Preface

This guide provides a compilation of topics from the Oracle Database user assistance documentation that are collected to help you complete a specific use case scenario.

- Use Case Scenario for this Document
- Documentation Accessibility

Use Case Scenario for this Document

Use this scenario document to assist you to unplug earlier release PDBs, plug them into a later release CDB, and then upgrade the PDBs.

Prerequisites for this Scenario

- You have installed the same release Oracle Database software on the destination server, and it is updated to the same release update and release update revision.
- You have completed preparation of the new Oracle home.
- You have run the Pre-Upgrade Information Tool on the PDB.
- The endian format of the source CDB and the target CDB are identical.
- The same set of options are installed on the source CDB and the target CDB.
- The source CDB and the target CDB have compatible character sets and national character sets.

The source CDB and the target CDB can be on the same or different server hardware.

Outline for this Scenario

2. Upgrading Pluggable Databases Sequentially. Use these procedures to complete your PDB upgrade:
   a. Unplug earlier release PDBs from the earlier release CDB.
   b. Plug in the earlier release PDB to the later release CDB.
   c. Upgrade the earlier release PDB to the later release CDB.
   d. Use inclusion or exclusion lists for PDB upgrades.

These steps correspond to the chapters in this document.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support
through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/
lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs
if you are hearing impaired.
To upgrade pluggable databases (PDBs) that are in an earlier release multitenant container databases (CDBs), Oracle Database Release 12c (12.1.0.1) and later, you can unplug the PDBs from the earlier release CDB, and plug the PDBs into the later release CDB.

- **About Upgrading Pluggable Databases (PDBs) Sequentially**
  You can upgrade PDBs by unplugging a PDB from an earlier release CDB, plugging it into a later release CDB, and then upgrading that PDB to the later release.

### About Upgrading Pluggable Databases (PDBs) Sequentially

You can upgrade PDBs by unplugging a PDB from an earlier release CDB, plugging it into a later release CDB, and then upgrading that PDB to the later release.

CDBs can contain zero, one, or more pluggable databases (PDBs). After you install a new Oracle Database release, or after you upgrade the CDB (CDB$ROOT), you can upgrade one or more PDB without upgrading all of the PDBs on the CDB.

You can choose the upgrade plan that meets the needs for your service delivery. For example, you can use Oracle Database Upgrade Assistant (DBUA) to upgrade a set of PDBs, or you can use a manual upgrade to upgrade PDBs individually, or with inclusion or exclusion lists. You can upgrade the CDB and all PDBs (an In Parallel manual upgrade), or you can upgrade the CDB, and then upgrade PDBs sequentially, either individually, or in sets using inclusion or exclusion lists.

The following is a high-level list of the steps required for sequential PDB upgrades:

1. Unplug the earlier release PDB from the earlier release CDB.
2. Drop the PDB from the CDB.
3. Plug the earlier release PDB into the later release CDB.
4. Upgrade the earlier release PDB to a later release.

With Oracle Database 12c Release 2 (12.2) and later releases, you can provide lists to the Parallel Upgrade Utility to upgrade PDBs:

- Priority lists, to set the order in which PDBs are upgraded
- Inclusion lists, which enable you to designate a set of PDBs to upgrade after the PDBs listed in the priority list are upgraded
- Exclusion lists, which enable you to designate a set of PDBs that are not upgraded
Note:

A PDB cannot be recovered unless it is backed up. After upgrading using the method of creating a CDB and plugging in a PDB, be sure to back up the PDB.

Unplugging the Earlier Release PDB from the Earlier Release CDB
To prepare for upgrading the PDB, use this procedure to unplug the PDB from the earlier release CDB.

1. Run the Pre-Upgrade Information Tool on the PDB.
   For example, where the PDB named salespdb is running in the CDB in $ORACLE_HOME_12.2:
   
   ```bash
   $ORACLE_HOME_12.2/jdk/bin/java -jar $ORACLE_HOME_18/rdbms/admin/preupgrade.jar dir /tmp -c salespdb
   ```

2. Run `preupgrade_fixups.sql` on your source database.
   For example:
   ```sql
   CONNECT / AS SYSDBA
   SQL> ALTER SESSION SET CONTAINER=salespdb;
   SQL> @/tmp/preupgrade_fixups_salespdb.sql
   ```

3. Follow all recommendations listed in `preupgrade.log`.
4. Close the PDB you want to unplug.
   For example, use the following command to close the PDB `salespdb`:
   ```sql
   SQL> ALTER PLUGGABLE DATABASE salespdb CLOSE;
   ```
5. Log back in to CDB$ROOT:

```
CONNECT / AS SYSDBA
SQL> ALTER SESSION SET CONTAINER=CDB$ROOT;
```

6. Unplug the earlier release PDB using the following SQL command syntax, where `pdb` is the name of the PDB, and `path` is the location of the PDB XML file:

```
ALTER PLUGGABLE DATABASE pdb UNPLUG INTO 'path/pdb.xml';
```

For example, where the pdb name is `salespdb` and `path` is `/home/oracle/salespdb.xml`:

```
SQL> ALTER PLUGGABLE DATABASE salespdb UNPLUG INTO '/home/oracle/salespdb.xml';
```

The following response displays when the command is completed:

```
Pluggable database altered
```

7. Drop the pluggable database `salespdb`, but keep data files.

Oracle recommends that you drop `salespdb` after this procedure to clean up leftover information in the CDB views, and to help to avoid future issues. As a best practice guideline, back up your PDB in the destination CDB first, and then issue the DROP command on the source.

```
Caution:
After you drop the PDB from its original CDB, you cannot revert to it using previously taken backup, because the DROP command removes backup files.
```

To drop the pluggable database, enter the following command:

```
SQL> DROP PLUGGABLE DATABASE salespdb KEEP DATAFILES;
```

8. Exit.

## Plugging in the Earlier Release PDB to the Later Release CDB

To plug the PDB from the earlier release CDB to the later release CDB, use the CREATE PLUGGABLE DATABASE command.

This procedure example shows how to plug in a PDB when you are using Oracle-Managed Files. Refer to Oracle Database Administrator’s Guide for additional information about plugging in PDBs.

1. Connect to the later release CDB.

2. Plug in the earlier release PDB using the following SQL command, where `pdb` is the name of the PDB, and `path` is the path where the PDB XML file is located:

```
CREATE PLUGGABLE DATABASE pdb USING 'path/pdb.xml';
```

For example:

```
SQL> CREATE PLUGGABLE DATABASE salespdb USING '/home/oracle/salespdb.xml';
```
The following response displays when the command is completed:

Pluggable database created.

**Note:**

When you plug in an earlier release PDB, the PDB is in restricted mode. You can only open the PDB for upgrade.

### Upgrading the Earlier Release PDB to the Later Release

Open PDBs in UPGRADE mode use the Parallel Upgrade Utility to carry out the upgrade of the earlier-release PDB to the release level of the CDB.

1. If needed, switch to the PDB that you want to upgrade. For example, enter the following command to switch to the PDB `salespdb`:

   ```sql
   SQL> ALTER SESSION SET CONTAINER=salespdb;
   ```

2. Open the PDB in UPGRADE mode.

   ```sql
   SQL> ALTER PLUGGABLE DATABASE OPEN UPGRADE;
   ```

3. Upgrade the PDB using the Parallel Upgrade Utility command (`catctl.pl`, or the shell utility `dbupgrade`).

   When you upgrade a PDB, you use the commands you normally use with the Parallel Upgrade Utility. However, you also add the option `-c PDBname` to specify which PDB you are upgrading. Capitalize the name of your PDB as shown in the following example using the PDB named `salespdb`:

   ```bash
   $ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catctl.pl -d  
   $ORACLE_HOME/rdbms/admin -c 'salespdb' -l $ORACLE_BASE catupgrd.sql
   ```

4. Review results.

   The default file path for the logs is in the path `Oracle_base/cfgtoollogs/dbname/upgradedatet ime`, where `Oracle_base` is the Oracle base path, `dbname` is the database name, and `upgradedatetime` is the date and time for the upgrade. The date and time strings are in the character string format `YYYYMMDDHHMMSSC`, in which `YYYY` designates the year, `MM` designates the month, `DD` designates the day, `HH` designates the hour, `MM` designates the minute, and `SC` designates the second.

   For example:

   ```bash
   $ORACLE_BASE/cfgtoollogs/salespdb/upgrade20160815120001/upg_summary.log
   ```

5. Log in to SQL*Plus, and open the PDB to execute post-upgrade fixups, and to recompile the INVALID objects in the database:

   ```sql
   SQL> STARTUP;
   SQL> ALTER SESSION SET CONTAINER=salespdb;
   ```

6. Use the utility `catcon.pl` to run the script `postupgrade_fixups.sql`:
7. Use the utility catcon.pl to run utlrp.sql from the $ORACLE_HOME/rdbms/admin directory:

$ORACLE_HOME/perl/bin/perl catcon.pl -c 'salespdb' -n 1 -e -b comp -d '***' /tmp/cfgtoollogs/salespdb/preupgrade/postupgrade_fixups.sql

The script compiles INVALID objects in the database, and places a log file in the current directory with the name comp0.log.

Use Inclusion or Exclusion Lists for PDB Upgrades

If you want to upgrade a subset of earlier release PDBs, then use inclusion or exclusion lists to avoid re-upgrading the CDB or PDBs that are at the new release level.

Oracle recommends that you record the containers that you upgrade, and use inclusion or exclusion lists to exclude these containers from successive bulk upgrades. Excluding upgraded containers from successive bulk upgrades ensures that the upgrade only runs on PDBs that require the upgrade. Avoiding re-upgrades minimizes the overall upgrade time, and avoids unnecessary unavailability.

For example: If you have installed Oracle Database 12c Release 12.2.0.1, then the containers CDB$ROOT, PDB$SEED, and any other PDBs created when the CDB was created, are part of the new release multitenant architecture. If you upgraded a CDB, and at the same time upgraded a set of PDBs to Release 12.2.0.1, then you do not need to upgrade either the CDB containers or the upgraded PDBs again.

In either case, when you plug in earlier release PDBs and then upgrade them, upgrade the PDBs with either an exclusion list, or an inclusion list:

- Use an inclusion list to specify only the set of PDBs that you want to upgrade.
- Use an exclusion list to exclude the CDB and PDB containers that are already upgraded.

If you do not use an inclusion list or an exclusion list to limit the upgrade scope, then the Parallel Upgrade Utility (catctl.pl) attempts to upgrade the entire CDB, not just the PDBs that require the upgrade. During that upgrade process, your system undergoes needless downtime. The inclusion list and the exclusion list options are mutually exclusive.
