAULT NULL);

Parameters

Table 187-15  GENERATE_CAPTURE_SUBSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input_capture_dir</td>
<td>(Mandatory) Name of the directory object that points to an existing workload capture</td>
</tr>
<tr>
<td>output_capture_dir</td>
<td>(Mandatory) Name of the directory object that points to the new capture</td>
</tr>
<tr>
<td>new_capture_name</td>
<td>(Mandatory) Name of new capture</td>
</tr>
<tr>
<td>begin_time</td>
<td>Start of the time range - time offset in seconds from the start of a workload capture</td>
</tr>
<tr>
<td>begin_include_incomplete</td>
<td>Column to include incomplete calls caused by begin_time</td>
</tr>
<tr>
<td>end_time</td>
<td>End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.</td>
</tr>
<tr>
<td>end_include_incomplete</td>
<td>Column to include incomplete calls caused by end_time</td>
</tr>
<tr>
<td>parallel_level</td>
<td>Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.</td>
</tr>
</tbody>
</table>
187.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT ( 
  replay_id    IN NUMBER, 
  stream_id    IN NUMBER, 
  call_counter IN NUMBER) 
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay in which that call diverged</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call</td>
</tr>
</tbody>
</table>

Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

187.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY 
RETURN VARCHAR2;
```

Related Topics

- **SET_REPLAY_DIRECTORY Procedure**
  This procedure sets a directory that contains multiple workload captures as the current replay directory.
187.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 187-17  GET_REPLAY_INFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>(Mandatory) Name of the workload replay directory object (case sensitive).</td>
</tr>
<tr>
<td>load_details</td>
<td>Load the divergence and tracked commits data. The default value is FALSE.</td>
</tr>
</tbody>
</table>

Return Values

The procedure returns the `CAPTURE_ID`, which can be associated with both `DBA_WORKLOAD_CAPTURES.ID` and `DBA_WORKLOAD_REPLAYS.CAPTURE_ID` to access the imported information.

Usage Notes

- The procedure first imports a row into `DBA_WORKLOAD_CAPTURES` which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into `DBA_WORKLOAD_REPLAYS`.
- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.

187.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
    enabled       OUT  BOOLEAN,
    min_delay     OUT  NUMBER,
    max_delay     OUT  NUMBER,
    delay_factor  OUT  NUMBER);
```
Parameters

Table 187-18 GET_REPLAY_TIMEOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE if the timeout action is enabled, FALSE otherwise.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor.</td>
</tr>
</tbody>
</table>

Usage Notes
This procedure can be called anytime during replay.

187.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id     IN   NUMBER,
    staging_schema IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 187-19 IMPORT_AWR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the replay whose AWR snapshots must be imported</td>
</tr>
<tr>
<td>staging_schema</td>
<td>(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.</td>
</tr>
</tbody>
</table>

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.
Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the `EXPORT_AWR` Procedure.
- `IMPORT_AWR` will fail if the `staging_schema` provided as input contains any tables with the same name as any of the AWR tables, such as `WRM$_SNAPSHOT` or `WRH$_PARAMETER`. Drop any such tables in the `staging_schema` before invoking `IMPORT_AWR`.

### 187.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in `INIT` for a multiple-capture replay.

It uses the `replay_dir` which has already been defined by the `SET_REPLAY_DIRECTORY` Procedure, pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule `schedule_name` from the directory, and loads required connection data into the replay system.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (  
  replay_name        IN    VARCHAR2,  
  schedule_name      IN    VARCHAR2,  
  plsql_mode         IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

**Parameters**

**Table 187-20  INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_name</td>
<td>(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>Name of the schedule to be replayed. It must have been created through the <code>BEGIN_REPLAY_SCHEDULE</code> Procedure for the replay directory <code>replay_dir</code>.</td>
</tr>
<tr>
<td>plsql_mode</td>
<td>Specifies the replay options for PL/SQL calls:</td>
</tr>
<tr>
<td></td>
<td>• <strong>TOP_LEVEL</strong> — only top-level PL/SQL calls are replayed</td>
</tr>
<tr>
<td></td>
<td>• <strong>EXTENDED</strong> — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.</td>
</tr>
</tbody>
</table>

**Usage Notes**

**Prerequisites:**

- Workload capture was already processed using the `PROCESS_CAPTURE` Procedure in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The `SET_REPLAY_DIRECTORY` Procedure has been called.
187.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (    replay_name     IN  VARCHAR2,    replay_dir      IN  VARCHAR2,    plsql_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',    rac_inst_list   IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 187-21  INITIALIZE_REPLAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_name</td>
<td>(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.</td>
</tr>
<tr>
<td>replay_dir</td>
<td>Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data</td>
</tr>
<tr>
<td>plsql_mode</td>
<td>Specifies the replay options for PL/SQL calls:</td>
</tr>
<tr>
<td></td>
<td>• TOP_LEVEL — only top-level PL/SQL calls are replayed</td>
</tr>
<tr>
<td></td>
<td>• EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in ‘EXTENDED’ PL/SQL mode.</td>
</tr>
<tr>
<td>rac_inst_list</td>
<td>Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example:</td>
</tr>
<tr>
<td></td>
<td>rac_inst_list='1,3,5'</td>
</tr>
</tbody>
</table>

Usage Notes

• Prerequisites:
  – Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  – Database state has been logically restored to what it was at the beginning of the original workload capture.

• The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');

This command will load up the connection map and by default will set all replay
time connection strings to be equal to NULL. A NULL replay time connection string
means that the workload replay clients (WRCs) will connect to the default host as
determined by the replay client's runtime environment settings. The user can
change a particular connection string to a new one (or a new service point) for
replay by using the REMAP_CONNECTION Procedure.

- For encrypted capture, the INITIALIZE_REPLAY Procedure relies on Oracle wallet.
The identifier is oracle.rat.database_replay.encryption (case-sensitive).

Related Topics
- PAUSE_REPLAY Procedure
  This procedure pauses the in-progress workload replay.
- INITIALIZE_REPLAY Procedure
  This procedure puts the database state in INIT for REPLAY mode, and loads data
  into the replay system that is required before preparing for the replay (by executing
  the PAUSE_REPLAY Procedure).
- PROCESS_CAPTURE Procedure
  This procedure processes the workload capture found in capture_dir in place.
- REMAP_CONNECTION Procedure
  This procedure remaps the captured connection to a new one so that the user
  sessions can connect to the database in a desired way during workload replay.

187.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
    RETURN BOOLEAN;
```

Return Values

Returns TRUE if the PAUSE_REPLAY Procedure has been called successfully and the
RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a
prerequisite.

187.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000
characters to the DBA_WORKLOAD_LONG_SQLTEXT view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (
    capture_id IN NUMBER);
```
Parameters

Table 187-22  LOAD_LONG_SQLTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>Internal key for the workload capture</td>
</tr>
</tbody>
</table>

Note:
This procedure is available starting with Oracle Database Release 18c.

See Also:
DBA_WORKLOAD_LONG_SQLTEXT in Oracle Database Reference

187.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;

Usage Notes

• Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
• User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

187.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (replay_id IN NUMBER, stream_id IN NUMBER DEFAULT NULL, call_counter IN NUMBER DEFAULT NULL);
Parameters

Table 187-23  POPULATE_DIVERGENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.</td>
</tr>
</tbody>
</table>

Related Topics

- **GET_DIVERGING_STATEMENT Function**
  This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

### 187.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the PREPARE_REPLAY Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (  
  synchronization IN BOOLEAN,  
  connect_time_scale IN NUMBER DEFAULT 100,  
  think_time_scale IN NUMBER DEFAULT 100,  
  think_time_auto_correct IN BOOLEAN DEFAULT TRUE,  
  capture_sts IN BOOLEAN DEFAULT FALSE,  
  sts_cap_interval IN NUMBER DEFAULT 300);
```

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (  
  synchronization IN VARCHAR2 DEFAULT 'OBJECT_ID',  
  connect_time_scale IN NUMBER DEFAULT 100,  
  think_time_scale IN NUMBER DEFAULT 100,  
  think_time_auto_correct IN BOOLEAN DEFAULT TRUE,  
  capture_sts IN BOOLEAN DEFAULT FALSE,  
  sts_cap_interval IN NUMBER DEFAULT 300);
```
### Parameters

**Table 187-24 PREPARE_CONsolidated_REPLAY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronization</td>
<td>Sets the synchronization mode for replay:&lt;br&gt;• 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time).&lt;br&gt;• 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.&lt;br&gt;• 'OBJECT_ID' — Every replayed action will be executed only after the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.&lt;br&gt;   This value is deprecated.&lt;br&gt;   For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:&lt;br&gt;   • TRUE means 'SCN'&lt;br&gt;   • FALSE means 'TIME'</td>
</tr>
<tr>
<td>connect_time_scale</td>
<td>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See &quot;Example 187-1&quot;.</td>
</tr>
<tr>
<td>think_time_scale</td>
<td>Scales the time elapsed between two successive user calls &quot;Example 187-1&quot; from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See &quot;Example 187-2&quot;.</td>
</tr>
<tr>
<td>think_time_auto_correct</td>
<td>Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See &quot;Example 187-3&quot;.</td>
</tr>
<tr>
<td>capture_sts</td>
<td>If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges (ADMINISTER SQL TUNING SET). The default value is FALSE.</td>
</tr>
<tr>
<td>sts_cap_interval</td>
<td>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</td>
</tr>
</tbody>
</table>
Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

• PREPARE_REPLAY Procedure
  This procedure puts the database state in PREPARE FOR REPLAY mode.

187.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (  
synchronization           IN BOOLEAN   DEFAULT TRUE,  
connect_time_scale        IN NUMBER    DEFAULT 100,  
think_time_scale          IN NUMBER    DEFAULT 100,  
think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,

query_only                IN BOOLEAN   DEFAULT FALSE);
### Parameters

**Table 187-25 PREPARE_REPLAY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>synchronization</strong></td>
<td>Sets the synchronization mode for replay:</td>
</tr>
<tr>
<td></td>
<td>• <code>'TIME'</code> — The synchronization will be based on the time the action took place during capture (clock-based time).</td>
</tr>
<tr>
<td></td>
<td>• <code>'SCN'</code> — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</td>
</tr>
<tr>
<td></td>
<td>• <code>'OBJECT_ID'</code> — Every replayed action will be executed only after the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This value is deprecated.</td>
</tr>
<tr>
<td></td>
<td>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</td>
</tr>
<tr>
<td></td>
<td>• TRUE means <code>'SCN'</code></td>
</tr>
<tr>
<td></td>
<td>• FALSE means <code>'TIME'</code></td>
</tr>
<tr>
<td><strong>connect_time_scale</strong></td>
<td>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <strong>DEFAULT VALUE</strong> is 100. See &quot;Example 187-1&quot;.</td>
</tr>
<tr>
<td><strong>think_time_scale</strong></td>
<td>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <strong>DEFAULT VALUE</strong> is 100. See &quot;Example 187-2&quot;.</td>
</tr>
<tr>
<td><strong>think_time_auto_correct</strong></td>
<td>Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. <strong>DEFAULT</strong> is TRUE which is to reduce think time if replay goes slower than capture. See &quot;Example 187-3&quot;.</td>
</tr>
<tr>
<td><strong>scale_up_multiplier</strong></td>
<td>Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <strong>scale_up_multiplier</strong>. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.</td>
</tr>
</tbody>
</table>
Table 187-25 (Cont.) PREPARE_REPLAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_sts</td>
<td>If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <code>EXPORT_AWR Procedure</code> along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.</td>
</tr>
<tr>
<td>sts_cap_interval</td>
<td>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</td>
</tr>
<tr>
<td>rac_mode</td>
<td>Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>•  <code>GLOBAL_SYNC</code> — Synchronization across all Oracle RAC instances. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>•  <code>PER_INSTANCE_CLIENT</code> — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance.</td>
</tr>
<tr>
<td></td>
<td>•  <code>PER_INSTANCE_SYNC</code> — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance</td>
</tr>
<tr>
<td>query_only</td>
<td>Replays only the read-only queries of the workload capture. The default value is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

- **Prerequisites:**
  - The database has been initialized for replay using the `INITIALIZE_REPLAY Procedure`.
  - Any capture time connection strings that require remapping have been already done using the `REMAP_CONNECTION Procedure`.
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to scale_up_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
  - Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
  - No replay data or error divergence records are generated for the scale-up sessions.
All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

**Example 187-1 Application of the connect_time_scale Parameter**

If the following was observed during the original workload capture:

12:00 : Capture was started  
12:10 : First session connect (10m after)  
12:30 : Second session connect (30m after)  
12:42 : Third session connect (42m after)

If the `connect_time_scale` is 50, then the session connects will happen as follows:

12:00 : Replay was started with 50% connect time scale  
12:05 : First session connect (5m after)  
12:15 : Second session connect (15m after)  
12:21 : Third session connect (21m after)

If the `connect_time_scale` is 200, then the session connects will happen as follows:

12:00 : Replay was started with 200% connect time scale  
12:20 : First session connect (20m after)  
13:00 : Second session connect (60m after)  
13:24 : Third session connect (84m after)

**Example 187-2 Application of the think_time_scale Parameter**

If the following was observed during the original workload capture:

12:00 : User SCOTT connects  
12:10 : First user call issued (10m after completion of prevcall)  
12:14 : First user call completes in 4mins  
12:30 : Second user call issued (16m after completion of prevcall)  
12:40 : Second user call completes in 10m  
12:42 : Third user call issued (2m after completion of prevcall)  
12:50 : Third user call completes in 8m

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

12:00 : User SCOTT connects  
12:05 : First user call issued 5 mins (50% of 10m) after the completion of previous call  
12:10 : First user call completes in 5m (takes a minute longer)  
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev call  
12:25 : Second user call completes in 7m (takes 3 minutes less)  
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev call  
12:35 : Third user call completes in 9m (takes a minute longer)

**Example 187-3 Application of the think_time_auto_correct Parameter**

If the following was observed during the original workload capture:

12:00 : User SCOTT connects  
12:10 : First user call issued (10m after completion of prevcall)  
12:14 : First user call completes in 4m  
12:30 : Second user call issued (16m after completion of prevcall)  
12:40 : Second user call completes in 10m  
12:42 : Third user call issued (2m after completion of prevcall)  
12:50 : Third user call completes in 8m
If the `think_time_scale` is 100 and the `think_time_auto_correct` is TRUE during the workload replay, then the user calls will look something like below:

12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev call took) after the completion of prev call
12:52 : Third user call completes in 8m

187.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (  
capture_dir            IN   VARCHAR2,
parallel_level         IN   NUMBER DEFAULT NULL,
synchronization        IN   VARCHAR2 DEFAULT 'SCN',
plsql_mode             IN   VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

| Parameter      | Description | | |
|----------------|-------------|-------------------------------|
| `capture_dir`  | (Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory. | | |
| `parallel_level` | Number of Oracle processes used to process the capture in parallel. The NULL default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution. | | |
Table 187-26  (Cont.) PROCESS_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronization</td>
<td>Determines the synchronization mode that the user will be able to use for replay:</td>
</tr>
<tr>
<td></td>
<td>• ‘TIME’ — When ‘TIME’ is selected, the replay can use ‘TIME’ synchronization mode only. When ‘TIME’ synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time).</td>
</tr>
<tr>
<td></td>
<td>• ‘SCN’ — When ‘SCN’ is selected, the replay can use the ‘TIME’ or ‘SCN’ synchronization mode. This is the default. When ‘SCN’ synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</td>
</tr>
<tr>
<td></td>
<td>• ‘OBJECT_ID’ — When ‘OBJECT_ID’ is selected, replay can use the ‘TIME’, ‘SCN’, or ‘OBJECT_ID’ synchronization mode. When ‘OBJECT_ID’ synchronization mode is used for replay, every replayed action will be executed only after the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.</td>
</tr>
<tr>
<td>plsql_mode</td>
<td>Specifies the processing mode for PL/SQL:</td>
</tr>
<tr>
<td></td>
<td>• ‘TOP_LEVEL’ — metadata is generated for top-level PL/SQL calls only; ‘TOP_LEVEL’ will be the only option for replay.</td>
</tr>
<tr>
<td></td>
<td>• ‘EXTENDED’ — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either ‘TOP_LEVEL’ or ‘EXTENDED’.</td>
</tr>
</tbody>
</table>

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.

- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in capture_dir.
Before a workload capture can be replayed in a particular database version, the capture must be processed using \texttt{PROCESS\_CAPTURE} in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload “foo” was captured in \texttt{rec\_dir} in Oracle database version 10.2.0.5. In order to replay the workload “foo” in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory \texttt{rec\_dir}:

\begin{verbatim}
DBMS\_WORKLOAD\_REPLAY\_PROCESS\_CAPTURE('rec\_dir');
\end{verbatim}

Now, \texttt{rec\_dir} contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload “foo” in 11.1.0.1 databases as many times as required.

For encrypted capture, the \texttt{PROCESS\_CAPTURE} procedure relies on Oracle wallet. The identifier is \texttt{oracle.rat.database_replay.encryption} (case-sensitive).

### 187.3.30 REMAP\_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

**Syntax**

\begin{verbatim}
DBMS\_WORKLOAD\_REPLAY\_REMAP\_CONNECTION (  
  connection_id         IN  NUMBER,  
  replay_connection     IN  VARCHAR2);
\end{verbatim}

\begin{verbatim}
DBMS\_WORKLOAD\_REPLAY\_REMAP\_CONNECTION (  
  capture_number        IN  VARCHAR2,  
  connection_id         IN  NUMBER,  
  replay_connection     IN  VARCHAR2);
\end{verbatim}

**Parameters**

\begin{tabular}{|c|p{9cm}|}
  \hline
  **Parameter** & **Description** \\
  \hline
  capture_number & Pointing to a capture of the current replay schedule \\
  connection_id & ID of the connection to be remapped. Corresponds to DBA\_WORKLOAD\_CONNECTION\_MAP\_CONN\_ID. \\
  replay_connection & New connection string to be used during replay \\
  \hline
\end{tabular}

**Usage Notes**

- Prior to calling \texttt{REMAP\_CONNECTION} all replay connection strings are set to \texttt{NULL} by default. If a \texttt{replay\_connection} is \texttt{NULL}, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable \texttt{TNS\_ADMIN} is defined and the user does not call the \texttt{REMAP\_CONNECTION} Procedure, then the \texttt{wrc} executable will connect to the server specified in the tnsnames.ora file pointed to by \texttt{TNS\_ADMIN}.
- A valid \texttt{replay\_connection} must specify a connect identifier or a service point. See the \textit{Oracle Database Net Services Reference} for ways to specify connect.
identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

187.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_number</td>
<td>Unique ID that identifies this capture within this schedule</td>
</tr>
</tbody>
</table>

187.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the `ADD_SCHEDULE_ORDERING Function` (`schedule_capture_id, waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
    schedule_capture_id IN NUMBER,
    waitfor_capture_id IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule (see procedure description).</td>
</tr>
<tr>
<td>waitfor_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule.</td>
</tr>
</tbody>
</table>
Usage Notes

Prerequisites:
- The `BEGIN_REPLAY_SCHEDULE` Procedure must have been called.
- The replay schedule order should have already been added using the `ADD_SCHEDULE_ORDERING` Function.

187.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id          IN NUMBER,
    format             IN VARCHAR2)
RETURN CLOB;
```

Parameters

**Table 187-30  REPORT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) Specifies the ID of the workload replay whose report is requested.</td>
</tr>
<tr>
<td>format</td>
<td>(Mandatory) Specifies the report format. Valid values:</td>
</tr>
<tr>
<td></td>
<td>- HTML - Generates the HTML version of the report</td>
</tr>
<tr>
<td></td>
<td>- XML - Generates the XML version of the report</td>
</tr>
<tr>
<td></td>
<td>- TEXT - Generates the text version of the report</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a `CLOB`.

187.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the `PAUSE_REPLAY Procedure` must have already been issued.
187.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function.

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
    replay_dir  IN VARCHAR2,
    filter_set  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Capture ID of the existing filter set with which it is associated</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to be reused</td>
</tr>
</tbody>
</table>

Related Topics

- ADD_SCHEDULE_ORDERING Function
  This function adds a schedule order between two captures.

187.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN VARCHAR2,
    pvalue   IN VARCHAR2);
```

```sql
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN VARCHAR2,
    pvalue   IN NUMBER);
```

```sql
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN VARCHAR2,
    pvalue   IN BOOLEAN);
```
**Parameters**

**Table 187-32  SET_ADVANCED_PARAMETER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Name of the parameter (case insensitive)</td>
</tr>
<tr>
<td>pvalue</td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>

**Usage Notes**

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the COMMIT issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

**Related Topics**

- **PREPARE_REPLAY Procedure**
  This procedure puts the database state in PREPARE FOR REPLAY mode.

**187.3.37 SET_REPLAY_DIRECTORY Procedure**

This procedure sets a directory that contains multiple workload captures as the current replay directory.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (replay_dir IN VARCHAR2);
```

**Parameters**

**Table 187-33  SET_REPLAY_DIRECTORY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Name of the OS directory containing the captures for a workload consolidation</td>
</tr>
</tbody>
</table>
187.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (  
  enabled       OUT  BOOLEAN DEFAULT TRUE,  
  min_delay     OUT  NUMBER DEFAULT 10,  
  max_delay     OUT  NUMBER DEFAULT 120,  
  delay_factor  OUT  NUMBER DEFAULT 8);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE to enable the timeout action, and FALSE to disable.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than ( \text{min_delay} ). Default = 10.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than ( \text{max_delay} ). Default = 120.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between ( \text{min_delay} ) and ( \text{max_delay} ). The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and ( \text{delay_factor} ). Default = 8.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter \( \text{min\_delay} \), then the timeout action is non-operational.
  - If the delay in minutes is more than an upper bound specified by parameter \( \text{max\_delay} \), the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter \( \text{delay\_factor} \).
### 187.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

**Syntax**

```sql
PROCEDURE SET_SQL_MAPPING (
    schedule_cap_id      IN NUMBER,
    sql_id               IN VARCHAR2,
    operation            IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```sql
PROCEDURE SET_SQL_MAPPING (
    sql_id               IN VARCHAR2,
    operation            IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_cap_id</td>
<td>ID of a capture in the schedule</td>
</tr>
<tr>
<td>sql_id</td>
<td>SQL identifier of the SQL statement at the time of capture</td>
</tr>
<tr>
<td>operation</td>
<td>Directs that one of the following actions be performed for the specified statement during database replay:</td>
</tr>
<tr>
<td></td>
<td>• ‘SKIP’ — Skip the SQL statement identified by sql_id</td>
</tr>
<tr>
<td></td>
<td>• ‘REPLACE’ — Replace this SQL statement identified by sql_id with the SQL statement in the replacement_sql_text parameter</td>
</tr>
</tbody>
</table>

**Usage Notes**

- `replacement_sql_text`: When ‘SKIP’ is specified for the `operation` parameter, this parameter is NULL. When ‘REPLACE’ is specified for the `operation` parameter, this parameter’s value is the SQL statement to be used.
- `schedule_cap_id` is used for consolidated replay.

### 187.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    schedule_cap_id      IN NUMBER,
    capture_user         IN VARCHAR2,
    replay_user          IN VARCHAR2);
```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (  
capture_user IN VARCHAR2,  
replay_user IN VARCHAR2);  

Parameters

Table 187-36  SET_USER_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_cap_id</td>
<td>ID of the a capture in the schedule</td>
</tr>
<tr>
<td>capture_user</td>
<td>User name during the time of the workload capture</td>
</tr>
<tr>
<td>replay_user</td>
<td>User name to which captured user is remapped during replay.</td>
</tr>
</tbody>
</table>

Usage Notes

- A schedule_cap_id of NULL is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If replay_user is set to NULL, then the mapping is disabled.
- After multiple calls with the same capture_user, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:
  
  SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP  

- The overloaded version without the schedule_cap_id calls the one with the schedule_cap_id argument by passing in NULL.
- Mappings are stored in a table made public through the view DBA_WORKLOAD_USER_MAP. To remove old mappings execute
  
  DELETE * FROM DBA_WORKLOAD_USER_MAP

187.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;

Usage Notes

Prerequisites:

- The call to the PREPARE_REPLAY Procedure was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using V$WORKLOAD_REPLAY_CLIENTS.
187.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

DBMS_WORKLOAD_REPLAY.START_REPLAY;

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using V$WORKLOAD_REPLAY_CLIENTS.
- Use the WRC's CALIBRATE mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  $ wrc mode=calibrate replaydir=

187.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

Syntax

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  capture_number IN VARCHAR2,
  filter_set IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  filter_set IN VARCHAR2);

Parameters

Table 187-37  USE_FILTER_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_number</td>
<td>Pointing to a capture of the current replay schedule</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set</td>
</tr>
</tbody>
</table>

Usage Notes

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.
The DBMS_WORKLOAD_REPOSITORY package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- Examples
- Data Structures
- Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

See Also:
Oracle Database Performance Tuning Guide for more information about the Automatic Workload Repository

188.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```sql
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
    DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
        1557521192, 1, 5390, 5392) ) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.

188.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The DBMS_WORKLOAD_REPOSITORY package defines an object and associated table types.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type
- AWRRPT_INSTANCE_LIST_TYPE Table Type
188.2.1 DBMS_WORKLOAD_REPOSITORY
AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```sql
TYPE awr_baseline_metric_type AS OBJECT (  
  baseline_name      VARCHAR2(64),
  dbid               NUMBER NOT NULL,
  instance_number    NUMBER NOT NULL,
  beg_time           DATE NOT NULL,
  end_time           DATE NOT NULL,
  metric_id          NUMBER NOT NULL,
  metric_name        VARCHAR2(64) NOT NULL,
  metric_unit        VARCHAR2(64) NOT NULL,
  num_interval       NUMBER NOT NULL,
  interval_size      NUMBER NOT NULL,
  average            NUMBER NOT NULL,
  minimum            NUMBER NOT NULL,
  maximum            NUMBER NOT NULL);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of the Baseline</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for the snapshot</td>
</tr>
<tr>
<td>instance_number</td>
<td>Instance number for the snapshot</td>
</tr>
<tr>
<td>beg_time</td>
<td>Begin time of the interval</td>
</tr>
<tr>
<td>end_time</td>
<td>End time of the interval</td>
</tr>
<tr>
<td>metric_id</td>
<td>Metric ID</td>
</tr>
<tr>
<td>metric_name</td>
<td>Metric name</td>
</tr>
<tr>
<td>metric_unit</td>
<td>Unit of measurement</td>
</tr>
<tr>
<td>num_interval</td>
<td>Number of intervals observed</td>
</tr>
<tr>
<td>interval_size</td>
<td>Interval size (in hundredths of a second)</td>
</tr>
<tr>
<td>average</td>
<td>Average over the period</td>
</tr>
<tr>
<td>minimum</td>
<td>Minimum value observed</td>
</tr>
<tr>
<td>maximum</td>
<td>Maximum value observed</td>
</tr>
</tbody>
</table>
188.2.2 DBMS_WORKLOAD_REPOSITORY
AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;

Related Topics

• SELECT_BASELINE_METRIC Function
  This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

188.2.3 DBMS_WORKLOAD_REPOSITORY
AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;

188.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the DBMS_WORKLOAD_REPOSITORY subprograms and briefly describes them.

Table 188-2  DBMS_WORKLOAD_REPOSITORY Package Subprograms

<table>
<thead>
<tr>

188.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a TOP SQL). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
  sql_id         IN VARCHAR2,
  dbid           IN NUMBER DEFAULT NULL);
```

Parameters

</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional DBID, defaults to Local DBID</td>
</tr>
</tbody>
</table>

188.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num      IN VARCHAR2(1023),
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER DEFAULT 0,
  l_slot_width    IN NUMBER DEFAULT 0,
  l_sid           IN NUMBER DEFAULT NULL,
  l_sql_id        IN VARCHAR2 DEFAULT NULL,
```
Parameters

Table 188-4  **ASH_GLOBAL_REPORT_HTML Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instances (such as ’1,2,3’), or NULL to report on all instances in the database</td>
</tr>
<tr>
<td>l_btime</td>
<td>The 'begin time'</td>
</tr>
<tr>
<td>l_etime</td>
<td>The 'end time'</td>
</tr>
<tr>
<td>l_options</td>

</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (see Usage Notes)</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (see Usage Notes)</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Ignored since the report works off of data on disk only</td>
</tr>
<tr>
<td>l_container</td>
<td>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows:</td>
</tr>
<tr>
<td></td>
<td>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</td>
</tr>
<tr>
<td></td>
<td>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB.</td>
</tr>
<tr>
<td></td>
<td>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).
Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefgij123', pass that `sql_id` value to the `l_sql_id` argument:

  ```sql
  l_sql_id => 'abcdefgij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

  ```sql
  l_module => 'PAYROLL', l_action => 'PROCESS'
  ```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

<table>
<thead>
<tr>

</tbody>
</table>

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL" and ACTION "PROCESS"`, use the following predicate:

\[
\text{l\_module => 'PAYROLL', l\_action => 'PROCESS'}
\]

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

188.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
    dbid           IN NUMBER DEFAULT NULL,
    inst_id        IN NUMBER DEFAULT NULL,
    begin_time     IN DATE,
    end_time       IN DATE,
    report_level   IN VARCHAR2 DEFAULT NULL,
    filter_list    IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 188-8  ASH_REPORT_ANALYTICS Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid</td>
<td>Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.</td>
</tr>
<tr>
<td>begin_time</td>
<td>The start time of the interval for which the ASH report is required.</td>
</tr>
<tr>
<td>end_time</td>
<td>The end time of the interval for which the ASH report is required.</td>
</tr>
<tr>
<td>report_level</td>
<td>Describes the list of components to build.</td>
</tr>
<tr>
<td>filter_list</td>
<td>Describes the list of filters to apply. Its default value is NULL (no filters to apply).</td>
</tr>
</tbody>
</table>

Return Values

Returns the ASH Analytics active report.
188.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER    DEFAULT 0,
  l_slot_width    IN NUMBER    DEFAULT 0,
  l_sid           IN NUMBER    DEFAULT NULL,
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
  l_wait_class    IN VARCHAR2  DEFAULT NULL,
  l_service_hash  IN NUMBER    DEFAULT NULL,
  l_module        IN VARCHAR2  DEFAULT NULL,
  l_action        IN VARCHAR2  DEFAULT NULL,
  l_client_id     IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
  l_data_src      IN NUMBER    DEFAULT 0,
  l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

</tr>
</tbody>
</table>
Table 188-9  (Cont.) ASH_REPORT_HTML Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_data_src</td>
<td>Can be used to specify a data source (see Usage Notes)</td>
</tr>
<tr>
<td></td>
<td>• 1 =&gt; memory (V$ACTIVE_SESSION_HISTORY)</td>
</tr>
<tr>
<td></td>
<td>• 2 =&gt; disk (DBA_HIST_ACTIVE_SESS_HISTORY)</td>
</tr>
<tr>
<td></td>
<td>• 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</td>
</tr>
<tr>
<td>l_container</td>
<td>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows:</td>
</tr>
<tr>
<td></td>
<td>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</td>
</tr>
<tr>
<td></td>
<td>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

• You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.

• By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

\[ l_{\text{data src}} \Rightarrow 1 \]

Similarly, to generate a report on samples found only on disk, use

\[ l_{\text{data src}} \Rightarrow 2 \]

• The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that sql_id value to the l_sql_id argument:

\[ l_{\text{sql id}} \Rightarrow 'abcdefghij123' \]

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to
generate an ASH report on module "PAYROLL" and action "PROCESS", use the following predicate:

\[ l_{module} \Rightarrow 'PAYROLL', l_{action} \Rightarrow 'PROCESS' \]

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

<tr>
<td></td>
<td>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB.</td>
</tr>
</tbody>
</table>

Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(80).
Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.

- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_etime` found in memory, use

  ```
l_data_src => 1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that SQL_ID value to the `l_sql_id` argument:

  ```
l_sql_id => 'abcdefghij123'
  ```

### Table 188-12  ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>l_sid</code></td>
<td>Session ID (for example, <code>V$SESSION.SID</code>)</td>
<td>No</td>
</tr>
<tr>
<td><code>l_sql_id</code></td>
<td>SQL ID (for example, <code>V$SQL.SQL_ID</code>)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_wait_class</code></td>
<td>Wait class name (for example, <code>V$EVENT_NAME.WAIT_CLASS</code>)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_service_hash</code></td>
<td>Service name hash (for example, <code>V$ACTIVE_SERVICES.NAME_HASH</code>)</td>
<td>No</td>
</tr>
<tr>
<td><code>l_module</code></td>
<td>Module name (for example, <code>V$SESSION.MODULE</code>)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_action</code></td>
<td>Action name (for example, <code>V$SESSION.ACTION</code>)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_client_id</code></td>
<td>Client ID for end-to-end backtracing (for example, <code>V$SESSION.CLIENT_IDENTIFIER</code>)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_plsql_entry</code></td>
<td>PL/SQL entry point (for example, &quot;SYS.DBMS_LOB.&quot;)</td>
<td>Yes</td>
</tr>
<tr>
<td><code>l_data_src</code></td>
<td>Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype</td>
<td>No</td>
</tr>
</tbody>
</table>

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

  ```
l_module => 'PAYROLL', l_action => 'PROCESS'
  ```
Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

188.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
    dbid1     IN NUMBER,
    inst_num1 IN NUMBER,
    bid1      IN NUMBER,
    eid1      IN NUMBER,
    dbid2     IN NUMBER,
    inst_num2 IN NUMBER,
    bid2      IN NUMBER,
    eid2      IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st instance number</td>
</tr>
<tr>
<td>bid1</td>
<td>1st beginning snapshot ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st ending snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd instance number</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd beginning snapshot ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd ending snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrdrpt.sql` script which prompts users for the required information.

188.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
    dbid1     IN NUMBER,
    inst_num1 IN NUMBER,
    bid1      IN NUMBER,
    eid1      IN NUMBER,
```
Parameters

Table 188-14  AWR_DIFF_REPORT_TEXT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st instance number</td>
</tr>
<tr>
<td>bid1</td>
<td>1st beginning snapshot ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st ending snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd instance number</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd beginning snapshot ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd ending snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrdrpt.sql script which prompts users for the required information.

188.3.9 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (  
dbid1       IN NUMBER,  
inst_num1   IN AWRREPORT_INSTANCE_LIST_TYPE,  
bid1        IN NUMBER,  
eid1        IN NUMBER,  
bid2        IN NUMBER,  
inst_num2   IN AWRREPORT_INSTANCE_LIST_TYPE,  
eid2        IN NUMBER)  
RETURN awrpt_html_type_table PIPELINED;
```

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (  
dbid1       IN NUMBER,  
inst_num1   IN VARCHAR2,  
bid1        IN NUMBER,  
eid1        IN NUMBER,  
bid2        IN NUMBER,  
eid2        IN NUMBER)  
RETURN awrpt_html_type_table PIPELINED;
```
Parameters

Table 188-15  AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid1</td>
<td>1st beginning snapshot ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st ending snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd beginning snapshot ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd ending snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).

188.3.10 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (  
dbid1       IN    NUMBER,  
inst_num1   IN    AWRRPT_INSTANCE_LIST_TYPE,  
bid1       IN    NUMBER,  
eid1       IN    NUMBER,  
dbid2       IN    NUMBER,  
inst_num2   IN    AWRRPT_INSTANCE_LIST_TYPE,  
bid2       IN    NUMBER,  
eid2       IN    NUMBER)  
RETURN awrdrpt_text_type_table PIPELINED;
```
Parameters

Table 188-16  AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid1</td>
<td>1st beginning snapshot ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st ending snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd beginning snapshot ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd ending snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(320).

188.3.11 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (  
  l_dbid       IN    NUMBER,  
  l_inst_num   IN    AWRRT_INSTANCE_LIST_TYPE,  
  l_bid        IN    NUMBER,  
  l_eid        IN    NUMBER,  
  l_options    IN    NUMBER DEFAULT 0)  
RETURN awrrpt_html_type_table PIPELINED;
```

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (  
  l_dbid       IN    NUMBER,  
  l_inst_num   IN    VARCHAR2,  
  l_bid        IN    NUMBER,  
  l_eid        IN    NUMBER,  
  l_options    IN    NUMBER DEFAULT 0)  
RETURN awrrpt_html_type_table PIPELINED;
```
Parameters

Table 188-17  AWR_GLOBAL_REPORT_HTML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>l_bid</td>
<td>Beginning snapshot ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>Ending snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>Report level (currently not used)</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).

188.3.12 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
  l_dbid IN NUMBER,
  l_inst_num IN AWRREPORT_INSTANCE_LIST_TYPE,
  l_bid IN NUMBER,
  l_eid IN NUMBER,
  l_options IN NUMBER DEFAULT 0)
RETURN awrdrpt_text_type_table PIPELINED;
```

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
  l_dbid IN NUMBER,
  l_inst_num IN VARCHAR2,
  l_bid IN NUMBER,
  l_eid IN NUMBER,
  l_options IN NUMBER DEFAULT 0)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 188-18  AWR_GLOBAL_REPORT_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
</tbody>
</table>
Table 188-18  (Cont.) AWR_GLOBAL_REPORT_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_inst_num</td>
<td>List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>l_bid</td>
<td>Beginning snapshot ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>Ending snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(320).

188.3.13 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
  l_eid        IN    NUMBER,
  l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 188-19  AWR_REPORT_HTML Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>Beginning snapshot ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>Ending snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>- l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).
188.3.14 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>Beginning snapshot ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>Ending snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>• l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

188.3.15 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
    top_n_events         IN   NUMBER DEFAULT NULL,
    top_n_files          IN   NUMBER DEFAULT NULL,
    top_n_segments       IN   NUMBER DEFAULT NULL,
)
```
Parameters

Table 188-21  AWR_SET_REPORT_THRESHOLDS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top_n_events</td>
<td>Number of most significant wait events to be included</td>
</tr>
<tr>
<td>top_n_files</td>
<td>Number of most active files to be included</td>
</tr>
<tr>
<td>top_n_segments</td>
<td>Number of most active segments to be included</td>
</tr>
<tr>
<td>top_n_services</td>
<td>Number of most active services to be included</td>
</tr>
<tr>
<td>top_n_sql</td>
<td>Number of most significant SQL statements to be included</td>
</tr>
<tr>
<td>top_n_sql_max</td>
<td>Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct</td>
</tr>
<tr>
<td>top_sql_pct</td>
<td>Significance threshold for SQL statements between top_n_sql and top_n_sql_max</td>
</tr>
<tr>
<td>shmem_threshold</td>
<td>Shared memory low threshold</td>
</tr>
<tr>
<td>versions_threshold</td>
<td>Plan version count low threshold</td>
</tr>
<tr>
<td>top_n_disks</td>
<td>Number of cell disks with most I/O</td>
</tr>
<tr>
<td>outlier_pct</td>
<td>Percentage of maximum capacity before displaying outliers for Exadata sections</td>
</tr>
<tr>
<td>outlier_cpu_pct</td>
<td>Threshold for mean percentage CPU to display outliers</td>
</tr>
</tbody>
</table>

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

188.3.16 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
)
```
188.3.17 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
  l_eid        IN    NUMBER,
  l_sqlid      IN    VARCHAR2,
  l_options    IN    NUMBER DEFAULT 0)
RETURN awrpt_text_type_table PIPELINED;
```

Parameters

Table 188-23  AWR_SQL_REPORT_TEXT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>Beginning snapshot ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>Ending snapshot ID</td>
</tr>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.
Table 188-23  (Cont.) AWR_SQL_REPORT_TEXT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>Flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

188.3.18 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the restricted session mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the restricted session mode. This procedure affects the local database on which it is executed.

Note:

To enable AWR snapshot creation for an Oracle RAC in the restricted session mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
    allow IN BOOLEAN);

Parameters

Table 188-24  CONTROL_RESTRICTED_SNAPSHOT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow</td>
<td>This parameter can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• TRUE: AWR snapshots can be created for the database in the restricted session mode.</td>
</tr>
<tr>
<td></td>
<td>• FALSE: AWR snapshots cannot be created for the database in the restricted session mode.</td>
</tr>
</tbody>
</table>
This function and procedure creates a baseline.

Syntax

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL)
RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);
RETURN NUMBER;

Parameters

Table 188-25  CREATE_BASELINE Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_snap_id</td>
<td>Start snapshot sequence number for the baseline.</td>
</tr>
<tr>
<td>end_snap_id</td>
<td>End snapshot sequence number for the baseline.</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time for the baseline.</td>
</tr>
<tr>
<td>end_time</td>
<td>End time for the baseline.</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.</td>
</tr>
</tbody>
</table>
Exceptions

• An error will be returned if this baseline name already exists in the system.

• The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105, end_snap_id => 107, baseline_name => 'oltp_peakload_bl');

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

188.3.20 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (start_time IN DATE, end_time IN DATE, baseline_name IN VARCHAR2, template_name IN VARCHAR2, expiration IN NUMBER, dbid IN NUMBER DEFAULT NULL);

Specifies a template for creating and dropping baseline based on repeating time periods:

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (day_of_week IN VARCHAR2, hour_in_day IN NUMBER, duration IN NUMBER, start_time IN DATE, end_time IN DATE, baseline_name_prefix IN VARCHAR2, template_name IN VARCHAR2, expiration IN NUMBER, dbid IN NUMBER DEFAULT NULL);
Parameters

Table 188-26  CREATE_BASELINE_TEMPLATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>Start Time for the baseline to be created</td>
</tr>
<tr>
<td>end_time</td>
<td>End Time for the baseline to be created</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline to be created</td>
</tr>
<tr>
<td>template_name</td>
<td>Name for the template</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>day_of_week</td>
<td>Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.</td>
</tr>
<tr>
<td>hour_in_day</td>
<td>Value of 0-23 to specify the Hour in the Day the baseline should start</td>
</tr>
<tr>
<td>duration</td>
<td>Duration (in number of hours) after hour in the day that the baseline should last</td>
</tr>
<tr>
<td>baseline_name_prefix</td>
<td>Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.</td>
</tr>
</tbody>
</table>

188.3.21 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id     IN NUMBER,
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT');
```

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id     IN NUMBER,
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name _ IN VARCHAR2,
    topology_name _ IN VARCHAR2 DEFAULT NULL,
    flush_level _ IN VARCHAR2 DEFAULT 'BESTFIT');
```

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name _ IN VARCHAR2,
    topology_name _ IN VARCHAR2 DEFAULT NULL,
    flush_level _ IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```
Parameters

Table 188-27  CREATE_REMOTE_SNAPSHOT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_id</td>
<td>RMF node identifier of the database for which the snapshot needs to be created.</td>
</tr>
<tr>
<td>node_name</td>
<td>RMF node name of the database for which the snapshot needs to be created.</td>
</tr>
<tr>
<td>topology_name</td>
<td>RMF topology name of the database for which the snapshot needs to be created.</td>
</tr>
<tr>
<td>flush_level</td>
<td>The flush level can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• BESTFIT:</td>
</tr>
<tr>
<td></td>
<td>- Uses the default value depending on the type of snapshot being taken.</td>
</tr>
<tr>
<td></td>
<td>• LITE:</td>
</tr>
<tr>
<td></td>
<td>- Lightweight snapshot. Only the most important statistics are collected.</td>
</tr>
<tr>
<td></td>
<td>- This is default for a pluggable database (PDB) and application container.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL:</td>
</tr>
<tr>
<td></td>
<td>- Regular snapshot. Most of the statistics are collected.</td>
</tr>
<tr>
<td></td>
<td>- This is default for a container database root (CDB root) and non-CDB</td>
</tr>
<tr>
<td></td>
<td>- database.</td>
</tr>
<tr>
<td></td>
<td>• ALL:</td>
</tr>
<tr>
<td></td>
<td>- Heavyweight snapshot. All the possible statistics are collected.</td>
</tr>
<tr>
<td></td>
<td>- This consumes a considerable amount of disk space and takes a long time to create.</td>
</tr>
</tbody>
</table>

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

188.3.22 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL);
```
### CREATE_SNAPSHOT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_level</td>
<td>The flush level can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• BESTFIT: Uses the default value depending on the type of snapshot being taken.</td>
</tr>
<tr>
<td></td>
<td>• LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID of the database for which the snapshot needs to be created.</td>
</tr>
<tr>
<td>source_name</td>
<td>Name of the database for which the snapshot needs to be created.</td>
</tr>
</tbody>
</table>

### Examples

This example creates a snapshot of the local database with the flush level of ALL:

```sql
EXECUTE DBMS_Workload_Repository.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

### 188.3.23 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

### Syntax

```sql
DBMS_Workload_Repository.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade IN BOOLEAN DEFAULT FALSE,
    dbid IN NUMBER DEFAULT NULL);
```
Parameters

Table 188-29  DROP_BASELINE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of baseline to drop from the system</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for which the baseline needs to be dropped  (defaults to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (baseline_name => 'oltp_peakload_bl');

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

188.3.24 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
    template_name    IN VARCHAR2,
    dbid             IN NUMBER   DEFAULT NULL);
```

Parameters

Table 188-30  DROP_BASELINE_TEMPLATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template_name</td>
<td>Name of the template to remove</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.</td>
</tr>
</tbody>
</table>

188.3.25 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
    low_snap_id    IN NUMBER,
```

high_snap_id   IN  NUMBER,
dbid           IN  NUMBER   DEFAULT NULL);

Parameters

Table 188-31  DROP_SNAPSHOT_RANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low_snap_id</td>
<td>Low snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>high_snap_id</td>
<td>High snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database id (defaults to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

188.3.26 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID() RETURN NUMBER;
```

188.3.27 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
    window_size IN   NUMBER,
    dbid           IN   NUMBER   DEFAULT NULL);
```

Parameters

Table 188-32  MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_size</td>
<td>New Window size for the default Moving Window Baseline, in number of days.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (defaults to local DBID).</td>
</tr>
</tbody>
</table>
Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

188.3.28 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention      IN  NUMBER    DEFAULT  NULL,
    interval       IN  NUMBER    DEFAULT  NULL,
    topnsql        IN  NUMBER    DEFAULT  NULL,
    dbid           IN  NUMBER    DEFAULT  NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention      IN  NUMBER    DEFAULT NULL,
    interval       IN  NUMBER    DEFAULT NULL,
    topnsql        IN  VARCHAR2,
    dbid           IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 188-33 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</td>
</tr>
</tbody>
</table>
Table 188-33  (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZER0 is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.</td>
</tr>
<tr>
<td>topnsql</td>
<td>• If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. • If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.</td>
</tr>
</tbody>
</table>

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (  
  interval => 60,  
  retention => 20160);  

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

188.3.29 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from WRH$_SQLTEXT, WRH$_SQL_PLAN, and WRH$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.
Syntax

DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
    numrows IN NUMBER DEFAULT NULL,
    dbid IN NUMBER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numrows</td>
<td>Number of rows</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>

188.3.30 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
    node_id IN NUMBER);

DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
    node_name IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_id</td>
<td>RMF node identifier of the database that needs to be registered in the AWR.</td>
</tr>
<tr>
<td>node_name</td>
<td>RMF node name of the database that needs to be registered in the AWR.</td>
</tr>
<tr>
<td>topology_name</td>
<td>RMF topology name of the database that needs to be registered in the AWR.</td>
</tr>
</tbody>
</table>

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
188.3.31 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
    sql_id         IN VARCHAR2,
    dbid           IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional dbid, defaults to Local DBID</td>
</tr>
</tbody>
</table>

188.3.32 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
    old_baseline_name     IN VARCHAR2,
    new_baseline_name     IN VARCHAR2,
    dbid                  IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_baseline_name</td>
<td>Old baseline name.</td>
</tr>
<tr>
<td>new_baseline_name</td>
<td>New baseline name.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for which the baseline needs to be renamed (defaults to local DBID).</td>
</tr>
</tbody>
</table>

188.3.33 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of `AWR_BASELINE_METRIC_TYPE Object Type`. 
Syntax

DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
  l_baseline_id   IN  NUMBER,
  l_begin_snap    IN  NUMBER DEFAULT NULL,
  l_end_snap      IN  NUMBER DEFAULT NULL,
  l_dbid          IN  NUMBER DEFAULT NULL)
RETURN awrbl_details_type_table PIPELINED;

Parameters

Table 188-38  SELECT_BASELINE_DETAILS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_baseline_id</td>
<td>ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.</td>
</tr>
<tr>
<td>l_begin_snap</td>
<td>Start snapshot sequence number for the baseline.</td>
</tr>
<tr>
<td>l_end_snap</td>
<td>End snapshot sequence number for the baseline.</td>
</tr>
<tr>
<td>l_dbid</td>
<td>Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.</td>
</tr>
</tbody>
</table>

188.3.34 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
  l_baseline_name     IN VARCHAR2,
  l_dbid              IN NUMBER DEFAULT NULL,
  l_instance_num      IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;

Parameters

Table 188-39  SELECT_BASELINE_METRIC Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_baseline_name</td>
<td>Name of the baseline for which the metrics need to be viewed.</td>
</tr>
<tr>
<td>l_dbid</td>
<td>Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.</td>
</tr>
<tr>
<td>l_instance_num</td>
<td>The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL.</td>
</tr>
</tbody>
</table>
188.3.35 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
    node_id        IN NUMBER,
    remote_check   IN BOOLEAN  DEFAULT TRUE);
```

```sql
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
    node_name      IN VARCHAR2,
    topology_name  IN VARCHAR2 DEFAULT NULL,
    remote_check   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 188-40  UNREGISTER_REMOTE_DATABASE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_id</td>
<td>Identifier of the remote database whose data needs to be removed from the AWR.</td>
</tr>
<tr>
<td>node_name</td>
<td>Name of the remote database whose data needs to be removed from the AWR.</td>
</tr>
<tr>
<td>topology_name</td>
<td>RMF topology name of the remote database.</td>
</tr>
<tr>
<td>remote_check</td>
<td>If set to TRUE, the remote database’s metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to FALSE, the remote database’s data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).</td>
</tr>
</tbody>
</table>

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

188.3.36 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```
188.3.37 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of \texttt{WRHS\_SEG\_STAT\_OBJ} table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

**Syntax**

\begin{verbatim}
DBMS\_WORKLOAD\_REPOSITORY.UPDATE\_OBJECT\_INFO(
    maxrows IN NUMBER DEFAULT 0);
\end{verbatim}

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxrows</td>
<td>Maximum number of rows to be updated. Default= 0, meaning there is no limit.</td>
</tr>
</tbody>
</table>
189

DBMS_XA

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Data Structures
- Summary of DBMS_XA Subprograms

See Also:
Oracle Database Advanced Application Developer's Guide for more information about "Developing Applications with Oracle XA"

189.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

189.2 DBMS_XA Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS. Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT or READ privilege on SYSDBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.
189.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in Table 189-1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 189-1  DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TMNOFLAGS</td>
<td>PLS_INTEGER</td>
<td>00000000</td>
<td>Indicates no flag value is selected.</td>
</tr>
<tr>
<td>TMSUCCESS</td>
<td>PLS_INTEGER</td>
<td>UTIL_RAW.CAST_TO_BINARY_INTEGER ('04000000')</td>
<td>Dissociates caller from transaction branch</td>
</tr>
<tr>
<td>TMJOIN</td>
<td>PLS_INTEGER</td>
<td>UTIL_RAW.CAST_TO_BINARY_INTEGER ('02000000')</td>
<td>Caller is joining existing transaction branch.</td>
</tr>
<tr>
<td>TMSUSPEND</td>
<td>PLS_INTEGER</td>
<td>UTIL_RAW.CAST_TO_BINARY_INTEGER ('02000000')</td>
<td>Caller is suspending, not ending, association.</td>
</tr>
<tr>
<td>TMRESUME</td>
<td>PLS_INTEGER</td>
<td>UTIL_RAW.CAST_TO_BINARY_INTEGER ('08000000')</td>
<td>Caller is resuming association with suspended transaction branch.</td>
</tr>
</tbody>
</table>

The DBMS_XA package uses the constants shown in Table 189-2 for Possible Return Values.

Table 189-2  DBMS_XA Constants for Possible Return Values

</table>

### 189.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been
called so that there is not any transaction associated with the current session, the application may call \texttt{XA\_PREPARE/COMMIT/ROLLBACK/FORGET}.

\texttt{XAER\_PROTO} error is returned from \texttt{XA\_PREPARE/COMMIT/ROLLBACK/FORGET} if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

189.5 DBMS\_XA Data Structures

The \texttt{DBMS\_XA} package uses this \texttt{OBJECT} type and associated \texttt{TABLE} type.

**OBJECT Types**
- \texttt{DBMS\_XA\_XID Object Type}

**TABLE Types**
- \texttt{DBMS\_XA\_XID\_ARRAY Table Type}

189.5.1 DBMS\_XA DBMS\_XA\_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

![Note:]

For more information, see “Distributed Transaction Processing: The XA Specification” in the public XA Standard.

**Syntax**

```sql
TYPE DBMS_XA_XID IS OBJECT(
  formatid    NUMBER,
  gtrid       RAW(64),
  bqual       RAW(64),
  constructor function DBMS_XA_XID(
    gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID ( 
    gtrid     IN   RAW,
    bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID ( 
    formatid IN   NUMBER,
```
Attributes

Table 189-3  DBMS_XA_XID Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatid</td>
<td>Format identifier, a number identifying different transaction managers (TM)</td>
</tr>
<tr>
<td>gtrid</td>
<td>Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes</td>
</tr>
<tr>
<td>bqual</td>
<td>Branch qualifier, of which the maximum size is 64 bytes</td>
</tr>
</tbody>
</table>

189.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of xid that represent a list of global transaction branches.

Syntax

TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID

189.6 Summary of DBMS_XA Subprograms

This table lists the DBMS_XA subprograms and briefly describes them.

Table 189-4  DBMS_XA Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

</tr>
<tr>
<td>XA_GETLASTOER Function</td>
<td>Obtains the last Oracle error code, in case of failure of previous XA calls.</td>
</tr>
<tr>
<td>XA_PREPARE Function</td>
<td>Prepares the transaction branch specified in xid for committing the transaction subsequently if possible</td>
</tr>
<tr>
<td>XA_RECOVER Function</td>
<td>Obtains a list of prepared or heuristically completed transaction branches from a resource manager</td>
</tr>
<tr>
<td>XA_ROLLBACK Function</td>
<td>Informs the resource manager to roll back work done on behalf of a transaction branch</td>
</tr>
<tr>
<td>XA_SETTIMEOUT Function</td>
<td>Sets the transaction timeout in seconds for the current session</td>
</tr>
</tbody>
</table>
Table 189-4  (Cont.) DBMS_XA Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XA_START Function</td>
<td>Associates the current session with the transaction branch specified by \textit{xid}</td>
</tr>
</tbody>
</table>

189.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

\begin{verbatim}
DBMS_XA.DIST_TXN_SYNC;
\end{verbatim}

189.6.2 XA_COMMIT Function

This function commits the global transaction specified by \textit{xid}.

Syntax

\begin{verbatim}
DBMS_XA.XA_COMMIT (xid IN DBMS_XA_XID, onePhase IN BOOLEAN) RETURN PLS_INTEGER;
\end{verbatim}

Parameters

Table 189-5  \textit{XA_COMMIT Function Parameters}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{xid}</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
<tr>
<td>onePhase</td>
<td>If TRUE, apply single phase commit</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return values indicating error are: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. Other possible return values include: \textit{XA_OK}, \textit{XA_RB}, \textit{XA_HEURHAZ}, \textit{XA_HEURCOM}, \textit{XA_HEURRB}, and \textit{XA_HEURMIX}.

Usage Notes

- An application must not call \texttt{COMMIT}, but instead must call \texttt{XA_COMMIT} to commit the global transaction specified by \textit{xid}. If a user needs to commit a transaction branch that is created by other users, \texttt{FORCE ANY TRANSACTION} must be granted to the user.
- If \texttt{onePhase} is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of \textit{xid}. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding \texttt{XA_PREPARE} call has returned \textit{XA_OK}, should \texttt{XA_COMMIT} be called.
- The application must make a separate \texttt{XA_COMMIT} call for each of the transaction branches of the global transaction for which \texttt{XA_PREPARE} has returned \textit{XA_OK}.
• If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

189.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists.

Syntax

```sql
DBMS_XA.XA_END (  
xid IN DBMS_XA_XID,  
flag IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
<tr>
<td>flag</td>
<td>See Table 189-1.</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

• `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.

• `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.

• Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.

• Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089`: `COMMIT` is not allowed in a subordinate session.
• Executing a COMMIT or a ROLLBACK statement after XA_END has no effect on the transaction identified by xid, since this transaction is no longer associated with the current session. To commit the transaction ID or the XA_ROLLBACK Function to commit/rollback the transaction specified by the xid.

189.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```sql
DBMS_XA.XA_FORGET (
    xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAERINVAL, or XAER_PROTO.

189.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```sql
DBMS_XA.XA_GETLASTOER
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

189.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```sql
DBMS_XA.XA_PREPARE (
    xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```
Parameters

Table 189-8  XA_PREPARE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, **FORCE ANY TRANSACTION** must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and XA_PREPARE has returned XA_OK, the application may proceed to call XA_COMMIT.

189.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```sql
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags TMSTARTSCAN, TMENDSCAN, TMNOFLAGS are **not supported**.
- The privilege SELECT ON DBA_PENDING_TRANSACTIONS must be granted to the user who needs to call XA_RECOVER.

189.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```sql
DBMS_XA.XA_ROLLBACK (    xid IN DBMS_XA_XID)    RETURN PLS_INTEGER;
```
Parameters

Table 189-9  XA_ROLLBACK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

189.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```plsql
DBMS_XA.XA_SETTIMEOUT (
    seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 189-10  XA_SETTIMEOUT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2. Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAERINVAL.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.
189.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```sql
DBMS_XA.XA_START (
    xid   IN  DBMS_XA_XID,    flag  IN  PLS_INTEGER)  RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type</td>
</tr>
<tr>
<td>flag</td>
<td>See Table 189-1.</td>
</tr>
</tbody>
</table>

Return Values

See Table 189-2

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in flag, the start is for joining an existing transaction branch identified by the xid. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.

- If `TMNOFLAGS` is specified in flag, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, `XA_START` returns an `XAER_DUPID` error code.

- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.

- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.
The **DBMS_XDB** package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- **DBMS_XDB Overview**
- **DBMS_XDB Security Model**
- **DBMS_XDB Constants**
- **Summary of DBMS_XDB Subprograms**

**See Also:**

- *Oracle XML DB Developer’s Guide*
- *Oracle Database New Features Guide*

### 190.1 DBMS_XDB Overview

**DBMS_XDB** provides a range of management functions.

The **DBMS_XDB** package supports the following features:

- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use **CHECKPRIVILEGES Function**, **GETACLDOCUMENT Function**, and **CHANGEPRIVILEGES Function** for Oracle Resources. **ACLCHECKPRIVILEGES Function** provides access to Oracle’s ACL-based Security mechanism without storing objects in the Hierarchy.
The XDB username is created during XDB installation. This user owns a set of default tables and packages. `GETXDB_TABLESPACE` Function and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction.

190.2 DBMS_XDB Security Model

Owned by XDB, the `DBMS_XDB` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

190.3 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c. They are relocated to either the `DBMS_XDB_CONFIG` package or the `DBMS_XDB_REPOS` package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their DBMS_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

**Table 190-1** DBMS_XDB Constants

<table>
<thead>
<tr>
<th>Constant</th>

<td>UPDATERESOURCENODEMETADATA Procedures</td>
<td>Updates metadata for a resource</td>
</tr>
</tbody>
</table>
190.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ACLCHECKPRIVILEGES Function.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
    acl_path  IN  VARCHAR2,
    owner     IN  VARCHAR2,
    privs     IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 190-3  ACLCHECKPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user &quot;DAV:owner&quot; is replaced by this user during ACL privilege resolution</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>

190.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the APPENDRESOURCEMETADATA Procedure.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (  
    abspath   IN  VARCHAR2,  
    metadata  IN  XMLTYPE);
```
DBMS_XDB.APPENDRESOURCEMETADATA (
    abspath IN VARCHAR2,
    metadata IN REF SYS.XMLTYPE);

Parameters

Table 190-4 APPENDRESOURCEMETADATA Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.</td>
</tr>
</tbody>
</table>

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

190.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEOWNER Procedure.

Syntax

DBMS_XDB.CHANGEOWNER (
    abspath IN VARCHAR2,
    owner IN VARCHAR2,
    recurse IN BOOLEAN := FALSE);

Parameters

Table 190-5 CHANGEOWNER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner for the resource</td>
</tr>
</tbody>
</table>
Table 190-5 (Cont.) CHANGEOWNER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recurse</td>
<td>If TRUE, recursively change owner of all resources in the folder tree</td>
</tr>
</tbody>
</table>

190.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource’s ACL. This procedure is deprecated in Release 12c.

Note:
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEPRIVILEGES Function.

Syntax

```sql
DBMS_XDB.CHANGEPRIVILEGES(
    res_path   IN    VARCHAR2,
    ace        IN    xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 190-6 CHANGEPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the &lt;ace&gt; element which specifies the &lt;principal&gt;, the operation &lt;grant&gt; and the list of privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.
190.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

**Note:**
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHECKPRIVILEGES Function.

**Syntax**

```sql
DBMS_XDB.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;
```

**Parameters**

**Table 190-7  CHECKPRIVILEGES Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges</td>
</tr>
</tbody>
</table>

**Return Values**

A positive integer if all requested privileges granted.

190.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

**Note:**
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEFOLDER Function.

**Syntax**

```sql
DBMS_XDB.CREATEFOLDER(
    path   IN  VARCHAR2)
RETURN BOOLEAN;
```
Parameters

Table 190-8  CREATEFOLDER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name’s parent folder must already exist in the hierarchy: if ‘/folder1/folder2’ is passed as the path parameter, then ‘/folder1’ must already exist.

190.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEOIDPATH Function.

Syntax

```sql
DBMS_XDB.CREATENODEPATH(
    oid  IN  RAW
) RETURN VARCHAR2;
```

Parameters

Table 190-9  CREATEOIDPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource</td>
</tr>
</tbody>
</table>
190.4.8 CREATERSOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

---

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATERSOURCE Functions.

---

**Syntax**

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```sql
DBMS_XDB.CREATERSOURCE(
    abspath       IN  VARCHAR2,
    datarow       IN  REF SYS.XMLTYPE,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```sql
DBMS_XDB.CREATERSOURCE(
    abspath       IN  VARCHAR2,
    data          IN  BLOB,
    csid          IN  NUMBER :=0,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```sql
DBMS_XDB.CREATERSOURCE ( 
    abspath       IN  VARCHAR2,
    data          IN  BFILE,
    csid          IN  NUMBER :=0,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```sql
DBMS_XDB.CREATERSOURCE ( 
    abspath       IN  VARCHAR2,
    data          IN  CLOB,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```sql
DBMS_XDB.CREATERSOURCE ( 
    abspath       IN  VARCHAR2,
    data          IN  VARCHAR2,
```
Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath        IN  VARCHAR2,
    data           IN  SYS.XMLTYPE,
    schemaurl      IN  VARCHAR2 := NULL,
    elem           IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an XMLType row to be used as the contents</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows:</td>
</tr>
<tr>
<td></td>
<td>• From the abspath extension, determine the resource's MIME type.</td>
</tr>
<tr>
<td></td>
<td>• If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</td>
</tr>
<tr>
<td></td>
<td>• Otherwise, it is defaulted to the database character set.</td>
</tr>
<tr>
<td>createfolders</td>
<td>If TRUE, create the parent folders if they do not exist</td>
</tr>
<tr>
<td>schemaurl</td>
<td>For XML data, schema URL data conforms to (default NULL)</td>
</tr>
<tr>
<td>elem</td>
<td>Element name (default NULL)</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if operation successful; FALSE, otherwise.
190.4.9 DELETERESOURCE Procedure

This deprecated procedure deletes a resource from the hierarchy.

Note:
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCE Procedure.

Syntax

DBMS_XDB.DELETERESOURCE(
  path          IN      VARCHAR2,
  delete_option IN      PLS_INTEGER);

Parameters

Table 190-11  DELETERESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted; defined in Table 190-1:</td>
</tr>
<tr>
<td></td>
<td>• DELETE_RESOURCE</td>
</tr>
<tr>
<td></td>
<td>• DELETE_RECURSIVE</td>
</tr>
<tr>
<td></td>
<td>• DELETE_FORCE</td>
</tr>
<tr>
<td></td>
<td>• DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>

190.4.10 DELETERESOURCETMETADATA Procedures

This deprecated procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Note:
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCETMETADATA Procedures.

Syntax

Can be used only for schema-based metadata:
DBMS_XDB.DELETERESOURCEMETADATA  
  abspath        IN  VARCHAR2,  
  metadata       IN  REF SYS.XMLTYPE,  
  delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);

Can be used for schema-based or nonschema-based metadata:

DBMS_XDB.DELETERESOURCEMETADATA  
  abspath        IN VARCHAR2,  
  mettadatans    IN VARCHAR2,  
  mettadataname  IN VARCHAR2,  
  delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);

Parameters

Table 190-12  DELETERESOURCEMETADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>REF to the piece of metadata (schema based) to be deleted</td>
</tr>
<tr>
<td>mettadatans</td>
<td>Namespace of the metadata fragment to be removed</td>
</tr>
<tr>
<td>mettadataname</td>
<td>Local name of the metadata fragment to be removed</td>
</tr>
<tr>
<td>delete_option</td>
<td>Only applicable for schema-based metadata, this can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</td>
</tr>
<tr>
<td></td>
<td>• DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</td>
</tr>
</tbody>
</table>

190.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ENABLEDIGESTAUTHENTICATION Procedure.

Syntax

DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
190.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the EXISTSRESOURCE Function.

Syntax

DBMS_XDB.EXISTSRESOURCE(
    abspath    IN    VARCHAR2)
RETURN BOOLEAN;

Parameters

Table 190-13  EXISTSRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is found.

190.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETACLDOCUMENT Function.

Syntax

DBMS_XDB.GETACLDOCUMENT(
    abspath IN VARCHAR2)
RETURN sys.xmltype;
Parameters

Table 190-14  GETACLDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

The XMLType for ACL document.

190.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a BLOB.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTBLOB Function.

Syntax

```sql
DBMS_XDB.GETCONTENTBLOB(
  abspath    IN     VARCHAR2,
  csid       OUT    PLS_INTEGER,
  locksrc    IN     BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 190-15  GETCONTENTBLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>csid</td>
<td>If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.</td>
</tr>
<tr>
<td>locksrc</td>
<td>Contents of the resource as a BLOB</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a BLOB.
190.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

Note:
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTCLOB Function.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
    abspath    IN     VARCHAR2,
RETURN CLOB;
```

Parameters

Table 190-16  GETCONTENTCLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a CLOB.

190.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

Note:
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTVARCHAR2 Function.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
    abspath    IN     VARCHAR2,
RETURN VARCHAR2;
```
### GETCONTENTVARCHAR2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

### Return Values

The contents of the resource as a string.

#### 190.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a REF to an XMLTYPE.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLREF Function.

**Syntax**

```sql
DBMS_XDB.GETCONTENTXMLREF(
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

### GETCONTENTXMLREF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

### Return Values

The contents of the resource as a REF to an XMLTYPE.
190.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an XMLTYPE.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLTYPE Function.

**Syntax**

```sql
DBMS_XDB.GETCONTENTXMLTYPE(
    abspath    IN     VARCHAR2,
RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

The contents of the resource as an XMLTYPE.

190.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

**Note:**

This procedure is deprecated in Release 12c.

**Syntax**

```sql
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name    IN   VARCHAR2)
RETURN VARCHAR2;
```
### Parameters

#### Table 190-20  GETHTTPREQUESTHEADER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header_name</td>
<td>Passed header</td>
</tr>
</tbody>
</table>

#### Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

### 190.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource’s lock token for the current user.

#### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETLOCKTOKEN Procedure.

### Syntax

```sql
DBMS_XDB.GETLOCKTOKEN(
  path      IN      VARCHAR2,
  locktoken OUT     VARCHAR2);
```

#### Parameters

#### Table 190-21  GETLOCKTOKEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user’s lock token for the resource</td>
</tr>
</tbody>
</table>

#### Usage Notes

The user must have READPROPERTIES privilege on the resource.
190.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the GETPRIVILEGES Function.

**Syntax**

```
DBMS_XDB.GETPRIVILEGES(
    res_path    IN     VARCHAR2)
RETURN sys.xmltype;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

An XMLType instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

190.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the GETRESOID Function.

**Syntax**

```
DBMS_XDB.GETRESOID(
    abs_path IN VARCHAR2)
RETURN RAW;
```
Parameters

Table 190-23 GETRESOID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

NULL if the resource is not present.

190.4.23 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETXDB_TABLESPACE Function.

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```

190.4.24 HASBLOBCONTENT Function

This deprecated function returns TRUE if the resource has BLOB content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASBLOBCONTENT Function.

Syntax

```
DBMS_XDB.HASBLOBCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```
Parameters

Table 190-24  HASBLOBCONTENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has BOB content.

190.4.25 HASCHARCONTENT Function

This deprecated function returns TRUE if the resource has character content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASCHARCONTENT Function.

Syntax

```
DBMS_XDB.HASCHARCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-25  HASCHARCONTENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has character content.

190.4.26 HASXMLCONTENT Function

This deprecated function returns TRUE if the resource has XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLCONTENT Function.
Syntax

DBMS_XDB.HASXMLCONTENT
    abspath IN VARCHAR2
RETURN BOOLEAN;

Parameters

Table 190-26  HASXMLCONTENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has XML content.

190.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLREFERENCE Function.

Syntax

DBMS_XDB.HASXMLREFERENCE
    abspath IN VARCHAR2
RETURN BOOLEAN;

Parameters

Table 190-27  HASXMLREFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE resource has a REF to XML content.
190.4.28 ISFOLDER Function

This deprecated function returns `TRUE` if the resource is a folder or container.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the ISFOLDER Function.

**Syntax**

```sql
DBMS_XDB.ISFOLDER
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

`TRUE` if the resource is a folder or container.

190.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the LINK Procedures.

**Syntax**

```sql
DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2);
```

```sql
DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2);
```
linkname IN VARCHAR2,
linktype IN PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);

Parameters

Table 190-29 LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is created</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link</td>
</tr>
</tbody>
</table>
| linktype  | Type of link to be created:  
  - DBMS_XDB.LINK_TYPE_HARD (default)  
  - DBMS_XDB.LINK_TYPE_WEAK  
  - DBMS_XDB.LINK_TYPE_SYMBOLIC |

190.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

>Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LOCKRESOURCE Function.

Syntax

DBMS_XDB.LOCKRESOURCE(
  path IN VARCHAR2,
  depthzero IN BOOLEAN,
  shared IN boolean)
RETURN BOOLEAN;

Parameters

Table 190-30 LOCKRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>Currently not supported</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE obtains a shared write lock</td>
</tr>
</tbody>
</table>

Return Values

TRUE if successful.
Usage Notes

The user must have **UPDATE** privileges on the resource.

190.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

---

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the **PROCESSLINKS Procedure**.

---

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
   abspath  IN  VARCHAR2,
   recurse  IN  BOOLEAN := FALSE);
```

Parameters

**Table 190-31  PROCESSLINKS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource. If the path is a folder, use the recurse flag.</td>
</tr>
<tr>
<td>recurse</td>
<td>Used only if abspath specifies a folder. If <strong>TRUE</strong>, process links of all resources in the folder hierarchy rooted at the specified resource. If <strong>FALSE</strong>, process links of all documents in this folder only.</td>
</tr>
</tbody>
</table>

190.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

---

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the **PURGERESOURCEMETADATA Procedure**.

---

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
   abspath  IN  VARCHAR2);
```
Parameters

Table 190-32 PURGERESOURCETMETADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

190.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the RENAMERESOURCE Procedure.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
    srcpath    IN  VARCHAR2,
    destfolder IN  CARCHAR2,
    newname    IN  VARCHAR2);
```

Parameters

Table 190-33 RENAMERESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Absolute path in the Hierarchy for the source resource destination folder</td>
</tr>
<tr>
<td>destfolder</td>
<td>Absolute path in the Hierarchy for the destination folder</td>
</tr>
<tr>
<td>newname</td>
<td>Name of the child in the destination folder</td>
</tr>
</tbody>
</table>

190.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SETACL Procedure.
Syntax

DBMS_XDB.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);

Parameters

Table 190-34  SETACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have `<write-acl>` privileges on the resource.

190.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package: the SPLITPATH Procedure.

Syntax

DBMS_XDB.SPLITPATH(
    abspath     IN  VARCHAR2,
    parentpath  OUT VARCHAR2,
    childpath   OUT VARCHAR2);

Parameters

Table 190-35  SPLITPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path to be split</td>
</tr>
<tr>
<td>parentpath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childpath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>
190.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

**Note:**
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the **DBMS_XDB_REPOS** package - the **TOUCHRESOURCE Procedure**.

**Syntax**

```
DBMS_XDB.TOUCHRESOURCE
    absopath IN VARCHAR2);
```

**Parameters**

**Table 190-36**   DBMS_XDB.TOUCHRESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absopath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

190.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

**Note:**
This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the **DBMS_XDB_REPOS** package - the **UNLOCKRESOURCE Function**.

**Syntax**

```
DBMS_XDB.UNLOCKRESOURCE (
    path IN VARCHAR2,
    deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

**Table 190-37**   UNLOCKRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
</tbody>
</table>
Table 190-37  (Cont.) UNLOCKRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deltoken</td>
<td>Lock token to be removed</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

190.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UPDATERESOURCEMETADATA Procedures.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath  IN VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath  IN VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath  IN VARCHAR2,
    oldns          IN   VARCHAR2,
    oldname IN VARCHAR,
    newmetadata    IN   XMLTYPE);
```
newmetadata IN XMLTYPE);

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

DBMS_XDB.UPDATERESOURCENODEMATA(
  abspath       IN   VARCHAR2,
  oldns         IN   VARCHAR2,
  oldname       IN   VARCHAR,
  newmetadata   IN   REF SYS.XMLTYPE);

Parameters

Table 190-38  UPDATERESOURCENODEMATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>oldmetadata</td>
<td>REF to the old of metadata</td>
</tr>
<tr>
<td>newmetadata</td>
<td>REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)</td>
</tr>
<tr>
<td>oldns</td>
<td>Namespace identifying old metadata</td>
</tr>
<tr>
<td>oldname</td>
<td>Local name identifying old metadata</td>
</tr>
</tbody>
</table>

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFS is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.
The DBMS_XDB_ADMIN package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- DBMS_XDB_ADMIN Security Model
- Summary of DBMS_XDB_ADMIN Subprograms

See Also:
Oracle XML DB Developer's Guide for information about Oracle XML DB Repository

191.1 DBMS_XDB_ADMIN Security Model

Owned by XDB, the DBMS_XDB_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

191.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 191-1  DBMS_XDB_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENONCEKEY Procedure</td>
<td>Generates a nonce value for use in digest authentication</td>
</tr>
<tr>
<td>INSTALLDEFAULTWALLET Procedure</td>
<td>Installs the default XDB wallet in the default XDB wallet directory</td>
</tr>
<tr>
<td>MOVEXDB_TABLESPACE Procedure</td>
<td>Moves the XDB (user) to the specified tablespace</td>
</tr>
<tr>
<td>REBUILDHIERARCHICALINDEX Procedure</td>
<td>Rebuilds the hierarchical index after import or export operations</td>
</tr>
</tbody>
</table>

191.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

DBMS_XDB_ADMIN.CREATENONCEKEY;
191.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by ORACLE_BASE when it is defined, or ORACLE_HOME. It is then followed by /admin/db_name/xdb_wallet where db_name is the unique database name.

Syntax

DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;

Usage Notes

Only SYS can install or replace the default wallet.

191.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
    new_tablespace   IN  VARCHAR2);

Parameters

Table 191-2  MOVEXDB_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>Name of the tablespace to where the XDB is moved</td>
</tr>
</tbody>
</table>

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If MOVEXDB_TABLESPACE fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the SYSAUX tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to READ ONLY because this might affect various XML operations being executed.

191.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:
- Overview
- Security Model
- Constants
- Summary of DBMS_XDB_CONFIG Subprograms

See Also:

*Oracle XML DB Developer's Guide*

### 192.1 DBMS_XDB_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of `XMLType` and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:
- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

### 192.2 DBMS_XDB_CONFIG Security Model

Owned by XDB, the `DBMS_XDB_CONFIG` package must be created by SYS or XDB. The `EXECUTE` privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
192.3 DBMS_XDB_CONFIG Constants

The DBMS_XDB_CONFIG package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 192-1    DBMS_XDB_CONFIG Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XDB_ENDPOINT_HTTP</td>
<td>NUMBER</td>
<td>1</td>
<td>Defining listener for first HTTP port</td>
</tr>
<tr>
<td>XDB_ENDPOINT_HTTP2</td>
<td>NUMBER</td>
<td>2</td>
<td>Defining listener for second HTTP port</td>
</tr>
<tr>
<td>XDB_ENDPOINT_RHTTP</td>
<td>NUMBER</td>
<td>3</td>
<td>Defining listener for a remote HTTP port</td>
</tr>
<tr>
<td>XDB_ENDPOINT_RHTTPS</td>
<td>NUMBER</td>
<td>4</td>
<td>Defining listener for a remote HTTPS port</td>
</tr>
<tr>
<td>XDB_PROTOCOL_TCP</td>
<td>NUMBER</td>
<td>1</td>
<td>Defining listener for HTTP protocol</td>
</tr>
<tr>
<td>XDB_PROTOCOL_TCPS</td>
<td>NUMBER</td>
<td>2</td>
<td>Defining listener for HTTPS protocol</td>
</tr>
</tbody>
</table>

192.4 Summary of DBMS_XDB_CONFIG Subprograms

The DBMS_XDB_CONFIG package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 192-2    DBMS_XDB_CONFIG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDHTTPEXPIREMAPPING Procedure</td>
<td>Adds to XDB$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.</td>
</tr>
<tr>
<td>ADDMIMEMAPPING Procedure</td>
<td>Adds a mime mapping to XDB configuration</td>
</tr>
<tr>
<td>ADDSCHEMALOCMAPPING Procedure</td>
<td>Adds a schema location mapping to the XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLET Procedure</td>
<td>Adds a servlet to XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLETMAPPING Procedure</td>
<td>Adds a servlet mapping to XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLETSECROLE Procedure</td>
<td>Adds a security role REF to a specified servlet in XDB configuration</td>
</tr>
</tbody>
</table>
| ADDXMLEXTENSION Procedure  | Adds adds the following XML extension to the XDB configuration under <xml-extensions>:
<extension>extension</extension> |
| CFG_GET Function          | Retrieves the session's configuration information as an XMLType instance      |
## Table 192-2  (Cont.) DBMS_XDB_CONFIG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<td>Sets the parameters of a listener end point corresponding to the XML DB HTTP server</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SETLISTENERLOCALACCESS Procedure</td>
<td>Restrictions all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to TRUE) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to FALSE)</td>
</tr>
<tr>
<td>SETREMOTEHTTPPORT Procedure</td>
<td>Sets the remote HTTP port to a new value</td>
</tr>
<tr>
<td>SETREMOTEHTTPSSPORT Procedure</td>
<td>Sets the remote HTTPS port to a new value</td>
</tr>
<tr>
<td>USEDPORT Procedure</td>
<td>Obtains the port numbers used by other pluggable databases in the same consolidation database</td>
</tr>
</tbody>
</table>

### 192.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

**Syntax**

```sql
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
<tr>
<td>expire</td>
<td>Expiration directive, follows the ExpireDefault in Apache's mod_expires:</td>
</tr>
<tr>
<td></td>
<td>base [plus] (num type)*</td>
</tr>
<tr>
<td></td>
<td>-- base: now</td>
</tr>
<tr>
<td></td>
<td>-- type: year</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test2/*', 'modification plus 1 day 30 seconds');
```

### 192.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```xml
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```
Syntax

DBMS_XDB_CONFIG.ADDMIMEMAPPING(
    extension IN VARCHAR2,
    mimetype IN VARCHAR2);

Parameters

Table 192-4  ADDMIMEMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is being added</td>
</tr>
<tr>
<td>mimetype</td>
<td>Mime type</td>
</tr>
</tbody>
</table>

192.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
    <namespace>namespace</namespace>
    <element>element</element>
    <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
    namespace IN VARCHAR2,
    element IN VARCHAR2,
    schemaURL IN VARCHAR2);

Parameters

Table 192-5  ADDSCHEMALOCMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>element</td>
<td>Element</td>
</tr>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>

192.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
    <servlet-name>name</servlet-name>     <servlet-language>language</servlet-language>
    <display-name>dispname</display-name>
    <description>descript</description>
    <servlet-class>class</servlet-class>
```
Syntax

DBMS_XDB_CONFIG.ADDSERVLET(
    name        IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL,
    schema      IN   VARCHAR2 := NULL);

Parameters

Table 192-6 ADDSERVLET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
<tr>
<td>language</td>
<td>Must be one of “C”, “Java”, “PL/SQL”</td>
</tr>
<tr>
<td>dispname</td>
<td>Display name</td>
</tr>
<tr>
<td>icon</td>
<td>Icon</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
<tr>
<td>class</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>jspfile</td>
<td>This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.</td>
</tr>
<tr>
<td>plsql</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema is used to specify servlet-schema xml element name in xdbconfig.xml. It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.</td>
</tr>
</tbody>
</table>

192.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servelt-mapping>
    <servelt-pattern>pattern</servelt-pattern>
    <servelt-name>name</servelt-name>
</servelt-mapping>
```
Syntax

DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
    pattern IN VARCHAR2, name IN VARCHAR2);

Parameters

Table 192-7  ADDSERVLETMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>Servlet pattern</td>
</tr>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>

192.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role <ref> to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```xml
<security-role-ref>
    <role-name>rolemame</role-name>
    <role-link>rolelink</role-link>
    <description>descript</description>
</security-role-ref>
```

Syntax

DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
    servname IN VARCHAR2, rolename IN VARCHAR2, rolelink IN VARCHAR2, descript IN VARCHAR2 := NULL);

Parameters

Table 192-8  ADDSERVLETSECROLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Role name</td>
</tr>
<tr>
<td>rolelink</td>
<td>Role link</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
</tbody>
</table>

192.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under <xml-extensions>.

It adds the following XML extension to the XDB configuration, under <xml-extensions>:

```xml
<extension>extension</extension>
```
Syntax

DBMS_XDB_CONFIG.ADDXMLEXTENSION(
    extension    IN   VARCHAR2);

Parameters

Table 192-9  ADDXMLEXTENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be added</td>
</tr>
</tbody>
</table>

192.4.8 CFG_GET Function

This function retrieves the session's configuration information as an XMLType instance.

Syntax

DBMS_XDB_CONFIG.CFG_GET
RETURN SYS.XMLType;

192.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

DBMS_XDB_CONFIG.CFG_REFRESH;

192.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

DBMS_XDB_CONFIG.CFG_UPDATE(
    xdbconfig   IN  SYS.XMLTYPE);

Parameters

Table 192-10  CFG_UPDATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdbconfig</td>
<td>The new configuration data</td>
</tr>
</tbody>
</table>
192.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
        pattern  IN   VARCHAR2);

Parameters

Table 192-11  DELETEHTTPEXPIREMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
</tbody>
</table>

192.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
        extension    IN   VARCHAR2);

Parameters

Table 192-12  DELETEMIMEMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is to be deleted</td>
</tr>
</tbody>
</table>

192.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
        schemaURL    IN   VARCHAR2);

Parameters

Table 192-13  DELETESCHEMALOCMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
192.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>

192.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETE_SERVLET_MAPPING(
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>

192.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETE_SERVLET_SEC_ROLE(
    servname IN VARCHAR2,  rolename IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Name of the role to be deleted</td>
</tr>
</tbody>
</table>
192.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

DBMS_XDB_CONFIG.DELETEXMLEXTENSION(
    extension IN VARCHAR2);

Parameters

Table 192-17  DELETEXMLEXTENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be deleted</td>
</tr>
</tbody>
</table>

192.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;

192.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

DBMS_XDB_CONFIG.GETFTPPORT
    RETURN NUMBER;

192.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
    RETURN VARCHAR2;

192.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

DBMS_XDB_CONFIG.GETHTTPPORT
    RETURN NUMBER;
192.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
RETURN NUMBER;
```

Usage Notes

Returns NULL if no port has been configured

192.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (  
    endpoint  IN   NUMBER,    
    host      OUT  VARCHAR2,    
    port      OUT  NUMBER,    
    protocol  OUT  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point listens</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point listens</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol accepted by the listener end point</td>
</tr>
</tbody>
</table>

192.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
RETURN NUMBER;
```
192.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

192.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the `GlobalPortEnabled` setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

192.4.27 SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPPORT(
    new_port  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the FTP port is set</td>
</tr>
</tbody>
</table>

192.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

Syntax

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (    isenabled  IN  BOOLEAN);
```
Parameters

Table 192-20  SETGLOBALPORTENABLED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| isenabled | TRUE enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port.  
          | FALSE enables the port ID to determine the PDB to use.  
          | The default is TRUE for PDBs but FALSE for the CDB root. |

Usage Notes

- **Use the** `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` **procedure if you use EM Express to manage database ports in a multitenant environment.**
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure in the CDB root.
- **After you set** `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` **to TRUE, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the Container Name field of the EM Express login page. For example, if you enter hr_pdb, then the EM Express URL becomes http://server_name:5500/hr_pdb/em. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB hr_pdb. The port can be an HTTP or HTTPS port.**
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED`. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the OPEN_MODE column of the V$PDBS dynamic view.
- The `DBMS_XDB_CONFIG.ISGLOBALPORTENABLED` function returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` setting.
- **You can use the** `XDB_PROTOCOLS` **lockdown profile to control the security for the global port.**

**See Also:**

- *Oracle Database 2 Day DBA* for information about using `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to start EM Express for a PDB
- *Oracle Database Security Guide*  
  for information about lockdown profiles
192.4.29 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```sql
DBMS_XDB_CONFIG.SETHTTPPORT(
    new_port  IN  NUMBER);
```

Parameters

Table 192-21 SETHTTPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTP port is set</td>
</tr>
</tbody>
</table>

192.4.30 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```sql
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
    realm IN VARCHAR2);
```

Parameters

Table 192-22 SETHTTPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm</td>
<td>Realm as defined in IETF's RFC2617</td>
</tr>
</tbody>
</table>

192.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```sql
DBMS_XDB_CONFIG.SETHTTPSPORT(
    new_port  IN  NUMBER);
```

Parameters

Table 192-23 SETHTTPSPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTPS port is set</td>
</tr>
</tbody>
</table>
192.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

DBMS_XDB_CONFIG.SETLISTENERENDPOINT (  
   endpoint  IN  NUMBER,  
   host      IN  VARCHAR2,  
   port      IN  NUMBER,  
   protocol  IN  NUMBER);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point is to listen. Its value can be 'LOCALHOST', NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point is to listen</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS</td>
</tr>
</tbody>
</table>

192.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when l_access is set to TRUE) or to listen on both localhost and non-localhost interfaces (when l_access is set to FALSE).

Syntax

DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (  
   l_access   BOOLEAN);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_access</td>
<td>TRUE or FALSE.</td>
</tr>
</tbody>
</table>
192.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
    new_port  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the remote HTTP port is set</td>
</tr>
</tbody>
</table>

192.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT {
    new_port  IN  NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the remote HTTPS port is set</td>
</tr>
</tbody>
</table>

192.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```
The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- Security Model
- Summary of `DBMS_XDB_CONSTANTS` Subprograms

### 193.1 DBMS_XDB_CONSTANTS Security Model

Owned by XDB, the `DBMS_XDB_CONSTANTS` package must be created by SYS or XDB. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

### 193.2 Summary of `DBMS_XDB_CONSTANTS` Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCODING_DEFAULT Function</td>
<td>Returns 'AL32UTF8'</td>
</tr>
<tr>
<td>ENCODING_ISO88591 Function</td>
<td>Returns 'WE8ISO8859P1'</td>
</tr>
<tr>
<td>ENCODING_UTF8 Function</td>
<td>Returns 'AL32UTF8'</td>
</tr>
<tr>
<td>ENCODING_WIN1252 Function</td>
<td>Returns 'WE8MSWIN1252'</td>
</tr>
<tr>
<td>NAMESPACE_ACL Function</td>
<td>Returns '<a href="http://xmlns.oracle.com/xdb/acl.xsd">http://xmlns.oracle.com/xdb/acl.xsd</a>'</td>
</tr>
<tr>
<td>NAMESPACE_METADATA Function</td>
<td>Returns '<a href="http://xmlns.oracle.com/xdbuserMetaData'">http://xmlns.oracle.com/xdbuserMetaData'</a></td>
</tr>
<tr>
<td>NAMESPACE_ORACLE Function</td>
<td>Returns '<a href="http://xmlns.oracle.com">http://xmlns.oracle.com</a>'</td>
</tr>
<tr>
<td>NAMESPACE_ORACLE_XDB Function</td>
<td>Returns '<a href="http://xmlns.oracle.com/xdb">http://xmlns.oracle.com/xdb</a>'</td>
</tr>
<tr>
<td>NAMESPACE_RESOURCE Function</td>
<td>Returns '<a href="http://xmlns.oracle.com/xdb/XDBResource.xsd">http://xmlns.oracle.com/xdb/XDBResource.xsd</a>'</td>

<tr>
<td>XSD_ELEMENT Function</td>
<td>Returns 'element'</td>
</tr>
<tr>
<td>XSD_GROUP Function</td>
<td>Returns 'group'</td>
</tr>
</tbody>
</table>
193.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

193.2.2 ENCODING_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'

193.2.3 ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

193.2.4 ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'
193.2.5 NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_ACL
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

193.2.6 NAMESPACE_METADATA Function

This function returns 'http://xmlns.oracle.com/xdbuserMetaData'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdbuserMetaData'

193.2.7 NAMESPACE_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com'

193.2.8 NAMESPACE_ORACLE_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb'
193.2.9 NAMESPACE_RESOURCE Function
This function returns '/XDBResource.xsd'

Syntax
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;

Return Value
'http://xmlns.oracle.com/xdb/XDBResource.xsd'

193.2.10 NAMESPACE_RESOURCE_EVENT Function
This function returns 'http://xmlns.oracle.com/resourceEvent'.

Syntax
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT
RETURN VARCHAR2 DETERMINISTIC;

Return Value
'http://xmlns.oracle.com/resourceEvent'

193.2.11 NAMESPACE_RESOURCE_CONFIG Function
This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

Syntax
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
RETURN VARCHAR2 DETERMINISTIC;

Return Value
'http://xmlns.oracle.com/XDBResConfig.xsd'

193.2.12 NAMESPACE_XDBSCHEMA Function
This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;

Return Value
'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
193.2.13 NAMESPACE_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

193.2.14 NAMESPACE_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://www.w3.org/2001/XMLSchema-instance'

193.2.15 NAMESPACE_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://www.w3.org/2001/XMLSchema'

193.2.16 NSPREFIX_ACL_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

Syntax

DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
193.2.17 NSPREFIX_RESCONFIG_RC Function

**This function returns** 'xmlns:rc=http://xmlns.oracle.com/xdb/XDBResConfig.xsd'.

**Syntax**

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
RETURN VARCHAR2 DETERMINISTIC;
```

**Return Value**

Returns 'xmlns:rc=http://xmlns.oracle.com/xdb/XDBResConfig.xsd'

193.2.18 NSPREFIX_RESOURCE_R Function

**This function returns** 'xmlns:r=http://xmlns.oracle.com/XDBResource.xsd'.

**Syntax**

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
RETURN VARCHAR2 DETERMINISTIC;
```

**Return Value**

'xmlns:r=http://xmlns.oracle.com/XDBResource.xsd'

193.2.19 NSPREFIX_XDB_XDB Function

**This function returns** 'http://xmlns.oracle.com/xdb'.

**Syntax**

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
RETURN VARCHAR2 DETERMINISTIC;
```

**Return Value**

'http://xmlns.oracle.com/xdb'

193.2.20 NSPREFIX_XMLINSTANCE_XSI Function

**This function returns** 'xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance'.

**Syntax**

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
RETURN VARCHAR2 DETERMINISTIC;
```

**Return Value**

'xmlns:xsi=http://www.w3.org/2001/XMLSchema-instance'
193.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'.

Syntax

DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'

193.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'.

Syntax

DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'

193.2.23 SCHEMAURL_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

193.2.24 SCHEMAELEM_RES_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'
193.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

193.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

193.2.27 SCHEMAURL_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

193.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
193.2.29 XDBSCHEMA_PREFIXES Function

This function returns 'xmlns:xsd=http://www.w3.org/2001/XMLSchema
xmlns:xdb=http://xmlns.oracle.com/xdb'.

Syntax

DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
RETURN VARCHAR2 DETERMINISTIC;

Return Value

193.2.30 XSD_ATTRIBUTE Function

This function returns 'attribute'.

Syntax

DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'attribute'

193.2.31 XSD_COMPLEX_TYPE Function

This function returns 'complexType'.

Syntax

DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'complexType'

193.2.32 XSD_ELEMENT Function

This function returns 'element'.

Syntax

DBMS_XDB_CONSTANTS.XSD_ELEMENT
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'element'
193.2.33 XSD_GROUP Function

This function returns 'group'

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'group'
DBMS_XDB_REPOS

The **DBMS_XDB_REPOS** package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Summary of DBMS_XDB_REPOS Subprograms**

**See Also:**

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

### 194.1 DBMS_XDB_REPOS Overview

The **DBMS_XDB_REPOS** package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - **DBMS_XDB_REPOS**, **DBMS_XDBZ**, and **DBMS_XDB_VERSION** - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

### 194.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the **DBMS_XDB_REPOS** package must be created by **SYS** or XDB. The **EXECUTE** privilege is granted to **PUBLIC**. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is **SYS** or XDB, or the current user has the **XDBADMIN** or **DBA** role.
194.3 DBMS_XDB_REPOS Constants

The DBMS_XDB_REPOS package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESOURCE</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletes a resource; fails if the resource has children.</td>
</tr>
<tr>
<td>DELETE_RECURSIVE</td>
<td>NUMBER</td>
<td>2</td>
<td>Deletes a resource and its children, if any.</td>
</tr>
<tr>
<td>DELETE_FORCE</td>
<td>NUMBER</td>
<td>3</td>
<td>Deletes the resource, even if the object it contains is invalid</td>
</tr>
<tr>
<td>DELETE_RECURSIVE_FORCE</td>
<td>NUMBER</td>
<td>4</td>
<td>Deletes a resource and its children, if any, even if the object it contains is invalid</td>
</tr>
<tr>
<td>DELETE_RES_METADATA_CA SCADE</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletes the row in the metadata</td>
</tr>
<tr>
<td>DELETE_RES_METADATA_NO CASCADE</td>
<td>NUMBER</td>
<td>2</td>
<td>Does not delete the row</td>
</tr>
<tr>
<td>DEFAULT_LOCK_TIMEOUT</td>
<td>PLS_INTEGER</td>
<td>(60*60)</td>
<td>Timeout value (in seconds) of the webdav lock</td>
</tr>
<tr>
<td>LINK_TYPE_HARD</td>
<td>NUMBER</td>
<td>1</td>
<td>Hard link of a folder to a resource</td>
</tr>
<tr>
<td>LINK_TYPE_WEAK</td>
<td>NUMBER</td>
<td>2</td>
<td>Weak link of a folder to a resource</td>
</tr>
<tr>
<td>LINK_TYPE_SYMBOLIC</td>
<td>NUMBER</td>
<td>3</td>
<td>Symbolic link of a folder to a resource</td>
</tr>
</tbody>
</table>

194.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the DBMS_XDB_REPOS subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACLCHECKPRIVILEGES Function</td>
<td>Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.</td>
</tr>
<tr>
<td>APPENDRESOURCEMETADATA Procedure</td>
<td>Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource</td>
</tr>
<tr>
<td>CHANGEOWNER Procedure</td>
<td>Changes the owner of the resource/s to the specified owner.</td>
</tr>
<tr>
<td>CHANGEPRIVILEGES Function</td>
<td>Adds a specified ACE to a specified resource's ACL</td>
</tr>
<tr>
<td>CHECKPRIVILEGES Function</td>
<td>Checks access privileges granted to the current user on the specified resource</td>
</tr>
<tr>
<td>CREATEFOLDER Function</td>
<td>Creates a new folder resource in the hierarchy</td>
</tr>
</tbody>
</table>
### Table 194-2  (Cont.) DBMS_XDB_REPOS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEOIDPATH Function</td>
<td>Creates a virtual path to the resource based on object ID</td>
</tr>
<tr>
<td>CREATEROUSERC Functions</td>
<td>Creates a new resource</td>
</tr>
<tr>
<td>DELETERESOURCE Procedure</td>
<td>Deletes a resource from the hierarchy</td>
</tr>
<tr>
<td>DELETERESOURCETMETADATA Procedures</td>
<td>Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)</td>
</tr>
<tr>
<td>EXISTSRESOURCE Function</td>
<td>Determines if a resource is the hierarchy, based on its absolute path</td>
</tr>
<tr>
<td>GETACLDOCUMENT Function</td>
<td>Retrieves ACL document that protects resource given its path name</td>
</tr>
<tr>
<td>GETCONTENTBLOB Function</td>
<td>Retrieves the contents of a resource returned as a BLOB</td>
</tr>
<tr>
<td>GETCONTENTCLOB Function</td>
<td>Retrieves the contents of a resource returned as a CLOB</td>
</tr>
<tr>
<td>GETCONTENTVARCHAR2 Function</td>
<td>Retrieves the contents of a resource returned as a string</td>
</tr>
<tr>
<td>GETCONTENTXMLREF Function</td>
<td>Retrieves the contents of a resource returned as a REF to an XMLTYPE</td>
</tr>
<tr>
<td>GETCONTENTXMLTYPE Function</td>
<td>Retrieves the contents of a resource returned as an XMLTYPE</td>
</tr>
<tr>
<td>GETLOCKTOKEN Procedure</td>
<td>Returns that resource's lock token for the current user given a path to a resource</td>
</tr>
<tr>
<td>GETPRIVILEGES Function</td>
<td>Gets all privileges granted to the current user on a specified resource</td>
</tr>
<tr>
<td>GETRESOID Function</td>
<td>Returns the object ID of the resource from its absolute path</td>
</tr>
<tr>
<td>GETXDB_TABLESPACE Function</td>
<td>Returns the current tablespace of the XDB (user)</td>
</tr>
<tr>
<td>HASBLOBCONTENT Function</td>
<td>Returns TRUE if the resource has BLOB content</td>
</tr>
<tr>
<td>HASCHARCONTENT Function</td>
<td>Returns TRUE if the resource has character content</td>
</tr>
<tr>
<td>HASXMLCONTENT Function</td>
<td>Returns TRUE if the resource has XML content</td>
</tr>
<tr>
<td>HASXMLREFERENCE Function</td>
<td>Returns TRUE if the resource has REF to XML content</td>
</tr>
<tr>
<td>ISFOLDER Function</td>
<td>Returns TRUE if the resource is a folder or container</td>
</tr>
<tr>
<td>LINK Procedures</td>
<td>Creates a link to an existing resource</td>
</tr>
<tr>
<td>LOCKRESOURCE Function</td>
<td>Gets a WebDAV-style lock on that resource given a path to that resource</td>
</tr>
<tr>
<td>PROCESSLINKS Procedure</td>
<td>Processes document links in the specified resource</td>
</tr>
<tr>
<td>PURGERESOURCETMETADATA Procedure</td>
<td>Deletes all user metadata from a resource</td>
</tr>
<tr>
<td>RENAMERESOURCE Procedure</td>
<td>Renames the XDB resource</td>
</tr>
<tr>
<td>SETACL Procedure</td>
<td>Sets the ACL on a specified resource</td>
</tr>
<tr>
<td>SPLITPATH Procedure</td>
<td>Splits the path into a parentpath and childpath</td>
</tr>
</tbody>
</table>
Table 194-2  (Cont.) DBMS_XDB_REPOS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOUCHRESOURCE Procedure</td>
<td>Changes the modification time of the resource to the current time</td>
</tr>
<tr>
<td>UNLOCKRESOURCE Function</td>
<td>Unlocks the resource given a lock token and resource path</td>
</tr>
<tr>
<td>UPDATERESOURCEMETADATA Procedures</td>
<td>Updates metadata for a resource</td>
</tr>
</tbody>
</table>

194.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the owner of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
    acl_path  IN  VARCHAR2,
    owner     IN  VARCHAR2,
    privs     IN  XMLType)
RETURN PLS_INTEGER;
```

Parameters

Table 194-3  ACLCHECKPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user &quot;DAV:owner&quot; is replaced by this user during ACL privilege resolution</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>

194.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath   IN  VARCHAR2,
    metadata  IN  XMLTYPE);
```

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath   IN  VARCHAR2,
    metadata  IN  REF SYS.XMLTYPE);
```
Parameters

Table 194-4  APPENDRESOURCEMETADATA Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.</td>
</tr>
</tbody>
</table>

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.

194.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```sql
DBMS_XDB_REPOS.CHANGEOWNER(
    abspath    IN   VARCHAR2,
    owner      IN   VARCHAR2,
    recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 194-5  CHANGEOWNER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner for the resource</td>
</tr>
<tr>
<td>recurse</td>
<td>If TRUE, recursively change owner of all resources in the folder tree</td>
</tr>
</tbody>
</table>

194.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```sql
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
    res_path   IN    VARCHAR2,
    ace        IN    xmltype)
RETURN PLS_INTEGER;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code>, the operation <code>&lt;grant&gt;</code> and the list of privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (`grant`/`deny`) already exists in the ACL, the new ACE is added at the end of the ACL.

194.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```sql
DBMS_XDB_REPOS.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if all requested privileges granted.

194.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```sql
DBMS_XDB_REPOS.CREATEFOLDER(
    path   IN  VARCHAR2)
RETURN BOOLEAN;
```
Parameters

Table 194-8 CREATEFOLDER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

194.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```sql
DBMS_XDB_REPOS.CREATEOIDPATH(
    oid    IN   RAW)
RETURN VARCHAR2;
```

Parameters

Table 194-9 CREATEOIDPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource</td>
</tr>
</tbody>
</table>

194.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax.

Syntax

Creates a new resource with a specified string as its contents:

```sql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```sql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  SYS.XMLTYPE)
RETURN BOOLEAN;
```
Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    datarow        IN  REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  BLOB,
    csid           IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath        IN  VARCHAR2,
    data           IN  BFILE,
    csid           IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (  
    abspath        IN  VARCHAR2,
    data           IN  CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (  
    abspath        IN  VARCHAR2,
    data           IN  VARCHAR2,
    schemaurl      IN  VARCHAR2 := NULL,
    elem           IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (  
    abspath        IN  VARCHAR2,
    data           IN  SYS.XMLTYPE,
    schemaurl      IN  VARCHAR2 := NULL,
    elem           IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```
Parameters

Table 194-10  CREATETABLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an XMLType row to be used as the contents</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: • From the abspath extension, determine the resource's MIME type. • If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>; • Otherwise, it is defaulted to the database character set.</td>
</tr>
<tr>
<td>schemaurl</td>
<td>For XML data, schema URL data conforms to (default NULL)</td>
</tr>
<tr>
<td>elem</td>
<td>Element name (default NULL)</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful; FALSE, otherwise.

194.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

DBMS_XDB_REPOS.DELETERESOURCE(
  path          IN      VARCHAR2,
  delete_option IN      PLS_INTEGER);

Parameters

Table 194-11  DELETERESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted: • DELETE_RESOURCE • DELETE_RECURSIVE • DELETE_FORCE • DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>
194.4.10 DELETERESOURCENAMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

**Syntax**

Can be used only for schema-based metadata:

```sql
DBMS_XDB_REPOS.DELETERESOURCENAMETADATA (
    abspath    IN VARCHAR2,
    metadata   IN REF SYS.XMLTYPE,
    delete_option IN pls_integer :=
        DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```sql
DBMS_XDB_REPOS.DELETERESOURCENAMETADATA (
    abspath    IN VARCHAR2,
    mettadatans IN VARCHAR2,
    mettadatename IN VARCHAR2,
    delete_option IN pls_integer :=
        DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>REF to the piece of metadata (schema based) to be deleted</td>
</tr>
<tr>
<td>mettadatans</td>
<td>Namespace of the metadata fragment to be removed</td>
</tr>
<tr>
<td>mettadatename</td>
<td>Local name of the metadata fragment to be removed</td>
</tr>
<tr>
<td>delete_option</td>
<td>Only applicable for schema-based metadata, this can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</td>
</tr>
</tbody>
</table>

194.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

**Syntax**

```sql
DBMS_XDB_REPOS.EXISTSRESOURCE(
    abspath    IN VARCHAR2)
RETURN BOOLEAN;
```
Parameters

Table 194-13  EXISTSRCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is found.

194.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
  abspath  IN  VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 194-14  GETACLDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

The XMLType for ACL document.

194.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
  abspath    IN     VARCHAR2,
  csid       OUT    PLS_INTEGER,
  locksrc    IN     BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 194-15  GETCONTENTBLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>csid</td>
<td>If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.</td>
</tr>
</tbody>
</table>
194.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```sql
DBMS_XDB_REPOS.GETCONTENTCLOB(
    abspath    IN     VARCHAR2,
RETURN CLOB;
```

Parameters

Table 194-16  GETCONTENTCLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a CLOB.

194.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```sql
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
    abspath    IN     VARCHAR2,
RETURN BLOB;
```

Parameters

Table 194-17  GETCONTENTVARCHAR2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a string.
194.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a [REF to an XMLTYPE].

Syntax

\[
\text{DBMS_XDB_REPOS.GETCONTENTXMLREF (}
\text{abspath IN VARCHAR2,}
\text{RETURN SYS.XMLTYPE;}
\]

Parameters

Table 194-18 GETCONTENTXMLREF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a [REF to an XMLTYPE].

194.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

\[
\text{DBMS_XDB_REPOS.GETCONTENTXMLTYPE (}
\text{abspath IN VARCHAR2,}
\text{RETURN SYS.XMLTYPE;}
\]

Parameters

Table 194-19 GETCONTENTXMLTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as an XMLTYPE.

194.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

\[
\text{DBMS_XDB_REPOS.GETLOCKTOKEN (}
\text{path IN VARCHAR2,}
\text{locktoken OUT VARCHAR2;}
\]
Parameters

Table 194-20  GETLOCKTOKEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user’s lock token for the resource</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have READPROPERTIES privilege on the resource.

194.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```sql
DBMS_XDB_REPOS.GETPRIVILEGES(
    res_path IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 194-21  GETPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource</td>
</tr>
</tbody>
</table>

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

194.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

Syntax

```sql
DBMS_XDB_REPOS.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 194-22  GETRESOID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
Return Values

NULL if the resource is not present.

194.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

DBMS_XDB_REPOS.GETXDB_TABLESPACE
RETURN VARCHAR2;

194.4.22 HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

DBMS_XDB_REPOS.HASBLOBCONTENT
abspath    IN     VARCHAR2)
RETURN BOOLEAN;

Parameters

Table 194-23  HASBLOBCONTENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has BLOB content.

194.4.23 HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

DBMS_XDB_REPOS.HASCHARCONTENT
abspath    IN     VARCHAR2)
RETURN BOOLEAN;

Parameters

Table 194-24  HASCHARCONTENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
Return Values

TRUE if the resource has character content.

194.4.24 HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has XML content.

194.4.25 HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE resource has a REF to XML content.
194.4.26 ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

**Syntax**

```sql
DBMS_XDB_REPOS.ISFOLDER
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if the resource is a folder or container.

194.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

**Syntax**

```sql
DBMS_XDB_REPOS.LINK(
    srcpath IN VARCHAR2,
    linkfolder IN VARCHAR2,
    linkname IN VARCHAR2,
    linktype IN PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is created</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link</td>
</tr>
<tr>
<td>linktype</td>
<td>Type of link to be created:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_XDB.LINK_TYPE_HARD (default)</td>
</tr>
<tr>
<td></td>
<td>• DBMS_XDB.LINK_TYPE_WEAK</td>
</tr>
<tr>
<td></td>
<td>• DBMS_XDB.LINK_TYPE_SYMBOLIC</td>
</tr>
</tbody>
</table>
194.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

**Syntax**

```
DBMS_XDB_REPOS.LOCKRESOURCE(
    path IN VARCHAR2,
    depthzero IN BOOLEAN,
    shared IN boolean
) RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>Currently not supported</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE obtains a shared write lock</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if successful.

**Usage Notes**

The user must have UPDATE privileges on the resource.

194.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

**Syntax**

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
    abspath IN VARCHAR2,
    recurse IN BOOLEAN := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource. If the path is a folder, use the recurse flag.</td>
</tr>
<tr>
<td>recurse</td>
<td>Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.</td>
</tr>
</tbody>
</table>
194.4.30 PURGERESOURCENMADATADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

DBMS_XDB_REPOS.PURGERESOURCENMADATADATA(
    abspath  IN  VARCHAR2);

Parameters

Table 194-31  PURGERESOURCENMADATADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

194.4.31 RENAMERESOURCEN Procedure

This procedure renames the XDB resource.

Syntax

DBMS_XDB_REPOS.RENAMERESOURCEN(
    srcpath    IN  VARCHAR2,
    destfolder IN  VARCHAR2,
    newname    IN  VARCHAR2);

Parameters

Table 194-32  RENAMERESOURCEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Absolute path in the Hierarchy for the source resource destination folder</td>
</tr>
<tr>
<td>destfolder</td>
<td>Absolute path in the Hierarchy for the destination folder</td>
</tr>
<tr>
<td>newname</td>
<td>Name of the child in the destination folder</td>
</tr>
</tbody>
</table>

194.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

DBMS_XDB_REPOS.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);
Parameters

**Table 194-33 SETACL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL</td>
</tr>
</tbody>
</table>

**Usage Notes**

The user must have `<write-acl>` privileges on the resource.

### 194.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

**Syntax**

```sql
DBMS_XDB_REPOS.SPLITPATH(
  abspath     IN  VARCHAR2,
  parentpath  OUT VARCHAR2,
  childpath   OUT VARCHAR2);
```

**Parameters**

**Table 194-34 SPLITPATH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path to be split</td>
</tr>
<tr>
<td>parentpath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childpath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>

### 194.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

**Syntax**

```sql
DBMS_XDB_REPOS.TOUCHRESOURCE
  abspath    IN     VARCHAR2);
```

**Parameters**

**Table 194-35 TOUCHRESOURCE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
194.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

**Syntax**

```sql
DBMS_XDB_REPOS.UNLOCKRESOURCE(
    path IN VARCHAR2,
    deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>deltoken</td>
<td>Lock token to be removed</td>
</tr>
</tbody>
</table>

**Return Values**

`TRUE` if operation successful.

**Usage Notes**

The user must have `UPDATE` privileges on the resource.

194.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its `REF`. It replaces that piece of metadata with user-defined metadata which is either in the form of a `REF` to `XMLTYPE` or an `XMLTYPE`.

**Syntax**

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```sql
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```sql
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN XMLTYPE);
```
Can be used for both schema-based and nonschema-based metadata:

```sql
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata
must be schema-based:

```sql
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN REF SYS.XMLTYPE);
```

### Parameters

**Table 194-37  UPDATERESOURCEMETADATA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>oldmetadata</td>
<td>REF to the old of metadata</td>
</tr>
<tr>
<td>newmetadata</td>
<td>REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)</td>
</tr>
<tr>
<td>oldns</td>
<td>Namespace identifying old metadata</td>
</tr>
<tr>
<td>oldname</td>
<td>Local name identifying old metadata</td>
</tr>
</tbody>
</table>

**Usage Notes**

In the case of REF, it stores the REF in the resource and the metadata is stored in a
separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is
passed in, data is parsed to determine if it is schema-based or not and is stored
accordingly.
Oracle XML DB versioning interfaces are found in the `DBMS_XBD_VERSION` package. Functions and procedures of `DBMS_XBD_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- Security Model
- Summary of DBMS_XDB_VERSION Subprograms

**195.1 DBMS_XDB_VERSION Security Model**

Owned by XDB, the `DBMS_XDB_VERSION` package must be created by SYS or XDB. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

**195.2 Summary of DBMS_XDB_VERSION Subprograms**

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKIN Function</td>
<td>Checks in a checked-out VCR and returns the resource id of the newly-created version</td>
</tr>
<tr>
<td>CHECKOUT Procedure</td>
<td>Checks out a VCR before updating or deleting it</td>
</tr>
<tr>
<td>GETCONTENTSBLOBBYRESID Function</td>
<td>Obtain contents as a BLOB</td>
</tr>
<tr>
<td>GETCONTENTSCLOBBYRESID Function</td>
<td>Obtain contents as a CLOB</td>
</tr>
<tr>
<td>GETCONTENTSXXMLBYRESID Function</td>
<td>Obtain contents as an XMLType</td>
</tr>
<tr>
<td>GETPREDECESSORS Function</td>
<td>Retrieves the list of predecessors by path name</td>
</tr>
<tr>
<td>GETPREDSDBYRESID Function</td>
<td>Retrieves the list of predecessors by resource id</td>
</tr>
<tr>
<td>GETRESOURCERYRESID Function</td>
<td>Obtains the resource as an XMLType, given the resource object ID</td>
</tr>
</tbody>
</table>
Table 195-1 (Cont.)  DBMS_XDB_VERSION Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETSUCCESSORS Function</td>
<td>Retrieves the list of successors by path name</td>
</tr>
<tr>
<td>GETSUCCSBYRESID Function</td>
<td>Retrieves the list of successors by resource id</td>
</tr>
<tr>
<td>MAKEVERSIONED Function</td>
<td>Turns a regular resource whose path name is given into a version-controlled resource</td>
</tr>
<tr>
<td>UNCHECKOUT Function</td>
<td>Checks in a checked-out resource, returns the resource id of the version before the resource is checked out</td>
</tr>
</tbody>
</table>

195.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```sql
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 195-2 CHECKIN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

195.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```sql
DBMS_XDB_VERSION.Checkout(
    pathname VARCHAR2);
```
Parameters

Table 195-3  CHECKOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the VCR to be checked out.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, or if the resource doesn't exist.

195.2.3 GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

Table 195-4  GETCONTENTSBLOBBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

195.2.4 GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBBYRESID(
    resid     DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

Table 195-5  GETCONTENTSCLOBBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
195.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid   DBMS_XDB.resid_type)
RETURN XMLType;
```

Parameters

Table 195-6  GETCONTENTSXMLBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Return Values

If the contents are not valid XML, returns NULL.

195.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname     VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 195-7  GETPREDECESSORS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Return Values

An exception is raised if pathname is illegal.

195.2.7 GETPREDSTYPEBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSTYPEBYRESID(
    resid   resid_type)
RETURN resid_list_type;
```
Parameters

Table 195-8  GETPREDSDBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.

195.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```sql
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
    resid resid_type)
RETURN XMLType;
```

Parameters

Table 195-9  GETRESOURCEBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

195.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```sql
DBMS_XDB_VERSION.GETSUCCESSORS(
    pathname VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 195-10  GETSUCCESSORS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>
Usage Notes
Getting successors by RESID is more efficient than by pathname.

Exceptions
An exception is raised if the pathname is illegal.

195.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```sql
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid resid_type
) RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes
Getting successors by RESID is more efficient than by pathname.

Exceptions
An exception is raised if the pathname is illegal.

195.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```sql
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource to be put under version control.</td>
</tr>
</tbody>
</table>
Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

195.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```sql
DBMS_XDB_VERSION.UNCHECKOUT(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 195-13 UNCHECKOUT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.
The **DBMS_XDBRESOURCE** package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Summary of DBMS_XDBRESOURCE Subprograms**

**See Also:**

Oracle XML DB Developer's Guide for examples of "Using **DBMS_XDBRESOURCE**"

---

### 196.1 DBMS_XDBRESOURCE Overview

The **DBMS_XDBRESOURCE** package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in **DBMS_XMLDOM** package, an XDBResource instance could be converted to a DOMDocument type by using **DBMS_XDBRESOURCE.MAKEDOCUMENT** routine.

### 196.2 DBMS_XDBRESOURCE Security Model

Owned by XDB, the **DBMS_XDBRESOURCE** package must be created by SYS or XDB. The **EXECUTE** privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

### 196.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the **DBMS_XDBRESOURCE** subprograms and briefly describes them.

**Table 196-1   **DBMS_XDBRESOURCE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREERESOURCE Procedure</td>
<td>Frees any memory associated with an XDBResource</td>
</tr>
<tr>

<tr>
<td><strong>SETCONTENTTYPE</strong> Procedure</td>
<td>Sets the content-type of the given XDBResource</td>
</tr>
<tr>
<td><strong>SETCUSTOMMETADATA</strong> Procedure</td>
<td>Sets the custom metadata specified by the XPath and namespace to new data</td>
</tr>
<tr>
<td><strong>SETDISPLAYNAME</strong> Procedure</td>
<td>Sets the display name of the given XDBResource</td>
</tr>
<tr>
<td><strong>SETLANGUAGE</strong> Procedure</td>
<td>Sets the language of the given XDBResource</td>
</tr>
<tr>
<td><strong>SETOWNER</strong> Procedure</td>
<td>Sets the owner of the given XDBResource</td>
</tr>
</tbody>
</table>
196.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

DBMS_XDBRESOURCE.FREERESOURCE (  
   res IN XDBResource)  
RETURN VARCHAR2;

Parameters

Table 196-2  FREERESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource to free</td>
</tr>
</tbody>
</table>

196.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

DBMS_XDBRESOURCE.GETACL (  
   res IN XDBResource)  
RETURN VARCHAR2;

Parameters

Table 196-3  GETACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

DBMS_XDBRESOURCE.GETACLDOCFROMRES (  
   res IN XDBResource)  
RETURN SYS.XMLTYPE;

Parameters

Table 196-4  GETACLDOCFROMRES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```sql
DBMS_XDBRESOURCE.GETAUTHOR (  
    res IN XDBResource  
) RETURN VARCHAR2;
```

Parameters

Table 196-5  GETAUTHOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```sql
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource  
) RETURN VARCHAR2;
```

Parameters

Table 196-6  GETCHARACTERSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```sql
DBMS_XDBRESOURCE.GETCOMMENT (  
    res IN XDBResource  
) RETURN VARCHAR2;
```

Parameters

Table 196-7  GETCOMMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (  
  res IN XDBResource,  
  csid OUT PLS_INTEGER)  
RETURN BLOB;
```

Parameters

Table 196-8 GETCONTENTBLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BLOB returned</td>
</tr>
</tbody>
</table>

196.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (  
  res IN XDBResource)  
RETURN CLOB;
```

Parameters

Table 196-9 GETCONTENTCLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (  
  res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 196-10  GETCONTENTREF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (  
   res   IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 196-11  GETCONTENTTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (  
   res   IN    XDBResource)  
RETURN XMLType;
```

Parameters

Table 196-12  GETCONTENTXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (  
   res   IN    XDBResource)  
RETURN VARCHAR2;
```
Parameters

Table 196-13  GETCONTENTVARCHAR2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```sql
DBMS_XDBRESOURCE.GETCREATIONDATE (    res IN XDBResource)    RETURN TIMESTAMP;
```

Parameters

Table 196-14  GETCREATIONDATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```sql
DBMS_XDBRESOURCE.GETCREATOR (    res IN XDBResource)    RETURN VARCHAR2;
```

Parameters

Table 196-15  GETCREATOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```sql
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (    res IN XDBResource,
```
Parameters

Table 196-16  GETCUSTOMMETADATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath for custom metadata</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".

196.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (  
    res  IN  XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 196-17  GETDISPLAYNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (  
    res  IN  XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 196-18  GETLANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (    
    res  IN    XDBResource)    
RETURN VARCHAR2;
```

Parameters

Table 196-19  GETLASTMODIFIER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (    
    res  IN    XDBResource)    
RETURN TIMESTAMP;
```

Parameters

Table 196-20  GETMODIFICATIONDATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (    
    res  IN    XDBResource)    
RETURN VARCHAR2;
```

Parameters

Table 196-21  GETOWNER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (  
   res IN    XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

**Table 196-22 GETREFCOUNT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (  
   res IN    XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

**Table 196-23 GETVERSIONID Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.23 HASACLCHANGED Function

This function returns **TRUE** if the ACL of the given resource has changed, **FALSE** otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (  
   res IN    XDBResource)  
RETURN BOOLEAN;
```

Parameters

**Table 196-24 HASACLCHANGED Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.24 HASAUTHORCHANGED Function

This function returns **TRUE** if the author of the given resource has changed, **FALSE** otherwise.

**Syntax**

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

**Parameters**

**Table 196-25  HASAUTHORCHANGED Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

**Syntax**

```
DBMS_XDBRESOURCE.HASCHANGED (
    res IN XDBResource,
    xpath IN VARCHAR2,
    namespace IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

**Table 196-26  HASCHANGED Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to check</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
</tbody>
</table>

196.3.26 HASCHARACTERSETCHANGED Function

This function returns **TRUE** if the character set of the given resource has changed, **FALSE** otherwise.

**Syntax**

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```
Parameters

Table 196-27  HASCHARACTERSETCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.27 HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
    res   IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 196-28  HASCOMMENTCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.28 HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
    res   IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 196-29  HASCONTENTCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.29 HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (  
  res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.30 HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (  
  res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.31 HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (  
  res IN XDBResource)  
RETURN BOOLEAN;
```
196.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```sql
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (
  res   IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 196-33  HASCUSTOMMETADATACHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (
  res   IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 196-34  HASDISPLAYNAMECHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (
    res IN XDBResource
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (
    res IN XDBResource
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
    res IN XDBResource
) RETURN BOOLEAN;
```
Parameters

### Table 196-37  HASMODIFICATIONDATECHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

#### 196.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

**Syntax**

```sql
DBMS_XDBRESOURCE.HASOWNERCHANGED (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

### Table 196-38  HASOWNERCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

#### 196.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

**Syntax**

```sql
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

### Table 196-39  HASREFCOUNTCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
196.3.39 HASVERSIONIDCHANGED Function

This function returns **TRUE** if the version ID of the given resource has changed, **FALSE** otherwise.

**Syntax**

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.40 ISFOLDER Function

This function returns **TRUE** if the given resource is a folder, **FALSE** otherwise.

**Syntax**

```
DBMS_XDBRESOURCE.ISFOLDER (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.41 ISNULL Function

This function returns **TRUE** if input resource is **NULL**.

**Syntax**

```
DBMS_XDBRESOURCE.ISNULL (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>Input resource</td>
</tr>
</tbody>
</table>
196.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

![See Also:]
The DBMS_XMLDOM package

**Syntax**

DBMS_XDBRESOURCE.MAKEDOCUMENT (  
    res   IN    XDBResource)  
RETURN DBMS_XMLDOM.DOMDocument;

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

**Syntax**

DBMS_XDBRESOURCE.SAVE (  
    res   IN    XDBResource);

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

196.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

**Syntax**

DBMS_XDBRESOURCE.SETACL (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
Parameters

**Table 196-45  SETACL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>Absolute path of the new ACL</td>
</tr>
</tbody>
</table>

196.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

**Syntax**

```sql
DBMS_XDBRESOURCE.SETAUTHOR (
    res IN OUT XDBResource,
    author IN VARCHAR2);
```

Parameters

**Table 196-46  SETAUTHOR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>author</td>
<td>Author</td>
</tr>
</tbody>
</table>

196.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

**Syntax**

```sql
DBMS_XDBRESOURCE.SETCHARACTERSET (    res IN OUT XDBResource,
    charSet IN VARCHAR2);
```

Parameters

**Table 196-47  SETCHARACTERSET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>charset</td>
<td>New character set</td>
</tr>
</tbody>
</table>
196.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (  
    res    IN OUT  XDBResource,  
    comment IN      VARCHAR2);  
```

Parameters

Table 196-48  SETCOMMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>comment</td>
<td>New comment</td>
</tr>
</tbody>
</table>

196.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      BFILE,  
    csid   IN      NUMBER);  
```

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      BLOB,  
    csid   IN      PLS_INTEGER);  
```

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      CLOB);  
```

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      REF SYS.XMLType,  
    sticky IN      BOOLEAN := TRUE);  
```

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      VARCHAR2);  
```

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res    IN OUT  XDBResource,  
    data   IN      SYS.XMLType);  
```
Parameters

Table 196-49  SETCONTENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>data</td>
<td>Data input as BFILE, BLOB, CLOB, string, XMLType</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BFILE, BLOB</td>
</tr>
<tr>
<td>sticky</td>
<td>If TRUE creates a sticky REF, otherwise non-sticky</td>
</tr>
</tbody>
</table>

196.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.SETCONTENTTYPE (  
    res       IN OUT  XDBResource,  
    conttype  IN      VARCHAR2);  
```

Parameters

Table 196-50  SETCONTENTTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>conttype</td>
<td>New content-type</td>
</tr>
</tbody>
</table>

196.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```sql
DBMS_XDBRESOURCE.SETCUSTOMMETADATA (  
    res          IN OUT  XDBResource,  
    xpath        IN      VARCHAR2,  
    namespace    IN      VARCHAR2,  
    newMetadata  IN      XMLType);  
```

Parameters

Table 196-51  SETCUSTOMMETADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to change</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
</tbody>
</table>
Table 196-51  (Cont.) SETCUSTOMMETADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>newMetadata</td>
<td>New data that should replace the metadata at the given XPath</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".

196.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.SETDISPLAYNAME (
    res      IN OUT  XDBResource,
    name     IN      VARCHAR2);
```

Parameters

Table 196-52  SETDISPLAYNAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>name</td>
<td>New display name</td>
</tr>
</tbody>
</table>

196.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.SETLANGUAGE (
    res      IN OUT  XDBResource,
    ACLPath  IN      VARCHAR2);
```

Parameters

Table 196-53  SETLANGUAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>New path</td>
</tr>
</tbody>
</table>
196.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (
    res   IN OUT  XDBResource,
    owner IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.
The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy.

The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index.

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of `DBMS_XDBT` Subprograms

See Also:

*Oracle XML DB Developer's Guide*

### 197.1 DBMS_XDBT Overview

The `DBMS_XDBT` package contains a set of package variables that describe the configuration settings for the index.

The `DBMS_XDBT` package can be used in the following ways:

- Customize the package to set up the appropriate configuration.
- Use the `DROPREFERENCES` Procedure to drop any existing index preferences.
- Create new index preferences using the `CREATEPREFERENCES` Procedure.
- Create the `CONTEXT` index using the `CREATEINDEX` Procedure.
- Set up automatic synchronization of the index using the `CONFIGUREAUTOSYNC` Procedure.

### 197.2 DBMS_XDBT Security Model

*Owned by XDB, the `DBMS_XDBT` package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB. Subprograms in this package are executed using the privileges of the current user.*
197.3 DBMS_XDBT Operational Notes

Configuration settings, or package variables, are available to customize the DBMS_XDBT package.

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views.

Table 197-1 General Indexing Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IndexName</td>
<td>XDB$CI</td>
<td>Name of the CONTEXT index.</td>
</tr>
<tr>
<td>IndexTablespace</td>
<td>XDB$RESINFO</td>
<td>Tablespace used by tables and indexes comprising the CONTEXT index.</td>
</tr>
<tr>
<td>IndexMemory</td>
<td>128M</td>
<td>Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).</td>
</tr>
<tr>
<td>LogFile</td>
<td>'XdbCtxLog'</td>
<td>The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.</td>
</tr>
</tbody>
</table>

Table 197-6  SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoSyncPolicy</td>
<td>SYNC_BY_PENDING_COUNT</td>
<td>Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNCE_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>MaxPendingCount</td>
<td>2</td>
<td>Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>CheckPendingCountInterval</td>
<td>10 minutes</td>
<td>How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>SyncInterval</td>
<td>60 minutes</td>
<td>Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
</tbody>
</table>

197.4 Summary of DBMS_XDBT Subprograms

This table lists the DBMS_XDBT subprograms in alphabetical order and briefly describes them.

Table 197-7  DBMS_XDBT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGUREAUTOSYNC</td>
<td>Configures the CONTEXT index for automatic maintenance, SYNC</td>
</tr>
<tr>
<td>CREATEDATASTOREPREF</td>
<td>Creates a USER datastore preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEFILTERPREF</td>
<td>Creates a filter preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEINDEX</td>
<td>Creates the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATELEXERPREF</td>
<td>Creates a lexer preference for the CONTEXT index</td>
</tr>
</tbody>
</table>
Table 197-7  (Cont.) DBMS_XDBT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEPREFERENCES Procedure</td>
<td>Creates preferences required for the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATESECTIONGROUPPREF</td>
<td>Creates a storage preference for the CONTEXT index</td>
</tr>
<tr>
<td>Procedure</td>
<td></td>
</tr>
<tr>
<td>CREATESTOPLISTPREF Procedure</td>
<td>Creates a section group for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTORAGEPREF Procedure</td>
<td>Creates a wordlist preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEWORLDLISTPREF</td>
<td>Creates a stoplist for the CONTEXT index</td>
</tr>
<tr>
<td>Procedure</td>
<td></td>
</tr>
<tr>
<td>DROPPREFERENCES Procedure</td>
<td>Drops any existing preferences</td>
</tr>
</tbody>
</table>

197.4.1 CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

DBMS_XDBT.CONFIGUREAUTOSYNC;

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views.
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

<table>
<thead>
<tr>
<th>Sync Basis</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYNC_BY_PENDING_COUNT</td>
<td>The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter) to determine if the number of documents exceeds the threshold.</td>
</tr>
<tr>
<td>SYNC_BY_TIME</td>
<td>The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter).</td>
</tr>
<tr>
<td>SYNC_BY_PENDING_COUNT_AND_TIME</td>
<td>A combination of both of the preceding options.</td>
</tr>
</tbody>
</table>
197.4.2 CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEDATASTOREPREF;

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the INSO filter through the IFILTER API.

197.4.3 CREATEFILTERPREF Procedure

This procedure creates a NULL filter preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEFILTERPREF;

Usage Notes

- The name of the filter preference can be modified; see FilterPref configuration setting.
- The USER datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedure for more details.

197.4.4 CREATEINDEX Procedure

This procedure creates the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEINDEX;

Usage Notes

- The name of the index can be changed; see the IndexName configuration setting.
Set the LogFile configuration parameter to enable ROWID logging during index creation.
Set the IndexMemory configuration parameter to determine the amount of memory that index creation, and later SYNCS, will use.

197.4.5 CREATELEXERPREF Procedure

This procedure creates a BASIC lexer preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the lexer preference can be modified; see LexerPref configuration setting. No other configuration settings are provided.
- MultiLexer preferences are not supported.
- Base letter translation is turned on by default.

197.4.6 CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

197.4.7 CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.

197.4.8 CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```
Usage Notes

- The name of the stoplist can be modified; see the StoplistPref configuration setting.
- Numbers are not indexed.
- The StopWords array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in CTXSYS.DEFAULT_STOPLIST.

197.4.9 CREATESTORAGEPREF Procedure

This procedure creates a BASIC_STORAGE preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATESTORAGEPREF;

Usage Notes

- The name of the storage preference can be modified; see the StoragePref configuration setting.
- A tablespace can be specified for the tables and indexes comprising the CONTEXT index; see the IndexTablespace Configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The I_INDEX_CLAUSE uses key compression.

197.4.10 CREATEWORLDLISTPREF Procedure

This procedure creates a word list preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEWORLDLISTPREF;

Usage Notes

- The name of the word list preference can be modified; see the WordlistPref configuration setting. No other configuration settings are provided.
- FUZZY_MATCH and STEMMER attributes are set to AUTO (auto-language detection)

197.4.11 DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.DROPPREFERENCES;
The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

• Security Model
• Constants
• Summary of DBMS_XDBZ Subprograms

See Also:
Oracle XML DB Developer’s Guide

198.1 DBMS_XDBZ Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

198.2 DBMS_XDBZ Constants

The DBMS_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 198-1  DBMS_XDBZ Constants - Name Format

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_FORMAT_SHORT</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>DB user name or LDAP nickname</td>
</tr>
<tr>
<td>NAME_FORMAT_DISTINGUISHED</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>LDAP distinguished name</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>ENABLE_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure</td>
</tr>
</tbody>
</table>
Table 198-2 *(Cont.*) **DBMS_XDBZ Constants** - Enable Option

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

Table 198-3 **DBMS_XDBZ Constants** - Enable Option Exercised

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_ENABLED CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>If hierarchy was enabled for contents, that is, the <strong>ENABLE_HIERARCHY</strong> Procedure was called with hierarchy_type as <strong>ENABLE_CONTENTS</strong></td>
</tr>
<tr>
<td>IS_ENABLED_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>If hierarchy was enabled for resource metadata, that is, the <strong>ENABLE_HIERARCHY</strong> Procedure was called with hierarchy_type as <strong>ENABLE_RESMETADATA</strong></td>
</tr>
</tbody>
</table>

198.3 Summary of DBMS_XDBZ Subprograms

This table lists the **DBMS_XDBZ** subprograms and briefly describes them.

Table 198-4 **DBMS_XDBZ Package Subprograms**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_HIERARCHY</td>
<td>Disables repository support for the specified XMLTYPE table or view</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY</td>
<td>Enables repository support for the specified XMLType table or view</td>
</tr>
<tr>
<td>GET_ACLOID Function</td>
<td>Retrieves the ACL Object ID for the specified resource</td>
</tr>
<tr>
<td>GET_USERID Function</td>

<tr>
<td>IS_HIERARCHY_ENABLED</td>
<td>Determines if repository support for the specified XMLType table or view is enabled</td>
</tr>
<tr>
<td>PURGELDAPCACHE Function</td>
<td>Purges the LDAP nickname cache</td>
</tr>
</tbody>
</table>

198.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

**Syntax**

```sql
DBMS_XDBZ.CREATENONCEKEY;
```
198.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

DBMS_XDBZ.DISABLE_HIERARCHY(
    object_schema IN VARCHAR2,
    object_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
</tbody>
</table>

198.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also:

Oracle XML DB Developer's Guide for more information about

Syntax

DBMS_XDBZ.ENABLE_HIERARCHY(
    object_schema IN VARCHAR2,
    object_name IN VARCHAR2,
    hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
</tbody>
</table>
Table 198-6  (Cont.) ENABLE_HIERARCHY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hierarchy_type</td>
<td>How to enable the hierarchy.</td>
</tr>
<tr>
<td></td>
<td>• ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository</td>
</tr>
<tr>
<td></td>
<td>• ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

198.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
    aclpath   IN   VARCHAR2,
    acloid    OUT  RAW)
RETURN BOOLEAN;
```

Parameters

Table 198-7  GET_ACLOID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aclpath</td>
<td>ACL resource path for the repository</td>
</tr>
<tr>
<td>acloid</td>
<td>Returned Object ID</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.

198.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
    username IN  VARCHAR2,
    userid   OUT RAW,
    format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```
Parameters

Table 198-8  GET_USERID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the database or LDAP user.</td>
</tr>
<tr>
<td>userid</td>
<td>Return parameter for the matching user id.</td>
</tr>
<tr>
<td>format</td>
<td>Format of the specified user name; valid options are:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_DISTRIBUTED -- LDAP distinguished name.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.

198.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```sql
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
    object_schema   IN  VARCHAR2,
    object_name     IN  VARCHAR2,
    hierarchy_type  IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

Parameters

Table 198-9  IS_HIERARCHY_ENABLED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
<tr>
<td>hierarchy_type</td>
<td>Type of hierarchy to check for:</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.
198.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.
It returns TRUE if successful.

Syntax

DBMS_XDBZ.PURGELDAPCACHE
RETURN BOOLEAN;
The DBMS_XEVENT package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_XEVENT Subprograms

See Also:
Oracle XML DB Developer's Guide for more information about "Oracle XML DB Repository Events"

199.1 DBMS_XEVENT Security Model

Owned by XDB, the DBMS_XEVENT package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

199.2 DBMS_XEVENT Constants

The DBMS_XEVENT package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENDER_EVENT</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td></td>

### 199.3 Subprogram Groups

The subprograms in the DBMS_XEVENT package can be divided in groups.

- **XDBEvent Type Subprograms**
- **XDBRepositoryEvent Type Subprograms**
- **XDBHandlerList Type Subprograms**
- **XDBHandler Type Subprograms**
- **XDBPath Type Subprograms**
- **XDBLink Type Subprograms**
199.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 199-2    XDBEvent Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCURRENTUSER Function</td>
<td>Returns the name of the user executing the operation that triggers the event</td>
</tr>
<tr>
<td>GETEVENT Function</td>
<td>Returns a value identifying the triggering event</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

199.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 199-3    XDBRepositoryEvent Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETAPPLICATIONDATA Function</td>
<td>Returns the &lt;applicationData&gt; element extracted from the resource configuration that defines the invoking handler</td>
</tr>
<tr>
<td>GETHANDLERLIST Function</td>
<td>Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler</td>
</tr>
<tr>
<td>GETINTERFACE Function</td>
<td>Returns the top-level interface used to initiate the operation that triggered the event</td>
</tr>
<tr>
<td>GETLINK Function</td>
<td>Returns an XDBLink object for the target resource</td>
</tr>
<tr>
<td>GETLOCK Function</td>
<td>Returns the lock object corresponding to the current operation</td>
</tr>
<tr>
<td>GETOLDRESOURCE Function</td>
<td>Returns the original XDBResource object before the operation was executed</td>
</tr>
<tr>
<td>GETOPENACCESSMODE Function</td>
<td>Returns the access mode for the open operation</td>
</tr>
<tr>
<td>GETOPENDENYMODE Function</td>
<td>Returns the deny mode for the open operation</td>
</tr>
<tr>
<td>GETOUTPUTSTREAM Function</td>
<td>Returns the output BLOB in which the handler can write the rendered data</td>
</tr>
<tr>
<td>GETPARAMETER Function</td>
<td>Returns the value of a request or session-specific parameter</td>
</tr>
<tr>
<td>GETPARENT Function</td>
<td>Returns the resource object corresponding to a parent folder of the target resource</td>
</tr>
<tr>
<td>GETPATH Function</td>
<td>Returns the XDBPath object representing the path of the resource for which the event was fired</td>
</tr>
</tbody>
</table>
### Table 199-3    (Cont.) XDBRepositoryEvent Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETRESOURCE Function</td>
<td>Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource</td>
</tr>
<tr>
<td>GETUPDATEBYTECOUNT Function</td>
<td>If the current operation is a byte-range write, returns the byte count</td>
</tr>
<tr>
<td>GETUPDATEBYTEOFFSET Function</td>
<td>If the current operation is a byte-range write, function returns the byte offset at which the range begins</td>
</tr>
<tr>
<td>GETXDBEVENT Function</td>
<td>Converts an XDBRepositoryEvent object to an XDBEvent type</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
<tr>
<td>SETRENDERPATH Procedure</td>
<td>Specifies the path of the resource that contains the rendered contents</td>
</tr>
<tr>
<td>SETRENDERSTREAM Procedure</td>
<td>sets the BLOB from which the rendered contents can be read</td>
</tr>
</tbody>
</table>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

#### 199.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

### Table 199-4    XDBHandlerList Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR Procedure</td>
<td>Clears the handler list</td>
</tr>
<tr>
<td>GETFIRST Function</td>
<td>Returns the first handler in the list</td>
</tr>
<tr>
<td>GETNAME Function</td>
<td>Returns the next handler in the list</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
<tr>
<td>REMOVE Procedure</td>
<td>Removes the specified handler from the handler list</td>
</tr>
</tbody>
</table>

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

#### 199.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

### Table 199-5    XDBHandler Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETLANGUAGE Function</td>
<td>Returns the implementation language of the handler</td>
</tr>
</tbody>
</table>
Table 199-5  (Cont.) XDBHandler Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETSCHEMA Function</td>
<td>Returns the schema of the handler's source</td>
</tr>
<tr>
<td>GETSOURCE Function</td>
<td>Returns the name of the Java class, PL/SQL package or object type implementing the handler</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

199.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 199-6  XDBPath Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETNAME Function</td>
<td>Returns the string representation of the path</td>
</tr>
<tr>
<td>GETPARENTPATH Function</td>
<td>Returns the parent's path</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

199.3.6 DBMS_XEVENT XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 199-7  XDBLink Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCHILDOID Function</td>
<td>Returns the OID of the resource to which the link is pointing</td>
</tr>
<tr>
<td>GETPARENTNAME Function</td>
<td>Returns the link's parent folder's name</td>
</tr>
<tr>
<td>GETPARENTOID Function</td>
<td>Returns the link's parent folder's OID</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

199.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

<tr>
<td>SETRENDERPATH Procedure</td>
<td>Specifies the path of the resource that contains the rendered contents</td>
<td>XDBRepositoryEvent Type Subprograms</td>
</tr>
<tr>
<td>SETRENDERSTREAM Procedure</td>
<td>sets the BLOB from which the rendered contents can be read</td>
<td>XDBRepositoryEvent Type Subprograms</td>
</tr>
</tbody>
</table>
199.4.1 CLEAR Procedure

This procedure clears the handler list.

See Also:
XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.CLEAR (hl IN OUT XDBHandlerList);

Parameters

Table 199-9 CLEAR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>

199.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also:
XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETAPPLICATIONDATA (ev IN XDBRepositoryEvent) RETURN XMLType;

Parameters

Table 199-10 GETAPPLICATIONDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
199.4.3 GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

See Also:
XDBLink Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETCHILDOID (  
    link IN XDBLink)  
RETURN RAW;

Parameters

Table 199-11 GETCHILDOID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>

199.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also:
XDBEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETCURRENTUSER (  
    ev IN XDBEvent)  
RETURN VARCHAR2;

Parameters

Table 199-12 GETCURRENTUSER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>
199.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

XDBEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETEVENT (  
    ev IN XDBEvent)  
RETURN XDBEventID;

Parameters

Table 199-13  GETEVENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>

199.4.6 GETFIRST Function

This function returns the first handler in the list.

See Also:

XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETFIRST (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;

Parameters

Table 199-14  GETFIRST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>
199.4.7 GETHANDLERLIST Function

This function returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
RETURN XDBHandlerList;

Parameters

Table 199-15  GETHANDLERLIST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETINTERFACE (  
    ev IN XDBRepositoryEvent)  
RETURN VARCHAR2;
### 199.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

#### Syntax
```
DBMS_XEVENT.GETLANGUAGE (  
    handler   IN   XDBHandler)  
RETURN VARCHAR2;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

#### See Also:
[XDBHandler Type Subprograms](#) for other subprograms in this group

### 199.4.10 GETLINK Function

This function returns an XDBLink object for the target resource.

For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, ParentName, ParentOID, ChildOID and LinkName.

#### Syntax
```
DBMS_XEVENT.GETLINK (  
    ev   IN   XDBRepositoryEvent)  
RETURN XDBLink;
```

#### See Also:
[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
Parameters

Table 199-18 GETLINK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.11 GETLINKNAME Function

This function returns the name of the link.

See Also:

XDBLink Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink
) RETURN VARCHAR2;
```

Parameters

Table 199-19 GETLINKNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>

199.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent
) RETURN XDBLock;
```
199.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also:

XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
RETURN VARCHAR2;
```

199.4.14 GETNAME Function

This function returns the string representation of the path.

See Also:

XDBPath Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
RETURN VARCHAR2;
```
Parameters

Table 199-22 GETNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>

199.4.15 GETNEXT Function

This function returns the next handler in the list.

See Also:

XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
RETURN XDBHandler;
```

Parameters

Table 199-23 GETNEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>

199.4.16 GETOLDRESOURCE Function

This function returns the original XDBResource object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
RETURN XDBResource;
```
Parameters

Table 199-24  GETOLDRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

See Also:

- XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETOPENACCESSMODE (   ev   IN   XDBRepositoryEvent)   RETURN PLS_INTEGER;
```

Parameters

Table 199-25  GETOPENACCESSMODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

199.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

See Also:

- XDBRepositoryEvent Type Subprograms for other subprograms in this group
Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (    
ev IN XDBRepositoryEvent)    
RETURN PLS_INTEGER;
```

Parameters

Table 199-26  GETOPENDENYMODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

199.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (    
ev IN XDBRepositoryEvent)    
RETURN BLOB;
```

Parameters

Table 199-27  GETOUTPUTSTREAM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
199.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

See Also:

* XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPARAMETER (
    ev IN XDBRepositoryEvent,
    key IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

**Table 199-28** GETPARAMETER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
<tr>
<td>key</td>
<td>Supported parameters:</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT-LANGUAGE</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT-CHARSET</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT_ENCODING</td>
</tr>
</tbody>
</table>

199.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

See Also:

* XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPARENT (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```
Parameters

Table 199-29  GETPARENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

See Also:
XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (  
   link IN XDBLink)  
RETURN VARCHAR2;
```

Parameters

Table 199-30  GETPARENTNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>

199.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also:
XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (  
   link IN XDBLink)  
RETURN RAW;
```
### 199.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

**Syntax**

```sql
DBMS_XEVENT.GETPARENTPATH (  
    path IN XDBPath,  
    level IN INTEGER)  
RETURN XDBPath;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
<tr>
<td>level</td>
<td>Number of levels up the hierarchy</td>
</tr>
</tbody>
</table>

### See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

### 199.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
Syntax

DBMS_XEVENT.GETPATH (  
    ev IN XDBRepositoryEvent)  
RETURN XDBPath;

Parameters

Table 199-33  GETPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.26 GETRESOURCE Function

This function returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETRESOURCE (  
    ev IN XDBRepositoryEvent)  
RETURN XDBResource;

Parameters

Table 199-34  GETRESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

See Also:

XDBHandler Type Subprograms for other subprograms in this group
Syntax

```sql
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 199-35  GETSCHEMA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

199.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

See Also:

XDBHandler Type Subprograms for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 199-36  GETSOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

199.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the GETUPDATEBYTECOUNT function returns the byte count. It is only valid for the inconsistent-update event.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group
Syntax

DBMS_XEVENT.GETUPDATEBYTECOUNT(
    ev IN XDBRepositoryEvent)
RETURN NUMBER;

Parameters

Table 199-37 GETUPDATEBYTECOUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the GETUPDATEBYTEOFFSET function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.GETUPDATEBYTEOFFSET(
    ev IN XDBRepositoryEvent)
RETURN NUMBER;

Parameters

Table 199-38 GETUPDATEBYTEOFFSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

199.4.31 GETXDBEVENT Function

This function converts an XDBRepositoryEvent object to an XDBEvent type.

See Also:

XDBRepositoryEvent Type Subprograms for other subprograms in this group
### Syntax

```sql
DBMS_XEVENT.GETXDBEVENT (  
    ev IN XDBRepositoryEvent  
) RETURN XDBEvent;
```

### Parameters

#### Table 199-39  GETXDBEVENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

### 199.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

### See Also:

- [XDBEvent Type Subprograms](#) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) for other subprograms in this group
- [XDBHandler Type Subprograms](#) for other subprograms in this group
- [XDBPath Type Subprograms](#) for other subprograms in this group
- [XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```sql
DBMS_XEVENT.ISNULL (  
    ev IN XDBEvent  
) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (  
    ev IN XDBRepositoryEvent  
) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (  
    hl IN XDBHandlerList  
) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (  
    handler IN XDBHandler  
) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (  
    path IN XDBPath  
) RETURN BOOLEAN;
```
DBMS_XEVENT.ISNULL {
    link       IN   XDBLink)
RETURN BOOLEAN;

Parameters

Table 199-40  ISNULL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of specified type</td>
</tr>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>

199.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

See Also:
XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

DBMS_XEVENT.REMOVE {
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);;

Parameters

Table 199-41  REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

199.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

DBMS_XEVENT.SETRENDERPATH {
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);;
Parameters

Table 199-42  SETRENDERPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>XDB Repository Event object</td>
</tr>
<tr>
<td>path</td>
<td>Path of the resource containing the rendered contents</td>
</tr>
</tbody>
</table>

199.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```sql
DBMS_XEVENT.SETRENDERSTREAM (
    ev IN XDBRepositoryEvent,
    istr IN BLOB);
```

Parameters

Table 199-43  SETRENDERSTREAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>XDBRepositoryEvent object</td>
</tr>
<tr>
<td>istr</td>
<td>Input stream from which to get the rendered contents</td>
</tr>
</tbody>
</table>
DBMS_XMLDOM

The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Types
- Exceptions
- Subprogram Groups
- Subprogram Groups
- Summary of DBMS_XMLDOM Subprograms

See Also:

Oracle XML Developer's Kit Programmer's Guide

200.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated.

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the DBMS_XMLDOM package allows you access to both schema-based and non schema-based documents.

Note:

Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.
One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as Node, Element, and others have equivalent PL/SQL types DOMNode, DOMElement, respectively.
- Various DOMException codes such as WRONG_DOCUMENT_ERR, HIERARCHY_REQUEST_ERR, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as ELEMENT_NODE, ATTRIBUTE_NODE, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform `APPENDCHILD Function` on a `DOMNode n`, the `APPENDCHILD Function` PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement elem`, use `PL/SQL procedure`.

DOM defines an inheritance hierarchy. For example, Document, Element, and Attr are defined to be subtypes of Node (see Figure 200-1). Thus, a method defined in the Node interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNode` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

**Figure 200-1** Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.
200.2 DBMS_XMLDOM Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

200.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 200-1 Defined Constants for DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELEMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The Node is an Element.</td>
</tr>
<tr>
<td>ATTRIBUTE_NODE</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The Node is an Attribute.</td>
</tr>
<tr>
<td>TEXT_NODE</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>The Node is a Text node.</td>
</tr>
<tr>
<td>CDATA_SECTION_NODE</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>The Node is a CDataSection.</td>
</tr>
<tr>
<td>ENTITY_REFERENCE_NODE</td>
<td>PLS_INTEGER</td>
<td>5</td>
<td>The Node is an Entity Reference.</td>
</tr>
<tr>
<td>ENTITY_NODE</td>
<td>PLS_INTEGER</td>
<td>6</td>
<td>The Node is an Entity.</td>
</tr>
<tr>
<td>PROCESSING_INSTRUCTION_NODE</td>
<td>PLS_INTEGER</td>
<td>7</td>
<td>The Node is a Processing Instruction.</td>
</tr>
<tr>
<td>COMMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>The Node is a Comment.</td>
</tr>
<tr>
<td>DOCUMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>9</td>
<td>The Node is a Document.</td>
</tr>
<tr>
<td>DOCUMENT_TYPE_NODE</td>
<td>PLS_INTEGER</td>
<td>10</td>
<td>The Node is a Document Type Definition.</td>
</tr>
<tr>
<td>DOCUMENT_FRAGMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>11</td>
<td>The Node is a Document fragment.</td>
</tr>
<tr>
<td>NOTATION_NODE</td>
<td>PLS_INTEGER</td>
<td>12</td>
<td>The Node is a Notation.</td>
</tr>
</tbody>
</table>

200.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the DBMS_XMLDOM.DOMTYPE package.

Table 200-2 XDB.XMLDOM Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMATTR</td>
<td>Implements the DOM Attribute interface.</td>
</tr>
<tr>
<td>DOMCDATASECTION</td>
<td>Implements the DOM CDataSection interface.</td>
</tr>
<tr>
<td>DOMCHARACTERDATA</td>
<td>Implements the DOM Character Data interface.</td>
</tr>
<tr>
<td>DOMCOMMENT</td>
<td>Implements the DOM Comment interface.</td>
</tr>
</tbody>
</table>
### Table 200-2  (Cont.) XDB_XMLDOM Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMDOCUMENT</td>
<td>Implements the DOM Document interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTFRAGMENT</td>
<td>Implements the DOM DocumentFragment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTTYPE</td>
<td>Implements the DOM Document Type interface.</td>
</tr>
<tr>
<td>DOMELEMENT</td>
<td>Implements the DOM Element interface.</td>
</tr>
<tr>
<td>DOMEENTITY</td>
<td>Implements the DOM Entity interface.</td>
</tr>
<tr>
<td>DOMEVENTREFERENCE</td>
<td>Implements the DOM EntityReference interface.</td>
</tr>
<tr>
<td>DOMIMPLEMENTATION</td>
<td>Implements the DOM Implementation interface.</td>
</tr>
<tr>
<td>DOMNAMEDNODEMAP</td>
<td>Implements the DOM Named Node Map interface.</td>
</tr>
<tr>
<td>DOMNODE</td>
<td>Implements the DOM Node interface.</td>
</tr>
<tr>
<td>DOMNODELIST</td>
<td>Implements the DOM NodeList interface.</td>
</tr>
<tr>
<td>DOMNOTATION</td>
<td>Implements the DOM Notation interface.</td>
</tr>
<tr>
<td>DOMPROCESSINGINSTRUCTION</td>
<td>Implements the DOM Processing instruction interface.</td>
</tr>
<tr>
<td>DOMTEXT</td>
<td>Implements the DOM Text interface.</td>
</tr>
</tbody>
</table>

### 200.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS_XMLDOM:

### Table 200-3  Exceptions for DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMSTRING_SIZE_ERR</td>
<td>If the specified range of text does not fit into a DOMString.</td>
</tr>
<tr>
<td>HIERARCHY_REQUEST_ERR</td>
<td>If any node is inserted somewhere it doesn't belong.</td>
</tr>
<tr>
<td>INDEX_SIZE_ERR</td>
<td>If index or size is negative, or greater than the allowed value.</td>
</tr>
<tr>
<td>INUSE_ATTRIBUTE_ERR</td>
<td>If an attempt is made to add an attribute that is already in use elsewhere.</td>
</tr>
<tr>
<td>INVALID_CHARACTER_ERR</td>
<td>If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.</td>
</tr>
<tr>
<td>NO_DATA_ALLOWED_ERROR</td>
<td>If data is specified for a node that does not support data.</td>
</tr>
<tr>
<td>NOT_FOUND_ERR</td>
<td>If an attempt is made to reference a node in a context where it does not exist.</td>
</tr>
<tr>
<td>NO_MODIFICATION_ALLOWED_ERR</td>
<td>If an attempt is made to modify an object where modifications are not allowed.</td>
</tr>
<tr>
<td>NOT_SUPPORTED_ERR</td>
<td>If the implementation does not support the requested type of object or operation.</td>
</tr>
<tr>
<td>WRONG_DOCUMENT_ERR</td>
<td>If a node is used in a different document than the one that created it (that doesn't support it).</td>
</tr>
</tbody>
</table>
200.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms
- DOMAttr Subprograms
- DOMCDataSection Subprograms
- DOMCharacterData Subprograms
- DOMComment Subprograms
- DOMDocument Subprograms
- DOMDocumentFragment Subprograms
- DOMDocumentType Subprograms
- DOMElememt Subprograms
- DOMEntity Subprograms
- DOMEntityReference Subprograms
- DOMImplementation Subprograms
- DOMNamedNodeMap Subprograms
- DOMnodeList Subprograms
- DOMNotation Subprograms
- DOMProcessingInstruction Subprograms
- DOMText Subprograms

200.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the DOMNode subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADOPTNODE Function</td>
<td>Adopts a node from another document</td>
</tr>
<tr>
<td>APPENDCHILD Function</td>
<td>Appends a new child to the node</td>
</tr>
<tr>
<td>CLONENODE Function</td>
<td>Clones the node</td>
</tr>
<tr>
<td>FREEENODE Procedure</td>
<td>Frees all resources associated with the node</td>
</tr>
<tr>
<td>GETATTRIBUTES Function</td>
<td>Retrieves the attributes of the node</td>
</tr>
<tr>
<td>GETCHILDNODES Function</td>
<td>Retrieves the children of the node</td>
</tr>
<tr>
<td>GETEXPANDEDNAME Procedure and Functions</td>
<td>Retrieves the expanded name of the node</td>
</tr>
<tr>
<td>GETFIRSTCHILD Function</td>
<td>Retrieves the first child of the node</td>
</tr>
<tr>
<td>GETLASTCHILD Function</td>
<td>Retrieves the last child of the node</td>
</tr>
<tr>
<td>GETLOCALNAME Procedure and Functions</td>
<td>Retrieves the local part of the qualified name</td>
</tr>
<tr>
<td>GETNAMESPACE Procedure and Functions</td>
<td>Retrieves the node's namespace URI</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>GETNEXTSIBLING Function</td>
<td>Retrieves the next sibling of the node</td>
</tr>
<tr>
<td>GETNODENAME Function</td>
<td>Retrieves the Name of the Node</td>
</tr>
<tr>
<td>GETNODETYPE Function</td>
<td>Retrieves the Type of the node</td>
</tr>
<tr>
<td>GETNODEVALUE Function</td>
<td>Retrieves the Value of the Node</td>
</tr>
<tr>
<td>GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</td>
<td>Retrieves Node Value as binary stream</td>
</tr>
<tr>
<td>GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</td>
<td>Retrieves Node Value as character stream</td>
</tr>
<tr>
<td>GETOWNERDOCUMENT Function</td>
<td>Retrieves the owner document of the node</td>
</tr>
<tr>
<td>GETPARENTPNODE Function</td>
<td>Retrieves the parent of this node</td>
</tr>
<tr>
<td>GETPREFIX Function</td>
<td>Retrieves the namespace prefix</td>
</tr>
<tr>
<td>GETPREVIOUSSIBLING Function</td>
<td>Retrieves the previous sibling of the node</td>
</tr>
<tr>
<td>GETSCHEMANODE Function</td>
<td>Retrieves the associated schema URI</td>
</tr>
<tr>
<td>HASATTRIBUTES Function</td>
<td>Tests if the node has attributes</td>
</tr>
<tr>
<td>HASCHILDNODES Function</td>
<td>Tests if the node has child nodes</td>
</tr>
<tr>
<td>IMPORTNODE Function</td>
<td>Imports a node from another document</td>
</tr>
<tr>
<td>INSERTBEFORE Function</td>
<td>Inserts a child before the reference child</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the node is NULL</td>
</tr>
<tr>
<td>MAKEATTR Function</td>
<td>Casts the node to an Attribute</td>
</tr>
<tr>
<td>MAKECDATASECTION Function</td>
<td>Casts the node to a CDATA Section</td>
</tr>
<tr>
<td>MAKECHARACTERDATA Function</td>
<td>Casts the node to Character Data</td>
</tr>
<tr>
<td>MAKECOMMENT Function</td>
<td>Casts the node to a Comment</td>
</tr>
<tr>
<td>MAKEDOCUMENT Function</td>
<td>Casts the node to a DOM Document</td>
</tr>
<tr>
<td>MAKEDOCUMENTFRAGMENT Function</td>
<td>Casts the node to a DOM Document Fragment</td>
</tr>
<tr>
<td>MAKEDOCUMENTTYPE Function</td>
<td>Casts the node to a DOM Document Type</td>
</tr>
<tr>
<td>MAKEELEMENT Function</td>
<td>Casts the node to a DOM Element</td>
</tr>
<tr>
<td>MAKEENTITY Function</td>
<td>Casts the node to a DOM Entity</td>
</tr>
<tr>
<td>MAKEENTITYREFERENCE Function</td>
<td>Casts the node to a DOM Entity Reference</td>
</tr>
<tr>
<td>MAKENOTATION Function</td>
<td>Casts the node to a DOM Notation</td>
</tr>
<tr>
<td>MAKEPROCESSINGINSTRUCTION Function</td>
<td>Casts the node to a DOM Processing Instruction</td>
</tr>
<tr>
<td>MAKETEXT Function</td>
<td>Casts the node to a DOM Text</td>
</tr>
<tr>
<td>REMOVECHILD Function</td>
<td>Removes a specified child from a node</td>
</tr>
<tr>
<td>REPLACECHILD Function</td>
<td>Replaces the old child with a new child</td>
</tr>
<tr>
<td>SETNODEVALUE Procedure</td>
<td>Sets the Value of the node</td>
</tr>
<tr>
<td>SETNODEVALUEASBINARYSTREAM Function &amp; Procedure</td>
<td>Sets the Node Value as binary stream</td>
</tr>
<tr>
<td>SETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</td>
<td>Sets the Node Value as a character stream</td>
</tr>
</tbody>
</table>
Table 200-4  (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETPREFIX Procedure</td>
<td>Sets the namespace prefix</td>
</tr>
<tr>
<td>USEBINARYSTREAM Function</td>
<td>Establishes that the stream is valid</td>
</tr>
<tr>
<td>WRITETOBUFFER Procedures</td>
<td>Writes the contents of the node to a buffer</td>
</tr>
<tr>
<td>WRITETOCLOB Procedures</td>
<td>Writes the contents of the node to a CLOB</td>
</tr>
<tr>
<td>WRITETOFILE Procedures</td>
<td>Writes the contents of the node to a file</td>
</tr>
</tbody>
</table>

200.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 200-5  Summary of DOMAttr Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETEXPANDEDNAME Procedure and Functions</td>
<td>Retrieves the expanded name of the attribute</td>
</tr>

</tbody>
</table>

200.6.9 DBMS_XMLDOM DOMElement Subprograms

This table lists the DOMElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 200-12 Summary of DOMElement Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREEELEMENT Procedure</td>
<td>Frees memory allocated to a DOMElement handle</td>
</tr>
<tr>
<td>GETATTRIBUTE Functions</td>
<td>Retrieves the attribute node by name</td>
</tr>
<tr>
<td>GETATTRIBUTENODE Functions</td>
<td>Retrieves the attribute node by name</td>
</tr>
<tr>
<td>GETCHILDRENBYTAGNAME Functions</td>
<td>Retrieves children of the element by tag name</td>
</tr>
</tbody>
</table>
Table 200-12  (Cont.) Summary of DOMElement Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>

<tr>
<td>RESOLVENAMESPACEPREFIX Function</td>
<td>Resolve the prefix to a namespace URI</td>
</tr>
<tr>
<td>SETATTRIBUTE Procedures</td>
<td>Sets the attribute specified by the name</td>
</tr>
<tr>
<td>SETATTRIBUTENODE Functions</td>
<td>Sets the attribute node in the element</td>
</tr>
</tbody>
</table>

200.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the DOMEntity subprograms of DBMS_XMLDOM.

Table 200-13  Summary of DOMEntity Subprograms; DBMS_XMLDOM

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETNOTATIONNAME Function</td>
<td>Retrieves the notation name of the entity</td>
</tr>
<tr>
<td>GETPUBLICID Functions</td>
<td>Retrieves the public Id of the entity</td>
</tr>
<tr>
<td>GETSYSTEMID Functions</td>
<td>Retrieves the system Id of the entity</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the Entity is NULL</td>
</tr>
<tr>
<td>MAKENODE Functions</td>
<td>Casts the Entity to a node</td>
</tr>
</tbody>
</table>

200.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the DOMEntityReference subprograms of DBMS_XMLDOM.
### 200.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the DOMImplementation subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the DOMImplementation node is NULL</td>
</tr>
<tr>
<td>HASFEATURE Function</td>
<td>Tests if the DOMImplementation implements a feature</td>
</tr>
</tbody>
</table>

### 200.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the DOMNamedNodeMap subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETLENGTH Functions</td>
<td>Retrieves the number of items in the map</td>
</tr>
<tr>
<td>GETNAMEDITEM Function</td>
<td>Retrieves the item specified by the name</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the NamedNodeMap is NULL</td>
</tr>
<tr>
<td>ITEM Functions</td>
<td>Retrieves the item given the index in the map</td>
</tr>
<tr>
<td>REMOVENAMEDITEM Function</td>
<td>Removes the item specified by name</td>
</tr>
<tr>
<td>SETNAMEDITEM Function</td>
<td>Sets the item in the map specified by the name</td>
</tr>
</tbody>
</table>

### 200.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the DOMNodeList subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREENODELIST Procedure</td>
<td>Frees all resources associated with a nodelist</td>
</tr>
<tr>
<td>GETLENGTH Functions</td>
<td>Retrieves the number of items in the list</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the NodeList is NULL</td>
</tr>
<tr>
<td>ITEM Functions</td>
<td>Retrieves the item given the index in the list</td>
</tr>
</tbody>
</table>
200.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the DOMNotation subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETPUBLICID Functions</td>
<td>Retrieves the public Id of the notation</td>
</tr>
<tr>
<td>GETSYSTEMID Functions</td>
<td>Retrieves the system Id of the notation</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the Notation is NULL</td>
</tr>
<tr>
<td>MAKENODE Functions</td>
<td>Casts the notation to a node</td>
</tr>
</tbody>
</table>

200.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the DOMProcessingInstruction subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETDATA Functions</td>
<td>Retrieves the data of the processing instruction</td>
</tr>
<tr>
<td>GETTARGET Function</td>
<td>Retrieves the target of the processing instruction</td>
</tr>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the Processing Instruction is NULL</td>
</tr>
<tr>
<td>MAKENODE Functions</td>
<td>Casts the Processing Instruction to a node</td>
</tr>
<tr>
<td>SETDATA Procedures</td>
<td>Sets the data of the processing instruction</td>
</tr>
</tbody>
</table>

200.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the DOMText subprograms of DBMS_XMLDOM.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISNULL Functions</td>
<td>Tests if the text is NULL</td>
</tr>
<tr>
<td>MAKENODE Functions</td>
<td>Casts the text to a node</td>
</tr>
<tr>
<td>SPLITTEXT Function</td>
<td>Splits the contents of the text node into 2 text nodes</td>
</tr>
</tbody>
</table>

200.7 Summary of DBMS_XMLDOM Subprograms

This table lists the DBMS_XMLDOM subprograms and briefly describes them.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
<th>Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADOPTNODE Function</td>
<td>Adopts a node from another document</td>
<td>DOMNode Subprograms</td>
</tr>
<tr>
<td>APPENDCHILD Function</td>
<td>Appends a new child to the node</td>
<td>DOMNode Subprograms</td>
</tr>
<tr>
<td>APPENDDATA Procedure</td>
<td>Appends the specified data to the node data</td>
<td>DOMCharacterData Subprograms</td>
</tr>
<tr>
<td>CLONENODE Function</td>
<td>Clones the node</td>
<td>DOMNode Subprograms</td>
</tr>
<tr>
<td>CREATEATTRIBUTE Functions</td>
<td>Creates an Attribute</td>
<td>DOMDocument Subprograms</td>
</tr>
<tr>
<td>CREATECDATASECTION Function</td>
<td>Creates a CDataSection node</td>
<td>DOMDocument Subprograms</td>
</tr>
<tr>
<td>CREATECOMMENT Function</td>
<td>Creates a Comment node</td>
<td>DOMDocument Subprograms</td>
</tr>
<tr>
<td>CREATEDOCUMENT Function</td>
<td>Creates a new Document</td>
<td>DOMDocument Subprograms</td>
</tr>
<tr>
<td>CREATEDOCUMENTFRAGMENT Function</td>
<td>Creates a new Document Fragment</td>
<td>DOMDocument Subprograms</td>

200.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also:
DOMNode Subprograms for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
    doc IN DOMDocument,
    importedNode IN DOMNode)
RETURN DOMNODE;
```

Parameters

Table 200-22  ADOPTNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document that is adopting the node</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to adopt</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.
200.7.2 APPENDCHILD Function

This function adds the node newchild to the end of the list of children of this node, and returns the newly added node. If the newchild is already in the tree, it is first removed.

Syntax

DBMS_XMLDOM.APPENDCHILD(
    n IN DOMNode,
    newchild IN DOMNode)
RETURN DOMNODE;

Parameters

Table 200-23  APPENDCHILD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>newchild</td>
<td>The child to be appended to the list of children of node n</td>
</tr>
</tbody>
</table>

200.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

Syntax

DBMS_XMLDOM.APPENDDATA(
    cd IN DOMCHARACTERDATA,
    arg IN VARCHAR2);

Parameters

Table 200-24  APPENDDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
</tbody>
</table>
Table 200-24 (Cont.) APPENDDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg</td>
<td>The data to append to the existing data</td>
</tr>
</tbody>
</table>

200.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.CLONENODE(
    n      IN    DOMNODE,
    deep  IN    BOOLEAN)
RETURN DOMNODE;

Parameters

Table 200-25 CLONENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>deep</td>
<td>Determines if children are to be cloned</td>
</tr>
</tbody>
</table>

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.
200.7.5 CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also:
DOMDocument Subprograms

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc    IN    DOMDOCUMENT,
    name   IN    VARCHAR2)
RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc    IN    DOMDOCUMENT,
    qname  IN    VARCHAR2,
    ns     IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 200-26  CREATEATTRIBUTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>qname</td>
<td>New attribute qualified name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.6 CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also:
DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
    doc    IN    DOMDOCUMENT,
    data   IN    VARCHAR2)
RETURN DOMCDATASECTION;
```
Parameters

Table 200-27 CREATECDATASECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMCDATASECTION node</td>
</tr>
</tbody>
</table>

200.7.7 CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also:

DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
    doc IN DOMDOCUMENT,
    data IN VARCHAR2)
RETURN DOMCOMMENT;
```

Parameters

Table 200-28 CREATECOMMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMComment node</td>
</tr>
</tbody>
</table>

200.7.8 CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

See Also:

DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATESUBDOCUMENT(
    namespaceURI IN VARCHAR2,
    qualifiedName IN VARCHAR2,

```
doctype IN DOMTYPE := NULL) RETURN DOMDOCUMENT;

Parameters

Table 200-29 CREATEDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespaceURI</td>
<td>Namespace URI</td>
</tr>
<tr>
<td>qualifiedName</td>
<td>Root element name</td>
</tr>
<tr>
<td>doctype</td>
<td>Document type</td>
</tr>
</tbody>
</table>

200.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also:
DOMDocument Subprograms

Syntax

DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
    doc IN DOMDOCUMENT
) RETURN DOMDOCUMENTFRAGMENT;

Parameters

Table 200-30 CREATEDOCUMENTFRAGMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
</tbody>
</table>

200.7.10 CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also:
DOMDocument Subprograms

Syntax

Creates a DOMElement with specified name:

DBMS_XMLDOM.CREATEELEMENT(
    doc IN DOMDOCUMENT,
Create a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATENELEMENT(
    doc    IN     DOMDOCUMENT,
    tagName    IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMELEMENT;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagName</td>
<td>Tagname for new DOMELEMENT</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

### 200.7.11 CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

```sql
DBMS_XMLDOM.CREATENEITYREFERENCE(
    doc    IN     DOMDOCUMENT,
    name   IN     VARCHAR2)
RETURN DOMENTITYREFERENCE;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>name</td>
<td>New entity reference name</td>
</tr>
</tbody>
</table>
200.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also:
DOMDocument Subprograms

Syntax

DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
    doc IN DOMDocument,
    target IN VARCHAR2,
    data IN VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;

Parameters

Table 200-33 CREATEPROCESSINGINSTRUCTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>target</td>
<td>Target of the new processing instruction</td>
</tr>
<tr>
<td>data</td>
<td>Content data of the new processing instruction</td>
</tr>
</tbody>
</table>

200.7.13 CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also:
DOMDocument Subprograms

Syntax

DBMS_XMLDOM.CREATETEXTNODE(
    doc IN DOMDocument,
    data IN VARCHAR2)
RETURN DOMTEXT;

Parameters

Table 200-34 CREATETEXTNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Content of the DOMText node</td>
</tr>
</tbody>
</table>

200.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also:
DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.DELETEDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER);
```

Parameters

Table 200-35  DELETEDATA PROCEDURE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset from which to delete the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (starting from offset) to delete</td>
</tr>
</tbody>
</table>

200.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also:
DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.FINDENTITY(
    dt     IN     DOMDOCUMENTTYPE,
    name   IN     VARCHAR2,
    par    IN     BOOLEAN)
RETURN  DOMENTITY;
```
Parameters

Table 200-36  FINDENTITY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>Entity to find</td>
</tr>
<tr>
<td>par</td>
<td>Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity</td>
</tr>
</tbody>
</table>

200.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

See Also:
DOMDocumentType Subprograms

Syntax

```sql
DBMS_XMLDOM.FINDNOTATION(
    dt        IN     DOMDocumentType,
    name      IN     VARCHAR2)
RETURN DOMNOTATION;
```

Parameters

Table 200-37  FINDNOTATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>The notation to find</td>
</tr>
</tbody>
</table>

200.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also:
DOMDocument Subprograms and DOMDocumentFragment Subprograms

Syntax

```sql
DBMS_XMLDOM.FREEDOCFRAG(
    df    IN    DOMDOCUMENTFRAGMENT);
```
Parameters

Table 200-38 FREEDOCFRAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>

200.7.18 FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also:

DOMDocument Subprograms

Syntax

```sql
DBMS_XMLDOM.FREEDOCUMENT(
    doc IN DOMDOCUMENT);
```

Parameters

Table 200-39 FREEDOCUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

See Also:

DBMS_XMLDOM DOMElement Subprograms

Syntax

```sql
DBMS_XMLDOM.FREEELEMENT(
    elem IN DOMELEMENT);
```
### Parameters

**Table 200-40  FREEELEMENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>Of type DOMELEMENT</td>
</tr>
</tbody>
</table>

#### 200.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

*See Also:*

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.FREENODE(
    n      IN     DOMNODE);
```

#### Parameters

**Table 200-41  FREENODE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

#### 200.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

*See Also:*

DBMS_XMLDOM DOMNodeList Subprograms

**Syntax**

```sql
DBMS_XMLDOM.FREENODELIST(
    nl IN DOMNodeList);
```
Parameters

Table 200-42 FREENODELIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nl</td>
<td>Of type DOMNODELIST</td>
</tr>
</tbody>
</table>

200.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of a DOMELEMENT by name.

See Also:

DOMElement Subprograms

Syntax

Returns the value of a DOMELEMENT’s attribute by name:

```sql
DBMS_XMLODOM.GETATTRIBUTE(
    elem       IN      DOMELEMENT,
    name       IN      VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT’s attribute by name and namespace URI:

```sql
DBMS_XMLODOM.GETATTRIBUTE(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 200-43 GETATTRIBUTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
200.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**See Also:**
DOMElement Subprograms

### Syntax

**Returns an attribute node from the DOMELEMENT by name:**

```
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2)
RETURN DOMATTR;
```

**Returns an attribute node from the DOMELEMENT by name and namespace URI:**

```
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMATTR;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.24 GETATTRIBUTES Function

This function retrieves a NAMESPACEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

**See Also:**
DOMNode Subprograms
Syntax

DBMS_XMLDOM.GETATTRIBUTES(
    n IN DOMNode)
RETURN DOMNAMEDNODEMAP;

Parameters

Table 200-45  GETATTRIBUTES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.25 GETCHARSET Function

This function retrieves the characterset of the DOM document.

See Also:

DOMDocument Subprograms

Syntax

DBMS_XMLDOM.GETCHARSET(
    doc IN DOMDocument)
RETURN VARCHAR2;

Parameters

Table 200-46  GETCHARSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
</tbody>
</table>

Usage Notes

For a newly parsed document, we return the database characterset. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.
200.7.26 GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also:
- DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
    n      IN    DOMNode)
RETURN DOMNodeList;
```

Parameters

Table 200-47  GETCHILDNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

See Also:
- DOMEElement Subprograms

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem   IN    DOMElement,
    name   IN    VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem   IN    DOMElement,
    name   IN    VARCHAR2,
    ns     IN    VARCHAR2)
RETURN DOMNODELIST;
```
Parameters

Table 200-48 GETCHILDRENBYTAGNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Tag name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```sql
DBMS_XMLDOM.GETDATA(
    cd IN DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms):

```sql
DBMS_XMLDOM.GETDATA(
    pi IN DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

Table 200-49 GETDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>pi</td>
<td>The DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>

200.7.29 GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also:

DOMDocument Subprograms
Syntax

DBMS_XMLDOM.GETDOCTYPE(
    doc      IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;

Parameters

Table 200-50  GETDOCTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also:

DOMDocument Subprograms

Syntax

DBMS_XMLDOM.GETDOCUMENTELEMENT(
    doc      IN      DOMDOCUMENT)
RETURN DOMELEMENT;

Parameters

Table 200-51  GETDOCUMENTELEMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms):

DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    doc         IN      DOMDOCUMENT,
    tagname     IN      VARCHAR2)
RETURN DOMNODELIST;
Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMNODELIST;
```

### Parameters

#### Table 200-52 GETELEMENTSBYTAGNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagname</td>
<td>Name of the tag to match on</td>
</tr>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Tag name; using a wildcard(*) would match any tag</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

### 200.7.32 GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

```
DBMS_XMLDOM.GETENTITIES(
    dt      IN     DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

#### Syntax

```
DBMS_XMLDOM.GETENTITIES(
    dt      IN     DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

#### Parameters

#### Table 200-53 GETENTITIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
### 200.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Retrieves the expanded name of the Node if it is in an Element or Attribute type; otherwise, returns NULL (See Also: DOMNode Subprograms)

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    n IN DOMNODE
    data OUT VARCHAR);
```

Returns the expanded name of the DOMAttr (See Also: DOMAttr Subprograms):

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    a IN DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the DOMElement (See Also: DOMElement Subprograms):

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    elem IN DOMElement)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned expanded name of the Node</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>

### 200.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

**Syntax**

```sql
DBMS_XMLDOM.GETFIRSTCHILD(
    n IN DOMNODE)
RETURN DOMNODE;
```

---

**See Also:**

DOMNode Subprograms
Parameters

Table 200-55  GETFIRSTCHILD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.35 GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also:

DOMDocument Subprograms

Syntax

DBMS_XMLDOM.GETIMPLEMENTATION(
    doc IN DOMDOCUMENT)
RETURN DOMIMPLEMENTATION;

Parameters

Table 200-56  GETIMPLEMENTATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.GETLASTCHILD(
    n IN DOMNODE)
RETURN DOMNODE;
Parameters

Table 200-57  GETLASTCHILD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
    cd IN DOMCHARACTERDATA
) RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
    nnm IN DOMNAMEDNODEMAP
) RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also:DOMNodeList Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
    nl IN DOMNODELIST
) RETURN NUMBER;
```

Parameters

Table 200-58  GETLENGTH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>nmm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNODELIST</td>
</tr>
</tbody>
</table>

200.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node’s qualified name (See Also: DOMNode Subprograms):

```
```
DBMS_XMLDOM.GETLOCALNAME(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);

Returns the local name of the DOMAttr (See Also: DOMAttr Subprograms):

DBMS_XMLDOM.GETLOCALNAME(
   a       IN     DOMATTR)
RETURN VARCHAR2;

Returns the local name of the DOMElement (See Also: DOMElement Subprograms)

DBMS_XMLDOM.GETLOCALNAME(
   elem    IN     DOMELEMENT)
RETURN VARCHAR2;

Parameters

Table 200-59  GETLOCALNAME Procedure and Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>data</td>
<td>Returned local name.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElement.</td>
</tr>
</tbody>
</table>

200.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms):

DBMS_XMLDOM.GETNAME(
   a       IN     DOMATTR)
RETURN VARCHAR2;

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: DOMDocumentType Subprograms):

DBMS_XMLDOM.GETNAME(
   dt      IN     DOMDOCUMENTTYPE)
RETURN VARCHAR2;

Parameters

Table 200-60  GETNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
200.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

**See Also:**
DOMNamedNodeMap Subprograms

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
    nnm    IN  DOMNAMEDNODEMAP,
    name   IN  VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
    nnm    IN  DOMNAMEDNODEMAP,
    name   IN  VARCHAR2,
    ns     IN  VARCHAR2)
RETURN DOMNODE;
```

Parameters

**Table 200-61  GETNAMEDITEM Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>name</td>
<td>Name of the item to be retrieved</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
    n       IN     DOMNODE,
    data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: DOMAttr Subprograms):
DBMS_XMLDOM.GETNAMESPACE(  
    a       IN     DOMATTR)  
RETURN VARCHAR2;

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms):

DBMS_XMLDOM.GETNAMESPACE(  
    elem       IN     DOMELEMENT)  
RETURN VARCHAR2;

Parameters

Table 200-62  GETNAMESPACE Procedure and Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned namespace URI</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>

200.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.GETNEXTSIBLING(  
    n       IN     DOMNODE)  
RETURN DOMNode;

Parameters

Table 200-63  GETNEXTSIBLING Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also:
DOMNode Subprograms

Syntax

```sql
DBMS_XMLDOM.GETNODETYPE(
    n       IN     DOMNODE)
RETURN NUMBER;
```

Parameters

Table 200-64  GETNODETYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

See Also:
DOMNode Subprograms

Syntax

```sql
DBMS_XMLDOM.GETNODENAME(
    n       IN     DOMNODE)
RETURN VARCHAR2;
```

Parameters

Table 200-65  GETNODENAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.GETNODEVALUE(
    n IN DOMNODE
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:**

DOMNode Subprograms

**Syntax**

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` — if not an exception is raised.

```sql
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n IN DOMNODE
) RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` — if not an exception is raised.

```sql
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n in DOMNODE,
    value in SYS.UTL_BINARYOUTPUTSTREAM);
```
Parameters

Table 200-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYOUTPUTSTREAM</td>
</tr>
</tbody>
</table>

### 200.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:**

DOMNode Subprograms

**Syntax**

This function returns an instance of the PL/SQL XMLCharacterInputStream. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```sql
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (n        IN     DOMNODE) RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```sql
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (n        IN   DOMNODE, value    IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 200-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTEROUTPUTSTREAM</td>
</tr>
</tbody>
</table>
200.7.48 GETNOTATIONNAME Function

This function returns the notation name of the DOMENTITY.

See Also:
DOMEntity Subprograms

Syntax

DBMS_XMLDOM.GETNOTATIONNAME(
    ent       IN     DOMENTITY)
RETURN VARCHAR2;

Parameters

Table 200-69  GETNOTATIONNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ent</td>
<td>DOMENTITY</td>
</tr>
</tbody>
</table>

200.7.49 GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also:
DOMDocumentType Subprograms

Syntax

DBMS_XMLDOM.GETNOTATIONS(
    dt       IN     DOMDOCUMENTTYPE)
RETURN DOMNAMEDNODEMAP;

Parameters

Table 200-70  GETNOTATIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
### 200.7.50 GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

**See Also:**
- DOMProcessingInstruction Subprograms

**Syntax**

```sql
DBMS_XMLDOM.GETTARGET(
    pi IN DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

**Parameters**

**Table 200-71 GETTARGET Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>

### 200.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

**See Also:**
- DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.GETOWNERDOCUMENT(
    n IN DOMNODE)
RETURN DOMDOCUMENT;
```

**Parameters**

**Table 200-72 GETOWNERDOCUMENT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also:

DOMAttr Subprograms

Syntax

DBMS_XMLDOM.GETOWNERELEMENT(
  a       IN     DOMATTR)
RETURN DOMElement;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Attribute</td>
</tr>
</tbody>
</table>

200.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except Attr, Document, DocumentFragment, Entity, and Notation may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is NULL.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.GETPARENTNODE(
  n       IN     DOMNODE)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.GETPREFIX(
    n       IN     DOMNODE)
RETURN VARCHAR2;
```

**Parameters**

**Table 200-75  GETPREFIX Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.55 GETPREVIOUSSibling Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.GETPREVIOUSSibling(
    n       IN     DOMNODE)
RETURN DOMNODE;
```

**Parameters**

**Table 200-76  GETPREVIOUSSibling Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms):

```sql
DBMS_XMLDOM.GETPUBLICID(
    dt       IN     DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms):

```sql
DBMS_XMLDOM.GETPUBLICID(
    ent      IN     DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms):

```sql
DBMS_XMLDOM.GETPUBLICID(
    n        IN     DOMNOTATION)
RETURN VARCHAR2;
```

**Parameters**

**Table 200-77** GETPUBLICID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>ent</td>
<td>DOMENTITY</td>
</tr>
<tr>
<td>n</td>
<td>DOMNOTATION</td>
</tr>
</tbody>
</table>

200.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Returns the qualified name of the DOMATTR (See Also: DOMAttr Subprograms):

```sql
DBMS_XMLDOM.GETQUALIFIEDNAME(
    a        IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the DOMELEMENT (See Also: DOMElement Subprograms):

```sql
DBMS_XMLDOM.GETQUALIFIEDNAME(
    elem     IN     DOMELEMENT)
RETURN VARCHAR2;
```
Parameters

Table 200-78  GETQUALIFIEDNAME Functions Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>

200.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also:

DOMNode Subprograms

Syntax

```sql
DBMS_XMLDOM.GETSCHEMANODE(
    n       IN     DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 200-79  GETSCHEMANODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

See Also:

DOMAttr Subprograms

Syntax

```sql
DBMS_XMLDOM.GETSPECIFIED(
    a       IN     DOMATTR)
RETURN BOOLEAN;
```
Parameters

Table 200-80  GETSPECIFIED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>

200.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also:
DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
    doc       IN     DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

Table 200-81  GETSTANDALONE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
    dt       IN     DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
    ent      IN     DOMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms):
DBMS_XMLDOM.GETSYSTEMID(
    n        IN     DOMNOTATION)
RETURN VARCHAR2;

Parameters

Table 200-82  GETSYSTEMID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation</td>
</tr>
</tbody>
</table>

200.7.62 GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also:

DOMElement Subprograms

Syntax

DBMS_XMLDOM.GETTAGNAME(
    elem       IN     DOMELEMENT)
RETURN VARCHAR2;

Parameters

Table 200-83  GETTAGNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>

200.7.63 GETVALUE Function

This function retrieves the value of the attribute.

See Also:

DOMAttr Subprograms

Syntax

DBMS_XMLDOM.GETVALUE(
    a       IN     DOMATTR)
RETURN VARCHAR2;
Parameters

Table 200-84  GETVALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>

200.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also:
DOMDocument Subprograms

Syntax

DBMS_XMLDOM.GETVERSION(
    doc       IN     DOMDOCUMENT)
RETURN VARCHAR2;

Parameters

Table 200-85  GETVERSION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.65 GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

See Also:
DOMDocument Subprograms

Syntax

DBMS_XMLDOM.GETXMLTYPE(
    doc       IN     DOMDOCUMENT)
RETURN SYS.XMLTYPE;
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMELEMENT, or has a default value.

See Also:
DOMEElement Subprograms

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2,
    ns      IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
200.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.HASATTRIBUTES(
   n       IN     DOMNODE)
RETURN BOOLEAN;

Parameters

Table 200-88 HASATTRIBUTES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

200.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.HASCHILDNODES(
   n       IN     DOMNODE)
RETURN BOOLEAN;

Parameters

Table 200-89 HASCHILDNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.69 HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also:
DOMImplementation Subprograms

Syntax
DBMS_XMLDOM.HASFEATURE(
    di       IN     DOMIMPLEMENTATION,
    feature  IN     VARCHAR2,
    version  IN     VARCHAR2)
RETURN BOOLEAN;

Parameters

Table 200-90 HASFEATURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>di</td>
<td>DOMIMPLEMENTATION</td>
</tr>
<tr>
<td>feature</td>
<td>The feature to check for</td>
</tr>
<tr>
<td>version</td>
<td>The version of the DOM to check in</td>
</tr>
</tbody>
</table>

200.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also:
DOMNode Subprograms

Syntax
DBMS_XMLDOM.IMPORTNODE(
    doc            IN  DOMDOCUMENT,
    importedNode   IN  DOMNODE,
    deep           IN  BOOLEAN)
RETURN DOMNODE;
Parameters

Table 200-91 IMPORTNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document from which the node is imported</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to import</td>
</tr>
<tr>
<td>deep</td>
<td>Setting for recursive import.</td>
</tr>
<tr>
<td></td>
<td>• If this value is TRUE, the entire subtree of the node will be imported</td>
</tr>
<tr>
<td></td>
<td>• If this value is FALSE, only the node itself will be imported.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

200.7.71 INSERTBEFORE Function

This function inserts the node newchild before the existing child node refchild. If refchild is NULL, insert newchild at the end of the list of children.

If newchild is a DOCUMENTFRAGMENT object, all of its children are inserted, in the same order, before refchild. If the newchild is already in the tree, it is first removed.

See Also:

DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(  
    n          IN     DOMNODE,  
    newchild   IN     DOMNODE,  
    refchild   IN     DOMNODE)  
RETURN DOMNode;
```

Parameters

Table 200-92 INSERTBEFORE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>newChild</td>
<td>The child to be inserted in the DOMNODE</td>
</tr>
<tr>
<td>refChild</td>
<td>The reference node before which the newchild is to be inserted</td>
</tr>
</tbody>
</table>
200.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also:
DOMCharacterData Subprograms

Syntax

DBMS_XMLDOM.INSERTDATA(
    cd       IN     DOMCHARACTERDATA,
    offset   IN     NUMBER,
    arg      IN     VARCHAR2);

Parameters

Table 200-93 INSERTDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to insert the data</td>
</tr>
<tr>
<td>arg</td>
<td>The value to be inserted</td>
</tr>
</tbody>
</table>

200.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms):

DBMS_XMLDOM.ISNULL(
    n      IN     DOMNODE)
RETURN BOOLEAN;

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms):

DBMS_XMLDOM.ISNULL(
    a      IN     DOMATTR)
RETURN BOOLEAN;

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms):

DBMS_XMLDOM.ISNULL(
    cds    IN     DOMCDATASECTION)
RETURN BOOLEAN;
Checks that the specified `DOMCharacterData` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMCharacterData Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    cd       IN     DOMCharacterData)
RETURN BOOLEAN;
```

Checks that the specified `DOMNode` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMNode Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    doc       IN     DOMDocument)
RETURN BOOLEAN;
```

Checks that the specified `DOMDocumentFragment` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMDocumentFragment Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    df       IN     DOMDocumentFragment)
RETURN BOOLEAN;
```

Checks that the specified `DOMDocumentType` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMDocumentType Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    dt       IN     DOMDocumentType)
RETURN BOOLEAN;
```

Checks that the specified `DOMElement` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMElement Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    elem     IN     DOMElement)
RETURN BOOLEAN;
```

Checks that the specified `DOMEntity` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMEntity Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    ent       IN     DOMEntity)
RETURN BOOLEAN;
```

Checks that the specified `DOMEntityReference` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: `DOMEntityReference Subprograms`):

```sql
DBMS_XMLDOM.ISNULL(
    EREF       IN     DOMEntityReference)
RETURN BOOLEAN;
```

Checks that the specified `DOMImplementation` is `NULL`; returns `TRUE` if it is `NULL` (See Also: `DOMImplementation Subprograms`):
DBMS_XMLDOM.ISNULL(
   di       IN     DOMIMPLEMENTATION)
RETURN BOOLEAN;

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms):

DBMS_XMLDOM.ISNULL(
   nnm      IN     DOMNAMEDNODEMAP)
RETURN BOOLEAN;

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also:DOMNodeList Subprograms):

DBMS_XMLDOM.ISNULL(
   nl       IN     DOMNODELIST)
RETURN BOOLEAN;

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms):

DBMS_XMLDOM.ISNULL(
   n        IN     DOMNOTATION)
RETURN BOOLEAN;

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms):

DBMS_XMLDOM.ISNULL(
   pi       IN     DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms):

DBMS_XMLDOM.ISNULL(
   t        IN     DOMTEXT)
RETURN BOOLEAN;

Parameters

200.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the INDEX parameter. If INDEX is greater than or equal to the number of nodes in this map, this returns NULL (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.ITEM(
    nmm        IN     DOMNAMEDNODEMAP,
    index      IN     NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the INDEX parameter. If index is greater than or equal to the number of nodes in the list, this returns NULL (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.ITEM(
    nl        IN     DOMNODELIST,
    index     IN     NUMBER)
RETURN DOMNODE;
```

Parameters

Table 200-95  ITEM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nmm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>index</td>
<td>The index in the node map at which the item is to be retrieved</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNODELIST</td>
</tr>
<tr>
<td>index</td>
<td>The index in the NodeList used to retrieve the item</td>
</tr>
</tbody>
</table>
200.7.75 MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEATTR(
    n IN DOMNODE)
RETURN DOMATTR;

Parameters

Table 200-96  MAKEATTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.76 MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKECDATASECTION(
    n IN DOMNODE)
RETURN DOMCDATASECTION;

Parameters

Table 200-97  MAKECDATASECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
200.7.77 MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also:
DOMNode Subprograms

Syntax

\[
\text{DBMS.XMLDOM.MAKECHARACTERDATA (}
\begin{align*}
\text{n} & \ \text{IN DOMNode}) \\
\text{RETURN DOMCharacterData;}
\end{align*}
\]

Parameters

Table 200-98  MAKECHARACTERDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.78 MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also:
DOMNode Subprograms

Syntax

\[
\text{DBMS.XMLDOM.MAKECOMMENT (}
\begin{align*}
\text{n} & \ \text{IN DOMNode}) \\
\text{RETURN DOMCOMMENT;}
\end{align*}
\]

Parameters

Table 200-99  MAKECOMMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
200.7.79 MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEDOCUMENT (  
   n       IN     DOMNODE)  
RETURN DOMDocument;

Parameters

Table 200-100  MAKEDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (  
   n       IN     DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;

Parameters

Table 200-101  MAKEDOCUMENTFRAGMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
200.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEDOCUMENTTYPE(
  n       IN     DOMNODE)
RETURN DOMDOCUMENTTYPE;

Parameters

Table 200-102  MAKEDOCUMENTTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.82 MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOMMAKEELEMENT(
  n       IN     DOMNODE)
RETURN DOMELEMENT;

Parameters

Table 200-103  MAKEELEMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
200.7.83 MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEENTITY(
    n       IN     DOMNODE)
RETURN DOMENTITY;

Parameters

Table 200-104  MAKEENTITY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.84 MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also:
DOMNode Subprograms

Syntax

DBMS_XMLDOM.MAKEENTITYREFERENCE(
    n       IN     DOMNODE)
RETURN DOMENTITYREFERENCE;

Parameters

Table 200-105  MAKEENTITYREFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
200.7.85 MAKE NODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    a        IN     DOMATTR)
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    cds      IN     DOMCDATASECTION)
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    cd       IN     DOMCHARACTERDATA)
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    com      IN     DOMCOMMENT)
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    doc      IN     DOMDOCUMENT)
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    df       IN     DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.MAKENODE(
    dt       IN     DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMEElement Subprograms):
DBMS_XMLDOM.MAKENODE(
    elem IN DOMELEMENT)
RETURN DOMNODE;

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms):

DBMS_XMLDOM.MAKENODE(
    ent IN DOMENTITY)
RETURN DOMNODE;

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms):

DBMS_XMLDOM.MAKENODE(
    eref IN DOMENTITYREFERENCE)
RETURN DOMNODE;

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms):

DBMS_XMLDOM.MAKENODE(
    n IN DOMNOTATION)
RETURN DOMNODE;

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms):

DBMS_XMLDOM.MAKENODE(
    pi IN DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms):

DBMS_XMLDOM.MAKENODE(
    t IN DOMTEXT)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR to cast</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDATASECTION to cast</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA to cast</td>
</tr>
<tr>
<td>com</td>
<td>DOMCOMMENT to cast</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT to cast</td>
</tr>
<tr>
<td>df</td>
<td>DOMDOCUMENTFRAGMENT to cast</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE to cast</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT to cast</td>
</tr>
<tr>
<td>ent</td>
<td>DOMENTITY to cast</td>
</tr>
<tr>
<td>eref</td>
<td>DOMENTITYREFERENCE to cast</td>
</tr>
</tbody>
</table>
### Table 200-106  (Cont.) MAKENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>

### 200.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.MAKENOTATION(
   n IN DOMNODE)
RETURN DOMNOTATION;
```

### Parameters

**Table 200-107  MAKENOTATION Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

### 200.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the DOMProcessingInstruction.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n IN DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```
Parameters

Table 200-108  MAKEPROCESSINGINSTRUCTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also:

- DOMNode Subprograms

Syntax

```sql
DBMS_XMLDOM.MAKETEXT(
    n   IN   DOMNODE)
RETURN DOMTEXT;
```

Parameters

Table 200-109  MAKETEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

200.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also:

- DOMDocument Subprograms

Syntax

Returns a new DOMDOCUMENT instance:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:
DBMS_XMLDOM.NEWDOMDOCUMENT(
    xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;

Returns a new DOMDOCUMENT instance created from the specified CLOB:

DBMS_XMLDOM.NEWDOMDOCUMENT(
    cl       IN    CLOB)
RETURN DOMDOCUMENT;

Parameters

Table 200-110    NEWDOMDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>XMLType source for the DOMDOCUMENT</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB source for the DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also:

DOMElement Subprograms

Syntax

DBMS_XMLDOM.NORMALIZE(
    elem       IN     DOMELEMENT);

Parameters

Table 200-111    NORMALIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>

200.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also:

DOMElement Subprograms
Syntax

Removes the value of a DOMELEMENT’s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT’s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2,
    ns       IN    VARCHAR2);
```

Parameters

Table 200-112 REMOVEATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

```
See Also:

DOMElement Subprograms
```

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
    elem       IN     DOMELEMENT,
    oldAttr    IN     DOMATTR)
RETURN DOMAttr;
```

Parameters

Table 200-113 REMOVEATTRIBUTENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>oldAttr</td>
<td>The old DOMATTR</td>
</tr>
</tbody>
</table>
200.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

`See Also:`

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.REMOVECHILD(
    n          IN     DOMNode,
    oldchild   IN     DOMNode)
RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>oldChild</td>
<td>The child of the node <code>n</code> to be removed</td>
</tr>
</tbody>
</table>

200.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

`See Also:`

DOMNamedNodeMap Subprograms

**Syntax**

Removes a node specified by name:

```sql
DBMS_XMLDOM.REMOVENAMEDITEM(
    nmm      IN     DOMNamedNodeMap,
    name     IN     VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:
**REMOVEDITEM Function**

DBMS_XMLDOM.REMOVEDITEM(
    nnm      IN     DOMNamedNodeMap,
    name     IN     VARCHAR2,
    ns       IN     VARCHAR2)
RETURN DOMNode;

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNamedNodeMap</td>
</tr>
<tr>
<td>name</td>
<td>The name of the item to be removed from the map</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

**REPLACECHILD Function**

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

**See Also:**

DOMNode Subprograms

**Syntax**

```sql
DBMS_XMLDOM.REPLACECHILD(
    n           IN     DOMNode,
    newchild    IN     DOMNode,
    oldchild    IN     DOMNode)
RETURN DOMNode;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>newchild</td>
<td>The new child which is to replace the old child</td>
</tr>
<tr>
<td>oldchild</td>
<td>The child of the node <code>n</code> which is to be replaced</td>
</tr>
</tbody>
</table>
200.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also:
DOMCharacterData Subprograms

Syntax

DBMS_XMLDOM.REPLACEDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER,
    arg       IN     VARCHAR2);

Parameters

Table 200-117  REPLACEDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to replace</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters to replace</td>
</tr>
<tr>
<td>arg</td>
<td>The value to replace with</td>
</tr>
</tbody>
</table>

200.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also:
DOMEElement Subprograms

Syntax

DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
    elem       IN     DOMELEMENT,
    prefix     IN     VARCHAR2) RETURN VARCHAR2;
Parameters

Table 200-118  RESOLVENAMESPACEPREFIX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>prefix</td>
<td>Namespace prefix</td>
</tr>
</tbody>
</table>

200.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT’s attribute by name.

See Also:

DOMElement Subprograms

Syntax

Sets the value of a DOMELEMENT’s attribute by name:

DBMS_XMLDOM.SETATTRIBUTE(
    elem       IN  DOMELEMENT,
    name       IN  VARCHAR2,
    newvalue   IN  VARCHAR2);

Sets the value of a DOMELEMENT’s attribute by name and namespace URI:

DBMS_XMLDOM.SETATTRIBUTE(
    elem       IN  DOMELEMENT,
    name       IN  VARCHAR2,
    newvalue   IN  VARCHAR2,
    ns         IN  VARCHAR2);

Parameters

Table 200-119  SETATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>newvalue</td>
<td>Attribute value</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
200.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the DOMELEMENT.

See Also:

DOMEElement Subprograms

Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the DOMElement; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR,
    ns        IN  VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 200-120  SETATTRIBUTENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>newAttr</td>
<td>The new DOMATTR</td>
</tr>
<tr>
<td>ns</td>
<td>The namespace</td>
</tr>
</tbody>
</table>

200.7.100 SETCHARSET Procedure

This function sets the characterset of the DOM document.

See Also:

DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETCHARSET(
    doc      IN  DOMDocument,
    charset  IN  VARCHAR2);
```
Parameters

Table 200-121  SETCHARSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
<tr>
<td>charset</td>
<td>Character set</td>
</tr>
</tbody>
</table>

Usage Notes

This is used for WRITETOFIILE Procedures if not explicitly specified at that time.

200.7.101 SETDATA Procedures

This overloaded procedure sets character data or DOMPROCESSINGINSTRUCTION content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.SETDATA(
    cd       IN     DOMCHARACTERDATA,
    data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.SETDATA(
    pi       IN     DOMPROCESSINGINSTRUCTION,
    data     IN     VARCHAR2);
```

Parameters

Table 200-122  SETDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>data</td>
<td>The data to which the node is set</td>
</tr>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
<tr>
<td>data</td>
<td>New processing instruction content data</td>
</tr>
</tbody>
</table>

200.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the GETDOCTYPE Function.
Syntax

DBMS_XMLDOM.SETDOCTYPE(
    doc IN DOMDocument,
    name IN VARCHAR2,
    sysid IN VARCHAR2,
    pubid IN VARCHAR2);

Parameters

Table 200-123  SETDOCTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>The document whose DTD has to be set</td>
</tr>
<tr>
<td>name</td>
<td>The name that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>sysid</td>
<td>The system ID that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>pubid</td>
<td>The public ID that the doctype needs to be initialized with</td>
</tr>
</tbody>
</table>

200.7.103 SETNAMEDITEM Function

This function adds a node using its NodeName attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also:

DOMNamedNodeMap Subprograms

Syntax

Adds a node using its NodeName attribute:

DBMS_XMLDOM.SETNAMEDITEM(
    nmm IN DOMNAMEDNODEMAP,
    arg IN DOMNODE)
RETURN DOMNode;

Adds a node using its NodeName attribute and namespace URI:

DBMS_XMLDOM.SETNAMEDITEM(
    nmm IN DOMNAMEDNODEMAP,
    arg IN DOMNODE,
    ns IN VARCHAR2)
RETURN DOMNode;
Parameters

Table 200-124 SETNAMEDITEM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnn</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>arg</td>
<td>The Node to be added using its NodeName attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

200.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

See Also:

DOMNode Subprograms

Syntax

DBMS_XMLDOM.SETNODEVALUE(  
  n IN DOMNODE,  
  nodeValue IN VARCHAR2);  

Parameters

Table 200-125 SETNODEVALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>nodeValue</td>
<td>The value to which node is set</td>
</tr>
</tbody>
</table>

200.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

See Also:

DOMNode Subprograms
Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```sql
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n IN DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_BINARYINPUTSTREAM` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```sql
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n in DOMNODE,
value in SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

### Table 200-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYINPUTSTREAM</td>
</tr>
</tbody>
</table>

200.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

> See Also:

DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or CLOB, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```sql
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (n IN DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The
datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (n        IN   DOMNODE,
    value    IN   SYS.UTL_CHARACTERINPUTSTREAM);
```

**Parameters**

**Table 200-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTERINPUTSTREAM</td>
</tr>
</tbody>
</table>

### 200.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

```
   # See Also: DOMNode Subprograms
```

**Syntax**

```
DBMS_XMLDOM.SETPREFIX(
    n       IN     DOMNODE,
    prefix  IN     VARCHAR2);
```

**Parameters**

**Table 200-128 SETPREFIX Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>prefix</td>
<td>The value for the namespace prefix of the node</td>
</tr>
</tbody>
</table>

### 200.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

```
   # See Also: DOMDocument Subprograms
```
### Syntax

```sql
DBMS_XMLDOM.SETSTANDALONE(
    doc IN DOMDOCUMENT,
    newValue IN VARCHAR2);
```

### Parameters

**Table 200-129 SETSTANDALONE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>newValue</td>
<td>Value of the standalone property of the document</td>
</tr>
</tbody>
</table>

### 200.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

**See Also:**

DOMAttr Subprograms

### Syntax

```sql
DBMS_XMLDOM.SETVALUE(
    a IN DOMATTR,
    value IN VARCHAR2);
```

### Parameters

**Table 200-130 SETVALUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>value</td>
<td>The value to which to set the attribute</td>
</tr>
</tbody>
</table>

### 200.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDocument.

**See Also:**

DOMDocument Subprograms
Syntax

DBMS_XMLDOM.SETVERSION(
    doc IN DOMDOCUMENT,
    version IN VARCHAR2);

Parameters

Table 200-131  SETVERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>version</td>
<td>The version of the document</td>
</tr>
</tbody>
</table>

200.7.111 SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also:
DBMS_XMLDOM DOMText Subprograms

Syntax

DBMS_XMLDOM.SPLITTEXT(
    t IN DOMTEXT,
    offset IN NUMBER)
RETURN DOMText;

Parameters

Table 200-132  SPLITTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>DOMTEXT</td>
</tr>
<tr>
<td>offset</td>
<td>Offset at which to split</td>
</tr>
</tbody>
</table>

200.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also:
DOMCharacterData Subprograms
Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
    cd IN DOMCHARACTERDATA,
    offset IN NUMBER,
    cnt IN NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 200-133  SUBSTRINGDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The starting offset of the data from which to get the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (from the offset) of the data to get</td>
</tr>
</tbody>
</table>

200.7.113 USEBINARYSTREAM Function

This function returns **TRUE** if the datatype of the node is **RAW** or **BLOB**, so that the node value may be read or written using an **UTL_BINARYINPUTSTREAM** or **UTL_BINARYOUTPUTSTREAM**.

If a value of **FALSE** is returned, the node value may only be accessed through an **UTL_CHARACTERINPUTSTREAM** or **UTL_CHARACTEROUTPUTSTREAM**.

See Also:

- DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM (n IN DOMNODE) RETURN BOOLEAN;
```

Parameters

Table 200-134  USEBINARYSTREAM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
200.7.114 WRITETOBUFFER Procedures

`WRITETOBUFFER` is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Writes XML node to specified buffer using the database character set (See Also: `DOMNode Subprograms`):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    n        IN      DOMNODE,
    buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: `DOMDocument Subprograms`):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    doc       IN      DOMDOCUMENT,
    buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: `DOMDocumentFragment Subprograms`):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    df        IN      DOMDOCUMENTFRAGMENT,
    buffer    IN OUT  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>

200.7.115 WRITETOCLOB Procedures

`WRITETOCLOB` is an overloaded procedure that writes an XML node or document to a specified `CLOB`.

The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Writes XML node to specified `CLOB` using the database character set (See Also: `DOMNode Subprograms`):
DBMS_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    cl      IN OUT  CLOB);

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms):

DBMS_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    cl      IN OUT  CLOB);

Parameters

Table 200-136  WRITETOCLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>

200.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

DBMS_XMLDOM.WRITETOFILE(
    n          IN      DOMNODE,
    fileName   IN      VARCHAR2);

 Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

DBMS_XMLDOM.WRITETOFILE(
    n          IN      DOMNODE,
    fileName   IN      VARCHAR2,
    charset    IN      VARCHAR2);

 Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

DBMS_XMLDOM.WRITETOFILE(
    doc        IN   DOMDOCUMENT,
    filename   IN   VARCHAR2);

 Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

DBMS_XMLDOM.WRITETOFILE(
    doc       IN   DOMDOCUMENT,
    fileName  IN   VARCHAR2,
    charset   IN   VARCHAR2);
### Parameters

#### Table 200-137 WRITETOFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>fileName</td>
<td>File to which to write. The filename should be in the format of <code>database_directory/object_name/filename</code>, for example <code>mydir/filename</code> (on Windows, use <code>\</code> instead of <code>/</code>).</td>
</tr>
<tr>
<td>charset</td>
<td>specified character set</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>charset</td>
<td>Character set</td>
</tr>
</tbody>
</table>
The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Security Model
- Summary of DBMS_XMLGEN Subprograms

**See Also:**

*Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`

### 201.1 DBMS_XMLGEN Security Model

Owned by XDB, the `DBMS_XMLGEN` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

### 201.2 Summary of DBMS_XMLGEN Subprograms

This table lists the DBMS_XMLGEN subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSECONTEXT Procedure</td>
<td>Closes the context and releases all resources</td>
</tr>
<tr>
<td>CONVERT Functions</td>
<td>Converts the XML into the escaped or unescaped XML equivalent</td>
</tr>
<tr>
<td>GETNUMROWSPROCESSED Function</td>
<td>Gets the number of SQL rows that were processed in the last call to GETXML Functions</td>
</tr>
<tr>
<td>GETXML Functions</td>
<td>Gets the XML document</td>
</tr>
<tr>
<td>GETXMLTYPE Functions</td>
<td>Gets the XML document and returns it as XMLType</td>
</tr>
<tr>
<td>NEWCONTEXT Functions</td>
<td>Creates a new context handle</td>
</tr>
</tbody>
</table>
Table 201-1  (Cont.) Summary of DBMS_XMLGEN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEWCONTEXTFROMHIERARCHY Function</td>
<td>Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result</td>
</tr>
<tr>
<td>RESTARTQUERY Procedure</td>
<td>Restarts the query to start fetching from the beginning</td>
</tr>
<tr>
<td>SETCONVERTSPECIALCHARS Procedure</td>
<td>Sets whether special characters such as $, which are non-XML characters, should be converted or not to their escaped representation</td>
</tr>
<tr>
<td>SETMAXROWS Procedure</td>
<td>Sets the maximum number of rows to be fetched each time</td>
</tr>
<tr>
<td>SETNULLHANDLING Procedure</td>
<td>Sets NULL handling options</td>
</tr>
<tr>
<td>SETROWSETTAG Procedure</td>
<td>Sets the name of the element enclosing the entire result</td>
</tr>
<tr>
<td>SETROWTAG Procedure</td>
<td>Sets the name of the element enclosing each row of the result</td>
</tr>
<tr>
<td>SETSKIPROWS Procedure</td>
<td>Sets the number of rows to skip every time before generating the XML.</td>
</tr>
<tr>
<td>USEITEMTAGSFORCOLL Procedure</td>
<td>Forces the use of the collection column name appended with the tag _ITEM for collection elements</td>
</tr>
<tr>
<td>USENULLATTRIBUTEINDICATOR Procedure</td>
<td>Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.</td>
</tr>
</tbody>
</table>

201.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (|
  ctx IN ctxHandle);
```

Parameters

Table 201-2  CLOSECONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle to close.</td>
</tr>
</tbody>
</table>
201.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```sql
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```sql
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

Parameters

Table 201-3 CONVERT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The XML CLOB data to be encoded or decoded.</td>
</tr>
<tr>
<td>flag</td>
<td>The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.</td>
</tr>
</tbody>
</table>

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character `<` is `&lt;`. Unescaping is the reverse transformation.

201.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```sql
DBMS_XMLGEN.GETNUMROWSPROCESSED (
    ctx     IN    ctxHandle)
RETURN NUMBER;
```
Parameters

Table 201-4 GETNUMROWSPROCESSED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

201.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functions call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    tmpclob      IN OUT NCOPY CLOB,  
    dtdOrSchema  IN number := NONE)  
RETURN BOOLEAN;  
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;  
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (  
    sqlQuery     IN VARCHAR2,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;  
```
Table 201-5  GETXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>tmpclob</td>
<td>The CLOB to which the XML document is appended.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

201.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results. This function is overloaded.

**Syntax**

Generates the XML document and returns it as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (  
    ctx IN ctxhandle,  
    dtdOrSchema IN number := NONE)  
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (  
    sqlQuery IN VARCHAR2,  
    dtdOrSchema IN number := NONE)  
RETURN sys.XMLType
```

Table 201-6  GETXMLTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>
201.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```sql
DBMS_XMLGEN.NEWCONTEXT (
    query     IN VARCHAR2)
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```sql
DBMS_XMLGEN.NEWCONTEXT (
    queryString  IN SYS_REFCURSOR)
RETURN ctxHandle;
```

Parameters

Table 201-7 NEWCONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>The query, in the form of a VARCHAR, the result of which must be converted to XML.</td>
</tr>
<tr>
<td>queryString</td>
<td>The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.</td>
</tr>
</tbody>
</table>

201.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```sql
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
    queryString IN VARCHAR2)
RETURN ctxHandle;
```
Parameters

Table 201-8  NEWCONTEXTFROMHIERARCHY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryString</td>
<td>The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.</td>
</tr>
</tbody>
</table>

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

201.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```sql
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 201-9  RESTARTQUERY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the current query.</td>
</tr>
</tbody>
</table>

201.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, *, ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.
Syntax

DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx IN ctxHandle,
conv IN BOOLEAN);

Parameters

Table 201-10  SETCONVERTSPECIALCHARS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from one of the NEWCONTEXT Functions call.</td>
</tr>
<tr>
<td>conv</td>
<td>TRUE indicates that conversion is needed.</td>
</tr>
</tbody>
</table>

201.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the maxrows parameter.

Syntax

DBMS_XMLGEN.SETMAXROWS (
ctx IN ctxHandle,
maxRows IN NUMBER);

Parameters

Table 201-11  SETMAXROWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>maxRows</td>
<td>The maximum number of rows to get for each call to GETXML Functions</td>
</tr>
</tbody>
</table>

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.
201.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```sql
DBMS_XMLGEN.SETNULLHANDLING(
ctx IN ctx,
flag IN NUMBER);
```

Parameters

Table 201-12  SETNULLHANDLING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>flag</td>
<td>The NULL handling option set.</td>
</tr>
<tr>
<td></td>
<td>- DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements.</td>
</tr>
<tr>
<td></td>
<td>- NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil=&quot;true&quot;.</td>
</tr>
<tr>
<td></td>
<td>- EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <code>&lt;foo/&gt;</code>.</td>
</tr>
</tbody>
</table>

201.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is ROWSET.

Syntax

```sql
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 201-13  SETROWSETTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call.</td>
</tr>
<tr>
<td>rowSetTagName</td>
<td>The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the rowSetTag to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
201.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

DBMS_XMLGEN.SETROWTAG (ctx IN ctxHandle, rowTagName IN VARCHAR2);

Parameters

Table 201-14 SETROWTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call.</td>
</tr>
<tr>
<td>rowTagName</td>
<td>The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

201.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set skiprows to zero. For the next set, set the skiprows to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function.

Syntax

DBMS_XMLGEN.SETSKIPROWS (ctx IN ctxHandle, skipRows IN NUMBER);

Parameters

Table 201-15 SETSKIPROWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>skipRows</td>
<td>The number of rows to skip for each call to getXML.</td>
</tr>
</tbody>
</table>
Related Topics

- **GETXML Functions**
  This function gets the XML document. The function is overloaded.

201.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

DBMS_XMLGEN.USEITEMTAGSFORCOLL (ctx IN ctxHandle);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle.</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.

201.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULL, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR (ctx IN ctxType, attrind IN BOOLEAN := TRUE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrind</td>
<td>Use attribute to indicate NULL?</td>
</tr>
</tbody>
</table>

The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Summary of DBMS_XMLINDEX Subprograms**

### See Also:

*Oracle XML DB Developer's Guide* for more information about "XMLIndex"

### 202.1 DBMS_XMLINDEX Overview

DBMS_XMLINDEX provides a mechanism for asynchronous index maintenance.

#### Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. DBMS_XMLINDEX provides this mechanism.

### 202.2 DBMS_XMLINDEX Security Model

Owned by XDB, the DBMS_XMLINDEX package must be created by SYS or XDB. The **EXECUTE** privilege is granted to **PUBLIC**.

Subprograms in this package are executed using the privileges of the current user.

### 202.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the DBMS_XMLINDEX subprograms and briefly describes them.

**Table 202-1  DBMS_XMLINDEX Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEDATEINDEX Procedure</td>
<td>Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>
</tr>
</tbody>
</table>
Table 202-1  (Cont.) DBMS_XMLINDEX Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENUMBERINDEX Procedure</td>
<td>Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>

<tr>
<td>SYNCINDEX Procedure</td>
<td>Synchronizes the index manually</td>
</tr>
</tbody>
</table>

202.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
    xml_index_schema   IN   VARCHAR2,
    xml_index_name     IN   VARCHAR2,
    date_index_name    IN   VARCHAR2,
    xmltypename        IN   VARCHAR2,
    date_index_clause  IN   VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
    xml_index_schema   IN   VARCHAR2
    xml_index_name     IN   VARCHAR2,
    date_index_name    IN   VARCHAR2,
    xmltypename        IN   VARCHAR2)
```

Parameters

Table 202-2  CREATEDATEINDEX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>date_index_name</td>
<td>Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.</td>
</tr>
</tbody>
</table>
Table 202-2  (Cont.) CREATEDATEINDEX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date_index_clause</td>
<td>Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index</td>
</tr>
</tbody>
</table>

202.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```sql
DBMS_XMLINDEX.CREATENUMBERINDEX (
    xml_index_schema   IN   VARCHAR2,
    xml_index_name     IN   VARCHAR2,
    num_index_name     IN   VARCHAR2,
    num_index_clause   IN   VARCHAR2,
    xmltypename        IN   VARCHAR2);
```

Parameters

Table 202-3  CREATENUMBERINDEX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>num_index_name</td>
<td>Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema</td>
</tr>
<tr>
<td>num_index_clause</td>
<td>Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.</td>
</tr>
</tbody>
</table>

202.3.3 DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```sql
DBMS_XMLINDEX.DROPPARAMETER ( name    IN    VARCHAR2);
```
202.3.4 MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```sql
DBMS_XMLINDEX.MODIFYPARAMETER (  
    name        IN      VARCHAR2,  
    parameter   IN      CLOB);  
```

Parameters

Table 202-5  MODIFYPARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_XMLINDEX.MODIFYPARAMETER (  
    'myIndexParam',  
    'PATH TABLE po_ptab  
        PATH ID INDEX po_pidx  
        ORDER KEY INDEX po_oidx  
        VALUE INDEX po_vidx');  
```

202.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN operation on an XMLIndex.

Syntax

```sql
DBMS_XMLINDEX.PROCESS_PENDING (  
    xml_index_schema    IN     VARCHAR2,  
    xml_index_name      IN     VARCHAR2,  
    pending_row_count   OUT    BINARY_INTEGER,  
    error_row_count     OUT    BINARY_INTEGER);  
```
Parameters

### Table 202-6  PROCESS_PENDING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION</td>
</tr>
<tr>
<td>pending_row_count</td>
<td>Number of pending rows to be processed</td>
</tr>
<tr>
<td>error_row_count</td>
<td>Number of rows for which indexing may have failed because of an error</td>
</tr>
</tbody>
</table>

**Usage Notes**

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in `SYS_AIXSXI_######_PENDINGTAB` and errors in `SYS_AIXSXI_#####_ERRORTAB`. Keeping track of rows and the errors is useful in triaging issues.

**Examples**

```sql
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
   'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

### 202.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

**Syntax**

```sql
DBMS_XMLINDEX.REGISTERPARAMETER ( 
   name        IN      VARCHAR2, 
   parameter   IN      CLOB);
```

**Parameters**

### Table 202-7  REGISTERPARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>
Examples

DBMS_XMLINDEX.REGISTERPARAMETER (  
   'myIndexParam',  
   'PATH TABLE po_ptab  
   PATH ID INDEX po_pidx  
   ORDER KEY INDEX po_oidx  
   VALUE INDEX po_vidx  
   PATHS (NAMESPACE MAPPING (xmlns:p="http://www.example.com/IPO"))  
   GROUP MASTERGROUP XMLTABLE PO_TAB  
   (''/p:PurchaseOrder''  
    COLUMNS  
     REFERENCE VARCHAR2(30) PATH ''p:Reference'',  
     REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )  
   GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB  
   (''/p:PurchaseOrder/p:LineItems/p:LineItem''  
    COLUMNS  
     LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',  
     QUANTITY NUMBER(38) PATH ''@p:Quantity'',  
     DESCRIPTION VARCHAR2(256) PATH ''p:Description''));

202.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings
the path table up-to-date with the base XMLTYPE column.

Syntax

DBMS_XMLINDEX.SYNCINDEX (  
   xml_index_schema  IN VARCHAR2,  
   xml_index_name  IN VARCHAR2,  
   partition_name  IN VARCHAR2 DEFAULT NULL,  
   reindex  IN BOOLEAN DEFAULT FALSE);

Parameters

Table 202-8  SYNCINDEX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>partition_name</td>
<td>[Currently not supported]</td>
</tr>
<tr>
<td>reindex</td>
<td>Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.</td>
</tr>
</tbody>
</table>

Examples

EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
Using the DBMS_XMLPARSER package, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XMLPARSER Subprograms

See Also:

Oracle XML DB Developer's Guide

203.1 DBMS_XMLPARSER Security Model

Owned by XDB, the DBMS_XMLPARSER package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

203.2 Summary of DBMS_XMLPARSER Subprograms

<td>Sets validation mode.</td>
</tr>
<tr>
<td>SHOWWARNINGS</td>
<td>Turns warnings on or off.</td>
</tr>
</tbody>
</table>

203.2.1 FREEPARSER

This procedure frees a parser object.

Syntax

```sql
PROCEDURE freeParser(
    p Parser);
```

Parameters

Table 203-2  FREEPARSER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
203.2.2 GETDOCTYPE

The GETDOCTYPE function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

FUNCTION getDoctype(
  p Parser)
RETURN DOMDocumentType;

Parameters

Table 203-3  GETDOCTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

203.2.3 GETDOCUMENT

GETDOCUMENT returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

FUNCTION GETDOCUMENT(
  p Parser)
RETURN DOMDocument;

Parameters

Table 203-4  GETDOCUMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

203.2.4 GETRELEASEVERSION

GETRELEASEVERSION returns the release version of the Oracle XML parser for PL/SQL.

Syntax

FUNCTION getReleaseVersion
RETURN VARCHAR2;
203.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

Syntax

```sql
FUNCTION GETVALIDATIONMODE(
    p Parser)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

203.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```sql
FUNCTION newParser
RETURN Parser;
```

203.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```sql
FUNCTION parse(url VARCHAR2)
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```sql
PROCEDURE parse(
    p Parser,
    url VARCHAR2);
```
Parameters

Table 203-6  PARSE Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>Complete path of the url/file to be parsed.</td>
</tr>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>

203.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEBUFFER(
    p   Parser,
    doc VARCHAR2);

Parameters

Table 203-7  PARSEBUFFER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>

203.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSECLOB(
    p   Parser,
    doc CLOB);

Parameters

Table 203-8  PARSECLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>
203.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTD(
    p    Parser,
    url  VARCHAR2,
    root VARCHAR2);

Parameters

Table 203-9 PARSEDTD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>url</td>
<td>(IN)</td>
<td>Complete path of the URL or file to be parsed.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>

203.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTDBUFFER(
    p    Parser,
    dtd  VARCHAR2,
    root VARCHAR2);

Parameters

Table 203-10 PARSEDTDBUFFER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD buffer to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
203.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTDCLOB(
   p    Parser,
   dtd  CLOB,
   root VARCHAR2);

Parameters

Table 203-11 PARSEDTDCLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD Clob to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>

203.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

PROCEDURE setBaseDir(
   p    Parser,
   dir  VARCHAR2);

Parameters

Table 203-12 SETBASEDIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dir</td>
<td>(IN)</td>
<td>Directory used as a base directory.</td>
</tr>
</tbody>
</table>
203.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

PROCEDURE setDoctype(
   p   Parser,
   dtd DOMDocumentType);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD to set.</td>
</tr>
</tbody>
</table>

203.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

PROCEDURE setErrorLog(
   p        Parser,
   fileName VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>fileName</td>
<td>(IN)</td>
<td>Complete path of the file to use as the error log.</td>
</tr>
</tbody>
</table>

203.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

PROCEDURE setPreserveWhitespace(
   p   Parser,
   yes BOOLEAN);
### Parameters

**Table 203-15**  SETPRESERVEWHITESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - preserve, FALSE - don't preserve.</td>
</tr>
</tbody>
</table>

#### 203.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

**Syntax**

```plaintext
PROCEDURE setValidationMode(
    p   Parser,
    yes BOOLEAN);
```

**Parameters**

**Table 203-16**  SETVALIDATIONMODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - validate, FALSE - don't validate.</td>
</tr>
</tbody>
</table>

#### 203.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

**Syntax**

```plaintext
PROCEDURE showWarnings(
    p   Parser,
    yes BOOLEAN);
```

**Parameters**

**Table 203-17**  SHOWWARNINGS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - show warnings, FALSE - don't show warnings.</td>
</tr>
</tbody>
</table>
DBMS_XMLQUERY provides database-to-XMLType functionality.

**Note:**

With Oracle Database 18.1 Release, the DBMS_XMLQUERY package is deprecated. Use DBMS_XMLGEN instead.

The DBMS_XMLQUERY package has been replaced with improved technology. While Oracle recommends you not to begin development using DBMS_XMLQUERY, Oracle continues to support DBMS_XMLQUERY for reasons of backward compatibility. Your existing applications using DBMS_XMLQUERY will continue to work.

**See Also:**

For more information, see DBMS_XMLGEN.

This chapter contains the following topics:

- DBMS_XMLQUERY Security Model
- DBMS_XMLQUERY Constants
- Types
- Summary of DBMS_XMLQUERY Subprograms

### 204.1 DBMS_XMLQUERY Security Model

Owned by XDB, the DBMS_XMLQUERY package must be created by SYS or XDB. The execute privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

### 204.2 DBMS_XMLQUERY Constants

The DBMS_XMLQUERY package includes several constants to use when specifying parameter values.

These constants are defined in the following table.
Table 204-1  Constants of DBMS/XMLQUERY

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_ENCODING</td>
<td>Used to signal that the DB character encoding is to be used.</td>
</tr>
<tr>
<td>DEFAULT ROWSETTAG</td>
<td>The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.</td>
</tr>
<tr>
<td>DEFAULT ERRORTAG</td>
<td>The default tag to enclose raised errors -- ERROR.</td>
</tr>
<tr>
<td>DEFAULT ROWIDATTR</td>
<td>The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM</td>
</tr>
<tr>
<td>DEFAULT ROWTAG</td>
<td>The default tag name for the element corresponding to db.records -- ROW</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask -- 'MM/dd/yyyy HH:mm:ss'</td>
</tr>
<tr>
<td>ALL_ROWS</td>
<td>Indicates that all rows are needed in the output.</td>
</tr>
<tr>
<td>NONE</td>
<td>Used to specify that the output should not contain any XML metadata (for example, no DTD).</td>
</tr>
<tr>
<td>DTD</td>
<td>Used to specify that the generation of the DTD is desired.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Used to specify that the generation of the XML Schema is desired.</td>
</tr>
<tr>
<td>LOWER_CASE</td>
<td>Use lower case tag names.</td>
</tr>
<tr>
<td>UPPER_CASE</td>
<td>Use upper case tag names.</td>
</tr>
</tbody>
</table>

204.3 Types

The DBMS/XMLQUERY subprograms use the ctxType type.

Table 204-2  Types of DBMS/XMLQUERY

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This is the return type of NEWCONTEXT.</td>
</tr>
</tbody>
</table>

204.4 Summary of DBMS/XMLQUERY Subprograms

This table lists the DBMS/XMLQUERY subprograms and briefly describes them.

Table 204-3  DBMS/XMLQUERY Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSECONTEXT</td>
<td>Closes or deallocates a particular query context.</td>
</tr>
<tr>
<td>GETDTD</td>
<td>Generates the DTD.</td>
</tr>
<tr>
<td>GETEXCEPTIONCONTENT</td>
<td>Returns the thrown exception's error code and error message.</td>
</tr>
<tr>
<td>GETNUMROWSPROCESSED</td>
<td>Returns the number of rows processed for the query.</td>
</tr>
<tr>
<td>GETVERSION</td>
<td>Prints the version of the XSU in use.</td>
</tr>
<tr>
<td>GETXML</td>
<td>Generates the XML document.</td>
</tr>
</tbody>
</table>
### Table 204-3 (Cont.) DBMS_XMLQUERY Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEWCONTEXT</td>
<td>Creates a query context and it returns the context handle.</td>
</tr>
<tr>
<td>PROPAGATEORIGINALEXCEPTION</td>
<td>Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an OracleXMLSQLException.</td>
</tr>
<tr>
<td>REMOVEXSLTPARAM</td>
<td>Removes a particular top-level stylesheet parameter.</td>
</tr>
<tr>
<td>SETBINDVALUE</td>
<td>Sets a value for a particular bind name.</td>
</tr>
<tr>
<td>SETCOLLIDATTRENAME</td>
<td>Sets the name of the id attribute of the collection element's separator tag.</td>
</tr>
<tr>
<td>SETDATAHEADER</td>
<td>Sets the XML data header.</td>
</tr>
<tr>
<td>SETDATEFORMAT</td>
<td>Sets the format of the generated dates in the XML document.</td>
</tr>
<tr>
<td>SETENCODINGTAG</td>
<td>Sets the encoding processing instruction in the XML document.</td>
</tr>
<tr>
<td>SETERRORTAG</td>
<td>Sets the tag to be used to enclose the XML error documents.</td>
</tr>
<tr>
<td>SETMAXROWS</td>
<td>Sets the maximum number of rows to be converted to XML.</td>
</tr>
<tr>
<td>SETMETAHEADER</td>
<td>Sets the XML meta header.</td>
</tr>
<tr>
<td>SETRAISEEXCEPTION</td>
<td>Tells the XSU to throw the raised exceptions.</td>
</tr>
<tr>
<td>SETRAISENOROWSEXCEPTION</td>
<td>Tells the XSU to throw or not to throw an OracleXMLNoRowsException in the case when for one reason or another, the XML document generated is empty.</td>
</tr>
<tr>
<td>SETROWIDATTRENAME</td>
<td>Sets the name of the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWIDATTRVALUE</td>
<td>Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWSETTAG</td>
<td>Sets the tag to be used to enclose the XML dataset.</td>
</tr>
<tr>
<td>SETROWTAG</td>
<td>Sets the tag to be used to enclose the XML element.</td>
</tr>
<tr>
<td>SETSKIPROWS</td>
<td>Sets the number of rows to skip.</td>
</tr>
<tr>
<td>SETSQLTOXMLNAMEESCAPING</td>
<td>This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.</td>
</tr>
<tr>
<td>SETSTYLEFILEHEADER</td>
<td>Sets the stylesheet header.</td>
</tr>
<tr>
<td>SETTAGCASE</td>
<td>Specified the case of the generated XML tags.</td>
</tr>
<tr>
<td>SETXSLT</td>
<td>Registers a stylesheet to be applied to generated XML.</td>
</tr>
<tr>
<td>SETXSLTPARAM</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>USENULLATTRIBUTEINDICATOR</td>
<td>Specifies weather to use an XML attribute to indicate NULLness.</td>
</tr>
<tr>
<td>USETYPEFORCOLLELEMTAG</td>
<td>Tells the XSU to use the collection element's type name as the collection element tag name.</td>
</tr>
</tbody>
</table>
204.4.1 CLOSECONTEXT

This procedure closes or deallocates a particular query context

Syntax

PROCEDURE CLOSECONTEXT(
   ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

204.4.2 GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax

Function that generates the DTD based on the SQL query that is used to initialize the context.

FUNCTION GETDTD(
   ctxHdl IN ctxType,
   withVer IN BOOLEAN := false)
RETURN CLOB;

Procedure that generates the DTD based on the SQL query that is used to initialize the context. Specifies the output CLOB for XML document result.

PROCEDURE GETDTD(
   ctxHdl IN ctxType,
   xDoc IN CLOB,
   withVer IN BOOLEAN := false);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>withVer</td>
<td>(IN)</td>
<td>Generate the version information? TRUE for yes.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
204.4.3 GETEXCEPTIONCONTENT

GETEXCEPTIONCONTENT returns the thrown exception's SQL error code and error message through the procedure's OUT parameters.

This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

PROCEDURE GETEXCEPTIONCONTENT(
    ctxHdl IN ctxType,
    errNo OUT NUMBER,
    errMsg OUT VARCHAR2);

Parameters

Table 204-6 GETEXCEPTIONCONTENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(OUT)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(OUT)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

204.4.4 GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

FUNCTION GETNUMROWSPROCESSED(
    ctxHdl IN ctxType)
RETURN NUMBER;

Table 204-7 GETNUMROWSPROCESSED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

204.4.5 GETVERSION

The GETVERSION procedure prints the version of the XSU in use.

Syntax

PROCEDURE GETVERSION();
204.4.6 GETXML

GETXML creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context does not need to be explicitly opened or closed.

Syntax

This function uses a SQL query in string form.

FUNCTION GETXML(
    sqlQuery IN VARCHAR2,
    metaType IN NUMBER := NONE)
RETURN CLOB;

This function uses a SQL query in CLOB form.

FUNCTION GETXML(
    sqlQuery IN CLOB,
    metaType IN NUMBER := NONE)
RETURN CLOB;

This function generates the XML document based on a SQL query used to initialize the context.

FUNCTION GETXML(
    ctxHdl IN ctxType,
    metaType IN NUMBER := NONE)
RETURN CLOB;

This procedure generates the XML document based on the SQL query used to initialize the context.

PROCEDURE GETXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB,
    metaType IN NUMBER := NONE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>metaType</td>
<td>(IN)</td>
<td>XML metadatatype (NONE, DTD, or SCHEMA).</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
204.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

Syntax

FUNCTION NEWCONTEXT(
    sqlQuery IN VARCHAR2
) RETURN ctxType;

FUNCTION NEWCONTEXT(
    sqlQuery IN CLOB
) RETURN ctxType;

Parameters

Table 204-9 NEWCONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query, the results of which to convert to XML.</td>
</tr>
</tbody>
</table>

204.4.8 PROPAGATEORIGINALEXCEPTION

The PROPAGATEORIGINALEXCEPTION procedure specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

Syntax

PROCEDURE PROPAGATEORIGINALEXCEPTION(
    ctxHdl IN ctxType,
    flag IN BOOLEAN
);

Parameters

Table 204-10 PROPAGATEORIGINALEXCEPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>TRUE if want to propagate original exception, FALSE to wrap in OracleXMLSQLException.</td>
</tr>
</tbody>
</table>

204.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

PROCEDURE REMOVEXSLTPARAM(
    ctxHdl IN ctxType,
    name IN VARCHAR2
);
Table 204-11  REMOVEXSLTPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
</tbody>
</table>

204.4.10 SETBINDVALUE

This procedure sets a value for a particular bind name.

Syntax

PROCEDURE SETBINDVALUE(
  ctxHdl IN ctxType,
  bindName IN VARCHAR2,
  bindValue IN VARCHAR2);

Table 204-12  SETBINDVALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>bindName</td>
<td>(IN)</td>
<td>Bind name.</td>
</tr>
<tr>
<td>bindValue</td>
<td>(IN)</td>
<td>Bind value.</td>
</tr>
</tbody>
</table>

204.4.11 SETCOLLIDATTRNAME

This procedure sets the name of the id attribute of the collection element's separator tag.

Passing NULL or an empty string for the tag causes the row id attribute to be omitted.

Syntax

PROCEDURE SETCOLLIDATTRNAME(
  ctxHdl IN ctxType,
  attrName IN VARCHAR2);

Table 204-13  SETCOLLIDATTRNAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

204.4.12 SETDATAHEADER

This procedure sets the XML data header.

The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the rowset. The two entities are enclosed by the docTag
argument. The last data header specified is used. Passing in NULL for the \texttt{header} parameter unsets the data header.

**Syntax**

\begin{verbatim}
PROCEDURE SETDATAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null,
tag IN VARCHAR2 := null);
\end{verbatim}

**Table 204-14 SETDATAHEADER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag used to enclose the data header and the rowset.</td>
</tr>
</tbody>
</table>

### 204.4.13 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the \texttt{java.text.SimpleDateFormat} class. Setting the mask to NULL or an empty string sets the default mask -- \texttt{DEFAULT_DATE_FORMAT}.

**Syntax**

\begin{verbatim}
PROCEDURE SETDATEFORMAT(
ctxHdl IN ctxType,
mask IN VARCHAR2);
\end{verbatim}

**Table 204-15 SETDATEFORMAT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>The date mask.</td>
</tr>
</tbody>
</table>

### 204.4.14 SETENCODINGTAG Procedure

This procedure sets the encoding processing instruction in the XML document.

**Syntax**

\begin{verbatim}
PROCEDURE SETENCODINGTAG(
ctxHdl IN ctxType,
enc IN VARCHAR2 := DB_ENCODING);
\end{verbatim}

**Table 204-16 SETENCODINGTAG Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
Table 204-16  (Cont.) SETENCODINGTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enc</td>
<td>(IN)</td>
<td>The encoding to use.</td>
</tr>
</tbody>
</table>

204.4.15 SETERRORTAG Procedure

This procedure sets the tag to be used to enclose the XML error documents.

Syntax

PROCEDURE SETERRORTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);

Table 204-17  SETERRORTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

204.4.16 SETMAXROWS Procedure

This procedure sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

PROCEDURE SETMAXROWS (
  ctxHdl IN ctxType,
  rows IN NUMBER);

Table 204-18  SETMAXROWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to generate.</td>
</tr>
</tbody>
</table>

204.4.17 SETMETAHEADER Procedure

This procedure sets the XML meta header.

When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in NULL for the header parameter unsets the meta header.
Syntax

PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);

Table 204-19  SETMETAHEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>Header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
</tbody>
</table>

204.4.18 SETRAISEEXCEPTION

This procedure specifies whether to throw raised exceptions.

If this call isn't made or if \texttt{FALSE} is passed to the \texttt{flag} argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

PROCEDURE SETRAISEEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=true);

Table 204-20  SETRAISEEXCEPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throw raised exceptions? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>

204.4.19 SETRAISENOROWSEXCEPTION

This procedure specifies whether to throw an \texttt{OracleXMLNoRowsException} when the generated XML document is empty. By default, the exception is not thrown.

Syntax

PROCEDURE SETRAISENOROWSEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=false);

Table 204-21  SETRAISENOROWSEXCEPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throws an \texttt{OracleXMLNoRowsException} if set to TRUE.</td>
</tr>
</tbody>
</table>
204.4.20 SETROWIDATTRNAME

This procedure sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

**Syntax**

```sql
PROCEDURE SETROWIDATTRNAME(
    ctxHdl IN ctxType,
    attrName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

204.4.21 SETROWIDATTRVALUE

This procedure specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.

Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

**Syntax**

```sql
PROCEDURE SETROWIDATTRVALUE(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column whose value is to be assigned to the row id attribute.</td>
</tr>
</tbody>
</table>

204.4.22 SETROWSETTAG

This procedure sets the tag to be used to enclose the XML dataset.

**Syntax**

```sql
PROCEDURE SETROWSETTAG(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```
### Table 204-24  SETROWSETTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

#### 204.4.23 SETROWTAG

This procedure sets the tag to be used to enclose the XML element corresponding to a `db.record`.

**Syntax**

```sql
PROCEDURE SETROWTAG(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

### Table 204-25  SETROWTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

#### 204.4.24 SETSKIPROWS

`SETSKIPROWS` sets the number of rows to skip. By default, 0 rows are skipped.

**Syntax**

```sql
PROCEDURE SETSKIPROWS(
    ctxHdl IN ctxType,
    rows IN NUMBER);
```

### Table 204-26  SETSKIPROWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to skip.</td>
</tr>
</tbody>
</table>

#### 204.4.25 SETSQLTOXMLNAMEESCAPING

This procedure turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

**Syntax**

```sql
PROCEDURE SETSQLTOXMLNAMEESCAPING(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>

204.4.26 SETSTYLESHEETHEADER

SETSTYLESHEETHEADER sets the stylesheet header (the stylesheet processing instructions) in the generated XML document.

Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

Syntax

PROCEDURE SETSTYLESHEETHEADER(
ctxHdl IN ctxType,
uri IN VARCHAR2,
type IN VARCHAR2 := 'text/xsl');

Table 204-28  SETSTYLESHEETHEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td>type</td>
<td>(IN)</td>
<td>Stylesheet type; defaults to &quot;text/xsl&quot;.</td>
</tr>
</tbody>
</table>

204.4.27 SETTAGCASE

SETTAGCASE specifies the case of the generated XML tags.

Syntax

PROCEDURE SETTAGCASE(
ctxHdl IN ctxType,
tCase IN NUMBER);

Table 204-29  SETTAGCASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tCase</td>
<td>(IN)</td>
<td>The tag's case:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 for as are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 for lower case</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2 for upper case</td>
</tr>
</tbody>
</table>
204.4.28 SETXSLT

SETXSLT registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. Passing NULL for the uri argument, or NULL or an empty string for the stylesheet argument, unsets the stylesheet header and type.

Syntax

To unregister the stylesheet, pass in NULL for the URI.

PROCEDURE SETXSLT(
  ctxHdl IN ctxType,
  uri IN VARCHAR2,
  ref IN VARCHAR2 := null);

To unregister the stylesheet pass in NULL or an empty string for the stylesheet.

PROCEDURE SETXSLT(
  ctxHdl IN ctxType,
  stylesheet CLOB,
  ref IN VARCHAR2 := null);

Parameters

Table 204-30  SETXSLT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td>stylesheet</td>
<td>(IN)</td>
<td>Stylesheet.</td>
</tr>
<tr>
<td>ref</td>
<td>(IN)</td>
<td>URL to include, imported and external entities.</td>
</tr>
</tbody>
</table>

204.4.29 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

PROCEDURE SETXSLTPARAM(
  ctxHdl IN ctxType,
  name IN VARCHAR2,
  value IN VARCHAR2);

Table 204-31  SETXSLTPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
Table 204-31  (Cont.) SETXSLSPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Value to be assigned to the stylesheet parameter.</td>
</tr>
</tbody>
</table>

204.4.30 USENULLATTRIBUTEINDICATOR

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

PROCEDURE SETNULLATTRIBUTEINDICATOR(
ctxHdl IN ctxType,
flag IN BOOLEAN);

Table 204-32  USENULLATTRIBUTEINDICATOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Sets attribute to NULL if TRUE, omits from XML document if FALSE.</td>
</tr>
</tbody>
</table>

204.4.31 USETYPEFORCOLLELEMTAG

This procedure specifies whether to use the collection element's type name as its element tag name.

By default, the tag name for elements of a collection is the collection's tag name followed by _item.

Syntax

PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);

Table 204-33  USETYPEFORCOLLELEMTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on use of the type name?</td>
</tr>
</tbody>
</table>
**DBMS_XMLSAVE** provides XML to database-type functionality.

**Note:**

With Oracle Database 18.1 Release, the **DBMS_XMLSAVE** package is deprecated. Use **DBMS_XMLSTORE** instead.

The **DBMS_XMLSAVE** package has been replaced with improved technology. While Oracle recommends you not to begin development using **DBMS_XMLSAVE**, Oracle continues to support this package for reasons of backward compatibility. Your existing applications using **DBMS_XMLSAVE** will continue to work.

This chapter contains the following topics:

- DBMS_XMLSAVE Security Model
- DBMS_XMLSAVE Constants
- Types
- Summary of DBMS_XMLSAVE Subprograms

**See Also:**

- For more information on **DBMS_XMLSTORE**, see **DBMS_XMLSTORE**
- *Oracle XML DB Developer’s Guide*

### 205.1 DBMS_XMLSAVE Security Model

Owned by XDB, the **DBMS_XMLSAVE** package must be created by SYS or XDB. The **EXECUTE** privilege is granted to **PUBLIC**.

Subprograms in this package are executed using the privileges of the current user.

### 205.2 DBMS_XMLSAVE Constants

The **DBMS_XMLSAVE** includes constants to use when specifying parameter values. These constants are defined in the following table.
Table 205-1  Constants of DBMS_XMLSAVE

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_ROWTAG</td>
<td>The default tag name for the element corresponding to database records -- ROW</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask: 'MM/dd/yyyy HH:mm:ss'</td>
</tr>
<tr>
<td>MATCH_CASE</td>
<td>Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.</td>
</tr>
<tr>
<td>IGNORE_CASE</td>
<td>Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.</td>
</tr>
</tbody>
</table>

205.3 Types

The DBMS(XMLSAVE subprograms use the ctxType Type.

Table 205-2  Types of DBMS_XMLSAVE

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT.</td>
</tr>
</tbody>
</table>

205.4 Summary of DBMS_XMLSAVE Subprograms

This table lists the DBMS_XMLSAVE subprograms and briefly describes them.

Table 205-3  DBMS_XMLSAVE Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEARKEYCOLUMNLIST</td>
<td>Clears the key column list.</td>
</tr>
<tr>
<td>CLEARUPDATECOLUMNLIST</td>
<td>Clears the update column list.</td>
</tr>
<tr>
<td>CLOSECONTEXT</td>
<td>It closes/deallocates a particular save context.</td>
</tr>
<tr>
<td>DELETEXML</td>
<td>Deletes records specified by data from the XML document, from the table specified at the context creation time.</td>

<td>Adds a column to the update column list.</td>
</tr>
<tr>
<td>SETXSLT</td>
<td>Registers a XSL transform to be applied to the XML to be saved.</td>
</tr>
<tr>
<td>SETXSLTPARAM</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>UPDATEXML</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>

205.4.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

**Syntax**

```sql
PROCEDURE clearKeyColumnList(
    ctxHdl  IN  ctxType);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

205.4.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

**Syntax**

```sql
PROCEDURE clearUpdateColumnList(
    ctxHdl  IN  ctxType);
```
Parameters

Table 205-5  CLEARUPDATECOLUMNLIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

205.4.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

PROCEDURE closeContext(
  ctxHdl IN ctxType);

Parameters

Table 205-6  CLOSECONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

205.4.4 DELETEXML

The DELETEXML function deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

The options are described in the following table.

Syntax

FUNCTION deleteXML(
  ctxHdl IN ctxPType,
  xDoc IN VARCHAR2)
RETURN NUMBER;

FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;

Parameters

Table 205-7  DELETEXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
205.4.5 GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code.

This is to get around the fact that the JVM throws an exception on top of whatever exception was raised, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(  
    ctxHdl IN ctxType,  
    errNo OUT NUMBER,  
    errMsg OUT VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(IN)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(IN)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

205.4.6 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax

```
FUNCTION insertXML(  
    ctxHdl IN ctxType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;  
```

Passes in the `xDoc` parameter as a VARCHAR2.

```
FUNCTION insertXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;  
```

Passes in the `xDoc` parameter as a CLOB.
Parameters

### Table 205-10  INSERTXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>

#### 205.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

**Syntax**

FUNCTION newContext(
  targetTable IN VARCHAR2)
RETURN ctxType;

#### Parameters

### Table 205-11  NEWCONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>

#### 205.4.8 PROPAGATEORIGINALEXCEPTION

The PROPAGATEORIGINALEXCEPTION procedure tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an OracleXMLSQLException.

**Syntax**

PROCEDURE propagateOriginalException(
  ctxHdl IN ctxType,
  flag IN BOOLEAN);

#### Parameters

### Table 205-12  PROPAGATEORIGINALEXCEPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Propagate the original exception? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
205.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter.

Syntax

PROCEDURE removeXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2);

Parameters

Table 205-13 REMOVEXSLTPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
</tbody>
</table>

205.4.10 SETBATCHSIZE

This procedure changes the batch size used during DML operations.

When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

PROCEDURE setBatchSize(
    ctxHdl IN ctxType,
    batchSize IN NUMBER);

Parameters

Table 205-14 SETBATCHSIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Batch size.</td>
</tr>
</tbody>
</table>

205.4.11 SETCOMMITBATCH

This procedure sets the commit batch size.

The commit batch size refers to the number or records inserted after which a commit should follow. If batchSize is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, commitBatch is 0.
Syntax

PROCEDURE setCommitBatch(
  ctxHdl IN ctxType,
  batchSize IN NUMBER);

Parameters

Table 205-15  SETCOMMITBATCH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Commit batch size.</td>
</tr>
</tbody>
</table>

205.4.12 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the class java.text.SimpleDateFormat. Setting the mask to <code>null</code> or an empty string unsets the date mask.

Syntax

PROCEDURE setDateFormat(
  ctxHdl IN ctxType,
  mask IN VARCHAR2);

Parameters

Table 205-16  SETDATEFORMAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>Syntax of the date format pattern.</td>
</tr>
</tbody>
</table>

205.4.13 SETIGNORECASE

This function tells the XSU whether to ignore case when the XSU maps XML elements to database columns/attributes. This matching is based on the element names (XML tags).

Syntax

PROCEDURE setIgnoreCase(
  ctxHdl IN ctxType,
  flag IN NUMBER);
Parameters

### Table 205-17 SETIGNORECASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>

#### 205.4.14 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```sql
PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

**Parameters**

### Table 205-18 SETKEYCOLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>

#### 205.4.15 SETPRESERVEWHITESPACE

This procedure tells the XSU whether or not to preserve whitespace.

**Syntax**

```sql
PROCEDURE setPreserveWhitespace(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);
```

**Parameters**

### Table 205-19 SETPRESERVEWHITESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Should XSU preserve whitespace?</td>
</tr>
</tbody>
</table>
205.4.16 SETROWTAG

This procedure names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);

Parameters

Table 205-20  SETROWTAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

205.4.17 SETSQLTOXMLNAMEESCAPING

SETSQLTOXMLNAMEESCAPING turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

PROCEDURE setSQLToXMLNameEscaping(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);

Parameters

Table 205-21  SETSQLTOXMLNAMEESCAPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping?</td>
</tr>
</tbody>
</table>

205.4.18 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
Parameters

Table 205-22  SETUPDATECOLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>

205.4.19 SETXSLT

**SETXSLT** registers an XSL transform to be applied to the XML to be saved.

If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax

Table 205-23  SETXSLT Procedure Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  ref IN VARCHAR2 := null);  
| Passes in the stylesheet through a URI. |
| PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  stylesheet IN CLOB,  
  ref IN VARCHAR2 := null);  
| Passes in the stylesheet through a **CLOB**. |

Parameters

Table 205-24  SETXSLT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>URI to the stylesheet to register.</td>
</tr>
<tr>
<td>ref</td>
<td>(IN)</td>
<td>URL for include, import, and external entities.</td>
</tr>
<tr>
<td>stylesheet</td>
<td>(IN)</td>
<td><strong>CLOB</strong> containing the stylesheet to register.</td>
</tr>
</tbody>
</table>

205.4.20 SETXSLTPARAM

**SETXSLTPARAM** sets the value of a top-level stylesheet parameter.

The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.
Syntax

PROCEDURE setXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2,
    value IN VARCHAR2);

Parameters

Table 205-25  SETXSLTPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Parameter value as an XPath expression</td>
</tr>
</tbody>
</table>

205.4.21 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;

FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB)
RETURN NUMBER;

Parameters

Table 205-26  UPDATEXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script dbmsxsch.sql during Oracle database installation.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_XMLSCHEMA Subprograms

See Also:

Oracle XML DB Developer's Guide

206.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas. These subprograms provide the following XML schema management:

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

206.2 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
206.3 DBMS_XMLSCHEMA Constants

The DBMS_XMLSCHEMA package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- Table 206-1
- Table 206-2
- Table 206-3

### Table 206-1  DBMS_XMLSCHEMA Constants - Delete Option

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESTRICT</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletion of an XML schema fails if there are any tables or XML schemas that depend on it</td>
</tr>
<tr>
<td>DELETE_INVALIDATE</td>
<td>NUMBER</td>
<td>2</td>
<td>Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.</td>
</tr>
<tr>
<td>DELETE CASCADE</td>
<td>NUMBER</td>
<td>3</td>
<td>Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.</td>
</tr>
<tr>
<td>DELETE CASCADE_FORCE</td>
<td>NUMBER</td>
<td>4</td>
<td>This option is similar to DELETE CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.</td>
</tr>
</tbody>
</table>

### Table 206-2  DBMS_XMLSCHEMA Constants - Enable Hierarchy

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_HIERARCHY_NONE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The ENABLE_HIERARCHY procedure of the DBMS_XDB2 package will not be called on any tables created while registering that schema</td>
</tr>
</tbody>
</table>
### Table 206-2  (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_HIERARCHY_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.</td>
</tr>
</tbody>
</table>

### Table 206-3 DBMS_XMLSCHEMA Constants - Register CSID

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER_NODOCID</td>
<td>NUMBER</td>
<td>1</td>
<td>If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage</td>
</tr>
<tr>
<td>REGISTER_CSID_NULL</td>
<td>NUMBER</td>
<td>-1</td>
<td>If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter</td>
</tr>
</tbody>
</table>

#### 206.4 Views

This table lists the views used by the DBMS_XMLSCHEMA package. The columns of these views are described in detail in the Oracle Database Reference.
Table 206-4  Summary of Views used by DBMS_XMLSCHEMA

<table>
<thead>
<tr>
<th>Schema</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_XML_SCHEMAS</td>
<td>All registered XML Schemas owned by the user</td>
</tr>
<tr>
<td>ALL_XML_SCHEMAS</td>
<td>All registered XML Schemas usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_SCHEMAS</td>
<td>All registered XML Schemas in the database</td>
</tr>
<tr>
<td>DBA_XML_TABLES</td>
<td>All XMLType tables in the system</td>
</tr>
<tr>
<td>USER_XML_TABLES</td>
<td>All XMLType tables owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_TABLES</td>
<td>All XMLType tables usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_TAB_COLS</td>
<td>All XMLType table columns in the system</td>
</tr>
<tr>
<td>USER_XML_TAB_COLS</td>
<td>All XMLType table columns in tables owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_TAB_COLS</td>
<td>All XMLType table columns in tables usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_VIEWS</td>
<td>All XMLType views in the system</td>
</tr>
<tr>
<td>USER_XML_VIEWS</td>
<td>All XMLType views owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_VIEWS</td>
<td>All XMLType views usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_VIEW_COLS</td>
<td>All XMLType view columns in the system</td>
</tr>
<tr>
<td>USER_XML_VIEW_COLS</td>
<td>All XMLType view columns in views owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_VIEW_COLS</td>
<td>All XMLType view columns in views usable by the current user</td>
</tr>
</tbody>
</table>

206.5 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.

2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only INPLACE_TRACE. Do not also use INPLACE_EVOLVE. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

206.6 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the DBMS_XMLSCHEMA subprograms and briefly describes them.
Table 206-5  DBMS_XMLSCHEMA Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILESCHEMA Procedure</td>
<td>Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.</td>
</tr>
<tr>
<td>COPYEVOLVE Procedure</td>
<td>Evolves registered schemas so that existing XML instances remain valid.</td>
</tr>
<tr>
<td>DELETESCHEMA Procedure</td>
<td>Removes the schema from the database</td>
</tr>
<tr>
<td>INPLACEEVOLVE Procedure</td>
<td>Evolves registered schemas by propagating schema changes to object types and tables</td>
</tr>
<tr>
<td>PURGESCHEMA Procedure</td>
<td>Removes the XML schema</td>
</tr>
<tr>
<td>REGISTERSCHEMA Procedures</td>
<td>Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.</td>
</tr>
<tr>
<td>REGISTERURI Procedure</td>
<td>Registers an XML schema specified by a URI name</td>
</tr>
</tbody>
</table>

206.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in an ORA-31001 exception: invalid resource handle or path name.

Syntax

```sql
DBMS_XMLSCHEMA.COMPILESCHEMA(
    schemaurl IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema</td>
</tr>
</tbody>
</table>

206.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in accordance to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
• Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
• drops temporary tables

See Also:

- “Schema Evolution” chapter of the Oracle XML DB Developer’s Guide for examples on how to evolve existing schemas
- Oracle Database Error Messages for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```sql
DBMS_XMLSCHEMA.COPYEVOLVE(
  schemaurls       IN  XDB$STRUBG_LIST_T,
  newschemas       IN  XMLSequenceType,
  transforms       IN  XMLSequenceType :=NULL,
  preserveolddocs  IN  BOOLEAN :=FALSE,
  maptablename     IN  VARCHAR2 :=NULL,
  generatetables   IN  BOOLEAN :=TRUE,
  force            IN  BOOLEAN :=FALSE,
  schemaowners     IN  XDB$STRING_LIST_T :=NULL
  parallelDegree   IN  PLS_INTEGER := 0,
  options          IN  PLS_INTEGER := 0);
```

Parameters

Table 206-7  COPYEVOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurls</td>
<td>VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the <strong>force</strong> parameter is <strong>TRUE</strong>, URLs should be in the order of dependency.</td>
</tr>
<tr>
<td>newschemas</td>
<td>VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.</td>
</tr>
<tr>
<td>transforms</td>
<td>VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.</td>
</tr>
<tr>
<td>preserveolddocs</td>
<td>Default is <strong>FALSE</strong>, and temporary tables with old data are dropped. If <strong>TRUE</strong>, these table are still available after schema evolution is complete.</td>
</tr>
</tbody>
</table>
### Table 206-7 (Cont.) COPYEVOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maptablename</td>
<td>Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are:</td>
</tr>
<tr>
<td></td>
<td>• SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms</td>
</tr>
<tr>
<td></td>
<td>• SCHEMA_OWNER - VARCHAR2(30) - Owner of the schema</td>
</tr>
<tr>
<td></td>
<td>• ELEMENT_NAME - VARCHAR2(256) - Element to which this table conforms</td>
</tr>
<tr>
<td></td>
<td>• TAB_NAME - VARCHAR2(65) - Qualified table name: &lt;owner_name&gt;.&lt;table_name&gt;</td>
</tr>
<tr>
<td></td>
<td>• COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables)</td>
</tr>
<tr>
<td></td>
<td>• TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table</td>
</tr>
<tr>
<td>generatetables</td>
<td>Default is TRUE, and new tables will be generated. If FALSE:</td>
</tr>
<tr>
<td></td>
<td>• new tables will not be generated after registration of new schemas</td>
</tr>
<tr>
<td></td>
<td>• preservelddocs must be TRUE</td>
</tr>
<tr>
<td></td>
<td>• maptablename must be non-NULL</td>
</tr>
<tr>
<td>force</td>
<td>Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.</td>
</tr>
<tr>
<td>schemaowners</td>
<td>VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.</td>
</tr>
<tr>
<td>paralleldegree</td>
<td>Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.</td>
</tr>
<tr>
<td>options</td>
<td>Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.</td>
</tr>
</tbody>
</table>

### Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.
206.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

**Syntax**

```sql
DBMS_XMLSCHEMA.DELETESCHEMA(
    schemaurl IN VARCHAR2,
    delete_option IN PLS_INTEGER := DELETE_RESTRICT);
```

**See Also:**

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

**Parameters**

**Table 206-8**  DELETESCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema to be deleted</td>
</tr>
</tbody>
</table>
| delete_option | Delete options:
|              |   • DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema
|              |   • DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.
|              |   • DELETE.Cascade - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.
|              |   • DELETE.CASCADE.FORCE - Similar to DELETE.CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors. |

**Exceptions**

**Table 206-9**  DELETESCHEMA Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
206.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```sql
DBMS_XMLSCHEMA.INPLACEEVOLVE(
    schemaURL    IN   VARCHAR2,
    diffXML      IN   XMLType,
    flags        IN   NUMBER);
```

Parameters

Table 206-10  INPLACEEVOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>URL of the schema to evolve</td>
</tr>
<tr>
<td>diffXML</td>
<td>Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.</td>
</tr>
<tr>
<td>flags</td>
<td>The following bits may be set in this parameter to control the behavior of this procedure:</td>
</tr>
<tr>
<td></td>
<td>• INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</td>
</tr>
<tr>
<td></td>
<td>• INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</td>
</tr>
<tr>
<td></td>
<td>• Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new.</td>
</tr>
<tr>
<td></td>
<td>• Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)</td>
</tr>
</tbody>
</table>

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPath expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
• If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
• Any errors resulting from CREATE TYPE, ALTER TYPE and like commands will generate error messages.

Usage Notes
• Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
• A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

206.6.5 PURGESCHEMA Procedure

This procedure removes the XML schema.

See Also:
"XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer's Guide

Syntax

DBMS_XMLSCHEMA.PURGESCHEMA(
    schemaid   IN  RAW);

Parameters

Table 206-11  PURGESCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaid</td>
<td>ID of the schema to be purged</td>
</tr>
</tbody>
</table>

Usage Notes

• The schema should have been originally registered for binary encoding and should have been deleted in the HIDE mode.
• Once a schema has been deleted in HIDE mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
• Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
The Schema ID can be obtained from the catalog views.

206.6.6 REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

Note:

As of Oracle Database 11g Release 2 (11.2) the genbean parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the Oracle XML DB Developer’s Guide

Syntax

Registers a schema specified as a VARCHAR2:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN VARCHAR2,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BFILE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```
Registers the schema specified as a \texttt{BFILE} and identifies the character set id of the schema document:

\begin{verbatim}
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl  IN  VARCHAR2,
    schemadoc  IN  BFILE,
    local      IN  BOOLEAN := TRUE,
    gentypes   IN  BOOLEAN := TRUE,
    genbean    IN  BOOLEAN := TRUE,
    gentables  IN  BOOLEAN := TRUE,
    force      IN  BOOLEAN := TRUE,
    owner      IN  VARCHAR2 := '','
    csid       IN  NUMBER,
    enablehierarchy IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options    IN  PLS_INTEGER := 0);
\end{verbatim}

Registers the schema specified as a \texttt{BLOB}. The contents of the schema document must be in the database character set:

\begin{verbatim}
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl  IN  VARCHAR2,
    schemadoc  IN  BLOB,
    local      IN  BOOLEAN := TRUE,
    gentypes   IN  BOOLEAN := TRUE,
    genbean    IN  BOOLEAN := FALSE,
    force      IN  BOOLEAN := FALSE,
    owner      IN  VARCHAR2 := NULL,
    enablehierarchy IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options    IN  PLS_INTEGER := 0);
\end{verbatim}

Registers the schema specified as a \texttt{BLOB} and identifies the character set id of the schema document:

\begin{verbatim}
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl  IN  VARCHAR2,
    schemadoc  IN  BLOB,
    local      IN  BOOLEAN := TRUE,
    gentypes   IN  BOOLEAN := TRUE,
    genbean    IN  BOOLEAN := TRUE,
    gentables  IN  BOOLEAN := TRUE,
    force      IN  BOOLEAN := TRUE,
    owner      IN  VARCHAR2 := '','
    csid       IN  NUMBER,
    enablehierarchy IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options    IN  PLS_INTEGER := 0);
\end{verbatim}

Registers the schema specified as a \texttt{CLOB}:

\begin{verbatim}
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl  IN  VARCHAR2,
    schemadoc  IN  CLOB,
    local      IN  BOOLEAN := TRUE,
    gentypes   IN  BOOLEAN := TRUE,
    genbean    IN  BOOLEAN := FALSE,
    force      IN  BOOLEAN := FALSE,
    owner      IN  VARCHAR2 := NULL,
    options    IN  PLS_INTEGER := 0);
\end{verbatim}
Registers the schema specified as an XMLTYPE.

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN SYS.XMLTYPE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN SYS.URIType,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

**Parameters**

**Table 206-12  REGSITERSCHEMA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schemaurl</code></td>
<td>URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.</td>
</tr>
<tr>
<td><code>schemadoc</code></td>
<td>A valid XML schema document</td>
</tr>
<tr>
<td><code>local</code></td>
<td>Is this a local or global schema?</td>
</tr>
<tr>
<td></td>
<td>• By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code></td>
</tr>
<tr>
<td></td>
<td>• If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code></td>
</tr>
<tr>
<td></td>
<td>You need write privileges on the directory to be able to register a schema as global.</td>
</tr>
<tr>
<td><code>gentypes</code></td>
<td>Determines whether the schema compiler generates object types. By default, <code>TRUE</code>. If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>genbean</code></td>
<td>Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code>. Oracle recommends that this parameter always be set to <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>gentables</code></td>
<td>Determines whether the schema compiler generates default tables. By default, <code>TRUE</code></td>
</tr>
</tbody>
</table>
Table 206-12  (Cont.) REGSITERSCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
<tr>
<td>owner</td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
<tr>
<td>csid</td>
<td>Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for &quot;text/xml&quot; MIME type.</td>
</tr>
</tbody>
</table>
| enablehierarchy | • ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema  
                  | • ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default.  
                  | • ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables. |
| options      | Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:  
                  | • REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)  
                  | • REGISTER_BINARYXML - Register the schema for Binary XML  
                  | • REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables |

206.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Note:

As of Oracle Database 11g Release 2 (11.2) the genbean parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.
Syntax

```sql
DBMS_XMLSCHEMA.REGISTERURI(
    schemaurl    IN  VARCHAR2,
    schemadocuri IN  VARCHAR2,
    local        IN  BOOLEAN := TRUE,
    gentypes     IN  BOOLEAN := TRUE,
    genbean      IN  BOOLEAN := FALSE,
    gentables    IN  BOOLEAN := TRUE,
    force        IN  BOOLEAN := FALSE,
    owner        IN  VARCHAR2 := NULL,
    options      IN  PLS_INTEGER := 0);
```

Parameters

**Table 206-13  REGISTERURI Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schemaurl</code></td>
<td>Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.</td>
</tr>
<tr>
<td><code>schemadocuri</code></td>
<td>Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code>, and invokes the <code>REGISTERSCHEMA Procedures</code>.</td>
</tr>
<tr>
<td><code>local</code></td>
<td>Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code>. If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> The user needs write privileges on the directory to register a global schema.</td>
</tr>
<tr>
<td><code>gentypes</code></td>
<td>Determines whether the compiler generate object types. By default, <code>TRUE</code>.</td>
</tr>
<tr>
<td><code>genbean</code></td>
<td>Determines whether the compiler generate Java beans. By default, <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>gentables</code></td>
<td>Determines whether the compiler generate default tables. <code>TRUE</code> by default.</td>
</tr>
<tr>
<td><code>force</code></td>
<td><code>TRUE</code>: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>owner</code></td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
<tr>
<td><code>options</code></td>
<td>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits:</td>
</tr>
<tr>
<td></td>
<td>• <code>REGISTER_NODOCID</code> - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)</td>
</tr>
</tbody>
</table>
The DBMS_XMLSCHEMA_ANNOTATE package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

See Also:
Oracle XML DB Developer's Guide

207.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The DBMS_XMLSCHEMA_ANNOTATE package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

207.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by XDB, the DBMS_XMLSCHEMA_ANNOTATE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

207.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the DBMS_XMLSCHEMA_ANNOTATE package subprograms.
### Table 207-1  DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDXDBNAMESPACE Procedure</td>
<td>Adds the XDB namespace required for XDB annotation</td>
</tr>
<tr>
<td>DISABLEDEFAULTTABLECREATION Procedure</td>
<td>Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element</td>
</tr>
<tr>
<td>DISABLEMAINTAINDOM Procedure</td>
<td>Sets the DOM fidelity attribute to FALSE</td>
</tr>
<tr>
<td>ENABLEDEFAULTTABLECREATION Procedure</td>
<td>Enables the creation of ALL top level tables by removing the empty default table name annotation</td>
</tr>
<tr>
<td>ENABLEMAINTAINDOM Procedure</td>
<td>Sets the DOM fidelity attribute to TRUE</td>
</tr>
<tr>
<td>GETSCHEMAANNOTATIONS Function</td>
<td>Creates a document containing the differences between the annotated XML schema and the original XML schema</td>
</tr>
<tr>
<td>GETSIDXDEFFROMVIEW Function</td>
<td>Takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table</td>
</tr>
<tr>
<td>PRINTWARNINGS Procedure</td>
<td>Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema</td>
</tr>
<tr>
<td>REMOVEANYSTORAGE Procedure</td>
<td>Removes the setting of the SQL type from the ANY child of the complex type with the given name</td>
</tr>
<tr>
<td>REMOVEDEFAULTTABLEProcedure</td>
<td>Removes any default table attribute given for the element. After calling this procedure, the system generates table names</td>
</tr>
<tr>
<td>REMOVEMAINTAINDOM Procedure</td>
<td>Removes all annotations used to maintain DOM from the given schema</td>
</tr>
<tr>
<td>REMOVEOUTOFLINE Procedure</td>
<td>Removes any existing SQLInline attributes to prevent out-of-line storage</td>
</tr>
<tr>
<td>REMOVESQCOLLTYPE Procedure</td>
<td>Removes a SQL collection type.</td>
</tr>
<tr>
<td>REMOVESQLNAME Procedure</td>
<td>Removes a SQLNAME from a global element</td>
</tr>
<tr>
<td>REMOVESQTYPE Procedure</td>
<td>Removes a SQL type</td>
</tr>
<tr>
<td>REMOVESQTPNAMEAPPING Procedure</td>
<td>Removes the SQL type mapping for the given schema type.</td>
</tr>
<tr>
<td>REMOVETABLEPROPS Procedure</td>
<td>Removes the table storage properties from the CREATE TABLE statement</td>
</tr>
<tr>
<td>REMOVETIMESTAMPWITHTIMEZONE Procedure</td>
<td>Removes the setting of the TimeStampWithTimeZone datatype from all dateTime typed elements in the XML schema</td>
</tr>
<tr>
<td>SETANYSTORAGE Procedure</td>
<td>Assigns a SQL datatype to the ANY child of the complex type with the given name</td>
</tr>
<tr>
<td>SETDEFAULTTABLE Procedure</td>
<td>Sets the name of the table for the specified global element</td>
</tr>
<tr>
<td>SETOUTOFLINE Procedure</td>
<td>Sets the SQLInline attribute to FALSE</td>
</tr>
</tbody>
</table>
Table 207-1  (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETSCHEMAANNOTATIONS Procedure</td>
<td>Takes the annotated differences resulting from a call to</td>
</tr>
<tr>
<td></td>
<td>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema</td>
</tr>
<tr>
<td>SETSQLCOLLTYPE Procedure</td>
<td>Assigns a SQL type name for a collection</td>
</tr>
<tr>
<td>SETSQLNAME Procedure</td>
<td>Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema</td>
</tr>
<tr>
<td>SETSQLTYPE Procedure</td>
<td>Assigns a SQL type to a global object</td>
</tr>
<tr>
<td>SETSQLTYPEMAPPING Procedure</td>
<td>Defines a mapping of schema type and SQL type</td>
</tr>
<tr>
<td>SETTABLEPROPS Procedure</td>
<td>Specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement</td>
</tr>
<tr>
<td>SETTIMESTAMPWITHTIMEZONE</td>
<td>Sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema</td>
</tr>
</tbody>
</table>

207.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
  xmlschema IN OUT XMLTYPE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>Gets an XML Schema as XMLTYPE, performs the annotation and returns it</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

207.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The
procedure always overwrites. This is equivalent to using the schema annotation
xdb:defaultTable="" for the top-level element or elements.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION {
    xmlschema IN OUT XMLType,
    globalElementName IN VARCHAR2};

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION {
    xmlschema IN OUT XMLType};

Parameters

Table 207-3  DISABLEDEFAULTTABLECREATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Example

The purchaseOrder element will have an annotation similar to xdb:defaultTable="".

DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema, 'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

207.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to FALSE.

There are two overloads. The first sets DOM fidelity attribute to FALSE for all complex
types, and the second sets it to FALSE for the named complex type. This is equivalent to
adding xdb:maintainDOM="false" on all or specified complex types respectively.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM {
    xmlschema IN OUT XMLType,
    overwrite IN BOOLEAN default TRUE};

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM {
    xmlschema IN OUT XMLType,
    complexTypeName IN VARCHAR2,
    overwrite IN BOOLEAN default TRUE};
Parameters

Table 207-4 DISABLEMAINTAINDOM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>

207.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (xmlschema IN OUT XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (xmlschema IN OUT XMLTYPE,
            globalElementName IN VARCHAR2);}
```

Parameters

Table 207-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not affect elements that have a default table name.

207.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to TRUE.

There are two overloads. The first sets DOM fidelity attribute to TRUE for all complex types, and the second sets it to TRUE for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (xmlschema IN OUT XMLType,
                                           overwrite IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (xmlschema IN OUT XMLType,
                                           overwrite IN BOOLEAN default TRUE);
```

Chapter 207
Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

207-5
complexTypeName IN VARCHAR2,
overwrite IN BOOLEAN default TRUE);

Parameters

Table 207-6  ENABLEMAINTAINDOM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>

207.3.6 GETSCHEMAMANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAMANNOTATIONS (
    xmlschema IN xmlType)
RETURN XMLType;
```

Parameters

Table 207-7  GETSCHEMAMANNOTATIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The original XML schema</td>
</tr>
</tbody>
</table>

Return Values

This function returns the document annotations.xml as an XMLType.

Usage Notes

This function saves all annotations in one document, named annotations, and returns it. With this document, you can apply all annotations to a non-annotated schema, using DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAMANNOTATIONS.

DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAMANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

- SETSCHEMAMANNOTATIONS Procedure
Example

For an example of \texttt{DBMS\_XMLSCHEMA\_ANNOTATE.GETSCHEMAANNOTATIONS}, see the example in \texttt{SETSCHEMAANNOTATIONS Procedure}.

### 207.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a \texttt{CLOB} which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

**Syntax**

\begin{verbatim}
DBMS\_XMLSCHEMA\_ANNOTATE.GETSIDXDEFFROMVIEW (  
    viewName   IN xmlType)  
RETURN CLOB;
\end{verbatim}

**Parameters**

Table 207-8  \textbf{GETSIDXDEFFROMVIEW Function Parameters}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>viewName</td>
<td>The original XML schema</td>
</tr>
</tbody>
</table>

**Return Values**

This function returns a \texttt{CLOB} which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

### 207.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

**Syntax**

\begin{verbatim}
DBMS\_XMLSCHEMA\_ANNOTATE.PRINTWARNINGS (  
    value       IN   BOOLEAN DEFAULT TRUE);
\end{verbatim}

**Parameters**

Table 207-9  \textbf{PRINTWARNINGS Procedure Parameters}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>For the \texttt{NO MATCHING ELEMENTS FOUND} error message to be raised, val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If an annotation maps to more than one node in the XML schema, this raise the error \texttt{ANNOTATION MAPS TO MULTIPLE ELEMENTS}. In this case no annotation is performed, and the
user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

207.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the ANY child of the complex type with the given name.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
    xmlschema       IN OUT XMLType,
    complexTypeName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated.</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETANYSTORAGE Procedure.

207.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
    xmlschema          IN OUT XMLTYPE,
    globalElementName  IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Example

Annotations can be verified anytime using "select out from annotation_tab".

--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema, 'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

207.3.11 REOMVE MAINTAIN DOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.REMOVE MAINTAIN DOM (xmlschema IN OUT XMLType);

Parameters

Table 207-12 REMOVE MAINTAIN DOM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
</tbody>
</table>

207.3.12 REMOVE OUT OF LINE Procedure

This procedure removes any existing SQLInline attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the SQLInline attribute for the named element.

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE {
    xmlschema IN OUT XMLType,
    elementName IN VARCHAR2,
    elementType IN VARCHAR2,
    overwrite IN BOOLEAN default TRUE);

Removes the SQLInline attribute for the object specified by its global object and local element names.

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE {
    xmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localElementName IN VARCHAR2);

Removes the SQLInline attribute for the referenced global element.
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema IN OUT XMLType,
    reference IN VARCHAR2);

Parameters

Table 207-13 REMOVEOUTOFLINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
<tr>
<td>elementType</td>
<td>The element type</td>
</tr>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element</td>
</tr>
<tr>
<td>reference</td>
<td>A reference to a global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses SETOUTOFLINE Procedure.

207.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    elementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localElementName IN VARCHAR2);

Parameters

Table 207-14 REMOVESQLCOLLTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
</tbody>
</table>
Table 207-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element</td>
</tr>
</tbody>
</table>

Usage Notes
This procedure reverses the SETSQLCOLLTYPE Procedure.

207.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME ( xmlschema IN OUT XMLType,
                                      globalObject IN VARCHAR2,
                                      globalObjectName IN VARCHAR2,
                                      localObject IN VARCHAR2,
                                      localObjectName IN VARCHAR2,
                                      sqlName IN VARCHAR2,
                                      overwrite IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

Table 207-15 REMOVESQLNAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlName</td>
<td>Name of the SQL attribute that corresponds to the element defined in the XML schema</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

**Example**

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.  

```sql
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
```
207.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
    xmlschema in out XMLType,
    globalElementName IN VARCHAR2);
```

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
    xmlschema IN OUT XMLTYPE,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localObject IN VARCHAR2,
    localObjectName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated.</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element.</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object.</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object.</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETSQLTYPE Procedure.

207.3.16 REMOVESQLTYPEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEMAPPING (
    xmlschema IN OUT XMLTYPE,
    schemaTypeName IN VARCHAR2);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Name of the schema type</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETSQLYPEMAPPING Procedure.

207.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the CREATE TABLE statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
    xmlschema IN OUT XMLTYPE,
    globalElementName IN VARCHAR2);
```

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
    xmlschema IN OUT XMLTYPE,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localElementName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>Name of a local element that descends from the global element</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETTABLEPROPS Procedure.
207.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (   
  xmlschema          IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (   
  xmlschema         IN OUT  XMLTYPE,   
  schemaTypeName    IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Name of the schema type</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the `SETTIMESTAMPWITHTIMEZONE Procedure`.

207.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (   
  xmlschema       IN OUT  XMLType,   
  complexTypeName IN      VARCHAR2,   
  sqlTypeName     IN      VARCHAR2,   
  overwrite       IN      BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>Name of the complex type</td>
</tr>
<tr>
<td>sqlTypeName</td>
<td>Name of the SQL type</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>
Example

The xsd:any child of complex type Items is assigned an annotation similar to xdb:SQLType="VARCHAR".

DECLARE  xml_schema  XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_tab;   DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage (xml_schema, 'Items', 'VARCHAR');   UPDATE annotation_tab SET out = xml_schema;END;
/

207.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation xdb:defaultTable="<default_table_name>" for the top-level element.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (xmlschema           IN  OUT  XMLTYPE,   globalElementName   IN       VARCHAR2,   tableName           IN       VARCHAR2,   overwrite           IN       BOOLEAN   DEFAULT TRUE);

Parameters

Table 207-21  SETDEFAULTTABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
<tr>
<td>tableName</td>
<td>Name being assigned to the table</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

207.3.21 SETOUTOFLINE Procedure

This procedure sets the SQLInline attribute to FALSE, that is, it sets xdb:SQLInLine=FALSE.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate XMLType table. XDB stores references to each row of the XMLType table in a link table that is maintained by the main table.

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.
There are three overloads.

Syntax

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
  xmlschema          IN OUT  XMLType,
  elementName        IN      VARCHAR2,
  elementType        IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
  xmlschema          IN OUT  XMLType,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localElementName   IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
  xmlschema         IN OUT  XMLType,
  reference         IN      VARCHAR2,
  defaultTableName  IN      VARCHAR2,
  overwrite         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 207-22 SETOUTOFLINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated.</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
<tr>
<td>elementType</td>
<td>The element type</td>
</tr>
<tr>
<td>defaultTableName</td>
<td>The name of the default table.</td>
</tr>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element.</td>
</tr>
<tr>
<td>reference</td>
<td>A reference to a global element</td>
</tr>
</tbody>
</table>
### Table 207-22 (Cont.) SETOUTOFLINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

### Usage Notes

After XML schema registration and before loading XML instance data, use DBMS_XMLSTORAGE_MANAGE_SCOPEXMLREFERENCES() to make these references scope to the out-of-line table only. This ensures better query performance later on.

### Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to xdb:defaultTable="CMMNT_DEFAULT_TABLE"

```sql
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT OUT INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
        'ipo:comment',
        'CMMNT_DEFAULT_TABLE');
    UPDATE annotation_tab SET OUT = xml_schema;
END;
/```

### 207.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema.

#### Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (    
    xmlschema IN OUT xmlType, 
    annotations IN VARCHAR2); 
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>An XML schema to be patched.</td>
</tr>
<tr>
<td>annotations</td>
<td>The differences document produced by calling DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS on the original XML schema and an annotated XML schema.</td>
</tr>
</tbody>
</table>
Usage Notes

DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:
GETSCHEMAANNOTATIONS Function

Example

The following example illustrates DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS shown here and GETSCHEMAANNOTATIONS Function.

```
-- test getannotations and apply them
declare
    xml_schema xmltype;
    xml_schema2 xmltype;
    annotations xmltype;
begin
    select out into xml_schema from annotation_tab;

    -- get the annotations from the schema
    annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

    -- apply the annotations to the schema
    select inp into xml_schema2 from annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);
    update annotation_tab t set t.out = xml_schema2;
end;
/
```

207.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with maxOccurs>1.

Using this procedure, XDB creates SQLTypes with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (  
    xsmlschema IN OUT XMLTYPE,
    elementName IN VARCHAR2,
    sqlCollType IN VARCHAR2,
    overwrite IN BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (  
    xsmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
```

Chapter 207
Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms
Parameters

Table 207-24  SETSQLCOLLTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
<tr>
<td>sqlCollType</td>
<td>The SQL collection type</td>
</tr>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The item element will have an annotation similar to
xdb:SQLCollType="ITEM_SQL_COL_TYPE".

declare
    xml_schema xmltype;
begin
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
        'item',
        'ITEM_SQL_COL_TYPE',TRUE);
    UPDATE annotation_tab SET out = xml_schema;
end;

207.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (  
    xmlschema          IN OUT XMLType,  
    globalObject       IN      VARCHAR2,  
    globalObjectName   IN      VARCHAR2,  
    localObject        IN      VARCHAR2,  
    localObjectName    IN      VARCHAR2,  
    sqlName            IN      VARCHAR2,  
    overwrite          IN      BOOLEAN DEFAULT TRUE);
Parameters

Table 207-25  SETSQLNAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlName</td>
<td>Name of the SQL attribute that corresponds to the element defined in the XML schema</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The shipTo element will have an annotation similar to xdb:SQLName="SHIPTO_SQLNAME".

DECLARE
    xml_schema   XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema, 'element', 'purchaseOrder',
                                         'element', 'shipTo', 'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

207.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (  
    xmlschema            IN OUT   XMLTYPE,  
    globalElementName    IN       VARCHAR2,  
    sqlType              IN       VARCHAR2,  
    overwrite            IN       BOOLEAN DEFAULT TRUE);  

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (  
    xmlschema           IN OUT   XMLTYPE,  
    globalObject        IN       VARCHAR2,  
    globalObjectName    IN       VARCHAR2,  
    localObject         IN       VARCHAR2,  
    localObjectName     IN       VARCHAR2,  
    sqlType             IN       VARCHAR2,  
    overwrite           IN       BOOLEAN DEFAULT TRUE);
Parameters

Table 207-26  SETSQLTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlType</td>
<td>SQL type assigned to the named global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites</td>
</tr>
<tr>
<td></td>
<td>element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The purchaseOrder element will have an annotation similar to xdb:SQLType="PO_SQLTYPE" and the shipTo element has one similar to xdb:SQLType="VARCHAR".

DECLARE
  xml_schema xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
    'purchaseOrder',
    'PO_SQLTYPE');

  UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE xml_schema xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
    'element', 'purchaseOrder',
    'element', 'shipTo',                         'VARCHAR');
  UPDATE annotation_tab SET out = xml_schema;
END;
/

207.3.26 SETSQLTYPEMAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the SETSQLTYPE procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPEMAPPING ( 
  xmlschema IN OUT XMLType, 
  schemaTypeName IN VARCHAR2, 
  sqlTypeName IN VARCHAR2, 
  overwrite IN BOOLEAN DEFAULT TRUE);
Parameters

Table 207-27  SETSQLTYPEMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Schema type</td>
</tr>
<tr>
<td>sqlTypeName</td>
<td>Name of the SQL type</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>

Example

The attribute orderDate will have an annotation similar to xdb:SQLType="DATE".

declare  xml_schema xmltype;beginSELECT out INTO xml_schema FROM annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping (xml_schema, 'date', 'DATE');UPDATE annotation_tab SET out = xml_schema;end;
/

207.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (  
  xmlschema IN OUT XMLType,  
  globalElementName IN VARCHAR2,  
  tableProps IN VARCHAR2,  
  overwrite IN BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (  
  xmlschema IN OUT XMLTYPE,  
  globalobject IN VARCHAR2,  
  globalObjectName IN VARCHAR2,  
  localElementName IN VARCHAR2,  
  tableProps IN VARCHAR2,  
  overwrite IN BOOLEAN DEFAULT TRUE);

Parameters

Table 207-28  SETTABLEPROPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>
Table 207-28  (Cont.) SETTABLEPROPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableProps</td>
<td>Table properties</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>Name of a local element that descends from the global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The purchaseOrder element will have an annotation similar to xdb:tableProps="CACHE".

```sql
DECLARE   xml_schema XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_tab;   DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema, 'purchaseOrder','CACHE');   UPDATE annotation_tab SET out = xml_schema;END;
```

207.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema.

This is equivalent to adding xdb:SQLType="TIMESTAMP WITH TIME ZONE" to all dateTime objects.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE ( xmlschema IN OUT XMLTYPE, overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 207-29  SETTIMESTAMPWITHTIMEZONE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>
The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of `DBMS_XMLSTORAGE_MANAGE` Subprograms

See Also:

*Oracle XML DB Developer’s Guide*

### 208.1 DBMS_XMLSTORAGE_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

### 208.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

### 208.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the `DBMS_XMLSTORAGE_MANAGE` package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLEINDEXESANDCONSTRAINTS Procedure</td>
<td>Disables the indexes and constraints for XMLType tables and XMLType columns</td>
</tr>
</tbody>
</table>
Table 208-1  (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLEINDEXESANDCONSTRAINTS Procedure</td>
<td>Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables</td>
</tr>
<tr>
<td>EXCHANGEPOSTPROC Procedure</td>
<td>Enable constraints after exchange partition</td>
</tr>
<tr>
<td>EXCHANGEPREPROC Procedure</td>
<td>Disable constraints before exchange partition</td>
</tr>
<tr>
<td>INDEXXMLREFERENCES Procedure</td>
<td>Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table</td>
</tr>
<tr>
<td>REFPARTITIONEXCHANGEIN Procedure</td>
<td>This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype Column with a local xmlindex.</td>
</tr>
<tr>
<td>REFPARTITIONEXCHANGEOUT Procedure</td>
<td>Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype Column with a local xmlindex.</td>
</tr>
<tr>
<td>RENAMECOLLECTIONTABLE Procedure</td>
<td>Renames a collection table to the given table name</td>
</tr>
<tr>
<td>SCOPEXMLREFERENCES Procedure</td>
<td>Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types</td>
</tr>
<tr>
<td>XPATH2TABCOLMAPPING Function</td>
<td>Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name</td>
</tr>
</tbody>
</table>

208.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (  
    owner_name    IN  VARCHAR2 DEFAULT USER,  
    table_name    IN  VARCHAR2,  
    column_name   IN  VARCHAR2 DEFAULT NULL,  
    clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 208-2  DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the XMLType table that the procedure is being performed on</td>
</tr>
<tr>
<td>column_name</td>
<td>XMLType column name</td>
</tr>
</tbody>
</table>
### Table 208-2   (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear</td>
<td>Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.</td>
</tr>
</tbody>
</table>

#### Usage Notes

### Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

### Using clear to Enable and Disable Indexes and Constraints

#### Note:

If the DISABLEINDEXESANDCONSTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONSTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.

#### Example

The following example illustrates the use of clear in the DISABLEINDEXESANDCONSTRAINTS procedure and the ENABLEINDEXESANDCONSTRAINTS Procedure.

First, add a not-NULL constraint on comment element of the PURCHASEORDER_TAB table:

```sql
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check ("XMLDATA"."comment" IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the clear as TRUE, by calling the DISABLEINDEXESANDCONSTRAINTS procedure:

```sql
BEGIN
    XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB', NULL, TRUE );
END;
/
```
Next, perform a bulk load operation (such as datapump import) which violates constraint c1 in the ALTER table statement. This does not raise an error because the constraint is disabled:

```
host impdp oremexample/oremexample directory=dir dumpfile=dmp.txt
tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

**NOTE:** To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because c1, the not null constraint, is violated by the bulk load operation:

```
BEGIN
    XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
        { USER,'PURCHASEORDER_TAB'};
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear=FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear=FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
    xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
        { USER,'PURCHASEORDER_TAB'};
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
    xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
        { USER,'PURCHASEORDER_TAB'};
END;
/
```

208.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this XMLType column.
Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (  
    owner_name   IN VARCHAR2 DEFAULT USER,  
    table_name   IN VARCHAR2,  
    column_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 208-3  ENABLEINDEXESANDCONSTRAINTS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses `DISABLEINDEXESANDCONSTRAINTS Procedure`.

Example

See `DISABLEINDEXESANDCONSTRAINTS Procedure`

### 208.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (  
    owner_name   IN VARCHAR2 DEFAULT USER,  
    table_name   IN VARCHAR2);
```

Parameters

**Table 208-4  EXCHANGEPOSTPROC Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
</tbody>
</table>

### 208.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (  
    owner_name   IN VARCHAR2 DEFAULT USER,  
    table_name   IN VARCHAR2);
```
Parameters

Table 208-5  EXCHANGEPREPROC Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
</tbody>
</table>

208.3.5 INDEXXMXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends _1, _2, and so on to their names.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.INDEXXMXMLREFERENCES (
    owner_name    IN VARCHAR2 DEFAULT USER,
    table_name    IN VARCHAR2,
    column_name   IN VARCHAR2 DEFAULT NULL);  
```

Parameters

Table 208-6  INDEXXMXMLREFERENCES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>The owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>The table being indexed</td>
</tr>
<tr>
<td>column_name</td>
<td>A column name. Not needed for XML type tables.</td>
</tr>
<tr>
<td>index_name</td>
<td>The name of the newly created index</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is only used if the REFs are scoped. See SCOPEXMLREFERENCES Procedure.

Indexed REFs lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFs.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMXMLREFERENCES does not index REFs recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.
208.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (  
    owner_name                 IN VARCHAR2,  
    parent_table_name          IN VARCHAR2,  
    child_table_name           IN VARCHAR2,  
    parent_exchange_table_name IN VARCHAR2,  
    child_exchange_table_name  IN VARCHAR2,  
    parent_exchange_stmt       IN CLOB,  
    child_exchange_stmt        IN CLOB);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>owner's name</td>
</tr>
<tr>
<td>parent_table_name</td>
<td>the partitioned base table</td>
</tr>
<tr>
<td>child_table_name</td>
<td>a partitioned table with reference partitioning based on the table named <code>parent_table_name</code></td>
</tr>
<tr>
<td>parent_exchange_table_name</td>
<td>an exchange table for the partitioned base table</td>
</tr>
<tr>
<td>child_exchange_table_name</td>
<td>an exchange table for the table named <code>child_table_name</code></td>
</tr>
<tr>
<td>parent_exchange_stmt</td>
<td>SQL statement to execute exchange partition operation between the table named <code>parent_table_name</code> and the table named <code>parent_exchange_table_name</code></td>
</tr>
<tr>
<td>child_exchange_stmt</td>
<td>SQL statement to execute exchange partition operation between the table named <code>child_table_name</code> and the table named <code>child_exchange_table_name</code></td>
</tr>
</tbody>
</table>

208.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.  

---

Note:

This procedure is limited to the structured storage model.
Syntax

DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT {
  owner_name IN VARCHAR2,
  parent_table_name IN VARCHAR2,
  child_table_name IN VARCHAR2,
  parent_exchange_table_name IN VARCHAR2,
  child_exchange_table_name IN VARCHAR2,
  parent_exchange_stmt IN CLOB,
  child_exchange_stmt IN CLOB};

Parameters

Table 208-8  REFPARTITIONEXCHANGEOUT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>owner's name</td>
</tr>
<tr>
<td>parent_table_name</td>
<td>the partitioned base table</td>
</tr>
<tr>
<td>child_table_name</td>
<td>a partitioned table with reference partitioning based on the table named</td>
</tr>
<tr>
<td>parent_exchange_table_name</td>
<td>an exchange table for the partitioned base table</td>
</tr>
<tr>
<td>child_exchange_table_name</td>
<td>an exchange table for the table named child_table_name</td>
</tr>
<tr>
<td>parent_exchange_stmt</td>
<td>SQL statement to execute exchange partition operation between the table named</td>
</tr>
<tr>
<td></td>
<td>parent_table_name and the table named parent_exchange_table_name</td>
</tr>
<tr>
<td>child_exchange_stmt</td>
<td>SQL statement to execute exchange partition operation between the table named</td>
</tr>
<tr>
<td></td>
<td>child_table_name and the table named child_exchange_table_name</td>
</tr>
</tbody>
</table>

208.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the XMLtype base table or an XMLType column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE {
  owner_name IN VARCHAR2 DEFAULT USER,
  table_name IN VARCHAR2,
  column_name IN VARCHAR2 DEFAULT NULL,
  xpath IN VARCHAR2,
  collection_table_name IN VARCHAR2,
  namespaces IN VARCHAR2 default NULL);  // For release 11.2 only
Parameters

Table 208-9  RENAMECOLLECTIONTABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>The name of the owner</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of a base table that can be used as the starting point for specifying the collection table</td>
</tr>
<tr>
<td>column_name</td>
<td>An XMLType column that can be the starting point for specifying the collection table</td>
</tr>
<tr>
<td>xpath</td>
<td>The XPath expression that specifies the collection table</td>
</tr>
<tr>
<td>collection_table_name</td>
<td>The name of the collection table</td>
</tr>
<tr>
<td>namespaces</td>
<td>For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath.</td>
</tr>
</tbody>
</table>

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

Note: This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a namespaces parameter may also be required.

Example

The collection table name will be EMP_TAB_NAMELIST. You can verify this using SELECT * FROM user_nested_tables.

Using DOT Notation:

call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (USER, 'EMP_TAB', NULL, "'XMLDATA'.'EMPLOYEE'.'NAME'", 'EMP_TAB_NAMELIST');

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE(
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '''http://www.oracle.com/emp.xsd' as "e"');

208.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types.

Syntax

DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;

Usage Notes

- If you have used SETOUTOFLINE Procedure in the DBMS_XMLSTORAGE_MANAGE package to avoid raising '1000 column limit' errors during XML schema registration, you should also use SCOPEXMLREFERENCES Procedure.
- Using SCOPEXMLREFERENCES after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

Note:

This procedure is limited to the structured storage model.

208.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING(
    owner_name IN VARCHAR2 DEFAULT USER,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2 DEFAULT NULL,
    xpath IN VARCHAR2,
    namespaces IN VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
Parameters

Table 208-10  XPATH2TABCOLMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the base table</td>
</tr>
<tr>
<td>column_name</td>
<td>Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLType table then column_name should be NULL.</td>
</tr>
<tr>
<td>xpath</td>
<td>Path expression in DOT notation or XPath notation (see examples below)</td>
</tr>
<tr>
<td>namespaces</td>
<td>Optional namespace definitions for path expression</td>
</tr>
</tbody>
</table>

Examples

XPath2TabColMapping evaluated on XMLType table with XPath Notation, namespaces provided

```sql
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
    USER, 'XML_TAB', '', '//n1:item/n1:location','''xdbXmark'' as "n1")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```sql
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
    USER, 'PurchaseOrderTab','XMLCOL','xmldata.LineItems.LineItem', '')
FROM DUAL;
```
DBMS_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- Security Model
- Types
- Summary of DBMS_XMLSTORE Subprograms

See Also:
Oracle XML DB Developer's Guide

209.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

209.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This is the return type of NEWCONTEXT.</td>
</tr>
</tbody>
</table>

209.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the DBMS_XMLSTORE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEARKEYCOLUMNLIST</td>
<td>Clears the key column list.</td>
</tr>
<tr>
<td>CLEARUPDATECOLUMNLIST</td>
<td>Clears the update column list.</td>
</tr>
<tr>
<td>CLOSECONTEXT</td>
<td>It closes/deallocates a particular save context.</td>
</tr>
</tbody>
</table>
### Table 209-2  (Cont.) DBMS_XMLSTORE Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETEXML</td>
<td>Deletes records specified by data from the XML document, from the table specified at the context creation time.</td>
</tr>
<tr>
<td>INSERTXML</td>
<td>Inserts the XML document into the table specified at the context creation time.</td>
</tr>
<tr>
<td>NEWCONTEXT</td>
<td>Creates a save context, and returns the context handle.</td>
</tr>
<tr>
<td>SETKEYCOLUMN</td>
<td>This method adds a column to the key column list.</td>
</tr>
<tr>
<td>SETROWTAG</td>
<td>Names the tag used in the XML document, to enclose the XML elements corresponding to the database.</td>
</tr>
<tr>
<td>SETUPUPDATECOLUMN</td>
<td>Adds a column to the &quot;update column list&quot;.</td>
</tr>
<tr>
<td>UPDATEXML</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>

### 209.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

**Syntax**

```
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

**Table 209-3  CLEARKEYCOLUMNLIST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

### 209.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

**Syntax**

```
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

**Table 209-4  CLEARUPDATECOLUMNLIST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

### 209.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

**Syntax**

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```
Table 209-5  CLOSECONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>

209.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

FUNCTION deleteXML(
    ctxHdl IN ctxPType,
    xDoc IN VARCHAR2)
RETURN NUMBER;

The following syntax uses a CLOB type for the xDoc parameter.

FUNCTION deleteXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB)
RETURN NUMBER;

The following syntax uses an XMLType type for the xDoc parameter.

FUNCTION deleteXML(
    ctxHdl IN ctxType,
    xDoc IN XMLType)
RETURN NUMBER;

Parameters

Table 209-6  DELETEXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>

209.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless SETUPDATECOLUMN is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.
Syntax

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;

Parameters

Table 209-7 INSERTXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>

209.3.6 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

Syntax

FUNCTION newContext(
  targetTable IN VARCHAR2)
RETURN ctxType;

Table 209-8 NEWCONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>

209.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

PROCEDURE setKeyColumn(
  ctxHdl IN ctxType,
  colName IN VARCHAR2);
### Table 209-9  SETKEYCOLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>

#### 209.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

**Syntax**

```sql
PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>

#### 209.3.9 SETUPUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

**Syntax**

```sql
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
209.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax
The following syntax passes the xDoc parameter as a VARCHAR2.

```sql
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the xDoc parameter as a CLOB.

```sql
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax passes the xDoc parameter as a XMLType.

```sql
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 209-12  UPDATEXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

**See Also:**

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*.
- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*.

This chapter contains the following topics:

- Overview
- Security Model
- Examples
- Summary of DBMS_XPLAN Subprograms

### 210.1 DBMS_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- **DISPLAY** - to format and display the contents of a plan table.
- **DISPLAY_AWR** - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- **DISPLAY_CURSOR** - to format and display the contents of the execution plan of any loaded cursor.
- **DISPLAY_SQL_PLAN_BASELINE** - to display one or more execution plans for the SQL statement identified by SQL handle.
• DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

210.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires SELECT or READ privileges on the following fixed views: V$SQL_PLAN, V$SESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR Function requires the user to have SELECT or READ privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

Using the DISPLAY_SQLSET Function requires the user to have the SELECT or READ privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

Using DISPLAY_SQL_PLAN_BASELINE Function requires the user to have the SELECT or READ privilege on DBA_SQL_PLAN_BASELINES as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

All these privileges are automatically granted as part of the SELECT_CATALOG role.

210.3 Examples

These examples show sample uses of DBMS_XPLAN.

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```sql
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```sql
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>1</td>
<td>57</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 1</td>
<td>HASH JOIN</td>
<td>EMP</td>
<td>1</td>
<td>57</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>TABLE ACCESS FULL</td>
<td>D</td>
<td>1</td>
<td>37</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>80</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>
```

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.
Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.empno=7369;
```

<table>
<thead>
<tr>
<th>ENAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMITH</td>
</tr>
</tbody>
</table>

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
| 1   | HASH JOIN          |      |     1 |    16 |     6  (34)| 00:00:01 |
| 2   | TABLE ACCESS FULL | EMP  |     1 |    13 |     3  (34)| 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT |     4 |    12 |     3  (34)| 00:00:01 |
------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
  1 - access("E"."DEPTNO"="D"."DEPTNO")
  2 - filter("E"."EMPNO"=7369)
```

You can also use the table function DISPLAY_CURSOR to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get sql_id and child_number for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

<table>
<thead>
<tr>
<th>SQL_ID</th>
<th>CHILD_NUMBER</th>
</tr>
</thead>
<tbody>
<tr>
<td>gwp663cqh5qbf</td>
<td>0</td>
</tr>
</tbody>
</table>
Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

```
<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>SORT GROUP BY</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (43)</td>

<tr>
<td>4</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>14</td>
<td>70</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

```
2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and display_cursor table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

```
<table>

</tbody>
</table>
```

Chapter 210

Examples

210-4
When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the statement_id parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no need to purge the plan table after each EXPLAIN PLAN. However, you should purge the plan table regularly to ensure good performance in the execution of the DISPLAY table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

**Using a View to Display Last Explain Plan**

```sql
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

## 210.4 Summary of DBMS_XPLAN Subprograms

This table lists the DBMS_XPLAN subprograms and briefly describes them.

### Table 210-1  DBMS_XPLAN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIFF_PLAN Function</td>
<td>Compares plans</td>
</tr>
<tr>
<td>DISPLAY Function</td>
<td>Displays the contents of the plan table</td>
</tr>
<tr>
<td>DISPLAY_AWR Function</td>
<td>Displays the contents of an execution plan stored in the AWR</td>
</tr>
<tr>
<td>DISPLAY_CURSOR Function</td>
<td>Displays the execution plan of any cursor in the cursor cache</td>
</tr>
<tr>
<td>DISPLAY_PLAN Function</td>
<td>Displays the contents of the plan table in a variety of formats with CLOB output type</td>
</tr>
<tr>
<td>DISPLAY_SQL_PLAN_BAS ELINE Function</td>
<td>Displays one or more execution plans for the specified SQL handle of a SQL plan baseline</td>
</tr>
</tbody>
</table>
Table 210-1  (Cont.) DBMS_XPLAN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY_SQLSET</td>
<td>Displays the execution plan of a given statement stored in a SQL tuning set</td>
</tr>
</tbody>
</table>

210.4.1 DIFF_PLAN Function

This function compares plans.

Syntax

```
DBMS_XPLAN.DIFF_PLAN(
    plan1    IN   SPC_SRC,
    plan2    IN   SPC_SRC)
RETURN VARCHAR2;
```

Parameters

Table 210-2  DIFF_PLAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_1</td>
<td>First plan</td>
</tr>
<tr>
<td>plan_2</td>
<td>Second plan</td>
</tr>
</tbody>
</table>

210.4.2 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or V$SQL_PLAN_STATISTICS_ALL if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
    table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
    statement_id  IN  VARCHAR2  DEFAULT NULL,
    format        IN  VARCHAR2  DEFAULT 'TYPICAL',
    filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-3  DISPLAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.</td>
</tr>
</tbody>
</table>
Table 210-3  (Cont.) DISPLAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function shows you the plan of the most recent explained statement.</td>
</tr>
</tbody>
</table>
Table 210-3  (Cont.) DISPLAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only projection, alias and remote SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>• SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (projection, alias and information about remote SQL if the operation is distributed).</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

- ROWS - if relevant, shows the number of rows estimated by the optimizer
- BYTES - if relevant, shows the number of bytes estimated by the optimizer
- COST - if relevant, shows optimizer cost information
- PARTITION - if relevant, shows partition pruning information
- PARALLEL - if relevant, shows PX information (distribution method and table queue information)
- PREDICATE - if relevant, shows the predicate section
- PROJECTION - if relevant, shows the projection section
- ALIAS - if relevant, shows the "Query Block Name / Object Alias" section
- REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
- NOTE - if relevant, shows the note section of the explain plan

Format keywords can be prefixed by the sign `-` to exclude the specified information. For example, `-PROJECTION` excludes projection information.

If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
Table 210-3  (Cont.) DISPLAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_preds</td>
<td>SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=&gt;'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)</td>
</tr>
</tbody>
</table>

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

⚠️ WARNING:

Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as statement_id='foo':

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```
210.4.3 DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```sql
DBMS_XPLAN.DISPLAY_AWR(
    sql_id            IN      VARCHAR2,
    plan_hash_value   IN      NUMBER DEFAULT NULL,
    db_id             IN      NUMBER DEFAULT NULL,
    format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.</td>
</tr>
<tr>
<td>db_id</td>
<td>Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.</td>
</tr>
</tbody>
</table>
### Table 210-4  (Cont.) DISPLAY_AWR Table Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>- BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>- SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>- ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

- ROWS - if relevant, shows the number of rows estimated by the optimizer
- BYTES - if relevant, shows the number of bytes estimated by the optimizer
- COST - if relevant, shows optimizer cost information
- PARTITION - if relevant, shows partition pruning information
- PARALLEL - if relevant, shows PX information (distribution method and table queue information)
- PREDICATE - if relevant, shows the predicate section
- PROJECTION - if relevant, shows the projection section
- ALIAS - if relevant, shows the "Query Block Name / Object Alias" section
- REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
- NOTE - if relevant, shows the note section of the explain plan

Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

### Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, DBA_HIST.SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.

- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
– Use ‘-BYTES -COST -PREDICATE’ to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.

– Use ‘BASIC ROWS’ to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
  (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL' )) tf
WHERE ht.sql_text like '%TOTO%';
```

210.4.4 DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
  sql_id IN VARCHAR2 DEFAULT NULL,
  cursor_child_no IN NUMBER DEFAULT 0,
  format IN VARCHAR2 DEFAULT 'TYPICAL');
```

Parameters

Table 210-5  DISPLAY_CURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.</td>
</tr>
<tr>
<td>cursor_child_n</td>
<td>Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.</td>
</tr>
</tbody>
</table>
Table 210-5  (Cont.) DISPLAY_CURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts five values:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>• SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>• ADAPTIVE:</td>
</tr>
<tr>
<td></td>
<td>- Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join.</td>
</tr>
<tr>
<td></td>
<td>- Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans.</td>
</tr>
<tr>
<td></td>
<td>- Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this.</td>
</tr>
<tr>
<td></td>
<td>- Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer.</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).

Format keywords must be separated by either a comma or a space:

• ROWS - if relevant, shows the number of rows estimated by the optimizer
• BYTES - if relevant, shows the number of bytes estimated by the optimizer
• COST - if relevant, shows optimizer cost information
• PARTITION - if relevant, shows partition pruning information
• PARALLEL - if relevant, shows PX information (distribution method and table queue information)
• PREDICATE - if relevant, shows the predicate section
• PROJECTION - if relevant, shows the projection section
• ALIAS - if relevant, shows the “Query Block Name / Object Alias” section
• REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
• NOTE - if relevant, shows the note section of the explain plan
• IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format
### Table 210-5 (Cont.) DISPLAY_CURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shows IO statistics for <strong>ALL</strong> (or only for the <strong>LAST</strong> as shown below) executions of the cursor.</td>
<td></td>
</tr>
<tr>
<td>MEMSTATS - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</td>
<td></td>
</tr>
<tr>
<td>ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</td>
<td></td>
</tr>
<tr>
<td>LAST - By default, plan statistics are shown for all executions of the cursor. The keyword <strong>LAST</strong> can be specified to see only the statistics for the last execution.</td>
<td></td>
</tr>
</tbody>
</table>

The following two formats are deprecated but supported for backward compatibility:

- RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.
- RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor.

Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '--PROJECTION' excludes projection information.

### Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have **SELECT** or **READ** privilege on the fixed views `V$SQL_PLAN_STATISTICS_ALL`, `V$SQL` and `V$SQL_PLAN`, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the `format` parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTON' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTON' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan of the last SQL statement executed by the current session:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```
To display runtime statistics for the cursor included in the preceding statement:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'))
```

### 210.4.5 DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

#### Syntax

```sql
DBMS_XPLAN.DISPLAY_PLAN (
    table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',
    statement_id     IN    VARCHAR2   DEFAULT NULL,
    format           IN    VARCHAR2   DEFAULT 'TYPICAL',
    filter_preds     IN    VARCHAR2   DEFAULT NULL,
    type             IN    VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```

#### Parameters

**Table 210-6  DISPLAY_PLAN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function shows you the plan of the most recent explained statement.</td>
</tr>
</tbody>
</table>
| filter_preds  | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds = 'plan_id = 10'

Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)}
Table 210-6  (Cont.) DISPLAY_PLAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts five values:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>• SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>• ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated):</td>
</tr>
<tr>
<td></td>
<td>- A list of the rowsources from the original which may be replaced, and the rowsources to replace them</td>
</tr>
<tr>
<td></td>
<td>- If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWS</td>
<td>if relevant, shows the number of rows estimated by the optimizer</td>
</tr>
<tr>
<td>BYTES</td>
<td>if relevant, shows the number of bytes estimated by the optimizer</td>
</tr>
<tr>
<td>COST</td>
<td>if relevant, shows optimizer cost information</td>
</tr>
<tr>
<td>PARTITION</td>
<td>if relevant, shows partition pruning information</td>
</tr>
<tr>
<td>PARALLEL</td>
<td>if relevant, shows PX information (distribution method and table queue information)</td>
</tr>
<tr>
<td>PREDICATE</td>
<td>if relevant, shows the predicate section</td>
</tr>
<tr>
<td>PROJECTION</td>
<td>if relevant, shows the projection section</td>
</tr>
<tr>
<td>ALIAS</td>
<td>if relevant, shows the &quot;Query Block Name / Object Alias&quot; section</td>
</tr>
<tr>
<td>REMOTE</td>
<td>if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</td>
</tr>
<tr>
<td>NOTE</td>
<td>if relevant, shows the note section of the explain plan</td>
</tr>
</tbody>
</table>

Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
Table 210-6  (Cont.) DISPLAY_PLAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).</td>
</tr>
</tbody>
</table>

Return Values

Returns the requested report as CLOB

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**WARNING:**

Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

210.4.6 DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```sql
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (  
  sql_handle      IN VARCHAR2 := NULL,  
  plan_name       IN VARCHAR2 := NULL,  
  format          IN VARCHAR2 := 'TYPICAL')  
RETURN dbms_xplan_type_table;
```

Parameters

Table 210-7  DISPLAY_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.</td>
</tr>
</tbody>
</table>
Table 210-7 (Cont.) DISPLAY_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.</td>
</tr>
</tbody>
</table>

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the plan_id stored in the SQL management base may not match with the plan_id of the generated plan. A mismatch between stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
WHERE sql_text like '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL, 'BASIC')) t;
```

210.4.7 DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
    sqlset_name IN VARCHAR2,
    sql_id IN VARCHAR2,
    plan_hash_value IN NUMBER := NULL,
    format IN VARCHAR2 := 'TYPICAL',
    sqlset_owner IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```
Parameters

Table 210-8  DISPLAY_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL Tuning Set</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.</td>
</tr>
</tbody>
</table>
Table 210-8  (Cont.) DISPLAY_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>• SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

• ROWS - if relevant, shows the number of rows estimated by the optimizer
• BYTES - if relevant, shows the number of bytes estimated by the optimizer
• COST - if relevant, shows optimizer cost information
• PARTITION - if relevant, shows partition pruning information
• PARALLEL - if relevant, shows PX information (distribution method and table queue information)
• PREDICATE - if relevant, shows the predicate section
• PROJECTION - if relevant, shows the projection section
• ALIAS - if relevant, shows the "Query Block Name / Object Alias" section
• REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
• NOTE - if relevant, shows the note section of the explain plan
• IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.
• MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used,
Table 210-8  (Cont.) DISPLAY_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</td>
</tr>
<tr>
<td></td>
<td>• ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</td>
</tr>
<tr>
<td></td>
<td>• LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility:</td>
</tr>
<tr>
<td></td>
<td>• RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</td>
</tr>
<tr>
<td></td>
<td>• RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</td>
</tr>
<tr>
<td></td>
<td>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set. The default is the current user.</td>
</tr>
</tbody>
</table>

Usage Notes

Here are some ways you might use variations on the format parameter:

• Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

• Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.

• Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.

• Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

SELECT * FROM table (DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf', 3693697075));

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

SELECT * FROM table (DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405', 'gwp663cqh5qbf'));
To display runtime statistics for the SQL statement included in the preceding statement:

```sql
SELECT * FROM table {
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqhbqbf', NULL, 'ALLSTATS LAST');
```
The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- DBMS_XSLPROCESSOR Overview
- DBMS_XSLPROCESSOR Deprecated Subprograms
- DBMS_XSLPROCESSOR Security Model
- Summary of DBMS_XSLPROCESSOR Subprograms

See Also:
- Oracle XML DB Developer’s Guide

### 211.1 DBMS_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

#### Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

#### Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

#### Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails
211.2 DBMS_XSLPROCESSOR Deprecated Subprograms

These subprograms are deprecated from the DBMS_XSLPROCESSOR package in Oracle Database 12c release 12.2.

Note:

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Starting in this release, these subprograms are available in the DBMS_LOB package.

- CLOB2FILE Procedure
- READ2CLOB Function

See Also:

Summary of DBMS_LOB Subprograms

211.3 DBMS_XSLPROCESSOR Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

211.4 Summary of DBMS_XSLPROCESSOR Subprograms

This table lists the DBMS_XSLPROCESSOR subprograms and briefly describes them.

Table 211-1  DBMS_XSLPROCESSOR Package Subprograms

### 211.4.1 CLOB2FILE Procedure

This procedure writes content of a CLOB into a file. This procedure has moved to the DBMS_LOB package, starting in Oracle Database 12c release 12.2.

#### Syntax

```sql
DBMS_XSLPROCESSOR.CLOB2FILE(
    cl IN CLOB;
    flocation IN VARCHAR2,
    fname IN VARCHAR2,
    csid IN NUMBER:=0);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOB</td>
<td>File directory</td>
</tr>
<tr>
<td>flocation</td>
<td>File directory</td>
</tr>
<tr>
<td>fname</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the file&lt;br&gt;Must be a valid Oracle id; otherwise returns an error&lt;br&gt;If 0, content of the output file will be in the database character set</td>
</tr>
</tbody>
</table>
211.4.2 FREEPROCESSOR Procedure

This procedure frees a Processor object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
    p IN Processor);
```

Parameters

Table 211-3  FREEPROCESSOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor</td>
</tr>
</tbody>
</table>

211.4.3 FREESTYLESHEET Procedure

This procedure frees a Stylesheet object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
    ss IN Stylesheet);
```

Parameters

Table 211-4  FREESTYLESHEET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet</td>
</tr>
</tbody>
</table>

211.4.4 NEWPROCESSOR Function

This function returns a new Processor instance.

The function must be called before the default behavior of Processor can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
RETURN Processor;
```

211.4.5 NEWSTYLESHEET Functions

This function creates and returns a new Stylesheet instance.

The options are described in the following table.
Syntax

Creates and returns a new stylesheet instance using the given DOMDocument and reference URLs:

```plaintext
DBMS_XSLPROCESSOR.NEWSTYLESHET(
    xmldoc IN DOMDOCUMENT,
    ref IN VARCHAR2)
RETURN Stylesheet;
```

Creates and returns a new Stylesheet instance using the given input and reference URLs:

```plaintext
DBMS_XSLPROCESSOR.NEWSTYLESHET(
    inp IN VARCHAR2,
    ref IN VARCHAR2)
RETURN Stylesheet;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>DOMDocument to use for construction</td>
</tr>
<tr>
<td>inp</td>
<td>Input URL to use for construction</td>
</tr>
<tr>
<td>ref</td>
<td>Reference URL</td>
</tr>
</tbody>
</table>

211.4.6 PROCESSXSL Functions and Procedures

This function transforms input XMLDocument.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```plaintext
DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    xmldoc IN DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```plaintext
DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    url IN VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:
DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    clb IN CLOB)
RETURN DOMDOCUMENTFRAGMENT;

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes
the output to the specified file:

DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR(
    p IN Processor,
    ss IN Stylesheet,
    xmldoc IN DOMDOCUMENT,
    dir IN VARCHAR2,
    fileName IN VARCHAR2);

Transforms input XMLDocument using given URL and the stylesheet, and writes the
output to the specified file in a specified directory:

DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    url IN VARCHAR2,
    dir IN VARCHAR2,
    fileName IN VARCHAR2);

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes
the output to a CLOB:

DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    xmldoc IN DOMDOCUMENT,
    cl IN OUT CLOB);

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and
returns the resultant document fragment:

DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    xmldf IN DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the
stylesheet, and writes the output to the specified file in a specified directory:

DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
    xmldf IN DOMDOCUMENTFRAGMENT,
    dir IN VARCHAR2,
    filename IN VARCHAR2);

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the
stylesheet, and writes the output to a buffer:

DBMS_XSLPROCESSOR.PROCESSXSL(
    p IN Processor,
    ss IN Stylesheet,
Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  xmldf IN DOMDOCUMENTFRAGMENT,
  cl IN OUT CLOB);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>xmldoc</td>
<td>XML document being transformed</td>
</tr>
<tr>
<td>url</td>
<td>URL for the information being transformed</td>
</tr>
<tr>
<td>clb</td>
<td>CLOB containing information to be transformed</td>
</tr>
<tr>
<td>dir</td>
<td>Directory where processing output file is saved</td>
</tr>
<tr>
<td>filename</td>
<td>Processing output file</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which the processing output is saved</td>
</tr>
<tr>
<td>xmldf</td>
<td>XMLDocumentFragment being transformed</td>
</tr>
</tbody>
</table>

211.4.7 READ2CLOB Function

This function reads content of a file into a CLOB.

Note: This procedure has moved to the DBMS_LOB package, starting in Oracle Database 12c release 12.2.

Syntax

DBMS_XSLPROCESSOR.READ2CLOB(
  flocation IN VARCHAR2,
  fname IN VARCHAR2,
  csid IN NUMBER:=0)
RETURN CLOB;
211.4.8 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```sql
DBMS_XSLPROCESSOR.REMOVEPARAM(
    ss     IN  Stylesheet,
    name   IN  VARCHAR2);
```

Parameters

Table 211-8   REMOVEPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>name</td>
<td>Name of the parameter</td>
</tr>
</tbody>
</table>

211.4.9 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```sql
DBMS_XSLPROCESSOR.RESETPARAMS(
    ss  IN   Stylesheet);
```

Parameters

Table 211-9   RESETPARAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
</tbody>
</table>
211.4.10 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
    n           IN   DBMS_XMLDOM.DOMNODE,
    pattern     IN   VARCHAR2,
    namespace   IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 211-10 SELECTNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>

211.4.11 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
    n           IN   DBMS_XMLDOM.DOMNODE,
    pattern     IN   VARCHAR2,
    namespace   IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 211-11 SELECTSINGLENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>
211.4.12 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

`DBMS_XSLPROCESSOR.SETERRORLOG(`
- `p` IN Processor,
- `fileName` IN VARCHAR2);

Parameters

Table 211-12  SETERRORLOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p</code></td>
<td>Processor instance</td>
</tr>
<tr>
<td><code>fileName</code></td>
<td>Complete path of the file to use as the error log</td>
</tr>
</tbody>
</table>

211.4.13 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

`DBMS_XSLPROCESSOR.SETPARAM(`
- `ss` IN Stylesheet,
- `name` IN VARCHAR2,
- `value` IN VARCHAR2);

Parameters

Table 211-13  SETPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ss</code></td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td><code>name</code></td>
<td>Name of the parameter</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>
211.4.14 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

DBMS_XSLPROCESSOR.SHOWWARNINGS(
    p IN Processor,
    yes IN BOOLEAN);

Parameters

Table 211-14  SHOWWARNINGS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>yes</td>
<td>Mode to set: TRUE to show warnings, FALSE otherwise</td>
</tr>
</tbody>
</table>

211.4.15 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

DBMS_XSLPROCESSOR.TRANSFORMNODE(
    n IN DOMNODE,
    ss IN Stylesheet)
RETURN DOMDocumentFragment;

Parameters

Table 211-15  TRANSFORMNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to transform</td>
</tr>
<tr>
<td>ss</td>
<td>Stylesheet to use</td>
</tr>
</tbody>
</table>

211.4.16 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

DBMS_XSLPROCESSOR.VALUEOF(
    n IN DBMS_XMLDOM.DOMNODE,
    pattern IN VARCHAR2,
    namespace IN VARCHAR2 := NULL)
RETURN VARCHAR2;
DBMS_XSLPROCESSOR.VALUEOF(
    n IN DBMS_XMLDOM.DOMNODE,
    pattern IN VARCHAR2,
    val OUT VARCHAR2,
    namespace IN VARCHAR2 := NULL);

Parameters

</tr>
</tbody>
</table>
212
DBMS_XSTREAM_ADM

This DBMS_XSTREAM_ADM package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

• Overview
• Security Model
• Operational Notes
• Summary of DBMS_XSTREAM_ADM Subprograms

See Also:

• Oracle Database XStream Guide
• Oracle Call Interface Programmer's Guide
• Oracle Database XStream Java API Reference

212.1 DBMS_XSTREAM_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).
212.2 DBMS_XSTREAM_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

See Also:

- `Oracle Database XStream Guide`
- `Oracle Database Concepts` for more information about CDBs and PDBs
212.3 DBMS_XSTREAM_ADM Operational Notes

Some subprograms in the DBMS_APPLY_ADM package can manage XStream outbound servers, and some subprograms in the DBMS_APPLY_ADM package can manage XStream inbound servers.

See Also:
DBMS_APPLY_ADM for details about which subprograms can manage outbound servers and inbound servers.

212.4 Summary of DBMS_XSTREAM_ADM Subprograms

This table lists the DBMS_XSTREAM_ADM subprograms and briefly describes them.

Table 212-1    DBMS_XSTREAM_ADM Package Subprograms

<tr>
<td>STOP_OUTBOUND Procedure</td>
<td>Stops an XStream outbound server.</td>
</tr>
</tbody>
</table>

Note:

All subprograms commit unless specified otherwise.

212.4.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.
This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

**Note:**

- `ADD_COLUMN` transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

**Syntax**

```sql
DBMS_XSTREAM_ADM.ADD_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA,
    value_type    IN  VARCHAR2     DEFAULT 'NEW',
    step_number   IN  NUMBER       DEFAULT 0,
    operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN(
    rule_name        IN  VARCHAR2,
    table_name       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    column_function  IN  VARCHAR2,
    value_type       IN  VARCHAR2     DEFAULT 'NEW',
    step_number      IN  NUMBER       DEFAULT 0,
    operation        IN  VARCHAR2     DEFAULT 'ADD');
```

**Parameters**

**Table 212-2  ADD_COLUMN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Table 212-2  (Cont.) ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to which the column is added in the row LCR, specified as [schema_name]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column added to each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.</td>
</tr>
<tr>
<td>column_function</td>
<td>Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to add the column to the new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>

**212.4.2 ADD_GLOBAL_PROPAGATION_RULES Procedure**

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

**Syntax**

```sql
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```
Parameters

Table 212-3  ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| streams_name   | The name of the propagation. Do not specify an owner.                                                                                           | If the specified propagation does not exist, then the procedure creates it automatically.  
If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.  
If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name. |
| source_queue_name | The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.                                      | For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.  
If the schema is not specified, then the current user is the default. |
| destination_queue_name | The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type. | For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.  
If the schema is not specified, then the current user is the default.  
If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.  
**Note:** Connection qualifiers are not allowed. |
| include_dml    | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.                                                                                   | |
| include_ddl    | If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.                                                                          | |
Table 212-3  (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
Table 212-3  (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (system_condition) AND (and_condition) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW('02') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</td>
</tr>
<tr>
<td></td>
<td>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>• If NULL, then the procedure does not change the queue to queue property of the propagation.</td>
</tr>
</tbody>
</table>

See Also: Logical Change Record TYPES

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

\[ (:dml.is_null_tag() = 'Y' \text{ and } :dml.get_source_database_name() = 'DBS1.NET') \]

212.4.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to an entire database.
  
  This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Syntax

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
    streams_type IN VARCHAR2,
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
  streams_type IN VARCHAR2,
  streams_name IN VARCHAR2 DEFAULT NULL,
  queue_name IN VARCHAR2 DEFAULT 'streams_queue',
  include_dml IN BOOLEAN DEFAULT TRUE,
  include_ddl IN BOOLEAN DEFAULT FALSE,
  include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
  source_database IN VARCHAR2 DEFAULT NULL,
  dml_rule_name OUT VARCHAR2,
  ddl_rule_name OUT VARCHAR2,
  inclusion_rule IN BOOLEAN DEFAULT TRUE,
  and_condition IN VARCHAR2 DEFAULT NULL,
  source_root_name IN VARCHAR2 DEFAULT NULL,
  source_container_name IN VARCHAR2 DEFAULT NULL);

<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
Table 212-4  (Cont.) ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NUL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NUL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. <strong>See Also:</strong> <a href="https://docs.oracle.com/database/121/ADMDG/">Oracle Streams Replication Administrator's Guide</a> for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <a href="https://docs.oracle.com/database/121/XSTRM/">Oracle Database XStream Guide</a> for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
</tbody>
</table>
Table 212-4  (Cont.) ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_rule_name</td>
<td>If <code>include_ddl</code> is TRUE, then this parameter contains the DDL rule name. If <code>include_ddl</code> is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If <code>inclusion_rule</code> is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If <code>inclusion_rule</code> is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</td>
</tr>
<tr>
<td></td>
<td>(system_condition) AND (and_condition)</td>
</tr>
<tr>
<td></td>
<td>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</td>
</tr>
<tr>
<td></td>
<td>:lcr.get_tag() = HEXTORAW('02')</td>
</tr>
<tr>
<td></td>
<td>The :lcr in the specified condition is converted to :dml or :ddi, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Note: This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDBSROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. Note: This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```sql
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

212.4.4 ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the `CREATE_OUTBOUND` Procedure.

To create the capture process individually, use one of the following packages:

- DBMS_XSTREAM_ADM
- DBMS_CAPTURE_ADM

To create a queue individually, use the `SET_UP_QUEUE` procedure in the DBMS_XSTREAM_ADM package.

This procedure is overloaded. One `table_names` parameter is type VARCHAR2 and the other `table_names` parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one `schema_names` parameter is type VARCHAR2 and the other `schema_names` parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.
Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.

- This procedure enables the outbound server that it creates.

- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
    server_name            IN  VARCHAR2,
    queue_name             IN  VARCHAR2   DEFAULT NULL,
    source_database        IN  VARCHAR2   DEFAULT NULL,
    table_names            IN  DBMS_UTILITY.UNCL_ARRAY,
    schema_names           IN  DBMS_UTILITY.UNCL_ARRAY,
    connect_user           IN  VARCHAR2   DEFAULT NULL,
    comment                IN  VARCHAR2   DEFAULT NULL,
    capture_name           IN  VARCHAR2   DEFAULT NULL,
    start_scn              IN  NUMBER     DEFAULT NULL,
    start_time             IN  TIMESTAMP  DEFAULT NULL,
    include_dml            IN  BOOLEAN   DEFAULT TRUE,
    include_ddl            IN  BOOLEAN   DEFAULT FALSE,
    source_root_name       IN  VARCHAR2  DEFAULT NULL,
    source_container_name  IN  VARCHAR2  DEFAULT NULL,
    lcrid_version          IN  NUMBER    DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
    server_name            IN  VARCHAR2,
    queue_name             IN  VARCHAR2   DEFAULT NULL,
    source_database        IN  VARCHAR2   DEFAULT NULL,
    table_names            IN  VARCHAR2   DEFAULT NULL,
    schema_names           IN  VARCHAR2   DEFAULT NULL,
    connect_user           IN  VARCHAR2   DEFAULT NULL,
    comment                IN  VARCHAR2   DEFAULT NULL,
    capture_name           IN  VARCHAR2   DEFAULT NULL,
    start_scn              IN  NUMBER     DEFAULT NULL,
    start_time             IN  TIMESTAMP  DEFAULT NULL,
    include_dml            IN  BOOLEAN   DEFAULT TRUE,
    include_ddl            IN  BOOLEAN   DEFAULT FALSE,
    source_root_name       IN  VARCHAR2  DEFAULT NULL,
    source_container_name  IN  VARCHAR2  DEFAULT NULL,
    lcrid_version          IN  NUMBER    DEFAULT NULL);
```
### Parameters

**Table 212-5 ADD_OUTBOUND Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The server_name Setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which the outbound server dequeues LCRs, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL, the procedure raises an error.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</td>
</tr>
<tr>
<td></td>
<td>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>table_names</td>
<td>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Comma-delimited list of type VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td></td>
<td>Each table should be specified as [schema_name.]table_name. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

<td>schema_names</td>
<td>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Comma-delimited list of type VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td>Note:</td>
<td>This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</td>
</tr>
<tr>
<td></td>
<td>See Also: &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>connect_user</td>
<td>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See &quot;CREATE_OUTBOUND Procedure&quot; for information about the privileges required by a connect user.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the current user is the default.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional comment associated with the outbound server.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</td>
</tr>
<tr>
<td></td>
<td>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If the specified name does not match the name of an existing capture process, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the outbound server is created without a capture process.</td>
</tr>
<tr>
<td>start_scn</td>
<td>A valid system change number (SCN) for the database from which the capture process starts capturing changes.</td>
</tr>
<tr>
<td></td>
<td>If the capture_name parameter is NULL, then this parameter is ignored.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if an invalid SCN is specified.</td>
</tr>
<tr>
<td></td>
<td>The start_scn and start_time parameters are mutually exclusive.</td>
</tr>
<tr>
<td>start_time</td>
<td>A valid time from which the capture process starts capturing changes.</td>
</tr>
<tr>
<td></td>
<td>If the capture_name parameter is NULL, then this parameter is ignored.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</td>
</tr>
<tr>
<td></td>
<td>The start_scn and start_time parameters are mutually exclusive.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>

<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>lcrid_version</td>
<td>The LCRID version for captured LCRs, either 1 or 2.</td>
</tr>
<tr>
<td></td>
<td>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</td>
</tr>
<tr>
<td></td>
<td>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.</td>
</tr>
</tbody>
</table>

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application. This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.
For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note:
An empty array includes one NULL entry.

212.4.5 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name             IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name             IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

</tbody>
</table>
Table 212-6  (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
Table 212-6  (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: 

(system_condition) AND (and_condition) 

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

:lcr.get_tag() = HEXTORAW('02') 

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. 

See Also: Logical Change Record TYPES 

queue_to_queue | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. 

If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. 

This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: 

* If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. 
* If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. 
* If NULL, then the procedure does not change the queue to queue property of the propagation. 

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations |
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

212.4.6 ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
Syntax

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
    schema_name            IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name          OUT  VARCHAR2,
    ddl_rule_name          OUT  VARCHAR2,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2  DEFAULT NULL,
    source_container_name  IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 212-7  (Cont.) ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| streams_name    | The name of the capture process or apply process. Do not specify an owner.  
If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.  
If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:  
• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.  
• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.  
If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.  
If NULL and multiple relevant apply processes exist, then the procedure raises an error.  
Each apply process must have a unique name. |
| queue_name      | The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.  
For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.  
For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions. |
| include_dml     | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.  
include_ddl      | If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. |
Table 212-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. See Also: Oracle Streams Replication Administrator's Guide for more information about tags.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
</tbody>
</table>
Table 212-7  (Cont.) ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (system_condition) AND (and_condition)</td>
</tr>
</tbody>
</table>

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

:lcr.get_tag() = HEXTORAW('02')

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Note: This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDBSROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. Note: This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

\[
\begin{align*}
&((:dml.get_object_owner() = 'HR') \text{ and } :dml.is_null_tag() = 'Y' \\
&\text{ and } :dml.get_source_database_name() = 'DBS1.NET' )
\end{align*}
\]

212.4.7 ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One column_list parameter is type VARCHAR2 and the other column_list parameter is type DBMS_UTILITY.LNAME_ARRAY. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

This procedure does not add rules to the outbound server's capture process.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN DBMS_UTILITY.LNAME_ARRAY,
    keep             IN BOOLEAN   DEFAULT TRUE,
    source_database  IN VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN VARCHAR2  DEFAULT NULL,
```
Parameters

Table 212-8  ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default. If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database. The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</td>
</tr>
<tr>
<td>condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary &gt; 4000 and job_id = ''SA_MAN'' ' If NULL, then the procedure raises an error. <strong>Note:</strong> The quotation marks in the preceding example are all single quotation marks.</td>
</tr>
</tbody>
</table>
| column_list   | The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the keep parameter. The columns can be specified in the following ways:  
  - Comma-delimited list of type VARCHAR2.  
  - A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL.  
To include or exclude all of the columns in a table, specify each column in the table in the list or array. If NULL, then the procedure raises an error. |
| keep          | If TRUE, then the columns specified in the column_list parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the condition parameter are streamed to the outbound server's client application. If FALSE, then the columns specified in the column_list parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application. **See Also:** "Usage Notes" |
Table 212-8  (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the container where the specified table_names and schema_names are located. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</td>
</tr>
</tbody>
</table>

Usage Notes

When the keep parameter is set to TRUE, this procedure creates a keep columns declarative rule-based transformation for the columns listed in column_list.

When the keep parameter is set to FALSE, this procedure creates a delete column declarative rule-based transformation for each column listed in column_list.

See Also:

Oracle Database XStream Guide for information about declarative rule-based transformations

212.4.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
    table_name               IN   VARCHAR2,
    dml_condition            IN   VARCHAR2,
    streams_name             IN   VARCHAR2  DEFAULT NULL,
    source_queue_name        IN   VARCHAR2,
    destination_queue_name   IN   VARCHAR2,
    include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
    source_database          IN   VARCHAR2  DEFAULT NULL,
    insert_rule_name         OUT  VARCHAR2,
    update_rule_name         OUT  VARCHAR2,
);```
DELETE_RULE_NAME OUT VARCHAR2,
queue_to_queue IN BOOLEAN DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name IN VARCHAR2,
  dml_condition IN VARCHAR2,
  streams_name IN VARCHAR2 DEFAULT NULL,
  source_queue_name IN VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
  source_database IN VARCHAR2 DEFAULT NULL,
  queue_to_queue IN BOOLEAN DEFAULT NULL);

Parameters

Table 212-9  ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
</tbody>
</table>
| dml_condition      | The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition:  
' salary > 4000 and job_id = ''SA_MAN'' '  
Note: The quotation marks in the preceding example are all single quotation marks. |
| streams_name       | The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name. |
| source_queue_name  | The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin Schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |
## Table 212-9  (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_queue_name| The name of the destination queue, including a database link, specified as `[schema_name.]queue_name[@dblink_name]`, if the destination queue is in a remote database. The queue must be ANYDATA type.  
For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter `strmadmin.streams_queue@dbs2.net` for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed. |
| include_tagged_lcr    | If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.  
If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.  
**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about tags |
| source_database       | The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.  
If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.  
Oracle recommends that you specify a source database for propagation rules. |
| insert_rule_name      | Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts. |
| update_rule_name      | Contains the system-generated UPDATE rule name. This rule handles updates that remain updates. |
| delete_rule_name      | Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes |
Table 212-9  (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_to_queue</td>
<td>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation. See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified $dml\_condition$, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified $dml\_condition$, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified $dml\_condition$, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified $dml\_condition$, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing
positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Note:
Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples
The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

@dml.get_object_owner()='HR' AND @dml.get_object_name()='REGIONS'
AND @dml.is_null_tag()='Y' AND @dml.get_source_database_name()='DBS1.NET'
AND @dml.get_command_type()='UPDATE'
AND (@dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (@dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (@dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (@dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)

212.4.9 ADD_SUBSET_RULES Procedure
This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.
This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

**Syntax**

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
  table_name             IN   VARCHAR2,
  dml_condition          IN   VARCHAR2,
  streams_type           IN   VARCHAR2 DEFAULT 'apply',
  streams_name           IN   VARCHAR2 DEFAULT NULL,
  queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr     IN   BOOLEAN DEFAULT FALSE,
  source_database        IN   VARCHAR2 DEFAULT NULL,
  insert_rule_name       OUT  VARCHAR2,
  update_rule_name       OUT  VARCHAR2,
  delete_rule_name       OUT  VARCHAR2,
  source_root_name       IN  VARCHAR2  DEFAULT NULL,
  source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
  table_name             IN   VARCHAR2,
  dml_condition          IN   VARCHAR2,
  streams_type           IN   VARCHAR2 DEFAULT 'apply',
  streams_name           IN   VARCHAR2 DEFAULT NULL,
  queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr     IN   BOOLEAN DEFAULT FALSE,
  source_database        IN   VARCHAR2 DEFAULT NULL,
  source_root_name       IN  VARCHAR2  DEFAULT NULL,
  source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

**Table 212-10  ADD_SUBSET_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is 'SA_MAN', enter the following as the condition: 'salary &gt; 4000 and job_id = '&quot;SA_MAN&quot;' ''</td>
</tr>
</tbody>
</table>

</table>
Table 212-10  (Cont.) ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the XStream client performs its action regardless of the tag:</td>
</tr>
<tr>
<td></td>
<td>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.</td>
</tr>
<tr>
<td></td>
<td>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then an XStream client performs its action only when the tag is NULL:</td>
</tr>
<tr>
<td></td>
<td>• A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.</td>
</tr>
<tr>
<td></td>
<td>• An LCR is considered for apply by an apply process only if the LCR contains a NULL tag.</td>
</tr>
<tr>
<td></td>
<td>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Replication Administrator's Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</td>
</tr>
<tr>
<td></td>
<td>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</td>
</tr>
<tr>
<td></td>
<td>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</td>
</tr>
<tr>
<td></td>
<td>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrdpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>insert_rule_name</td>
<td>Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.</td>
</tr>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes</td>
</tr>
</tbody>
</table>
Table 212-10  (Cont.) ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name
is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

Note:
Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples
The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS' AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET' AND :dml.get_command_type()='UPDATE' AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL) AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL) AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2) AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)

212.4.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
Parameters

Table 212-11  ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>

Note: Connection qualifiers are not allowed.
Table 212-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. See Also: Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
</tbody>
</table>
Table 212-11  (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition   | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  

\[(system\_condition) \text{ AND } (and\_condition)\]  

The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:  

\[:lcr\text{.get\_tag()} = \text{HEXTORAW(''02'')}\]  

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

Table 212-11  (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| queue_to_queue  | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.  
If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.  
This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:  
• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.  
• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.  
• If NULL, then the procedure does not change the queue to queue property of the propagation.  
See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations |

Usage Notes
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples
The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET'
```

212.4.11 ADD_TABLE_RULES Procedure
This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

• When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a specified table.
This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
    table_name             IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name          OUT  VARCHAR2,
    ddl_rule_name          OUT  VARCHAR2,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2   DEFAULT NULL,
    source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
    table_name             IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2   DEFAULT NULL,
    source_container_name  IN  VARCHAR2   DEFAULT NULL);
```

<td>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Each apply process must have a unique name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
Table 212-12  (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_ddl</td>
<td><strong>If</strong> TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. <strong>NULL</strong> is not permitted.</td>
</tr>
<tr>
<td></td>
<td>The generated rule evaluates to <strong>TRUE</strong> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <strong>FALSE</strong> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <strong>FALSE</strong> for changes that create synonyms or views based on the table. The rule also evaluates to <strong>FALSE</strong> for a change to a PL/SQL subprogram that refers to the table.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td><strong>If</strong> TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <strong>TRUE</strong> regardless of whether a redo entry, session, or LCR has a non-<strong>NULL</strong> tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</td>
</tr>
<tr>
<td></td>
<td>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<strong>NULL</strong> tag.</td>
</tr>
<tr>
<td></td>
<td>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-<strong>NULL</strong> tag.</td>
</tr>
<tr>
<td></td>
<td>If the rules are added to a positive rule set, then setting this parameter to <strong>TRUE</strong> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</td>
</tr>
<tr>
<td></td>
<td><strong>If</strong> FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <strong>TRUE</strong> only if a redo entry, session, or LCR has a <strong>NULL</strong> Oracle Streams tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is <strong>NULL</strong>:</td>
</tr>
<tr>
<td></td>
<td>• A redo entry is considered for capture by a capture process only when the redo entry contains a <strong>NULL</strong> tag.</td>
</tr>
<tr>
<td></td>
<td>• An LCR is considered for apply by an apply process only if the LCR contains a <strong>NULL</strong> tag.</td>
</tr>
<tr>
<td></td>
<td>If the rules are added to a positive rule set, then setting this parameter to <strong>FALSE</strong> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a <strong>NULL</strong> tag.</td>
</tr>
<tr>
<td></td>
<td><strong>A setting of <strong>FALSE</strong> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Usually, specify <strong>TRUE</strong> for this parameter if the inclusion_rule parameter is set to <strong>FALSE</strong>.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> <em>Oracle Streams Replication Administrator’s Guide</em> for more information about tags</td>

</tbody>
</table>
Table 212-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
Table 212-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</td>
</tr>
<tr>
<td></td>
<td>(system_condition) AND (and_condition)</td>
</tr>
<tr>
<td></td>
<td>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</td>
</tr>
<tr>
<td></td>
<td>:lcr.get_tag() = HEXTORAW(''02'')</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Note: This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. Note: This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.
Examples

The following is an example of a table rule condition created for DML changes:

```sql
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

212.4.12 ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```sql
DBMS_XSTREAM_ADM.ALTER_INBOUND(
    server_name IN VARCHAR2,
    apply_user  IN VARCHAR2  DEFAULT NULL,
    comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 212-13  ALTER_INBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.</td>
</tr>
<tr>
<td>apply_user</td>
<td>The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply_user is not changed.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.</td>
</tr>
</tbody>
</table>
212.4.13 ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration. This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the CREATE_OUTBOUND procedure in this package.
- The queue used by the capture process was created by the CREATE_OUTBOUND procedure.

To check whether this procedure can alter the outbound server's capture process, query the CAPTURE_NAME column in the ALL_XSTREAM_OUTBOUND view. When the name of the capture process appears in the CAPTURE_NAME column of this view, the ALTER_OUTBOUND procedure can manage the capture process's rules or change the capture user for the capture process. When the CAPTURE_NAME column of this view is NULL, the ALTER_OUTBOUND procedure cannot manage the capture process.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:
Starting with Oracle Database 11g Release 2 (11.2.0.2), the start_scn and start_time parameters are included in this procedure.

Syntax

```sql
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
    server_name IN VARCHAR2,
    table_names IN DBMSUTILITY.UNCL_ARRAY,
    schema_names IN DBMSUTILITY.UNCL_ARRAY,
    add IN BOOLEAN DEFAULT TRUE,
    capture_user IN VARCHAR2 DEFAULT NULL,
    connect_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    start_scn IN NUMBER DEFAULT NULL,
    start_time IN TIMESTAMP DEFAULT NULL,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
    server_name IN VARCHAR2,
    table_names IN VARCHAR2 DEFAULT NULL,
    schema_names IN VARCHAR2 DEFAULT NULL,
    add IN BOOLEAN DEFAULT TRUE,
    capture_user IN VARCHAR2 DEFAULT NULL,
    connect_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    start_scn IN NUMBER DEFAULT NULL,
    start_time IN TIMESTAMP DEFAULT NULL,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 212-14  ALTER_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.</td>
</tr>
</tbody>
</table>
| table_names  | The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter. The tables can be specified in the following ways:  
  • Comma-delimited list of type VARCHAR2.  
  • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.  
Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.  
See Also: "Usage Notes" for more information about this parameter. |
| schema_names | The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter. The schemas can be specified in the following ways:  
  • Comma-delimited list of type VARCHAR2.  
  • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.  
Note: This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).  
See Also: "Usage Notes" for more information about this parameter. |
| add          | If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.  
If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter. |
### Table 212-14  (Cont.) ALTER_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If NULL, then the capture user is not changed. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. Ensure that the capture user is granted the other required privileges. See &quot;CREATE_OUTBOUND Procedure&quot; for information about the privileges required by a capture user. The capture process is stopped and restarted automatically when you change the value of this parameter. <strong>Note:</strong> If the capture user for a capture process is dropped using <strong>DROP USER</strong> . . . <strong>CASCADE</strong>, then the capture process is also dropped automatically.</td>
</tr>
<tr>
<td>connect_user</td>
<td>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user. Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS. If NULL, then the connect user is not changed. If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. Ensure that the connect user is granted the other required privileges. See &quot;CREATE_OUTBOUND Procedure&quot; for information about the privileges required by a connect user.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional comment associated with the outbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.</td>
</tr>
</tbody>
</table>
### Table 212-14  (Cont.) ALTER_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| inclusion_rule | If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.  
If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration.  
If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.  
If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration. |
| start_scn      | A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.  
If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.  
An error is returned if an invalid SCN is specified.  
If NULL and the start_time parameter is NULL, then the start SCN is not changed.  
If NULL and the start_time parameter is non-NULL, then the start SCN is changed to match the specified start time.  
The start_scn and start_time parameters are mutually exclusive.  
**Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL. |
Table 212-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| start_time    | A valid time from which the capture process starts capturing changes.  
                   To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.  
                   If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.  
                   An error is returned if an invalid time is specified.  
                   If NULL and the start_scn parameter is NULL, then the start time is not changed.  
                   If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.  
                   The start_scn and start_time parameters are mutually exclusive.  
                   **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL. |
| include_dml   | If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted. |
| include_ddl   | If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. |
| source_database | The global name of the container where the specified table_names and schema_names are located.  
                   If source_database is non-NULL, then a condition is added to the outbound server’s rules to filter the LCRs based on the global name of the source database. |
| source_container_name | The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.  
                   **Note:** This parameter only applies to a CDB. |

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream
Out configuration, depending on the setting of the add parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the DBMS_UTILITIES.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note:
An empty array includes one NULL entry.

212.4.14 CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

Note:
A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See Oracle Call Interface Programmer’s Guide and Oracle Database XStream Java API Reference for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
    server_name IN VARCHAR2,
    queue_name  IN VARCHAR2,
    apply_user  IN VARCHAR2 DEFAULT NULL,
    comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. Note: The server_name setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</td>
</tr>
</tbody>
</table>
Table 212-15  (Cont.) CREATE_INBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue used by the inbound server, specified as <code>[schema_name.]queue_name</code>. If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it. For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default. <strong>Note:</strong> An inbound server’s queue is used only to store error transactions.</td>
</tr>
</tbody>
</table>
| apply_user | The apply user. If NULL, then the current user is the default. The client application must attach to the inbound server as the apply user. The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:  
• The necessary privileges to perform DML and DDL changes on the apply objects  
• EXECUTE privilege on the rule sets used by the inbound server  
• EXECUTE privilege on all rule-based transformation functions used in the rule set  
• EXECUTE privilege on all apply handler procedures  
You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the apply user for an inbound server is dropped using DROP USER . . . CASCADE, then the inbound server is also dropped automatically. |
| comment | An optional comment associated with the inbound server. |

**Usage Notes**

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the DBMS_XSTREAM_ADM and DBMS_RULE_ADM packages.

In a CDB, you can execute the CREATE_INBOUND procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.
212.4.15 CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See “OCIXStreamOutAttach()” in the Oracle Call Interface Programmer's Guide and Oracle Database XStream Java API Reference for information about attaching to an outbound server.

- If the `capture_name` parameter is NULL, then this procedure automatically generates a name for the capture process that it creates.

- This procedure automatically generates a name for the queue that it creates.

- This procedure enables both the capture process and outbound server that it creates.

- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```sql
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
    server_name            IN VARCHAR2,
    source_database        IN VARCHAR2  DEFAULT NULL,
    table_names            IN DBMS_UTILITY.UNCL_ARRAY,
    schema_names           IN DBMS_UTILITY.UNCL_ARRAY,
    capture_user           IN VARCHAR2  DEFAULT NULL,
    connect_user           IN VARCHAR2  DEFAULT NULL,
    comment                IN VARCHAR2  DEFAULT NULL,
    capture_name           IN VARCHAR2  DEFAULT NULL,
    include_dml            IN BOOLEAN   DEFAULT TRUE,
    include_ddl            IN BOOLEAN   DEFAULT FALSE,
    source_root_name       IN VARCHAR2  DEFAULT NULL,
    source_container_name  IN VARCHAR2  DEFAULT NULL,
    lcrid_version          IN NUMBER    DEFAULT NULL);
```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
    server_name IN VARCHAR2,
    source_database IN VARCHAR2 DEFAULT NULL,
    table_names IN VARCHAR2 DEFAULT NULL,
    schema_names IN VARCHAR2 DEFAULT NULL,
    capture_user IN VARCHAR2 DEFAULT NULL,
    connect_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT NULL,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    source_root_name IN VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL,
    lcrid_version IN NUMBER DEFAULT NULL);

Parameters

Table 212-16  CREATE_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| server_name        | The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.  
Note: The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created. |
| source_database    | The global name of the source database. The source database is where the changes to be captured originated. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. |
| source_container_name | In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See Oracle Database XStream Guide for instructions. |
| include_dml        | If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. |
### Table 212-16  (Cont.) CREATE_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_names</td>
<td>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Comma-delimited list of type VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td></td>
<td>Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>See Also: &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
<tr>
<td>schema_names</td>
<td>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Comma-delimited list of type VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</td>
</tr>
<tr>

<td>See Also: &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
</tbody>
</table>
Table 212-16  (Cont.) CREATE_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| capture_user | The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. In addition, ensure that the capture user has the following privileges:
  - EXECUTE privilege on the rule sets used by the capture process
  - EXECUTE privilege on all rule-based transformation functions used in the positive rule set
You can grant these privileges directly to the apply user, or you can grant them through roles.
In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.
Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.
A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.

| connect_user | The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user. If NULL, then the current user is the default.
The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, grant the following privileges to the connect user:
  - EXECUTE privilege on the rule sets used by the outbound server
  - EXECUTE privilege on all rule-based transformation functions used in the rule set
You can grant these privileges directly to the connect user, or you can grant them through roles.
In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles. |
Table 212-16  (Cont.) CREATE_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>An optional comment associated with the outbound server.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. If the specified name matches the name of an existing capture process, then an error is raised. If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name. If NULL, then the system creates a new capture process with a system-generated name. <strong>Note:</strong> The capture process name cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>source_container_name</td>
<td>The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
<tr>
<td>lcrid_version</td>
<td>The LCRID version for captured LCRs, either 1 or 2. If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher. If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower. If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.</td>
</tr>
</tbody>
</table>
Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application. This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note:

An empty array includes one NULL entry.

212.4.16 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.
Note:

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- `KEEP_COLUMNS` Procedure

Syntax

```sql
DBMS_XSTREAM_ADM.DELETE_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    value_type    IN  VARCHAR2   DEFAULT '*',
    step_number   IN  NUMBER     DEFAULT 0,
    operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 212-17  DELETE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column deleted from each row LCR that satisfies the rule.</td>
</tr>
</tbody>
</table>
Table 212-17  (Cont.) DELETE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified column_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified table_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name and column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
212.4.17 DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

See Also:
"CREATE_INBOUND Procedure"

Syntax

```sql
DBMS_XSTREAM_ADM.DROP_INBOUND(
    server_name IN VARCHAR2);
```

Parameters

Table 212-18 DROP_INBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.</td>
</tr>
</tbody>
</table>

212.4.18 DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the DROP_OUTBOUND procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the CREATE_OUTBOUND procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.
212.4.19 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Streams components.

This procedure is intended for users of Oracle Streams who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Streams replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Streams components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling
- Capture process parallelism

Syntax

```sql
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
    enable IN BOOLEAN  TRUE);
```
Parameters

Table 212-20  ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>If TRUE, then enable XStream performance optimizations for Oracle Streams components. If FALSE, then disable XStream performance optimizations for Oracle Streams components.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the PURPOSE column in the following views displays XStream Streams:
  - ALL_APPLY
  - DBA_APPLY
  - ALL_CAPTURE
  - DBA_CAPTURE
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Streams components.

See Also:

- IS_GG_XSTREAM_FOR_STREAMS Function
- Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream

212.4.20 GET_MESSAGE_TRACKING Function

The GET_MESSAGE_TRACKING Function returns the tracking label for the current session.

See Also:

- SET_MESSAGE_TRACKING Procedure

Syntax

DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
212.4.21 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

- "SET_TAG Procedure"
- Oracle Streams Replication Administrator's Guide for more information about tags

Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS_ADM.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

212.4.22 IS_GG_XSTREAM_FOR_STREAMS Function

This function returns TRUE if XStream performance optimizations are enabled for Oracle Streams components, or this function returns FALSE if XStream performance optimizations are disabled for Oracle Streams components.

See Also:

"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```
212.4.23 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

---

**Note:**

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

---

**See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- `DELETE_COLUMN Procedure`

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
  rule_name     IN  VARCHAR2,
  table_name    IN  VARCHAR2,
  column_list   IN  VARCHAR2,
  value_type    IN  VARCHAR2 DEFAULT '***',
  step_number   IN  NUMBER DEFAULT 0,
  operation     IN  VARCHAR2 DEFAULT 'ADD');
```

```sql
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
  rule_name     IN  VARCHAR2,
  table_name    IN  VARCHAR2,
  column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
  value_type    IN  VARCHAR2 DEFAULT '***',
  step_number   IN  NUMBER DEFAULT 0,
  operation     IN  VARCHAR2 DEFAULT 'ADD');
```
Parameters

Table 212-21  KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table for which the columns are kept in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>column_table</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation. See Also: Oracle Database XStream Guide for more information about transformation ordering</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

<table>

### 212.4.24 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.
However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$STREAMS_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- `MERGE_STREAMS Procedure`
- `SPLIT_STREAMS Procedure`

Syntax

```sql
DBMS_XSTREAM_ADM.MERGE_STREAMS(
    cloned_propagation_name IN VARCHAR2,
    propagation_name         IN VARCHAR2  DEFAULT NULL,
    queue_name               IN VARCHAR2  DEFAULT NULL,
    perform_actions          IN BOOLEAN   DEFAULT TRUE,
)
```
Parameters

Table 212-22  MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: • The queue specified in the queue_name parameter does not exist. • The queue specified in the queue_name parameter exists but is not used by a capture process.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: • script_name • script_directory_object</td>
</tr>
</tbody>
</table>
Table 212-22  (Cont.) MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

212.4.25 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.
If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or `0` (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

### See Also:

- `MERGE_STREAMS` Procedure
- `SPLIT_STREAMS` Procedure
- *Oracle Streams Replication Administrator’s Guide* for instructions on using the `MERGE_STREAMS_JOB` procedure

### Syntax

```sql
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
    cloned_propagation_name IN VARCHAR2,
    propagation_name        IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    merge_threshold         IN NUMBER,
    schedule_name           IN VARCHAR2 DEFAULT NULL,
    merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

#### Table 212-23  MERGE_STREAMS_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cloned_propagation_name</code></td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
## Table 212-23  (Cont.) MERGE_STREAMS_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| propagation_name   | The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions:  
  • The queue specified in the queue_name parameter does not exist.  
  • The queue specified in the queue_name parameter exists but is not used by a capture process. |
| queue_name         | The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. |
| merge_threshold    | The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing. |
| schedule_name      | The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually. |
| merge_job_name     | The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually. |
Usage Notes

You can use the `MERGE_STREAMS_JOB` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the `MERGE_STREAMS_JOB` procedure completes, you can query the `DBA_CAPTURE` and `DBA_PROPAGATION` views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the `schedule_name` and `merge_job_name` parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The `DBA_STREAMS_SPLIT_MERGE` view contains information about split and merge operations.

212.4.26 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object.

You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```sql
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
    source_database IN VARCHAR2,
    source_object_name IN VARCHAR2,
    source_object_type IN VARCHAR2,
    source_root_name IN VARCHAR2);
```

Parameters

Table 212-24  PURGE_SOURCE_CATALOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source_database</code></td>
<td>In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</td>
</tr>
<tr>
<td><code>source_object_name</code></td>
<td>The name of the object specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>source_object_type</code></td>
<td>Type of the object. Currently, <code>TABLE</code> is the only possible object type.</td>
</tr>
</tbody>
</table>
Table 21-24 (Cont.) PURGE_SOURCE_CATALOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_root_name</td>
<td>The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If the source_root_name parameter is NULL, then the global name of the local root is the default. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

**Note:**

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

212.4.27 RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.
This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

---

**Note:**

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

**See Also:**

- "SPLIT_STREAMS Procedure"
- "MERGE_STREAMS Procedure"
- "MERGE_STREAMS_JOB Procedure"
- *Oracle Streams Replication Administrator’s Guide*

**Syntax**

```sql
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
    script_id IN RAW,
    operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```
Parameters

Table 212-25  RECOVER_OPERATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_id</td>
<td>The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.</td>
</tr>
<tr>
<td>operation_mode</td>
<td>If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.</td>
</tr>
</tbody>
</table>

212.4.28 REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the XStream clients that are using the queue.

Note:
The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
    cascade                  IN  BOOLEAN  DEFAULT FALSE,
    drop_unused_queue_table  IN  BOOLEAN  DEFAULT TRUE);
```
Parameters

### Table 212-26  REMOVE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the procedure drops any XStream clients that use the queue. If FALSE, then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no XStream clients are using the queue currently.</td>
</tr>
<tr>
<td>drop_unused_queue_table</td>
<td>If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.</td>
</tr>
</tbody>
</table>

### 212.4.29 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

**Note:**

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the DBMS_RULE_ADM.DROP_RULE procedure. If you use the DBMS_RULE_ADM.DROP_RULE procedure, then some metadata about the rule might remain.

### Syntax

```sql
DBMS_XSTREAM_ADM.REMOVE_RULE(
  rule_name IN VARCHAR2,
  streams_type IN VARCHAR2,
  streams_name IN VARCHAR2,
  drop_unused_rule IN BOOLEAN DEFAULT TRUE,
  inclusion_rule IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 212-27  REMOVE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule to remove, specified as [schema_name.]rule_name. If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of XStream client:</td>
</tr>
<tr>
<td></td>
<td>• Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>• Specify propagation for a propagation.</td>
</tr>
<tr>
<td></td>
<td>• Specify apply for an apply process.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</td>
</tr>
<tr>
<td>drop_unused_rule</td>
<td>If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.</td>
</tr>
</tbody>
</table>

212.4.30 REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD_SUBSET_OUTBOUND_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
FROM ALL_XSTREAM_RULES
WHERE SUBSETTING_OPERATION IS NOT NULL;
```
Note:

• This procedure removes the declarative rule-based transformation associated with each rule it removes.
• This procedure does not remove rules from the outbound server's capture process.

See Also:

"ADD_SUBSET_OUTBOUND_RULES Procedure"

Syntax

DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   insert_rule_name IN VARCHAR2,
   update_rule_name IN VARCHAR2,
   delete_rule_name IN VARCHAR2);

212.4.31 REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
   container IN VARCHAR2 DEFAULT NULL);

Parameters

Table 212-28  REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB. If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. Note: This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes

Specifically, this procedure performs the following actions at the local database:

• Drops all capture processes
• If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package.

• If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package.

• If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package.

• Drops propagations that were created using either the DBMS_XSTREAM_ADM package or the DBMS_PROPAGATION_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS_AQADM package.

• Disables all propagation jobs used by propagations.

• Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.

• Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers.

• Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers.

• Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers.

• Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database.

• Removes messaging clients.

• Unsets message notification specifications that were set using the SET_MESSAGE_NOTIFICATION procedure in the DBMS_XSTREAM_ADM package.

• Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers.

• Removes update conflict handlers.

• Removes specifications for substitute key columns for apply tables.

• Drops rule sets and rules that were created using the DBMS_XSTREAM_ADM package.

• Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

• The rule sets or rules were created using the DBMS_RULE_ADM package.

• The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.
212.4.32 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

Oracle Database XStream Guide for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

**Syntax**

```sql
DBMS_XSTREAM_ADM.RENAME_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    from_column_name IN  VARCHAR2,
    to_column_name  IN  VARCHAR2,
)
```
value_type        IN  VARCHAR2  DEFAULT '*",
step_number       IN  NUMBER    DEFAULT 0,
operation         IN  VARCHAR2  DEFAULT 'ADD');

Parameters

Table 212-29  RENAME_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table in which the column is renamed in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_column_name</td>
<td>The name of the column to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new name of the column in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation. See Also: Oracle Database XStream Guide for more information about transformation ordering</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>

212.4.33 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

**Note:**

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

**Syntax**

```sql
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
    rule_name         IN  VARCHAR2,
    from_schema_name  IN  VARCHAR2,
    to_schema_name    IN  VARCHAR2,
    step_number       IN  NUMBER    DEFAULT 0,
    operation         IN  VARCHAR2  DEFAULT 'ADD');
```

**Parameters**

**Table 212-30  RENAME_SCHEMA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code>, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</td>
</tr>

</tr>
</tbody>
</table>
212.4.34 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

**Note:**

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

**Syntax**

```sql
DBMS_XSTREAM_ADM.RENAME_TABLE(
    rule_name        IN  VARCHAR2,
    from_table_name  IN  VARCHAR2,
    to_table_name    IN  VARCHAR2,
    step_number      IN  NUMBER    DEFAULT 0,
    operation        IN  VARCHAR2  DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>from_table_name</td>
<td>The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code>. For example, hr.employees.</td>
</tr>
</tbody>
</table>

</table>
### 212.4.35 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

#### Note:

The tracking label set by this procedure does not track non-LCR messages.

#### See Also:

KAWGET_MESSAGE_TRACKING

#### Syntax

```sql
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
    actions IN NUMBER DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

#### Parameters

#### Table 212-32  SET_MESSAGE_TRACKING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracking_label</td>
<td>The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.</td>
</tr>
</tbody>
</table>

Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</td>
</tr>
</tbody>
</table>

212.4.36 SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

DBMS_XSTREAM_ADM.SET_PARAMETER(
    streams_name    IN  VARCHAR2,
    streams_type    IN  VARCHAR2,
    parameter       IN  VARCHAR2,
    value           IN  VARCHAR2  DEFAULT NULL,
    no_wait         IN  BOOLEAN   DEFAULT FALSE,
    source_database IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 212-33  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
</table>
| streams_type | The type of XStream client:  
  - Specify capture for a capture process.  
  - Specify apply for an outbound server or inbound server.   |   |
| streams_name | The name of the capture process, outbound server, or inbound server. Do not specify an owner. |   |
| parameter | The name of the parameter you are setting.  
See "Capture Process Parameters" for information about capture process parameters.  
See "Apply Component Parameters" for information about outbound server and inbound server parameters. |   |
| value | The value to which the parameter is set.  
If NULL, then the parameter is set to its default value. |   |
Table 212-33  (Cont.) SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_wait</td>
<td>If TRUE, then the parameter is set immediately. If FALSE, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to TRUE speeds up each call. However, if the process is currently running, you must set this parameter to FALSE in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to TRUE for the last call to the procedure, the running process might not detect the parameter changes.</td>
</tr>
<tr>
<td>source_database</td>
<td>If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then the parameter is set in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. NOTE: This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters: include_objects capture parameter, excludetag capture or apply parameter, excludetrans capture or apply parameter, excludeuser capture or apply parameter, excludeuserid capture or apply parameter, getreplicates capture or apply parameter, getapplops capture or apply parameter</td>
</tr>
</tbody>
</table>

212.4.37 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

潦 See Also:

Oracle Streams Replication Administrator's Guide for more information about tags
Syntax

DBMS_XSTREAM_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);

Parameters

Table 212-34  SET_TAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also:

BUILD Procedure

212.4.38 SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

DBMS_XSTREAM_ADM.SET_UP_QUEUE(
    queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    storage_clause IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    queue_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL);
Parameters

Table 212-35  SET_UP_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</td>
</tr>
<tr>
<td></td>
<td>Queue table names can be a maximum of 24 bytes.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table</td>
</tr>
<tr>
<td></td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</td>
</tr>
<tr>
<td></td>
<td>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</td>
</tr>
<tr>
<td>See Also:</td>
<td>Oracle Database SQL Language Reference for more information about storage clauses.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>Queue names can be a maximum of 24 bytes.</td>
</tr>
<tr>
<td>queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment for the queue</td>
</tr>
</tbody>
</table>

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it
creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release before Oracle Database 10g release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.

• If the specified queue table exists, then the queue uses the properties of the existing queue table.

• If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.

• This procedure starts the queue.

• If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

---

Note:

If the agent that SET_UP_QUEUE tries to create exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

---

See Also:

Oracle Streams Concepts and Administration for more information about secure queue users

212.4.39 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:
1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.

2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.

3. Stops the capture process.

4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.

7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.

8. If the auto_merge_threshold parameter is set to a positive number, then creates an Oracle Scheduler job to run the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the MERGE_STREAMS_JOB procedure runs the MERGE_STREAMS procedure to merge the streams automatically.

After the SPLIT_STREAMS procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the START_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

The DBA_STREAMS_SPLIT_MERGE view contains the name of each cloned component and information about the split and merge operation.

**Note:**

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.
See Also:

- "MERGE_STREAMS Procedure"
- "MERGE_STREAMS_JOB Procedure"
- Oracle Streams Replication Administrator's Guide for instructions on using the SPLIT_STREAMS procedure

Syntax

```sql
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
  propagation_name         IN      VARCHAR2,
  cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
  cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
  cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
  perform_actions          IN      BOOLEAN   DEFAULT TRUE,
  script_name              IN      VARCHAR2  DEFAULT NULL,
  script_directory_object  IN      VARCHAR2  DEFAULT NULL,
  auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
  schedule_name            IN OUT  VARCHAR2,
  merge_job_name           IN OUT  VARCHAR2);
```

Parameters

Table 212-36  SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.</td>
</tr>
<tr>
<td>cloned_queue_name</td>
<td>The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.</td>
</tr>
<tr>
<td>cloned_capture_name</td>
<td>The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>- script_name</td>
</tr>
<tr>
<td></td>
<td>- script_directory_object</td>
</tr>
</tbody>
</table>
### Table 212-36  (Cont.) SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. <strong>Note:</strong> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>auto_merge_threshold</td>
<td>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.</td>
</tr>
</tbody>
</table>
Table 212-36  (Cont.) SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| schedule_name   | The Oracle Scheduler schedule name, specified as [schema_name.]schedule_name. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default.                                                                                             If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.  
If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.  
If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.  
If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.  
If an existing schedule name is specified, an error is raised.                                                                                                                                                                                                                       |
| merge_job_name  | The Oracle Scheduler job name, specified as [schema_name.]merge_job_name. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default.                                                                                      If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.  
If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name.  
If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.  
If an existing job name is specified, an error is raised.                                                                                                                                                                                                                                                                               |

Oracle Database Administrator's Guide for information about Oracle Scheduler

212.4.40 START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```sql
DBMS_XSTREAM_ADM.START_OUTBOUND(
    server_name  IN  VARCHAR2);
```
Parameters

**Table 212-37  START_OUTBOUND Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>

212.4.41 STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

**Syntax**

```sql
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
    server_name  IN  VARCHAR2,
    force        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

**Table 212-38  STOP_OUTBOUND Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>
| force      | If TRUE, then the procedure stops the outbound server and its capture process as soon as possible.  
            | If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions.  
            | The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. |
213

DBMS_XSTREAM_AUTH

The DBMS_XSTREAM_AUTH package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

• Overview
• Security Model
• Summary of DBMS_XSTREAM_AUTH Subprograms

See Also:

GRANT_ADMIN_PRIVILEGE Procedure

213.1 DBMS_XSTREAM_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

213.2 DBMS_XSTREAM_AUTH Security Model

Security on this package can be controlled by either granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

The user executing the subprograms in the DBMS_XSTREAM_AUTH package must have SYSDBA administrative privilege, and the user must exercise the privilege using AS SYSDBA at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

213.3 Summary of DBMS_XSTREAM_AUTH Subprograms

This table lists the DBMS_XSTREAM_AUTH subprograms and briefly describes them.
Table 213-1  DBMS_XSTREAM_AUTH Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_ADMIN_PRIVILEGE Procedure</td>
<td>Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.</td>
</tr>
<tr>
<td>GRANT_REMOTE_ADMIN_ACCESS Procedure</td>
<td>Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.</td>
</tr>
<tr>
<td>REVOKE_ADMIN_PRIVILEGE Procedure</td>
<td>Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.</td>
</tr>
<tr>
<td>REVOKE_REMOTE_ADMIN_ACCESS Procedure</td>
<td>Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.</td>
</tr>
</tbody>
</table>

Note:
All subprograms commit unless specified otherwise.

213.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

See Also:
"GRANT_ADMIN_PRIVILEGE Procedure"

Syntax

```sql
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE(
  grantee            IN  VARCHAR2,
  privilege_type     IN  VARCHAR2  DEFAULT '*',
  grant_select_privileges IN BOOLEAN  DEFAULT FALSE,
  do_grants          IN  BOOLEAN  DEFAULT TRUE,
  file_name           IN  VARCHAR2  DEFAULT NULL,
  directory_name      IN  VARCHAR2  DEFAULT NULL,
  grant_optional_privileges IN VARCHAR2  DEFAULT NULL,
  container           IN  VARCHAR2  DEFAULT 'CURRENT');
```
### Parameters

Table 213-2  GRANT_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
<tr>
<td>privilege_type</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• CAPTURE</td>
</tr>
<tr>
<td></td>
<td>Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes.</td>
</tr>
<tr>
<td></td>
<td>• APPLY</td>
</tr>
<tr>
<td></td>
<td>Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</td>
</tr>
<tr>
<td></td>
<td>• *</td>
</tr>
<tr>
<td></td>
<td>Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</td>
</tr>
<tr>
<td>grant_select_privileges</td>
<td>If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not grant the set of privileges to the user.</td>
</tr>
<tr>
<td></td>
<td>SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model.</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to FALSE for the XStream untrusted user model.</td>
</tr>
<tr>
<td>do_grants</td>
<td>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column.</td>
</tr>
<tr>
<td></td>
<td>If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view.</td>
</tr>
<tr>
<td></td>
<td>You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not generate a file.</td>
</tr>
</tbody>
</table>
Table 213-2  (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>grant_optional_privileges</td>
<td>A comma-separated list of optional privileges to grant to the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges</td>
</tr>
<tr>
<td>container</td>
<td>If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. Note: This parameter only applies to CDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- **The RESTRICTED SESSION system privilege**
- **EXECUTE on the following packages**:
  - DBMS_APLLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQEIM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_ADVISOR_ADM
Privileges to enqueue messages into and dequeue messages from any queue

Privileges to manage any queue

Privileges to create, alter, and execute any of the following types of objects in the user’s own schema and in other schemas:

- Evaluation contexts
- Rule sets
- Rules

In addition, the grantee can grant these privileges to other users.

**SELECT_CATALOG_ROLE**

**SELECT** or **READ** privilege on data dictionary views related to XStream and Oracle Streams

The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee.

This ability is enabled by running the **GRANT_REMOTE_ADMIN_ACCESS** procedure in this package.

### Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

### See Also:

- "**GRANT_REMOTE_ADMIN_ACCESS** Procedure"
- *Oracle Database SQL Language Reference* for information about the **CREATE DIRECTORY** SQL statement
213.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

Note:

The GRANT_ADMIN_PRIVILEGE procedure in this package runs this procedure.

See Also:

"GRANT_ADMIN_PRIVILEGE Procedure"

213.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
    grantee           IN  VARCHAR2,
    privilege_type    IN  VARCHAR2  DEFAULT '"',
    revoke_select_privileges IN BOOLEAN DEFAULT FALSE,
    do_revokes        IN  BOOLEAN  DEFAULT TRUE,
    file_name         IN  VARCHAR2  DEFAULT NULL,
```

directory_name              IN  VARCHAR2  DEFAULT NULL  
revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,  
container                   IN  VARCHAR2  DEFAULT 'CURRENT');

Parameters

Table 213-4  REVOKE_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>

<tr>
<td>container</td>
<td>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. <strong>Note:</strong> This parameter only applies to CDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

**Note:**
To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

**See Also:**

- "GRANT_ADMIN_PRIVILEGE Procedure"
- Oracle Database SQL Language Reference for information about the CREATE DIRECTORY SQL statement
213.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

**Note:**

The **REVOKE_ADMIN_PRIVILEGE** procedure in this package runs this procedure.

**See Also:**

"**REVOKE_ADMIN_PRIVILEGE Procedure**"

**Syntax**

```sql
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

**Parameters**

**Table 213-5  REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote XStream administrator is disabled. If a row for the grantee exists in the DBA_XSTREAM_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_XSTREAM_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.</td>
</tr>
</tbody>
</table>
The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

• Security Model
• Operational Notes
• Rules and Limits
• Summary of DEBUG_EXTPROC Subprograms

214.1 DEBUG_EXTPROC Security Model

Your Oracle account must have EXECUTE privileges on the package and CREATE LIBRARY privileges.

214.2 DEBUG_EXTPROC Operational Notes

These operational notes apply to DEBUG_EXTPROC.

To install the package, run the script DBGEXTP.SQL.

• Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
• Ensure that you have execute privileges on package DEBUG_EXTPROC.

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

• You can install this package as any other user, as long as you have EXECUTE privileges on the package.

Note:

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

• Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
• Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;` Do not exit this session, because that terminates the extproc agent.

• Determine the PID of the extproc agent that was started up for this session.

• Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.

• Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.

• Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`.

• Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

• The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.

• Now proceed with your debugging.

214.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

214.4 Summary of DEBUG_EXTPROC Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>STARTUP_EXTPROC_AGENT</code></td>
<td>Starts up the extproc agent process in the session</td>
</tr>
</tbody>
</table>

214.4.1 STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

`DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;`
The **HTF** (hypertext functions) and **HTP** (hypertext procedures) packages generate HTML tags. For example, the **HTF.ANCHOR** function generates the HTML anchor tag, `<A>`.

**See Also:**

For more information about implementation of this package:
- Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
- Oracle Fusion Middleware User's Guide for mod_plsql

This chapter contains the following topics:

- Deprecated Subprograms
- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTF Subprograms

### 215.1 HTF Deprecated Subprograms

The **ESCAPE_URL** function is deprecated with Oracle Database 10g.

**Note:**

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

**Related Topics**

- **ESCAPE_URL** Function
  This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.
215.2 HTF Operational Notes

These operational notes apply to the HTF package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF PRINT function. It then prints its parameters to the generated Web page.

215.3 Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

215.4 HTF Examples

The commands in this example generate a simple HTML document.

```sql
CREATE OR REPLACE PROCEDURE hello AS
    BEGIN
        HTP.P (HTF.HTMLOPEN); -- generates <HTML>
        HTP.P (HTF.HEADOPEN); -- generates <HEAD>
        HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
        HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
        HTP.P (HTF.BODYOPEN); -- generates <BODY>
        HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
        HTP.P (HTF.BODYCLOSE); -- generates </BODY>
        HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
    END;
```

215.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

**HTML, HEAD, and BODY Tags**

- **HTMLOPEN Function, HTMLCLOSE Function** - generate `<HTML>` and `</HTML>`
HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>

BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->

Frame Tags
FRAME Function - generates <FRAME>
FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

215.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

Table 215-1  HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Function</td>
<td>Generates the &lt;ADDRESS&gt; and &lt;/ADDRESS&gt; tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>ANCHOR Function</td>
<td>Generates the &lt;A&gt; and &lt;/A&gt; tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Function</td>
<td>Generates the &lt;A&gt; and &lt;/A&gt; tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Function</td>
<td>Closes the applet invocation with the &lt;/APPLET&gt; tag</td>
</tr>
<tr>
<td>APPLETOPEN Function</td>
<td>Generates the &lt;APPLET&gt; tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Function</td>
<td>Generates the &lt;AREA&gt; tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Function</td>
<td>Generates the &lt;BASE&gt; tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Function</td>
<td>Generates the &lt;BASEFONT&gt; tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Function</td>
<td>Generates the &lt;BGSOUND&gt; tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Function</td>
<td>Generates the &lt;BIG&gt; and &lt;/BIG&gt; tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Function</td>
<td>Generates the &lt;/BLOCKQUOTE&gt; tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Function</td>
<td>Generates the &lt;BLOCKQUOTE&gt; tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Function</td>
<td>Generates the &lt;/BODY&gt; tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Function</td>
<td>Generates the &lt;BODY&gt; tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Function</td>
<td>Generates the &lt;B&gt; and &lt;/B&gt; tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Function</td>
<td>Generates the &lt;BR&gt; tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Function</td>
<td>Generates the &lt;CENTER&gt; and &lt;/CENTER&gt; tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Function</td>
<td>Generates the &lt;/CENTER&gt; tag which marks the end of a section of text to center</td>
</tr>
<tr>
<td>CENTEROPEN Function</td>
<td>Generates the &lt;CENTER&gt; tag which mark the beginning of a section of text to center</td>
</tr>
<tr>
<td>CITE Function</td>
<td>Generates the &lt;CITE&gt; and &lt;/CITE&gt; tags which direct the browser to render the text as a citation</td>
</tr>
</tbody>
</table>
Table 215-1  (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CODE Function</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
<tr>
<td>COMMENT Function</td>
<td>Generates the comment tags <code>&lt;!-- ctext --&gt;</code></td>
</tr>
<tr>
<td>DFN Function</td>
<td>Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however &quot;definition&quot; is defined stylistically</td>
</tr>
<tr>
<td>DIRLISTCLOSE Function</td>
<td>Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Function</td>
<td>Generates the <code>&lt;DIR&gt;</code> tag which starts a directory list section</td>
</tr>
<tr>
<td>DIV Function</td>
<td>Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Function</td>
<td>Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Function</td>
<td>Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Function</td>
<td>Generates the <code>&lt;DL&gt;</code> tag which starts a definition list</td>
</tr>
<tr>
<td>DLISTTERM Function</td>
<td>Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code></td>
</tr>
<tr>
<td>EM Function</td>
<td>Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Function</td>
<td>Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Function</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>ESCAPE_URL Function</td>
<td>Replaces characters that have special meaning in HTML and HTTP with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Function</td>
<td>Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOPEN Function</td>
<td>Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMAT_CELL Function</td>
<td>Formats column values inside an HTML table using the TABLEDATA Function</td>
</tr>
<tr>
<td>FORMCHECKBOX Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;checkbox&quot;</code> which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Function</td>
<td>Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;file&quot;</code> which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;hidden&quot;</code> which inserts a hidden form element</td>
</tr>
<tr>
<td>FORMIMAGE Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;image&quot;</code> which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMOPEN Function</td>
<td>Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document</td>
</tr>
</tbody>
</table>
### Table 215-1  (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMPASSWORD Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;password&quot; which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;radio&quot;, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>FORMRESET Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;reset&quot; which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Function</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Function</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPTION Function</td>
<td>Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;submit&quot; which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Function</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;text&quot;, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Function</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Function</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Function</td>
<td>Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN Function</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN2 Function</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Function</td>
<td>Generates the <code>&lt;FRAME&gt;</code> tag which defines the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Function</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Function</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Function</td>
<td>Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Function</td>
<td>Generates opening heading tags (&lt;H1&gt; to &lt;H6&gt;) and their corresponding closing tags (&lt;H1&gt; to &lt;/H6&gt;)</td>
</tr>
<tr>
<td>HEADOPEN Function</td>
<td>Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Function</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>HTMLCLOSE Function</td>
<td>Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTMLOPEN Function</td>
<td>Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document</td>
</tr>
<tr>
<td>IMG Function</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Function</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute</td>
</tr>
<tr>
<td>ISINDEX Function</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Function</td>
<td>Generates the <code>&lt;I&gt;</code> and <code>&lt;/I&gt;</code> tags which direct the browser to render the text in italics</td>
</tr>
<tr>
<td>KBD Function</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Function</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Function</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Function</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Function</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Function</td>
<td>Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Function</td>
<td>Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Function</td>
<td>Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Function</td>
<td>Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Function</td>
<td>Generates the <code>&lt;A&gt;</code> tag with the <code>HREF</code> set to 'mailto' prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Function</td>
<td>Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MAPOPEN Function</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which marks the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Function</td>
<td>Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Function</td>
<td>Generates the <code>&lt;MENU&gt;</code> tag which begins a list that presents one line for each item</td>
</tr>
<tr>
<td>META Function</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Function</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NOBR Function</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Function</td>
<td>Generates the <code>&lt;/NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Function</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Function</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLISTOPEN Function</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Function</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Function</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Function</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Function</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Function</td>
<td>Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Function</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Functions</td>
<td>Generates the specified parameter as a string terminated with the \n newline character</td>
</tr>
<tr>
<td>PRN Functions</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>S Function</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Function</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however &quot;sample&quot; is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Function</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Function</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Function</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Function</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Function</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Function</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Function</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
</tbody>
</table>
Table 215-1  (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLECAPTION Function</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Function</td>
<td>Generates the <code>&lt;/TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Function</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Function</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table</td>
</tr>
<tr>
<td>TABLEOPEN Function</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Function</td>
<td>Generates the <code>&lt;/TR&gt;</code> tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Function</td>
<td>Generates the <code>&lt;TR&gt;</code> tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYP Function</td>
<td>Generates the <code>&lt;TT&gt;</code> and <code>&lt;/TT&gt;</code> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Function</td>
<td>Generates the <code>&lt;TITLE&gt;</code> and <code>&lt;/TITLE&gt;</code> tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Function</td>
<td>Generates the <code>&lt;/UL&gt;</code> tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Function</td>
<td>Generates the <code>&lt;UL&gt;</code> tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Function</td>
<td>Generates the <code>&lt;U&gt;</code> and <code>&lt;/U&gt;</code> tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Function</td>
<td>Generates the <code>&lt;VAR&gt;</code> and <code>&lt;/VAR&gt;</code> tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Function</td>
<td>Generates the <code>&lt;WBR&gt;</code> tag, which inserts a soft line break within a section of NOBR text</td>
</tr>
</tbody>
</table>

215.6.1 ADDRESS Function

This function generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (   
    cvalue      IN       VARCHAR2
    cnowrap     IN       VARCHAR2   DEFAULT NULL
    cclear      IN       VARCHAR2   DEFAULT NULL
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
Parameters

Table 215-2  ADDRESS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.</td>
</tr>
<tr>
<td>nowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

215.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (    
    curl          IN       VARCHAR2,  
    ctext         IN       VARCHAR2,  
    cname         IN       VARCHAR2 DEFAULT NULL,  
    cattributes   IN       VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-3  ANCHOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```
Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

215.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (  
  curl           IN       VARCHAR2,  
  ctext          IN       VARCHAR2,  
  cname          IN       VARCHAR2   DEFAULT NULL,  
  ctarget        in       VARCHAR2   DEFAULT NULL,  
  cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-4  ANCHOR2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

215.6.4 APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet usingAPPLETOPEN Function

Syntax

```
HTF.APPLETCLOSE  
RETURN VARCHAR2;
```
215.6.5 APPLETOPEN Function

This function generates the &lt;APPLET&gt; tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Function which generates the &lt;/APPLET&gt; tag.

Syntax

```sql
HTF.APPLETOPEN (
  ccode          IN       VARCHAR2,
  cheight        IN       NUMBER,
  cwidth         IN       NUMBER,
  cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-5  APPLETOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
&lt;APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes&gt;
```

so that, for example,

```sql
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```html
&lt;APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets"&gt;
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.
215.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

**Syntax**

```
HTF.AREA (
    ccoords    IN       VARCHAR2,
    cshape     IN       VARCHAR2   DEFAULT NULL,
    chref      IN       VARCHAR2   DEFAULT NULL,
    cnohref    IN       VARCHAR2   DEFAULT NULL,
    ctarget    IN       VARCHAR2   DEFAULT NULL,
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The value for the <code>COORDS</code> attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the <code>SHAPE</code> attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the <code>HREF</code> attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>NOHREF</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the <code>TARGET</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

215.6.7 BASE Function

This function generates the `<BASE>` tag which records the URL of the document.

**Syntax**

```
HTF.BASE (
    ctarget    IN       VARCHAR2   DEFAULT NULL,
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
### Parameters

#### Table 215-7  BASE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

#### Examples

This function generates

```html
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

### 215.6.8 BASEFONT Function

This function generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

#### Syntax

```sql
HTF.BASEFONT (nsize IN INTEGER) RETURN VARCHAR2;
```

#### Parameters

#### Table 215-8  BASEFONT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

#### Examples

This function generates

```html`
<BASEFONT SIZE="nsize”>
```

### 215.6.9 BGSOUND Function

This function generates the `<BGSOUND>` tag which includes audio for a Web page.

#### Syntax

```sql
HTF.BGSOUND (csrc IN VARCHAR2,
             cloop IN VARCHAR2 DEFAULT NULL,
             cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;
```
Parameters

Table 215-9  BGSOUND Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

215.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```sql
HTF.BIG (  
  ctext    IN       VARCHAR2,  
  cattributes IN       VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-10  BIG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BIG cattributes>ctext</BIG>
```

215.6.11 BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```sql
HTF.BLOCKQUOTECLOSE  
RETURN VARCHAR2;
```
Examples
This function generates
</BLOCKQUOTE>

215.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
    cnowrap        IN       VARCHAR2   DEFAULT NULL,
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-11  BLOCKQUOTEOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples
This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

215.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
RETURN VARCHAR2;
```

Examples
This function generates

```
</BODY>
```
215.6.14 BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```sql
HTF.BODYOPEN (
    cbackground    IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

Table 215-12  BODYOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BODY background="cbackground" cattributes>
```

so that

```sql
HTF.BODYOPEN('/img/background.gif')
RETURN VARCHAR2;
```

generates:

```html
<BODY background="/img/background.gif">
```

215.6.15 BOLD Function

This function generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

Syntax

```sql
HTF.BOLD (    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
Parameters

Table 215-13  BOLD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<B cattributes>ctext</B>
```

215.6.16 BR Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the NL Function.

Syntax

```plaintext
HTF.BR(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-14  BR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BR CLEAR="cclear" cattributes>
```

215.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```plaintext
HTF.CENTER (  
    ctext          IN       VARCHAR2)
RETURN VARCHAR2;
```
### Parameters

**Table 215-15 CENTER Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<CENTER>ctext</CENTER>
```

### 215.6.18 CENTERCLOSE Function

This function generates the ```<CENTER>``` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the `CENTEROPEN` Function.

**Syntax**

```sql
HTF.CENTERCLOSE
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</CENTER>
```

### 215.6.19 CENTEROPEN Function

This function generates the ```<CENTER>``` tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the `CENTERCLOSE` Function.

**Syntax**

```sql
HTF.CENTEROPEN
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
<.CENTER>
```
215.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (  
    ctext         IN       VARCHAR2,  
    cattributes   IN       VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-16  CITE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

215.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (  
    ctext         IN       VARCHAR2,  
    cattributes   IN       VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-17  CODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```
215.6.22 COMMENT Function

This function generates the comment tags.

Syntax

```sql
HTF.COMMENT (  
    ctext          IN       VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 215-18  COMMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<!-- ctext -->
```

215.6.23 DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```sql
HTF.DFN (  
    ctext          IN       VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 215-19  DFN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<DFN>ctext</DFN>
```
215.6.24 DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

HTF.DIRLISTCLOSE
    RETURN VARCHAR2;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

</DIR>

Related Topics

• DIRLISTOPEN Function
  This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

215.6.25 DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

HTF.DIRLISTOPEN
    RETURN VARCHAR2;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

<DIR>

Related Topics

• DIRLISTCLOSE Function
  This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.
215.6.26 DIV Function

This function generates the `<DIV>` tag which creates document divisions.

Syntax

```sql
HTF.DIV (calign IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-20  DIV Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

215.6.27 DLISTCLOSE Function

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```sql
HTF.DLISTCLOSE
RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

Related Topics

- DLISTOPEN Function
  This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.
215.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```sql
HTF.DLISTDEF (  
    ctext          IN       VARCHAR2   DEFAULT NULL,  
    cclear         IN       VARCHAR2   DEFAULT NULL,  
    cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-21  DLISTDEF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```xml
<DD CLEAR="cclear" cattributes>ctext
```

215.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```sql
HTF.DLISTOPEN (  
    cclear         IN       VARCHAR2   DEFAULT NULL,  
    cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-22  DLISTOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Usage Notes
A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples
This function generates

```xml
<DL CLEAR="cclear" cattributes>

Related Topics
• DLISTCLOSE Function
This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

215.6.30 DLISTTERM Function
This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax
```sql
HTF.DLISTTERM (  
  ctext          IN       VARCHAR2   DEFAULT NULL,  
  cclear         IN       VARCHAR2   DEFAULT NULL,  
  cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-23   DLISTTERM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples
This function generates

```xml
<DT CLEAR="cclear" cattributes>ctext
```

215.6.31 EM Function
This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EMPHASIS Function.

Syntax
```sql
HTF.EM(  
  ctext          IN       VARCHAR2,  
```
215.6.32 EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```sql
HTF.EMPHASIS(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-25  EMPHASIS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

215.6.33 ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`
- `"` to `&quot;`
This function performs the same operation as HTP. **PRINTS Procedure** and HTP. **PS Procedure**.

**Syntax**

```sql
HTF.ESCAPE_SC(
    ctext          IN       VARCHAR2);
```

**Parameters**

**Table 215-26  ESCAPE_SC Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>

### 215.6.34 ESCAPE_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

**Note:**

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the **ESCAPE Function** in the **UTL_URL** package.

The following characters are converted:

- `&` to `&amp;`
- `"` to `&quot;`
- `<` to `&lt;`
- `>` to `&gt;`
- `%` to `&25`

**Syntax**

```sql
HTF.ESCAPE_URL(
    p_url          IN       VARCHAR2);
```
### Parameters

**Table 215-27  ESCAPE_URL Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_url</td>
<td>The string to convert.</td>
</tr>
</tbody>
</table>

#### 215.6.35 FONTCLOSE Function

This function generates the `<FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTOPEN Function.

**Syntax**

```sql
HTF.FONTCLOSE
    RETURN VARCHAR2;
```

**Examples**

This function generates

`<FONT>`

#### 215.6.36 FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Function.

**Syntax**

```sql
HTF.FONTOPEN(
    ccolor         IN       VARCHAR2   DEFAULT NULL,
    cface          IN       VARCHAR2   DEFAULT NULL,
    csize          IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
    RETURN VARCHAR2;
```

**Parameters**

**Table 215-28  FONTOPEN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>

215.6.37 FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

HTF.FORMAT_CELL(
  columnValue          IN       VARCHAR2
  format_numbers       IN       VARCHAR2   DEFAULT NULL
RETURN VARCHAR2;

Parameters

Table 215-29  FORMAT_CELL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValue</td>
<td>The value that needs to be formatted in an HTML table.</td>
</tr>
<tr>
<td>format_numbers</td>
<td>The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<TD >columnValue</TD>

Related Topics

- TABLEDATA Function
  This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

215.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

HTF.FORMCHECKBOX ( 
  cname          IN       VARCHAR2, 
  cvalue         IN       VARCHAR2   DEFAULT 'ON', 
  cchecked       IN       VARCHAR2   DEFAULT NULL, 
  cattributes    IN       VARCHAR2   DEFAULT NULL) 
RETURN VARCHAR2;
Parameters

Table 215-30  FORMCHECKBOX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

215.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```sql
HTF.FORMCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</FORM>
```

215.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```sql
HTF.FORMFILE(
  cname          IN       VARCHAR2,
  caccept        IN       VARCHAR2   DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
Parameters

Table 215-31  FORMFILE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>

215.6.41 FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

HTF.FORMHIDDEN(
    cname          IN       VARCHAR2,
    cvalue         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-32  FORMHIDDEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>

215.6.42 FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted
under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
    cname        IN       VARCHAR2,
    csrc         IN       VARCHAR2,
    calign       IN       VARCHAR2   DEFAULT NULL,
    cattributes  IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-33  FORMIMAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

215.6.43 FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
    curl           IN       VARCHAR2,
    cmethod        IN       VARCHAR2   DEFAULT 'POST',
    ctarget        IN       VARCHAR2   DEFAULT NULL,
    cencctype       IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-34  FORMOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
</tbody>
</table>
Table 215-34  (Cont.) FORMOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```xml
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

215.6.44 FORMPASSWORD Function

This function generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```sql
HTF.FORMPASSWORD(
    cname            IN       VARCHAR2,
    csize            IN       VARCHAR2,
    cmaxlength       IN       VARCHAR2   DEFAULT NULL,
    cvalue           IN       VARCHAR2   DEFAULT NULL,
    cattributes      IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-35  FORMPASSWORD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```xml
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
215.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

**Syntax**

```
HTF.FORMRADIO(
    cname          IN       VARCHAR2,
    cvalue         IN       VARCHAR2,
    cchecked       IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

215.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

**Syntax**

```
HTF.FORMRESET(
    cvalue         IN       VARCHAR2   DEFAULT 'Reset',
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This function generates

```html
<input TYPE="reset" VALUE="cvalue" cattributes>
```

### 215.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function. The values are inserted using FORMSELECTOPTION Function.

**Syntax**

```
HTF.FORMSELECTCLOSE
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

### 215.6.48 FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function. The values are inserted using FORMSELECTOPTION Function.

**Syntax**

```
HTF.FORMSELECTOPEN(
    cname    IN    VARCHAR2,
    cprompt  IN    VARCHAR2   DEFAULT NULL,
    nsize    IN    INTEGER    DEFAULT NULL,
    cattributes  IN    VARCHAR2   DEFAULT NULL)
    RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This function generates

cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>

so that

HTF.FORMSELECTOPEN('greatest_player';
   'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');
HTF.FORMSELECTCLOSE;

generates

Pick the greatest player:
<Select NAME="greatest_player">
  <Option>Messier
  <Option>Howe
  <Option>Gretzky
</Select>

215.6.49 FORMSELECTOPTION Function

This function generates the <Option> tag which represents one choice in a Select element.

Syntax

HTF.FORMSELECTOPTION(
   cvalue           IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-39  FORMSELECTOPTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates <Option SELECTED cattributes>cvalue as shown under the Examples section of the FORMSELECTOPEN Function.
215.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
    cname          IN       VARCHAR2   DEFAULT NULL,
    cvalue         IN       VARCHAR2   DEFAULT 'Submit',
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-40  FORMSUBMIT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

215.6.51 FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
    cname          IN       VARCHAR2,
    csize          IN       VARCHAR2   DEFAULT NULL,
    cmaxlength     IN       VARCHAR2   DEFAULT NULL,
    cvalue         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-41  FORMTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
</tbody>
</table>
Table 215-41  (Cont.) FORMTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue" cattributes>
```

215.6.52 FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```sql
HTF.FORMTEXTAREA(
   cname     IN       VARCHAR2,
   nrows     IN       INTEGER,
   ncolumns  IN       INTEGER,
   calign    IN       VARCHAR2 DEFAULT NULL,
   cattributes IN       VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-42  FORMTEXTAREA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```
215.6.53 FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

**Syntax**

```sql
HTF.FORMTEXTAREA2(
    cname        IN       VARCHAR2,
    nrows        IN       INTEGER,
    ncolumns     IN       INTEGER,
    calign       IN       VARCHAR2   DEFAULT NULL,
    cwrap        IN       VARCHAR2   DEFAULT NULL,
    cattributes  IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<Textarea NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes>></Textarea>
```

215.6.54 FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either FORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

**Syntax**

```sql
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates
215.6.55 FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
  cname          IN       VARCHAR2,
  nrows          IN       INTEGER,
  ncolumns       IN       INTEGER,
  calign         IN       VARCHAR2   DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-44 FORMTEXTAREAOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

215.6.56 FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
  cname          IN       VARCHAR2,
  nrows          IN       INTEGER,
  ncolumns       IN       INTEGER,
  calign         IN       VARCHAR2   DEFAULT NULL,
  cwrap          IN       VARCHAR2   DEFAULT NULL,
```

### Parameters

**Table 215-45**  FORMTEXTAREAOPEN2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td><code>cwrap</code></td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

### 215.6.57 FRAME Function

This function generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

**Syntax**

```
HTF.FRAME(
    csrc           IN       VARCHAR2,
    cname          IN       VARCHAR2   DEFAULT NULL,
    cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
    cmarginheight  IN       VARCHAR2   DEFAULT NULL,
    cscrolling     IN       VARCHAR2   DEFAULT NULL,
    cnoresize      IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

**Table 215-46**  FRAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>csrc</code></td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>cmarginwidth</code></td>
<td>The value for the <code>MARGINWIDTH</code> attribute.</td>
</tr>
<tr>
<td><code>cmarginheight</code></td>
<td>The value for the <code>MARGINHEIGHT</code> attribute.</td>
</tr>
<tr>
<td><code>cscrolling</code></td>
<td>The value for the <code>SCROLLING</code> attribute.</td>
</tr>
<tr>
<td><code>cnoresize</code></td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>NORESIZE</code> attribute is added to the tag.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

215.6.58 FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

215.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
   RETURN VARCHAR2;
```

Parameters

Table 215-47  FRAMESETOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
215.6.60 HEADCLOSE Function

This function generates the &lt;HEAD&gt; tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

HTF.HEADCLOSE
    RETURN VARCHAR2;

Examples

This function generates

&lt;/HEAD&gt;

215.6.61 HEADER Function

This function generates opening heading tags (&lt;H1&gt; to &lt;H6&gt;) and their corresponding closing tags (&lt;/H1&gt; to &lt;/H6&gt;).

Syntax

HTF.HEADER(
    nsize          IN       INTEGER,
    cheader        IN       VARCHAR2,
    calign         IN       VARCHAR2   DEFAULT NULL,
    cnowrap        IN       VARCHAR2   DEFAULT NULL,
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
    RETURN VARCHAR2;

Parameters

Table 215-48  HEADER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

HTF.header (1,'Overview')
    RETURN VARCHAR2;

produces:
215.6.62 HEADOPEN Function

This function generates the `<head>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
   RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

215.6.63 HR Function

This function generates the `<hr>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
   RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

215.6.64 HTMLCLOSE Function

This function generates the `</html>` tag which marks the end of an HTML document.

You use the HTMLOPEN Function to mark the beginning of an HTML document.
Syntax
HTF.HTMLCLOSE
    RETURN VARCHAR2;

Examples
This function generates
</HTML>

215.6.65 HTMLOPEN Function
This function generates the <HTML> tag which marks the beginning of an HTML document.
You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax
HTF.HTMLOPEN
    RETURN VARCHAR2;

Examples
This function generates
<HTML>

215.6.66 IMG Function
This function generates the <IMG> tag which directs the browser to load an image onto the HTML page.
The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax
HTF.IMG(
    curl      IN       VARCHAR2   DEFAULT NULL,
    calign    IN       VARCHAR2   DEFAULT NULL,
    calt      IN       VARCHAR2   DEFAULT NULL,
    cismap    IN       VARCHAR2   DEFAULT NULL,
    catapults IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-50  IMG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
</tbody>
</table>
Table 215-50  (Cont.) IMG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

215.6.67 IMG2 Function

This function generates the `<IMG>` tag, which directs the browser to load an image onto the HTML page.

The IMG Function performs the same operation but does not use the cusemap parameter.

Syntax

```
HTF.IMG2(
    curl           IN       VARCHAR2   DEFAULT NULL,
    calign         IN       VARCHAR2   DEFAULT NULL,
    calt           IN       VARCHAR2   DEFAULT NULL,
    cismap         IN       VARCHAR2   DEFAULT NULL,
    cusemap        IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-51  IMG2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side image map.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
215.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

**Syntax**

```sql
HTF.ISINDEX(
    cprompt        IN       VARCHAR2 DEFAULT NULL,
    curl           IN       VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

Table 215-52  ISINDEX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<ISINDEX PROMPT="cprompt" HREF="curl">```

215.6.69 ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

**Syntax**

```sql
HTF.ITALIC(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

Table 215-53  ITALIC Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<I cattributes>ctext</I>```
215.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<KBD cattributes>ctext</KBD>
```

215.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates
215.6.72 LINE Function

This function generates the `<hr>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    csrc           IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-56  LINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

215.6.73 LINKREL Function

This function generates the `<link>` tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
    crel           IN       VARCHAR2,
    curl           IN       VARCHAR2,
    ctitle         IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
Parameters

Table 215-57  LINKREL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

215.6.74 LINKREV Function

This function generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

**Syntax**

```
HTF.LINKREV(
  crev           IN       VARCHAR2,
  curl           IN       VARCHAR2,
  ctitle         IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-58  LINKREV Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crev</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```
215.6.75 LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

**Syntax**

```
HTF.LISTHEADER(
    ctext     IN       VARCHAR2,
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code></td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<LH cattributes>ctext</LH>
```

---

215.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

**Syntax**

```
HTF.LISTINGCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```
</LISTING>
```

---

215.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.
Syntax

HTF.LISTINGOPEN
  RETURN VARCHAR2;

Examples

This function generates

<LISTING>

215.6.78 LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

HTF.LISTITEM(
  ctext          IN       VARCHAR2   DEFAULT NULL,
  cclear         IN       VARCHAR2   DEFAULT NULL,
  cdingbat       IN       VARCHAR2   DEFAULT NULL,
  csrc           IN       VARCHAR2   DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-60  LISTITEM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext

215.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

HTF.MAILTO(
  caddress       IN       VARCHAR2,
  ctext          IN       VARCHAR2,
  cname          IN       VARCHAR2,
  cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
Parameters

Table 215-61 MAILTO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```sql
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```html
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

215.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```sql
HTF.MAPCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</MAP>
```

215.6.81 MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```sql
HTF.MAPOPEN(
    cname          IN       VARCHAR2   DEFAULT NULL,
    ...)
```

```sql
RETURN VARCHAR2;
```
cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-62   MAPOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<MAP NAME="cname" cattributes>
```

215.6.82 MENULISTCLOSE Function

This function generates the ```<MENU>``` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```sql
HTF.MENULISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</MENU>
```

215.6.83 MENULISTOPEN Function

This function generates the ```<MENU>``` tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```sql
HTF.MENULISTOPEN
RETURN VARCHAR2;
```

Examples

This function generates

```html
</MENU>
```
215.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
    chttp_equiv    IN       VARCHAR2,
    cname          IN       VARCHAR2,
    ccontent       IN       VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 215-63  META Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

215.6.85 NL Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```
Parameters

Table 215-64  NL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<BR CLEAR="cclear" cattributes>

215.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```sql
HTF.NOBR(
    ctext        IN        VARCHAR2
) RETURN VARCHAR2;
```

Parameters

Table 215-65  NOBR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<NOBR>ctext</NOBR>`

215.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```sql
HTF.NOFRAMESCLOSE
    RETURN VARCHAR2;
```
Examples
This function generates
</NOFRAMES>

215.6.88 NOFRAMESOPEN Function
This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax
HTF.NOFramesopen
    RETURN VARCHAR2;

Examples
This function generates
</NOFRAMES>

215.6.89 OLISTCLOSE Function
This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax
HTF.OLISTCLOSE
    RETURN VARCHAR2;

Examples
This function generates
</OL>

215.6.90 OLISTOPEN Function
This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax
HTF.OLISTOPEN(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cwrap          IN       VARCHAR2   DEFAULT NULL,
)

Parameters

**Table 215-66  OLISTOPEN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

### 215.6.91 PARA Function

This function generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Function.

**Syntax**

```sql
HTF.PARA
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
<P>
```

### 215.6.92 PARAGRAPH Function

You can use this function to add attributes to the `<P>` tag created by the PARA Function.

**Syntax**

```sql
HTF.PARAGRAPH(
    calign         IN       VARCHAR2   DEFAULT NULL,
    cnnowrap       IN       VARCHAR2   DEFAULT NULL,
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
    RETURN VARCHAR2;
```
Parameters

Table 215-67   PARAGRAPH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

\[
<P \text{ ALIGN}=\text{calign} \ \text{NOWRAP CLEAR}=\text{cclear} \ \text{cattributes}>
\]

Related Topics

- PARA Function
  This function generates the \(<p>\) tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

215.6.93 PARAM Function

This function generates the \(<param>\) tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```sql
HTF.PARAM(
    cname          IN       VARCHAR2
    cvalue         IN       VARCHAR2
) RETURN VARCHAR2;
```

Parameters

Table 215-68   PARAM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

\[
<\text{PARAM NAME}=\text{cname} \ \text{VALUE}=\text{cvalue}>
\]
215.6.94 PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```sql
HTF.PLAINTEXT(
  ctext      IN       VARCHAR2,
  cattributes IN       VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-69  PLAINTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<PLAINTEXT cattributes>ctext</PLAINTEXT>`

215.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```sql
HTF.PRECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

`</PRE>`

215.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.
Syntax

HTF.PREOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwidth IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;

Parameters

Table 215-70  PREOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<pre CLEAR="cclear" WIDTH="cwidth" cattributes>

215.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character.

The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

HTF.PRINT ( cbuf IN VARCHAR2) RETURN VARCHAR2;

HTF.PRINT ( dbuf IN DATE) RETURN VARCHAR2;

HTF.PRINT ( nbuf IN NUMBER) RETURN VARCHAR2;

Parameters

Table 215-71  PRINT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>
Usage Notes

- The \n character is not the same as \<br>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use \<br> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

215.6.98 PRN Functions

These functions generate the specified parameter as a string.
Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

HTF.PRN (  
    cbuf      IN       VARCHAR2)  
RETURN VARCHAR2;

HTF.PRN (  
    dbuf      IN       DATE)  
RETURN VARCHAR2;

HTF.PRN (  
    nbuf      IN       NUMBER)  
RETURN VARCHAR2;

Parameters

Table 215-72   PRN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These functions do not have function equivalents.

215.6.99 S Function

This function generates the \<s> and \</s> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Function.

Syntax

HTF.S (  
    ctext          IN       VARCHAR2,  
    cattributes    IN       VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
Parameters

Table 215-73  S Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<S cattributes>ctext</S>
```

215.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```sql
HTF.SAMPLE (  
    ctext          IN       VARCHAR2,  
    cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-74  SAMPLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<SAMP cattributes>ctext</SAMP>
```

215.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```sql
HTF.SCRIPT (  
    cscript        IN       VARCHAR2,  
    clanguage      IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```
Parameters

Table 215-75  SCRIPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>

so that

HTF.script ('Erupting_Volcano', 'Javascript');

generates

<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>

This causes the browser to run the script enclosed in the tags.

215.6.102 SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

HTF.SMALL (ctext IN VARCHAR2, cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;

Parameters

Table 215-76  SMALL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<SMALL cattributes>ctext</SMALL>
215.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Function.

Syntax

```sql
STRIKE (  
    ctext          IN       VARCHAR2,  
    cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-77  STRIKE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

215.6.104 STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```sql
HTF.STRONG(  
    ctext          IN       VARCHAR2,  
    cattributes    IN       VARCHAR2   DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 215-78  STRONG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```
215.6.105 STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
    cstyle  IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 215-79  STYLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

215.6.106 SUB Function

This function generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
    ctext  IN  VARCHAR2,
    calign in  VARCHAR2  DEFAULT NULL,
    cattributes IN  VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-80  SUB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates
215.6.107 SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

Syntax

```sql
HTF.SUP(
    ctext          IN       VARCHAR2,
    calign         in       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-81 SUP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

215.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```sql
HTF.TABLECAPTION(
    ccaption       IN       VARCHAR2,
    calign         in       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-82 TABLECAPTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This function generates

\[<\text{CAPTION ALIGN="calign" cattributes}>\text{caption}</\text{CAPTION}>\]

215.6.109 TABLECLOSE Function

This function generates the \(<\text{/TABLE}>\) tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Function.

Syntax

```
HTF.TABLECLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

\(<\text{/TABLE}>\)

215.6.110 TABLEDATA Function

This function generates the \(<\text{TD}>\) and \(<\text{TD}>\) tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
    cvalue         IN       VARCHAR2   DEFAULT NULL,
    calign         IN       VARCHAR2   DEFAULT NULL,
    cdp            IN       VARCHAR2   DEFAULT NULL,
    cnnowrap       IN       VARCHAR2   DEFAULT NULL,
    crowspan       IN       VARCHAR2   DEFAULT NULL,
    ccolspan       IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
    RETURN VARCHAR2;
```

Parameters

Table 215-83  TABLEDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This function generates

<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>

215.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

HTF.TABLEHEADER ( 
    cvalue         IN       VARCHAR2   DEFAULT NULL, 
    calign         IN       VARCHAR2   DEFAULT NULL, 
    cdp            IN       VARCHAR2   DEFAULT NULL, 
    cnoswrap       IN       VARCHAR2   DEFAULT NULL, 
    crowspan       IN       VARCHAR2   DEFAULT NULL, 
    ccolspan       IN       VARCHAR2   DEFAULT NULL, 
    cattributes    IN       VARCHAR2   DEFAULT NULL) 
RETURN VARCHAR2;

Parameters

Table 215-84   TABLEHEADER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnoswrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>

215.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Function.
Syntax

```
HTF.TABLEOPEN(
    cborder      IN       VARCHAR2   DEFAULT NULL,
    calign       IN       VARCHAR2   DEFAULT NULL,
    cnowrap      IN       VARCHAR2   DEFAULT NULL,
    cclear       IN       VARCHAR2   DEFAULT NULL,
    cattributes  IN       VARCHAR2   DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

Table 215-85  TABLEOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

215.6.113 TABLEROWCLOSE Function

This function generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

215.6.114 TABLEROWOPEN Function

This function generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Function.
Syntax

HTF.TABLEROWOPEN(
    calign     IN       VARCHAR2   DEFAULT NULL,
    cvalign    IN       VARCHAR2   DEFAULT NULL,
    cdp        IN       VARCHAR2   DEFAULT NULL,
    cnowrap    IN       VARCHAR2   DEFAULT NULL,
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-86  TABLEROWOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

215.6.115 TELETYPE Function

This function generates the `<TT>` and `/TT` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

HTF.TELETYPE(
    ctext       IN       VARCHAR2,
    cattributes IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

Parameters

Table 215-87  TELETYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TT cattributes>ctext</TT>
```
215.6.116 TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
    ctitle          IN       VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 215-88 TITLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

215.6.117 ULISTCLOSE Function

This function generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

215.6.118 ULISTOPEN Function

This function generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    ...
RETURN VARCHAR2 DEFAULT NULL;
```
Parameters

Table 215-89  ULISTOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

215.6.119 UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 215-90  UNDERLINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<U cattributes>ctext</U>
```
215.6.120 VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however “variable” is defined stylistically.

**Syntax**

```
HTF.VARIABLE(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

**Table 215-91  VARIABLE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<VAR cattributes>ctext</VAR>
```

215.6.121 WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of `NOBR` text.

**Syntax**

```
HTF.WBR
RETURN VARCHAR2;
```

**Examples**

This function generates

```html
<WBR>
```
The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTP Subprograms

**See Also:**

For more information about implementation of this package:

- Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
- Oracle Fusion Middleware User's Guide for mod_plsql

### 216.1 HTP Operational Notes

Certain operational notes apply to the HTP package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PRINT procedure. It then prints its parameters to the generated Web page.
216.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

216.3 HTP Examples

These commands generate a simple HTML document.

```sql
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN; -- generates <HTML>
    HTP.HEADOPEN; -- generates <HEAD>
    HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE; -- generates </HEAD>
    HTP.BODYOPEN; -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE; -- generates </BODY>
    HTP.HTMLCLOSE; -- generates </HTML>
END;
```

216.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

**HTML, HEAD, and BODY Tags**

- **HTMLOPEN Procedure, HTMLCLOSE Procedure** - generate `<HTML>` and `</HTML>`
- **HEADOPEN Procedure, HEADCLOSE Procedure** - generate `<HEAD>` and `</HEAD>`
- **BODYOPEN Procedure, BODYCLOSE Procedure** - generate `<BODY>` and `</BODY>`

**Comment Tag**

- **COMMENT Procedure** - generates <!-- and -->

**Tags in the <HEAD> Area**

- **BASE Procedure** - generates `<BASE>`
- **LINKREL Procedure** - generates `<LINK>` with the REL attribute
- **LINKREV Procedure** - generates `<LINK>` with the REV attribute
- **TITLE Procedure** - generates `<TITLE>`
- **META Procedure** - generates `<META>`
- **SCRIPT Procedure** - generates `<SCRIPT>`
- **STYLE Procedure** - generates `<STYLE>`
- **ISINDEX Procedure** - generates `<ISINDEX>`
Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate `<APPLET>` and `</APPLET>`

PARAM Procedure - generates `<PARAM>`

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate `<OL>` and `</OL>`

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate `<UL>` and `</UL>`

DLISTOPEN Procedure, DLISTCLOSE Procedure - generate `<DL>` and `</DL>`

DLISTTERM Procedure - generates `<DT>`

DLISTDEF Procedure - generates `<DD>`

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate `<DIR>` and `</DIR>`

LISTHEADER Procedure - generates `<LH>`

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate `<LISTING>` and `</LISTING>`

MENULISTOPEN Procedure - generate `<MENU>` and `</MENU>`

LISTITEM Procedure - generates `<LI>`

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate `<FORM>` and `</FORM>`

FORMCHECKBOX Procedure - generates `<INPUT TYPE="CHECKBOX">`

FORMHIDDEN Procedure - generates `<INPUT TYPE="HIDDEN">`

FORMIMAGE Procedure - generates `<INPUT TYPE="IMAGE">`

FORMPASSWORD Procedure - generates `<INPUT TYPE="PASSWORD">`

FORMRADIO Procedure - generates `<INPUT TYPE="RADIO">`

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate `<SELECT>` and `</SELECT>`

FORMSELECTOPTION Procedure - generates `<OPTION>`

FORMTEXT Procedure - generates `<INPUT TYPE="TEXT">`

FORMTEXTAREA Procedure - generate `<TEXTAREA>`

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate `<TEXTAREA>` and `</TEXTAREA>`

FORMRESET Procedure - generates `<INPUT TYPE="RESET">`

FORMSUBMIT Procedure - generates `<INPUT TYPE="SUBMIT">`
Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>
TABLECAPTION Procedure - generates <CAPTION>
TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>
TABLEHEADER Procedure - generates <TH>
TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>
IMG Procedure, IMG2 Procedure - generate <IMG>
ANCHOR Procedure, ANCHOR2 Procedure - generate <A>
MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)
PARA Procedure, PARAGRAPH Procedure - generate <P>
PRN Procedures, PRINT Procedures - generate any text that is passed in
PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>
BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>
DIV Procedure - generates <DIV>
NL Procedure, BR Procedure - generate <BR>
NOBR Procedure - generates <NOBR>
WBR Procedure - generates <WBR>
PLAINTEXT Procedure - generates <PLAINTEXT>
ADDRESS Procedure - generates <ADDRESS>
MAILTO Procedure - generates <A> with the MAILTO attribute
AREA Procedure - generates <AREA>
BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>
BIG Procedure - generates <BIG>
BOLD Procedure - generates `<b>`

CENTER Procedure - generates `<center>` and `</center>`

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate `<center>` and `</center>`

CITE Procedure - generates `<cite>`

CODE Procedure - generates `<code>`

DFN Procedure - generates `<dfn>`

EM Procedure, EMPHASIS Procedure - generate `<em>`

FONTOPEN Procedure, FONTCLOSE Procedure - generate `<font>` and `</font>`

ITALIC Procedure - generates `<i>`

KBD Procedure, KEYBOARD Procedure - generate `<kbd>` and `</kbd>`

S Procedure - generates `<s>`

SAMPLE Procedure - generates `<samp>`

SMALL Procedure - generates `<small>`

STRIKE Procedure - generates `<strike>`

STRONG Procedure - generates `<strong>`

SUB Procedure - generates `<sub>`

SUP Procedure - generates `<sup>`

TELETYPE Procedure - generates `<tt>`

UNDERLINE Procedure - generates `<u>`

VARIABLE Procedure - generates `<var>`

Frame Tags

FRAME Procedure - generates `<frame>`

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate `<frameset>` and `</frameset>`

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate `<noframes>` and `</noframes>`

### 216.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

#### Table 216-1  HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Procedure</td>
<td>Generates the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ANCHOR Procedure</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Procedure</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Procedure</td>
<td>Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag</td>
</tr>
<tr>
<td>APPLETOPEN Procedure</td>
<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Procedure</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Procedure</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Procedure</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Procedure</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Procedure</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Procedure</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Procedure</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Procedure</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Procedure</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Procedure</td>
<td>Generates the <code>&lt;B&gt;</code> and <code>&lt;/B&gt;</code> tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Procedure</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Procedure</td>
<td>Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;/CENTER&gt;</code> tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Procedure</td>
<td>Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center</td>
</tr>
<tr>
<td>CENTEROPEN Procedure</td>
<td>Generates the <code>&lt;CENTER&gt;</code> tag which mark the beginning of a section of text to center</td>
</tr>
<tr>
<td>CITE Procedure</td>
<td>Generates the <code>&lt;CITE&gt;</code> and <code>&lt;/CITE&gt;</code> tags which direct the browser to render the text as a citation</td>
</tr>
<tr>
<td>CODE Procedure</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
<tr>
<td>COMMENT Procedure</td>
<td>Generates procedure generates the comment tags <code>!--ctext --&gt;</code></td>
</tr>
<tr>
<td>DFN Procedure</td>
<td>Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however &quot;definition&quot; is defined stylistically</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DIRLISTCLOSE Procedure</td>
<td>Generates the &lt;/DIR&gt; tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Procedure</td>
<td>Generates the &lt;DIR&gt; which starts a directory list section</td>
</tr>
<tr>
<td>DIV Procedure</td>
<td>Generates the &lt;DIV&gt; tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Procedure</td>
<td>Generates the &lt;/DL&gt; tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Procedure</td>
<td>Generates the &lt;DD&gt; tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Procedure</td>
<td>Generates the &lt;DL&gt; tag which starts a definition list</td>
</tr>
<tr>
<td>DLISTTERM Procedure</td>
<td>Generates the &lt;DT&gt; tag which defines a term in a definition list &lt;DL&gt;</td>
</tr>
<tr>
<td>EM Procedure</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Procedure</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Procedure</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Procedure</td>
<td>Generates the &lt;/FONT&gt; tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOPEN Procedure</td>
<td>Generates the &lt;FONT&gt; tag which marks the beginning of section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMCHECKBOX Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;checkbox&quot; which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Procedure</td>
<td>Generates the &lt;/FORM&gt; tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMOPEN Procedure</td>
<td>Generates the &lt;FORM&gt; tag which marks the beginning of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;file&quot; which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;hidden&quot; which inserts a hidden form element</td>
</tr>
<tr>
<td>FORMIMAGE Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;image&quot; which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMPASSWORD Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;password&quot; which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;radio&quot;, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>FORMRESET Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;reset&quot; which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Procedure</td>
<td>Generates the &lt;/SELECT&gt; tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Procedure</td>
<td>Generates the &lt;/SELECT&gt; tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FORMSELECTOPTION Procedure</td>
<td>Generates the &lt;OPTION&gt; tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;submit&quot; which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Procedure</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;text&quot;, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Procedure</td>
<td>Generates the &lt;TEXTAREA&gt; tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Procedure</td>
<td>Generates the &lt;TEXTAREA&gt; tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Procedure</td>
<td>Generates the &lt;/TEXTAREA&gt; tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN Procedure</td>
<td>Generates the &lt;TEXTAREA&gt; which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN2 Procedure</td>
<td>Generates the &lt;TEXTAREA&gt; which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Procedure</td>
<td>Generates the &lt;FRAME&gt; tag which begins the characteristics of a frame created by a &lt;FRAMESET&gt; tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Procedure</td>
<td>Generates the &lt;/FRAMESET&gt; tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Procedure</td>
<td>Generates the &lt;/FRAMESET&gt; tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Procedure</td>
<td>Generates the &lt;/HEAD&gt; tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Procedure</td>
<td>Generates opening heading tags (&lt;H1&gt; to &lt;H6&gt;) and their corresponding closing tags (&lt;H1&gt; to &lt;/H6&gt;)</td>
</tr>
<tr>
<td>HEADOPEN Procedure</td>
<td>Generates the &lt;HEAD&gt; tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Procedure</td>
<td>Generates the &lt;HR&gt; tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>HTMLCLOSE Procedure</td>
<td>Generates the &lt;/HTML&gt; tag which marks the end of an HTML document</td>
</tr>
<tr>
<td>HTMLOPEN Procedure</td>
<td>Generates the &lt;HTML&gt; tag which marks the beginning of an HTML document</td>
</tr>
<tr>
<td>IMG Procedure</td>
<td>Generates the &lt;IMG&gt; tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Procedure</td>
<td>Generates the &lt;IMG&gt; tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute</td>
</tr>
<tr>
<td>ISINDEX Procedure</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Procedure</td>
<td>Generates the &lt;I&gt; and &lt;/I&gt; tags which direct the browser to render the text in italics</td>
</tr>
</tbody>
</table>
### Table 216-1 (Cont.) HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KBD Procedure</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Procedure</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Procedure</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Procedure</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Procedure</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Procedure</td>
<td>Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Procedure</td>
<td>Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Procedure</td>
<td>Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Procedure</td>
<td>Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Procedure</td>
<td>Generates the <code>&lt;A&gt;</code> tag with the HREF set to 'mailto' prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Procedure</td>
<td>Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MAPOPEN Procedure</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which mark the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Procedure</td>
<td>Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Procedure</td>
<td>Generates the <code>&lt;MENU&gt;</code> tag which begins a list that presents one line for each item</td>
</tr>
<tr>
<td>META Procedure</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Procedure</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Procedure</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Procedure</td>
<td>Generates the <code>&lt;/NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Procedure</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLSTCLOSE Procedure</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLISTOPEN Procedure</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Procedure</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PARAGRAPH Procedure</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Procedure</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Procedure</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Procedure</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Procedure</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Procedures</td>
<td>Generates the specified parameter as a string terminated with the <code>\n</code> newline character</td>
</tr>
<tr>
<td>PRINTS Procedure</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>PRN Procedures</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>PS Procedure</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>S Procedure</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Procedure</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however &quot;sample&quot; is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Procedure</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Procedure</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Procedure</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Procedure</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Procedure</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Procedure</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Procedure</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Procedure</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Procedure</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Procedure</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Procedure</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table.</td>
</tr>
</tbody>
</table>
Table 216-1  (Cont.) HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLEOPEN Procedure</td>
<td>Generates the &lt;TABLE&gt; tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Procedure</td>
<td>Generates the &lt;/TR&gt; tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Procedure</td>
<td>Generates the &lt;TR&gt; tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPETcure Procedure</td>
<td>Generates the &lt;TT&gt; and &lt;/TT&gt; tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Procedure</td>
<td>Generates the &lt;TITLE&gt; and &lt;/TITLE&gt; tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Procedure</td>
<td>Generates the &lt;/UL&gt; tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Procedure</td>
<td>Generates the &lt;UL&gt; tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Procedure</td>
<td>Generates the &lt;U&gt; and &lt;/U&gt; tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Procedure</td>
<td>Generates the &lt;VAR&gt; and &lt;/VAR&gt; tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Procedure</td>
<td>Generates the &lt;WBR&gt; tag, which inserts a soft line break within a section of NOBR text</td>
</tr>
</tbody>
</table>

216.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (cvalue IN VARCHAR2, cnwrap IN VARCHAR2 DEFAULT NULL, cclear IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-2  ADDRESS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the &lt;ADDRESS&gt; and &lt;/ADDRESS&gt; tags.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

216.5.2 ANCHOR Procedure

Like the ANCHOR2 procedure, this procedure generates the `<a>` and `</a>` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (curl IN VARCHAR2, ctext IN VARCHAR2, cname IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-3  ANCHOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;a&gt;</code> and <code>&lt;/a&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

216.5.3 ANCHOR2 Procedure

Like the ANCHOR procedure, this procedure generates the `<a>` and `</a>` HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the ANCHOR procedure is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (curl IN VARCHAR2, ctext IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 216-4  ANCHOR2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

216.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

216.5.5 APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN ( 
    ccode          IN       VARCHAR2, 
    cheight        IN       NUMBER, 
    cwidth         IN       NUMBER, 
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-5  APPLETOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```sql
HTP.appleopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```xml
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

• Specify parameters to the Java applet using the PARAM Procedure.
• Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

216.5.6 AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```sql
HTP.AREA (
    ccoords  IN     VARCHAR2
,  cshape   IN     VARCHAR2   DEFAULT NULL,
,  chref    IN     VARCHAR2   DEFAULT NULL,
,  cnhref   IN     VARCHAR2   DEFAULT NULL,
,  ctarget  IN     VARCHAR2   DEFAULT NULL,
,  cattributes IN     VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-6  AREA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The value for the COORDS attribute.</td>
</tr>
</tbody>
</table>
### Table 216-6  (Cont.) AREA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

### 216.5.7 BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

#### Syntax

```
HTP.BASE ( 
    ctarget        IN       VARCHAR2   DEFAULT NULL, 
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

#### Parameters

### Table 216-7  BASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

### 216.5.8 BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

#### Syntax

```
HTP.BASEFONT ( 
    nsize    IN    INTEGER);
```
Parameters

Table 216-8  BASEFONT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BASEFONT SIZE="nsize"> </BASEFONT>
```

216.5.9 BGSOUND Procedure

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (csrc IN VARCHAR2, cloop IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-9  BGSOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BGSOUND SRC="csrc" LOOP="cloop" cattributes> </BGSOUND>
```

216.5.10 BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (ctext IN VARCHAR2, cattributes IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 216-10  BIG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<BIG cattributes>ctext</BIG>
```

216.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the `BLOCKQUOTEOPEN Procedure`.

Syntax

```sql
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```html
</BLOCKQUOTE>
```

216.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the `BLOCKQUOTECLOSE Procedure`.

Syntax

```sql
HTP.BLOCKQUOTEOPEN (    cnwrap IN VARCHAR2 DEFAULT NULL,    cclear IN VARCHAR2 DEFAULT NULL,    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-11  BLOCKQUOTEOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is added to the tag.</td>
</tr>
</tbody>
</table>
### Table 216-11  (Cont.) BLOCKQUOTEOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

#### Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

### 216.5.13 BODYCLOSE Procedure

This procedure generates the `<BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Procedure.

#### Syntax

```
HTP.BODYCLOSE;
```

#### Examples

This procedure generates

```
</BODY>
```

### 216.5.14 BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Procedure.

#### Syntax

```
HTP.BODYOPEN ( cbackground IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

#### Examples

This procedure generates
216.5.15 BOLD Procedure

This procedure generates the \(<\texttt{B}}\) and \(</\texttt{B}>\) tags which direct the browser to display the text in boldface.

Syntax

\[
\texttt{HTP.BOLD (ctext \quad \text{IN} \quad 
\quad \text{VARCHAR2},}
\]
\[
\texttt{cattributes \quad \text{IN} \quad 
\quad \text{VARCHAR2 DEFAULT NULL});}
\]

Parameters

Table 216-13  BOLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\(<\texttt{B}} \texttt{cattributes}\texttt{ctext}</\texttt{B}>\)

216.5.16 BR Procedure

This procedure generates the \(<\texttt{BR}>\) tag which begins a new line of text.

It performs the same operation as the NL Procedure.

Syntax

\[
\texttt{HTP.BR(}
\]
\[
\texttt{cclear \quad \text{IN} \quad 
\quad \text{VARCHAR2 DEFAULT NULL,}}
\]
\[
\texttt{cattributes \quad \text{IN} \quad 
\quad \text{VARCHAR2 DEFAULT NULL});}
\]

Parameters

Table 216-14  BR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This procedure generates

<BR CLEAR="cclear" cattributes>

216.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (ctext IN VARCHAR2);
```

Parameters

**Table 216-15  CENTER Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

216.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

216.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.
Syntax

HTP.CENTEROPEN;

Examples

This procedure generates

<CENTER>

216.5.20 CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

HTP.CITE (  
            ctext          IN       VARCHAR2,  
            cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-16   CITE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<CITE cattributes>ctext</CITE>

216.5.21 CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

HTP.CODE (  
            ctext          IN       VARCHAR2,  
            cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-17   CODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>
Examples
This procedure generates

<pre>&lt;CODE cattributes&gt;ctext&lt;/CODE&gt;</pre>

216.5.22 COMMENT Procedure
This procedure generates the comment tags.

Syntax

```sql
HTP.COMMENT ( ctext IN VARCHAR2);
```

Parameters

Table 216-18  COMMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples
This procedure generates

```
<!-- ctext -->
```

216.5.23 DFN Procedure
This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```sql
HTP.DFN ( ctext IN VARCHAR2);
```

Parameters

Table 216-19  DFN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples
This procedure generates

```
<DFN>ctext</DFN>
```
216.5.24 DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

HTP.DIRLISTCLOSE;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

</DIR>

Related Topics

• DIRLISTOPEN Procedure
  This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

216.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

HTP.DIRLISTOPEN;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

<DIR>

Related Topics

• DIRLISTCLOSE Procedure
  This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.
216.5.26 DIV Procedure

This procedure generates the `<DIV>` tag which creates document divisions.

**Syntax**

```sql
HTP.DIV (  
calign         IN       VARCHAR2   DEFAULT NULL,  
cattributes    IN       VARCHAR2   DEFAULT NULL);
```

**Parameters**

**Table 216-20  DIV Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

216.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

**Syntax**

```sql
HTP.DLISTCLOSE;
```

**Usage Notes**

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

**Examples**

This procedure generates

```
</DL>
```

**Related Topics**

- DLISTOPEN Procedure
  This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.
216.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```sql
HTP.DLISTDEF (ctext          IN       VARCHAR2   DEFAULT NULL,
cclear         IN       VARCHAR2   DEFAULT NULL,
cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-21  DLISTDEF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<DD CLEAR="cclear" cattributes>c texte
```

216.5.29 DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```sql
HTP.DLISTOPEN (cclear         IN       VARCHAR2   DEFAULT NULL,
cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-22  DLISTOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.
Examples

This procedure generates

\[
\text{<DL CLEAR="cclear" cattributes>}
\]

Related Topics

- **DLISTCLOSE Procedure**
  
  This procedure generates the \text{</DL>} tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

216.5.30 DLISTTERM Procedure

This procedure generates the \text{<DT>} tag which defines a term in a definition list \text{<DL>}.  

Syntax

\[
\text{HTP.DLISTTERM (}
\text{ctext \hspace{0.5em} IN \hspace{0.5em} VARCHAR2 \hspace{0.5em} DEFAULT \hspace{0.5em} NULL,}
\text{cclear \hspace{0.5em} IN \hspace{0.5em} VARCHAR2 \hspace{0.5em} DEFAULT \hspace{0.5em} NULL,}
\text{cattributes \hspace{0.5em} IN \hspace{0.5em} VARCHAR2 \hspace{0.5em} DEFAULT \hspace{0.5em} NULL);}
\]

Parameters

**Table 216-23  DLISTTERM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\[
\text{<DT CLEAR="cclear" cattributes>ctext}
\]

216.5.31 EM Procedure

This procedure generates the \text{<EM>} and \text{</EM>} tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

\[
\text{HTP.EM (}
\text{ctext \hspace{0.5em} IN \hspace{0.5em} VARCHAR2,}
\text{cattributes \hspace{0.5em} IN \hspace{0.5em} VARCHAR2 \hspace{0.5em} DEFAULT \hspace{0.5em} NULL);}\]
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<EM cattributes>ctext</EM>
```

216.5.32 EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```sql
HTP.EMPHASIS(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<EM cattributes>ctext</EM>
```

216.5.33 ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;
- `"` to `&quot;
- `<` to `&lt;
- `>` to `&gt;"`
This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```sql
HTP.ESCAPE_SC(
    ctext          IN       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>

216.5.34 FONTCLOSE Procedure

This procedure generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTPROcedure.

Syntax

```sql
HTP.FONTCLOSE;
```

Examples

This procedure generates

```sql
</FONT>
```

216.5.35 FONTPROcedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```sql
HTP.FONTPROcedure(
    ccolor         IN       VARCHAR2   DEFAULT NULL,
    cface          IN       VARCHAR2   DEFAULT NULL,
    csize          IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
</tbody>
</table>
Table 216-27  (Cont.) FONTOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

216.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```sql
HTP.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-28  FORMCHECKBOX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

216.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Procedure.
Syntax

HTP.FORMCLOSE;

Examples

This procedure generates

</FORM>

216.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
    curl           IN       VARCHAR2,
    cmethod        IN       VARCHAR2   DEFAULT 'POST',
    ctarget        IN       VARCHAR2   DEFAULT NULL,
    cenctype       IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

**Table 216-29 FORMOPEN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

216.5.39 FORMFILE Procedure

This procedure generates the `<INPUT>` tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
    cname          IN       VARCHAR2,
    caccept        IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-30 FORMFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\[
\text{<INPUT TYPE=\"file\" NAME=\"cname\" ACCEPT=\"caccept\" cattributes>}
\]

216.5.40 FORMHIDDEN Procedure

This procedure generates the \(<\text{INPUT}>\) tag with \text{TYPE="hidden"}, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

\[
\text{HTP.FORMHIDDEN}(\text{cname}, \text{cvalue}, \text{cattributes})
\]

Parameters

Table 216-31 FORMHIDDEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\[
\text{<INPUT TYPE=\"hidden\" NAME=\"cname\" VALUE=\"cvalue\" cattributes>}
\]

216.5.41 FORMIMAGE Procedure

This procedure generates the \(<\text{INPUT}>\) tag with \text{TYPE="image"} which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted
under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
    cname          IN       VARCHAR2,
    csrc           IN       VARCHAR2,
    calign         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

216.5.42 FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
    cname          IN       VARCHAR2,
    csize          IN       VARCHAR2,
    cmaxlength     IN       VARCHAR2   DEFAULT NULL,
    cvalue         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This procedure generates

```html
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

216.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```sql
HTP.FORMRADIO(
    cname          IN       VARCHAR2,
    cvalue         IN       VARCHAR2,
    cchecked       IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-34  FORMRADIO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

216.5.44 FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```sql
HTP.FORMRESET(
    cvalue         IN       VARCHAR2   DEFAULT 'Reset',
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
### Parameters

#### Table 216-35 FORMRESET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

#### Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

### 216.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure. The values are inserted using FORMSELECTOPTION Procedure.

#### Syntax

```
HTP.FORMSELECTCLOSE;
```

#### Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

### 216.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure. The values are inserted using FORMSELECTOPTION Procedure.

#### Syntax

```
FORMSELECTOPEN(
  cname          IN       VARCHAR2,
  cprompt        IN       VARCHAR2   DEFAULT NULL,
  nsize          IN       INTEGER    DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-36 FORMSELECTOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>

so that

HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;

generates

Pick the greatest player:
<select name="greatest_player">
  <option>Messier</option>
  <option>Howe</option>
  <option>Gretzky</option>
</select>

216.5.47 FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

HTP.FORMSELECTOPTION(  
  cvalue         IN       VARCHAR2,  
  cselected      IN       VARCHAR2   DEFAULT NULL,  
  cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-37 FORMSELECTOPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
</tbody>
</table>
### Table 216-37 (Cont.) FORMSELECTOPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the \texttt{SELECTED} attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This procedure generates

\[
\text{<OPTION SELECTED cattributes>cvalue}
\]

as shown under Examples of the \texttt{FORMSELECTOPEN} Procedure.

### 216.5.48 FORMSUBMIT Procedure

This procedure generates the \texttt{<INPUT>} tag with \texttt{TYPE="submit"} which creates a button that, when clicked, submits the form. If the button has a \texttt{NAME} attribute, the button contributes a name/value pair to the submitted data.

#### Syntax

```sql
HTP.FORMSUBMIT(
    cname          IN       VARCHAR2   DEFAULT NULL,
    cvalue        IN       VARCHAR2   DEFAULT 'Submit',
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the \texttt{NAME} attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the \texttt{VALUE} attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This procedure generates

\[
\text{<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>}
\]

### 216.5.49 FORMTEXT Procedure

This procedure generates the \texttt{<INPUT>} tag with \texttt{TYPE="text"}, which creates a field for a single line of text.

#### Syntax

```sql
HTP.FORMTEXT(
    cname          IN       VARCHAR2,
    csize          IN       VARCHAR2   DEFAULT NULL,
```

...
cmaxlength  IN       VARCHAR2   DEFAULT NULL,
cvalue     IN       VARCHAR2   DEFAULT NULL,
cattributes IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-39  FORMTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

216.5.50 FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(    
    cname          IN       VARCHAR2,    
    nrows          IN       INTEGER,    
    ncolumns       IN       INTEGER,    
    calign          IN       VARCHAR2 DEFAULT NULL,    
    cattributes IN       VARCHAR2 DEFAULT NULL);    
```

Parameters

Table 216-40  FORMTEXTAREA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" 'attributes"></TEXTAREA>
```

216.5.51 FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2( 
    cname          IN       VARCHAR2, 
    nrows          IN       INTEGER, 
    ncolumns       IN       INTEGER, 
    calign         IN       VARCHAR2   DEFAULT NULL, 
    cwrap          IN       VARCHAR2   DEFAULT NULL, 
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

**Table 216-41 FORMTEXTAREA2 Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" 'attributes'></TEXTAREA>
```

216.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```
Examples

This procedure generates

</TEXTAREA>

216.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

HTP.FORMTEXTAREAOPEN(
  cname          IN       VARCHAR2,  
nrows          IN       INTEGER,  
ncolumns       IN       INTEGER,  
calign         IN       VARCHAR2 DEFAULT NULL,  
cattributes    IN       VARCHAR2 DEFAULT NULL);

Parameters

Table 216-42  FORMTEXTAREAOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>

216.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

HTP.FORMTEXTAREAOPEN2 (  
cname          IN       VARCHAR2,
nrows          IN       INTEGER,
ncolumns       IN       INTEGER,
calign         IN       VARCHAR2   DEFAULT NULL,
cwrap          IN       VARCHAR2   DEFAULT NULL,
cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-43 FORMTEXTAREAOPEN2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>

216.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

HTP.FRAME{
csrc           IN       VARCHAR2,
cname          IN       VARCHAR2   DEFAULT NULL,
cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
cmarginheight  IN       VARCHAR2   DEFAULT NULL,
cscrolling     IN       VARCHAR2   DEFAULT NULL,
cnoresize      IN       VARCHAR2   DEFAULT NULL,
cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-44 FRAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
</tbody>
</table>
Table 216-44  (Cont.) FRAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is added</td>
</tr>
<tr>
<td></td>
<td>to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates:

```html
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth" MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

216.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```sql
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates:

```html
</FRAMESET>
```

216.5.57 FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```sql
HTP.FRAMESETOPEN(
    crows          IN       VARCHAR2   DEFAULT NULL,
    ccols          IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-45  FRAMESETOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
Examples
This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattribs>
```

216.5.58 HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

216.5.59 HEADER Procedure

This procedure generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

Syntax

```
HTP.HEADER(  
nsize           IN       INTEGER,  
cheader         IN       VARCHAR2,  
align           IN       VARCHAR2   DEFAULT NULL,  
nowrap          IN       VARCHAR2   DEFAULT NULL,  
clear           IN       VARCHAR2   DEFAULT NULL,  
attributes      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-46  HEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The the heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>align</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>nowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>clear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

```
HTP.header (1,'Overview');
```
produces:

```html
<H1>Overview</H1>
```

### 216.5.60 HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the `HEADCLOSE` Procedure.

**Syntax**

```sql
HTP.HEADOPEN;
```

**Examples**

This procedure generates

```html
<HEAD>
```

### 216.5.61 HR Procedure

This procedure generates the `<HR>` tag which generates a line in the HTML document.

This subprogram performs the same operation as the `LINE Procedure`.

**Syntax**

```sql
HTP.HR(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    csrc           IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

**Parameters**

**Table 216-47  HR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

### 216.5.62 HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document.

You use the `HTMLOPEN Procedure` to mark the beginning of an HTML document.
Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

### 216.5.63 HTMLOPEN Procedure

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) to mark the end of the HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

### 216.5.64 IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTP.IMG(
  curl           IN       VARCHAR2   DEFAULT NULL,
  calign         IN       VARCHAR2   DEFAULT NULL,
  calt           IN       VARCHAR2   DEFAULT NULL,
  cismap         IN       VARCHAR2  DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

**Table 216-48  IMG Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
</tbody>
</table>

---

*Oracle*
Table 216-48  (Cont.) IMG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>

216.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

HTP.IMG2(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cusemap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

Table 216-49  IMG2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side image map.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
216.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as “enter value,” then sends that value to the URL of the page or program.

Syntax

```sql
HTP.ISINDEX(
  cprompt IN VARCHAR2 DEFAULT NULL,
  curl IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<i cprompt="cprompt" HREF="curl">
```

216.5.67 ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```sql
HTP.ITALIC(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<i cattributes>ctext</i>
```
216.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```sql
HTP.KBD(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-52  KBD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

216.5.69 KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Procedure.

Syntax

```sql
HTP.KEYBOARD(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-53  KEYBOARD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```
216.5.70 LINE Procedure

This procedure generates the `<hr>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    csrc           IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-54  LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

216.5.71 LINKREL Procedure

This procedure generates the `<link>` tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
    crel           IN       VARCHAR2,
    curl           IN       VARCHAR2,
    ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-55  LINKREL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
</tbody>
</table>
Table 216-55 (Cont.) LINKREL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```<LINK REL="crel" HREF="curl" TITLE="ctitle">```

216.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```HTP.LINKREV(
crev           IN       VARCHAR2,
curl           IN       VARCHAR2,
ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-56 LINKREV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```<LINK REV="crev" HREF="curl" TITLE="ctitle">```

216.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```HTP.LISTHEADER(
ctext          IN       VARCHAR2,
cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-57 LISTHEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between &lt;LH&gt; and &lt;/LH&gt;.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<LH cattributes>ctext</LH>
```

216.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```javascript
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```html
</LISTING>
```

216.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```javascript
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```html
<LISTING>
```
216.5.76 LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

**Syntax**

```
HTP.LISTITEM(
    ctext            IN       VARCHAR2   DEFAULT NULL,
    cclear           IN       VARCHAR2   DEFAULT NULL,
    cdingbat         IN       VARCHAR2   DEFAULT NULL,
    csrc             IN       VARCHAR2   DEFAULT NULL,
    cattributes      IN       VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the <code>CLEAR</code> attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the <code>DINGBAT</code> attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the <code>SRC</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

216.5.77 MAILTO Procedure

This procedure generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

**Syntax**

```
HTP.MAILTO(
    caddress       IN       VARCHAR2,
    ctext          IN       VARCHAR2,
    cname          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
</tbody>
</table>
Table 216-59  (Cont.) MAILTO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```sql
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```html
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

216.5.78 MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```sql
HTP.MAPCLOSE;
```

Examples

This procedure generates

```html
</MAP>
```

216.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```sql
HTP.MAPOPEN(  
    cname          IN       VARCHAR2   DEFAULT NULL,  
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-60  MAPOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples
This procedure generates

<MAP NAME="cname" cattributes>

216.5.80 MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTCLOSE;

Examples

This procedure generates

</MENU>

216.5.81 MENULISTOPEN Procedure

This procedure generates the <MENU> tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTOPEN;

Examples

This procedure generates

<MENU>
216.5.82 META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```sql
HTP.META(
    chttp_equiv    IN       VARCHAR2,
    cname          IN       VARCHAR2,
    ccontent       IN       VARCHAR2);
```

Parameters

Table 216-61  META Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```sql
HTP.meta ('Refresh', NULL, 120);
```

generates

```html
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

216.5.83 NL Procedure

This procedure generates the <BR> tag which begins a new line of text.

It performs the same operation as the BR Procedure.

Syntax

```sql
HTP.NL(
    cclear         IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-62 NL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BR CLEAR="cclear" cattributes>
```

216.5.84 NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```sql
HTP.NOBR(c,ctext IN VARCHAR2);
```

Parameters

Table 216-63 NOBR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<NOBR>ctext</NOBR>
```

216.5.85 NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```sql
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates
216.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```html
</NOFRAMES>
```

216.5.87 OLISTCLOSE Procedure

This procedure generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```html
</OL>
```

216.5.88 OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(cclear IN VARCHAR2 DEFAULT NULL, cwrap IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 216-64  OLISTOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$cclear$</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>$cwrap$</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>$cattributes$</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<OL CLEAR="$cclear$" WRAP="$cwrap$" $cattributes$>

216.5.89 PARA Procedure

This procedure generates the <p> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

HTP.PARA;

Examples

This procedure generates

<p>

216.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the <p> tag created by the PARA Procedure.

Syntax

HTP.PARAGRAPH(
  $calign$ IN VARCHAR2 DEFAULT NULL,
  $cnowrap$ IN VARCHAR2 DEFAULT NULL,
  $cclear$ IN VARCHAR2 DEFAULT NULL,
  $cattributes$ IN VARCHAR2 DEFAULT NULL);

Parameters

Table 216-65  PARAGRAPH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$calign$</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>$cnowrap$</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
</tbody>
</table>
Table 216-65  (Cont.) PARAGRAPh Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- PARA Procedure
  This procedure generates the `<p>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

216.5.91 PARAM Procedure

This procedure generates the `<param>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```sql
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 216-66  PARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<PARAM NAME=cname VALUE="cvalue">
```
216.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

**Syntax**

```
HTP.PLAINTEXT(c pretext IN VARCHAR2,
               c attributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pretext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<PLAINTEXT c attributes>pretext</PLAINTEXT>
```

216.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the **PREOPEN** Procedure.

**Syntax**

```
HTP.PRECLOSE;
```

**Examples**

This procedure generates

```
</PRE>
```

216.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the **PRECLOSE** Procedure.

**Syntax**

```
HTP.PREOPEN(c clear IN VARCHAR2 DEFAULT NULL,
              cclear IN VARCHAR2 DEFAULT NULL);
```
cwidth IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

Table 216-68  PREOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>

216.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character.

The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

HTP.PRINT (cbuf IN VARCHAR2);

HTP.PRINT (dbuf IN DATE);

HTP.PRINT (nbuf IN NUMBER);

Parameters

Table 216-69  PRINT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.
216.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (ctext IN VARCHAR2);
```

Parameters

### Table 216-70 PRINTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).

216.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the PRINT Procedures the string is not terminated with the `\n` newline character.

**Syntax**

```
HTP.PRN (cbuf IN VARCHAR2);
HTP.PRN (dbuf IN DATE);
HTP.PRN (nbuf IN NUMBER);
```
Parameters

Table 216-71  PRN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These procedures do not have function equivalents.

216.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- `<` to `<
- `>` to `>
- `"` to `"`
- `&` to `&`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (ctext  IN  VARCHAR2);
```

Parameters

Table 216-72  PS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).
216.5.99 S Procedure

This procedure generates the `<s>` and `</s>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Procedure.

Syntax

```sql
HTP.S (  
  ctext           IN       VARCHAR2,  
  cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-73   S Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<s cattributes>ctext</s>
```

216.5.100 SAMPLE Procedure

This procedure generates the `<samp>` and `</samp>` tags which direct the browser to render the text they surround in monospace font or however “sample” is defined stylistically.

Syntax

```sql
HTP.SAMPLE (  
  ctext           IN       VARCHAR2,  
  cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-74   SAMPLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<samp cattributes>ctext</samp>
```
216.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (cscript IN VARCHAR2,
clanguage IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 216-75**  SCRIPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

216.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (ctext IN VARCHAR2,
caattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 216-76**  SMALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
</tbody>
</table>
Table 216-76  (Cont.) SMALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<SML cattributes>ctext</SML>
```

216.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE ( 
    ctext          IN       VARCHAR2, 
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-77  STRIKE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<STRIKE cattributes>ctext</STRIKE>
```

216.5.104 STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however “strong” is defined.

Syntax

```
HTP.STRONG( 
    ctext          IN       VARCHAR2, 
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```
Parameters

Table 216-78  STRONG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<STRONG cattributes>ctext</STRONG>
```

216.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at [http://www.w3.org](http://www.w3.org). This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```sql
HTP.STYLE(
    cstyle          IN       VARCHAR2);
```

Parameters

Table 216-79  STYLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The the style information to include.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<STYLE>cstyle</STYLE>
```

216.5.106 SUB Procedure

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

Syntax

```sql
HTP.SUB(
    ctext          IN       VARCHAR2,
    calign         in       VARCHAR2 DEFAULT NULL,
    cattributes    IN       VARCHAR2 DEFAULT NULL);
```
Parameters

Table 216-80  SUB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>align</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```<SUB ALIGN="align" attributes>ctext</SUB>```

216.5.107 SUP Procedure

This procedure generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

Syntax

```HTP.SUP(  
  ctext          IN       VARCHAR2,  
  align         in       VARCHAR2   DEFAULT NULL,  
  attributes    IN       VARCHAR2   DEFAULT NULL);```

Parameters

Table 216-81  SUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>align</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```<SUP ALIGN="align" attributes>ctext</SUP>```

216.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```HTP.TABLECAPTION(  
  ccaption       IN       VARCHAR2,  
```

Oracle
Parameters

Table 216-82  TABLECAPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

216.5.109 TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

216.5.110 TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA (cvalue IN VARCHAR2 DEFAULT NULL,
                calign IN VARCHAR2 DEFAULT NULL,
                cdp   IN VARCHAR2 DEFAULT NULL,
                cnnowrap IN VARCHAR2 DEFAULT NULL,
                crowspan IN VARCHAR2 DEFAULT NULL,
                cccolspton IN VARCHAR2 DEFAULT NULL,
                cattributes IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 216-83   TABLEDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added</td>
</tr>
<tr>
<td></td>
<td>to the tag.</td>
</tr>
<tr>
<td>colspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

216.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```sql
HTP.TABLEHEADER(
    cvalue         IN       VARCHAR2   DEFAULT NULL,
    calign         IN       VARCHAR2   DEFAULT NULL,
    cdp            IN       VARCHAR2   DEFAULT NULL,
    cnowrap        IN       VARCHAR2   DEFAULT NULL,
    crowspan       IN       VARCHAR2   DEFAULT NULL,
    colspan        IN       VARCHAR2   DEFAULT NULL,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 216-84   TABLEHEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added</td>
</tr>
<tr>
<td></td>
<td>to the tag.</td>
</tr>
<tr>
<td>colspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
</tbody>
</table>
Table 216-84 (Cont.) TABLEHEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TH ALIGN="" algin" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>
```

216.5.112 TABLEOPEN Procedure

This procedure generates the `<TABLE>` tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```sql
HTP.TABLEOPEN (cborder IN VARCHAR2 DEFAULT NULL, calign IN VARCHAR2 DEFAULT NULL, cnowrap IN VARCHAR2 DEFAULT NULL, cclear IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-85 TABLEOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>algin</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
216.5.113 TABLEROWCLOSE Procedure

This procedure generates the \(<\text{TR}\rangle\) tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

\[
\text{HTP.TABLEROWCLOSE;}
\]

Examples

This procedure generates

\[
\langle/\text{TABLE}\rangle
\]

216.5.114 TABLEROWOPEN Procedure

This procedure generates the \(<\text{TR}\rangle\) tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

\[
\text{HTP.TABLEROWOPEN (}
\begin{array}{llll}
\text{calign} & \text{IN} & \text{VARCHAR2} & \text{DEFAULT NULL,}
\hline
\text{cvalign} & \text{IN} & \text{VARCHAR2} & \text{DEFAULT NULL,}
\text{cdp} & \text{IN} & \text{VARCHAR2} & \text{DEFAULT NULL,}
\text{cnowrap} & \text{IN} & \text{VARCHAR2} & \text{DEFAULT NULL,}
\text{cattributes} & \text{IN} & \text{VARCHAR2} & \text{DEFAULT NULL)};
\end{array}
\]

Parameters

Table 216-86  TABLEROWOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\[
\langle\text{TR ALIGN}="\text{calign}\" \text{VALIGN}="\text{cvalign}\" \text{DP}="\text{cdp}\" \text{NOWRAP} \text{cattributes}\rangle
\]
216.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

**Syntax**

```sql
HTP.TELETYPE(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<TT cattributes>ctext</TT>
```

216.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

**Syntax**

```sql
HTP.TITLE(
    ctitle          IN       VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<TITLE>ctitle</TITLE>
```
216.5.117 ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

HTP.ULISTCLOSE;

Examples

This procedure generates

</TABLE>

216.5.118 ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

HTP.ULISTOPEN(
  cclear         IN       VARCHAR2   DEFAULT NULL,
  cwrap          IN       VARCHAR2   DEFAULT NULL,
  cdingbat       IN       VARCHAR2   DEFAULT NULL,
  csrc           IN       VARCHAR2   DEFAULT NULL,
  cattributes    IN       VARCHAR2   DEFAULT NULL);

Parameters

Table 216-89  ULISTOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
216.5.119 UNDERLINE Procedure

This procedure generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```sql
HTP.UNDERLINE(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<U cattributes>ctext</U>
```

216.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```sql
HTP.VARIABLE(
    ctext          IN       VARCHAR2,
    cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<VAR cattributes>ctext</VAR>
```
216.5.121 WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of `NOBR` text.

**Syntax**

```
HTP.WBR;
```

**Examples**

This procedure generates

```
<WBR>
```
This Oracle Multimedia package supports the management and manipulation of audio data stored in BLOBs and BFILEs.

**Note:**

ORD_AUDIO is deprecated in Oracle Database Release 18c. Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The Oracle Multimedia ORD_AUDIO package provides functions and procedures to perform common operations such as exporting audio data from Oracle Database into operating system files, and extracting information from audio data. Information from audio data such as format, encoding type, and sampling rate can be extracted from audio data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see ORD_AUDIO in the Oracle Multimedia Reference.
This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs.

Note:

ORD_DICOM was deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia ORD_DICOM package provides functions and procedures to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM in the Oracle Multimedia DICOM Developer’s Guide.
This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

Note:

ORD_DICOM_ADMIN was deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia ORD_DICOM_ADMIN package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM_ADMIN in the Oracle Multimedia DICOM Developer’s Guide.
This Oracle Multimedia package supports the management and manipulation of media data stored in BLOBs and BFILEs. This package can be used in applications that require different types of multimedia data such as image, audio, and video to be stored in the same BLOB or BFILE column.

Note:

ORD_DOC is deprecated in Oracle Database Release 18c. Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The Oracle Multimedia ORD_DOC package provides functions and procedures to perform common operations such as exporting multimedia data from Oracle Database into operating system files, and extracting information from multimedia data. Information from image, audio, and video data such as format, mime type, and content length can be extracted into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see ORD_DOC in the Oracle Multimedia Reference.
This Oracle Multimedia package supports the management and manipulation of image data stored in BLOBs and BFILEs.

Note:

ORD_IMAGE is deprecated in Oracle Database Release 18c. Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The Oracle Multimedia ORD_IMAGE package provides functions and procedures to perform common operations such as exporting image data from Oracle Database into operating system files, creating thumbnail images, converting images from one format to another, and extracting information from image data. Information from image data such as format, width, height, and compression type can be extracted from image data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see ORD_IMAGE in the Oracle Multimedia Reference.
This Oracle Multimedia package supports the management and manipulation of video data stored in BLOBs and BFILEs.

Note:

ORD_VIDEO is deprecated in Oracle Database Release 18c. Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The Oracle Multimedia ORD_VIDEO package provides functions and procedures to perform common operations such as exporting video data from Oracle Database into operating system files, and extracting information from video data. Information from video data such as format, width, height, and frame rate can be extracted from video data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see ORD_VIDEO in the Oracle Multimedia Reference.
The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:
- Constants
- Summary of OWA_CACHE Subprograms

223.1 OWA_CACHE Constants
OWA_CACHE defines several constants to use when specifying parameter values.

- system_level CONSTANT VARCHAR(6) := 'SYSTEM';
- user_level CONSTANT VARCHAR(4) := 'USER';

223.2 Summary of OWA_CACHE Subprograms
This table lists the OWA_CACHE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure</td>
<td>Disables the cache for this particular request</td>
</tr>
<tr>
<td>GET_ETAG Function</td>
<td>Returns the tag associated with the cached content (used in the Validation technique model only)</td>
</tr>
<tr>
<td>GET_LEVEL Function</td>
<td>Returns the caching level (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_CACHE Procedure</td>
<td>Sets up the cache headers for validation model cache type</td>
</tr>
<tr>
<td>SET_EXPIRES Procedure</td>
<td>Sets up the cache headers for expires model cache type</td>
</tr>
<tr>
<td>SET_NOT_MODIFIED Procedure</td>
<td>Sets up the headers for a not modified cache hit (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_SURROGATE_CONTROL Procedure</td>
<td>Sets up the headers for a surrogate-control header for Web cache</td>
</tr>
</tbody>
</table>
223.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

223.2.2 GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
   RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.

223.2.3 GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
   RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

223.2.4 SET_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag        IN       VARCHAR2,
   p_level       IN       VARCHAR2);
```

Parameters

Table 223-2  SET_CACHE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_etag</td>
<td>The etag associated with this content</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>
Exceptions

VALUE_ERROR is thrown if

• p_etag is greater than 55
• p_level is not 'USER' or 'SYSTEM'

223.2.5 SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

OWA_CACHE.SET_EXPIRES(
    p_expires      IN       NUMBER,
    p_level        IN       VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_expires</td>
<td>The number of minutes this content is valid.</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

Exceptions

VALUE_ERROR is thrown if

• p_expires is negative or zero
• p_level is not 'USER' or 'SYSTEM'
• p_expires is > 525600 (1 year)

223.2.6 SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

OWA_CACHE.SET_NOT_MODIFIED;

Exceptions

VALUE_ERROR is thrown if If the etag was not passed in
223.2.7 SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

OWA_CACHE.SET_SURROGATE_CONTROL(
    p_value        IN       VARCHAR2);

Parameters

Table 223-4  SET_SURROGATE_CONTROL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_value</td>

Exceptions

VALUE_ERROR is thrown if p_value is greater than 55 in length.
The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

See Also:
For more information about implementation of this package:
- Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
- Oracle Fusion Middleware User's Guide for mod_plsql

The chapter contains the following topics:
- Overview
- Types
- Rules and Limits
- Summary of OWA_COOKIE Subprograms

224.1 OWA_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

224.2 OWA_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
    name VARCHAR2(4000),
    vals vc_arr,
    num_vals INTEGER);

224.3 OWA_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.
224.4 Summary of OWA_COOKIE Subprograms

This table lists the OWA_COOKIE subprograms and briefly describes them.

Table 224-1  OWA_COOKIE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET Function</td>
<td>Gets the value of the specified cookie</td>
</tr>
<tr>
<td>GET_ALL Procedure</td>
<td>Gets all cookie name-value pairs</td>
</tr>
<tr>
<td>REMOVE Procedure</td>
<td>Removes the specified cookie</td>
</tr>
<tr>
<td>SEND procedure</td>
<td>Generates a &quot;Set-Cookie&quot; line in the HTTP header</td>
</tr>
</tbody>
</table>

224.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```
OWA_COOKIE.GET(
    name       IN VARCHAR2)
RETURN COOKIE;
```

Parameters

Table 224-2  GET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
</tbody>
</table>

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

224.4.2 GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
    names   OUT vc_arr,
    vals    OUT vc_arr,
    num_vals OUT INTEGER);
```
Parameters

Table 224-3  GET_ALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>The names of the cookies.</td>
</tr>
<tr>
<td>vals</td>
<td>The values of the cookies.</td>
</tr>
<tr>
<td>num_vals</td>
<td>The number of cookie-value pairs.</td>
</tr>
</tbody>
</table>

224.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
    name           IN       VARCHAR2,
    val            IN       VARCHAR2,
    path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 224-4  REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie to expire.</td>
</tr>
<tr>
<td>val</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>path</td>
<td>[Currently unused]</td>
</tr>
</tbody>
</table>

224.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
    name           in       varchar2,
    value          in       varchar2,
    expires        in       date       DEFAULT NULL,
    path           in       varchar2   DEFAULT NULL,
    domain         in       varchar2   DEFAULT NULL,
    secure         in       varchar2   DEFAULT NULL);
```
### Parameters

**Table 224-5**  SEND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>expires</td>
<td>The date at which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The value for the path field.</td>
</tr>
<tr>
<td>domain</td>
<td>The value for the domain field.</td>
</tr>
<tr>
<td>secure</td>
<td>If the value of this parameter is not <code>NULL</code>, the &quot;secure&quot; field is added to the line.</td>
</tr>
</tbody>
</table>
The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

See Also:
For more information about implementation of this package:
- Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
- Oracle Fusion Middleware User's Guide for mod_plsql

The chapter contains the following topics:
- Constants
- Summary of `OWA_CUSTOM` Subprograms

### 225.1 OWA_CUSTOM Constants
`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

### 225.2 Summary of OWA_CUSTOM Subprograms
The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>AUTHORIZE</code> Function</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
</tbody>
</table>
225.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Syntax

OWA_CUSTOM.AUTHORIZE
    RETURN BOOLEAN;
The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- **Overview**
- **Types**
- **Variables**
- **Examples**
- **Summary of OWA_IMAGE Subprograms**

**See Also:**

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

### 226.1 OWA_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

### 226.2 OWA_IMAGE Types

This datatype (point) contain the x and y values of a coordinate, and so provides the coordinates of a user’s click on an imagemap.

It is defined as:

```plaintext
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

### 226.3 OWA_IMAGE Variables

This package variable (null_point) of TYPE POINT is used to default point parameters. Both the X and the Y fields of this variable are NULL.
### 226.4 OWA_IMAGE Examples

This example shows use of OWA_IMAGE.

```sql
CREATE OR REPLACE PROCEDURE process_image
  (my_img IN OWA_IMAGE.POINT)
AS
  x INTEGER := OWA_IMAGE.GET_X(my_img);
  y INTEGER := OWA_IMAGE.GET_Y(my_img);
BEGIN
/* process the coordinate */
END;
```

### 226.5 Summary of OWA_IMAGE Subprograms

This table lists the OWA_IMAGE subprograms and briefly describes them.

#### Table 226-1 OWA_IMAGE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_X Function</td>
<td>Gets the X value of a point type</td>
</tr>
<tr>
<td>GET_Y Function</td>
<td>Gets the Y value of a point type</td>
</tr>
</tbody>
</table>

#### 226.5.1 GET_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

#### Syntax

```sql
OWA_IMAGE.GET_X(
p        IN        point)
RETURN INTEGER;
```

#### Parameters

#### Table 226-2 GET_X Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

#### Return Values

The X coordinate as an integer.
226.5.2 GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
    p        IN        point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
</tr>
<tr>
<td>p</td>
</tr>
<tr>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The Y coordinate as an integer.
OWA_OPT_LOCK

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

• Overview
• Types
• Summary of OWA_OPT_LOCK Subprograms

See Also:

For more information about implementation of this package:

• Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
• Oracle Fusion Middleware User's Guide for mod_plsql

227.1 OWA_OPT_LOCK Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

• The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.

• The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

227.2 OWA_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
Note that this is different from the OWA_TEXT.VC_ARR DATA TYPE.

227.3 Summary of OWA_OPT_LOCK Subprograms

This table lists the OWA_OPT_LOCK subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKSUM Functions</td>
<td>Returns the checksum value</td>
</tr>
<tr>
<td>GET_ROWID Function</td>
<td>Returns the ROWID value</td>
</tr>
<tr>
<td>STORE_VALUES Procedure</td>
<td>Stores unmodified values in hidden fields for later verification</td>
</tr>
<tr>
<td>VERIFY_VALUES Function</td>
<td>Verifies the stored values against modified values</td>
</tr>
</tbody>
</table>

### 227.3.1 CHECKSUM Functions

This function returns a checksum value for a specified string, or for a row in a table. For a row in a table, the function calculates the checksum value based on the values of the columns in the row. This function comes in two versions.

The first version returns a checksum based on the specified string. This is a "pure" 32-bit checksum executed by the database and based on the Internet 1 protocol.

The second version returns a checksum based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

**Syntax**

```sql
OWA_OPT_LOCK.CHECKSUM(
  p_buff        IN       VARCHAR2)
RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
  p_owner       IN      VARCHAR2,
  p_tname       IN       VARCHAR2,
  p_rowid       IN       ROWID)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_buff</td>
<td>The nstring where you want to calculate the checksum.</td>
</tr>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The table name.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.</td>
</tr>
</tbody>
</table>
227.3.2 GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```sql
OWA_OPT_LOCK.GET_ROWID(
    p_old_values IN vcarray)
RETURN ROWID;
```

Parameters

Table 227-3  GET_ROWID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>This parameter is usually passed in from an HTML form.</td>
</tr>
</tbody>
</table>

227.3.3 STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```sql
OWA_OPT_LOCK.STORE_VALUES(
    p_owner        IN       VARCHAR2,
    p_tname        IN       VARCHAR2,
    p_rowid        IN       ROWID);
```

Parameters

Table 227-4  STORE_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row where you want to store values.</td>
</tr>
</tbody>
</table>

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
• One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.

• One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

227.3.4 VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the STORE_VALUES Procedure.

Syntax

OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
RETURN BOOLEAN;

Parameters

Table 227-5  VERIFY_VALUES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>A PL/SQL table containing the following information:</td>
</tr>
<tr>
<td></td>
<td>• p_old_values(1) specifies the owner of the table.</td>
</tr>
<tr>
<td></td>
<td>• p_old_values(2) specifies the table.</td>
</tr>
<tr>
<td></td>
<td>• p_old_values(3) specifies the rowid of the row to verify.</td>
</tr>
<tr>
<td></td>
<td>The remaining indexes contain values for the columns in the table.</td>
</tr>
<tr>
<td></td>
<td>Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if no other update has been performed, otherwise FALSE.
The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

See Also:
For more information about implementation of this package, see the following:
• Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
• Oracle Fusion Middleware User's Guide for mod_plsql

The chapter contains the following topics:
• Types
• Operational Notes
• Summary of OWA_PATTERN Subprograms

228.1 OWA_PATTERN Types
You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

• OWA_PATTERN.PATTERN

228.2 OWA_PATTERN Operational Notes
The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE.

The subprograms use the following parameters:
• line - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line datatype.
• pat - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called from_str.
• flags - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.
• Wildcards
• Quantifiers
• Flags

228.2.1 OWA_PATTERN Wildcards

Wildcard tokens match something other than themselves.

Table 228-1  Wildcard tokens recognized by OWA_PATTERN package

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches newline or the beginning of the target</td>
