## Changes in This Release for Oracle Database PL/SQL Packages and Types Reference
- Changes in Oracle Database Release 19c, Version 19.1 cxliii

## 1 Introduction to Oracle Supplied PL/SQL Packages & Types
- 1.1 Package Overview 1-2
  - 1.1.1 Package Components 1-2
  - 1.1.2 Using Oracle Supplied Packages 1-2
  - 1.1.3 Creating New Packages 1-2
    - 1.1.3.1 Separating the Specification and Body 1-3
  - 1.1.4 Referencing Package Contents 1-5
- 1.2 Summary of Oracle Supplied PL/SQL Packages and Types 1-5

## 2 Oracle Application Express Packages APEX_APPLICATION Through APEX_ZIP

## 3 CTX_ADM

## 4 CTX_ANL
14.1 DBMS_ADDM Security Model 14-1
14.2 Summary of DBMS_ADDM Subprograms 14-1
  14.2.1 ANALYZE_DB Procedure 14-2
  14.2.2 ANALYZE_INST Procedure 14-3
  14.2.3 ANALYZE_PARTIAL Procedure 14-5
  14.2.4 COMPARE_CAPTURE_REPLAY_REPORT Function 14-6
  14.2.5 COMPARE_DATABASES Function 14-6
  14.2.6 COMPARE_INSTANCES Function 14-7
  14.2.7 COMPARE_REPLAY_REPLAY_REPORT Function 14-8
  14.2.8 DELETE Procedure 14-9
  14.2.9 DELETE_FINDING_DIRECTIVE Procedure 14-9
14.2.10 DELETE_PARAMETER_DIRECTIVE Procedure 14-10
14.2.11 DELETE_SEGMENT_DIRECTIVE Procedure 14-10
14.2.12 DELETE_SQL_DIRECTIVE Procedure 14-11
14.2.13 GET_ASH_QUERY Function 14-11
14.2.14 GET_REPORT Function 14-12
14.2.15 INSERT_FINDING_DIRECTIVE Procedure 14-12
14.2.16 INSERT_PARAMETER_DIRECTIVE Procedure 14-13
14.2.17 INSERT_SEGMENT_DIRECTIVE Procedure 14-14
14.2.18 INSERT_SQL_DIRECTIVE Procedure 14-15
14.2.19 REAL_TIME_ADDM_REPORT Function 14-16

15 DBMS_ADVANCED_REWRITE
15.1 DBMS_ADVANCED_REWRITE Security Model 15-1
15.2 Summary of DBMS_ADVANCED_REWRITE Subprograms 15-1
  15.2.1 ALTER_REWRITE_EQUIVALENCE Procedure 15-2
  15.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure 15-3
  15.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures 15-3
  15.2.4 DROP_REWRITE_EQUIVALENCE Procedure 15-6
  15.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure 15-6

16 DBMS_ADVISOR
16.1 DBMS_ADVISOR Deprecated Subprograms 16-1
16.2 DBMS_ADVISOR Security Model 16-2
16.3 Summary of DBMS_ADVISOR Subprograms 16-2
  16.3.1 ADD_SQLWKLD_REF Procedure 16-5
  16.3.2 ADD_SQLWKLD_STATEMENT Procedure 16-6
  16.3.3 ADD_STS_REF Procedure 16-8
  16.3.4 CANCEL_TASK Procedure 16-9
  16.3.5 COPY_SQLWKLD_TO_STS Procedure 16-10
  16.3.6 CREATE_FILE Procedure 16-11
  16.3.7 CREATE_OBJECT Procedure 16-13
  16.3.8 CREATE_SQLWKLD Procedure 16-14
  16.3.9 CREATE_TASK Procedures 16-16
  16.3.10 DELETE_SQLWKLD Procedure 16-18
  16.3.11 DELETE_SQLWKLD_REF Procedure 16-19
  16.3.12 DELETE_SQLWKLD_STATEMENT Procedure 16-20
  16.3.13 DELETE_STS_REF Procedure 16-21
  16.3.14 DELETE_TASK Procedure 16-22
  16.3.15 EXECUTE_TASK Procedure 16-22
| 16.3.16 | GET_REC_ATTRIBUTES Procedure | 16-24 |
| 16.3.17 | GET_TASK_REPORT Function | 16-25 |
| 16.3.18 | GET_TASK_SCRIPT Function | 16-26 |
| 16.3.19 | IMPLEMENT_TASK Procedure | 16-27 |
| 16.3.20 | IMPORT_SQLWKLD_SCHEMA Procedure | 16-28 |
| 16.3.21 | IMPORT_SQLWKLD_SQLCACHE Procedure | 16-30 |
| 16.3.22 | IMPORT_SQLWKLD_STS Procedure | 16-31 |
| 16.3.23 | IMPORT_SQLWKLD_SUMADV Procedure | 16-33 |
| 16.3.24 | IMPORT_SQLWKLD_USER Procedure | 16-35 |
| 16.3.25 | INTERRUPT_TASK Procedure | 16-36 |
| 16.3.26 | MARK_RECOMMENDATION Procedure | 16-37 |
| 16.3.27 | QUICK_TUNE Procedure | 16-38 |
| 16.3.28 | RESET_SQLWKLD Procedure | 16-39 |
| 16.3.29 | RESET_TASK Procedure | 16-40 |
| 16.3.30 | SET_DEFAULT_SQLWKLD_PARAMETER Procedure | 16-41 |
| 16.3.31 | SET_DEFAULT_TASK_PARAMETER Procedure | 16-42 |
| 16.3.32 | SET_SQLWKLD_PARAMETER Procedure | 16-43 |
| 16.3.33 | SET_TASK_PARAMETER Procedure | 16-44 |
| 16.3.34 | TUNE_MVIEW Procedure | 16-60 |
| 16.3.35 | UPDATE_OBJECT Procedure | 16-62 |
| 16.3.36 | UPDATE_REC_ATTRIBUTES Procedure | 16-63 |
| 16.3.37 | UPDATE_SQLWKLD_ATTRIBUTES Procedure | 16-65 |
| 16.3.38 | UPDATE_SQLWKLD_STATEMENT Procedure | 16-66 |
| 16.3.39 | UPDATE_TASK_ATTRIBUTES Procedure | 16-68 |

### 17 DBMS_ALERT

| 17.1 | DBMS_ALERT Overview | 17-1 |
| 17.2 | DBMS_ALERT Security Model | 17-1 |
| 17.3 | DBMS_ALERT Constants | 17-2 |
| 17.4 | DBMS_ALERT Restrictions | 17-2 |
| 17.5 | DBMS_ALERT Exceptions | 17-2 |
| 17.6 | DBMS_ALERT Operational Notes | 17-2 |
| 17.7 | DBMS_ALERT Examples | 17-3 |
| 17.8 | Summary of DBMS_ALERT Subprograms | 17-4 |

#### 17.8.1 REGISTRATION Procedure | 17-4 |
#### 17.8.2 REMOVE Procedure | 17-5 |
#### 17.8.3 REMOVEALL Procedure | 17-5 |
#### 17.8.4 SET_DEFAULTS Procedure | 17-6 |
#### 17.8.5 SIGNAL Procedure | 17-6 |
#### 17.8.6 WAITANY Procedure | 17-7 |
18  DBMS_APP_CONT

18.1  DBMS_APP_CONT Overview 18-1
18.2  DBMS_APP_CONT Security Model 18-2
18.3  Summary of DBMS_APP_CONT Subprograms 18-2
  18.3.1  GET_LTXID_OUTCOME Procedure 18-2

19  DBMS_APP_CONT_ADMIN

19.1  DBMS_APP_CONT_ADMIN Security Model 19-1
19.2  Summary of DBMS_APP_CONT_ADMIN Subprograms 19-1
  19.2.1  ACCHK_SET Procedure 19-1
  19.2.2  ACCHK_VIEWS Procedure 19-3
  19.2.3  ADD_SQL_CONNECTION_TEST Procedure 19-3
  19.2.4  DELETE_SQL_CONNECTION_TEST Procedure 19-4
  19.2.5  DISABLE_CONNECTION_TEST Procedure 19-5
  19.2.6  ENABLE_CONNECTION_TEST Procedure 19-6

20  DBMS_APPLICATION_INFO

20.1  DBMS_APPLICATION_INFO Overview 20-1
20.2  DBMS_APPLICATION_INFO Security Model 20-1
20.3  DBMS_APPLICATION_INFO Operational Notes 20-1
20.4  Summary of DBMS_APPLICATION_INFO Subprograms 20-2
  20.4.1  READ_CLIENT_INFO Procedure 20-2
  20.4.2  READ_MODULE Procedure 20-2
  20.4.3  SET_ACTION Procedure 20-3
  20.4.4  SET_CLIENT_INFO Procedure 20-4
  20.4.5  SET_MODULE Procedure 20-5
  20.4.6  SET_SESSION_LONGOPS Procedure 20-5

21  DBMS_APPLY_ADM

21.1  DBMS_APPLY_ADM Overview 21-1
21.2  DBMS_APPLY_ADM Security Model 21-2
21.3  DBMS_APPLY_ADM Deprecated Subprograms 21-3
21.4  Summary of DBMS_APPLY_ADM Subprograms 21-3
  21.4.1  ALTER_APPLY Procedure 21-5
  21.4.2  CLEAR_KEY_COLUMNS Procedure 21-10
  21.4.3  COMPARE_OLD_VALUES Procedure 21-11
21.4.4 CREATE_APPLY Procedure 21-13
21.4.5 CREATE_OBJECT_DEPENDENCY Procedure 21-20
21.4.6 DELETE_ALL_ERRORS Procedure 21-21
21.4.7 DELETE_ERROR Procedure 21-21
21.4.8 DROP_APPLY Procedure 21-22
21.4.9 DROP_OBJECT_DEPENDENCY Procedure 21-23
21.4.10 EXECUTE_ALL_ERRORS Procedure 21-24
21.4.11 EXECUTE_ERROR Procedure 21-25
21.4.12 GET_ERROR_MESSAGE Function 21-28
21.4.13 HANDLE_COLLISIONS 21-29
21.4.14 SET_DML_CONFLICT_HANDLER Procedure 21-30
21.4.15 SET_DML_HANDLER Procedure 21-36
21.4.16 SET_ENQUEUE_DESTINATION Procedure 21-41
21.4.17 SET_EXECUTE Procedure 21-42
21.4.18 SET_GLOBAL_INSTANTIATION_SCN Procedure 21-44
21.4.19 SET_KEY_COLUMNS Procedures 21-47
21.4.20 SET_PARAMETER Procedure 21-50
21.4.21 SET_REPERROR_HANDLER Procedure 21-72
21.4.22 SET_SCHEMA_INSTANTIATION_SCN Procedure 21-73
21.4.23 SET_TABLE_INSTANTIATION_SCN Procedure 21-76
21.4.24 SET_UPDATE_CONFLICT_HANDLER Procedure 21-79
21.4.25 SET_VALUE_DEPENDENCY Procedure 21-82
21.4.26 START_APPLY Procedure 21-83
21.4.27 STOP_APPLY Procedure 21-84

22 DBMS_AQ

22.1 DBMS_AQ Security Model 22-1
22.2 DBMS_AQ Constants 22-2
22.3 DBMS_AQ Data Types 22-3
22.4 DBMS_AQ Operational Notes 22-6
22.5 Summary of DBMS_AQ Subprograms 22-6
  22.5.1 BIND_AGENT Procedure 22-7
  22.5.2 DEQUEUE Procedure 22-7
  22.5.3 DEQUEUE_ARRAY Function 22-9
  22.5.4 ENQUEUE Procedure 22-11
  22.5.5 ENQUEUE_ARRAY Function 22-12
  22.5.6 LISTEN Procedures 22-13
  22.5.7 POST Procedure 22-14
  22.5.8 REGISTER Procedure 22-15
  22.5.9 UNBIND_AGENT Procedure 22-16
23

DBMS_AQADM

23.1 DBMS_AQADM Security Model
23.2 DBMS_AQADM Constants
23.3 DBMS_AQADM Subprogram Groups
  23.3.1 DBMS_AQADM Queue Table Subprograms
  23.3.2 DBMS_AQADM Privilege Subprograms
  23.3.3 DBMS_AQADM Queue Subprograms
  23.3.4 DBMS_AQADM Subscriber Subprograms
  23.3.5 DBMS_AQADM Propagation Subprograms
  23.3.6 DBMS_AQADM Miscellaneous Subprograms
  23.3.7 DBMS_AQADM Agent Subprograms
  23.3.8 DBMS_AQADM Alias Subprograms
23.4 Summary of DBMS_AQADM Subprograms
  23.4.1 ADD_ALIAS_TO_LDAP Procedure
  23.4.2 ADD_SUBSCRIBER Procedure
  23.4.3 ALTER_AQ_AGENT Procedure
  23.4.4 ALTER_PROPAGATION_SCHEDULE Procedure
  23.4.5 ALTER_QUEUE Procedure
  23.4.6 ALTER_QUEUE_TABLE Procedure
  23.4.7 ALTER_SHARDED_QUEUE Procedure
  23.4.8 ALTER_SUBSCRIBER Procedure
  23.4.9 CREATE_AQ_AGENT Procedure
  23.4.10 CREATE_NP_QUEUE Procedure
  23.4.11 CREATE_QUEUE Procedure
  23.4.12 CREATE_QUEUE_TABLE Procedure
  23.4.13 CREATE_SHARDED_QUEUE Procedure
  23.4.14 CREATE_EXCEPTION_QUEUE Procedure
  23.4.15 DEL_ALIAS_FROM_LDAP Procedure
  23.4.16 DISABLE_DB_ACCESS Procedure
  23.4.17 DISABLE_PROPAGATION_SCHEDULE Procedure
  23.4.18 DROP_AQ_AGENT Procedure
  23.4.19 DROP_QUEUE Procedure
  23.4.20 DROP_QUEUE_TABLE Procedure
  23.4.21 DROP_SHARDED_QUEUE Procedure
  23.4.22 ENABLE_DB_ACCESS Procedure
  23.4.23 ENABLE_JMS_TYPES Procedure
  23.4.24 ENABLE_PROPAGATION_SCHEDULE Procedure
  23.4.25 GET_MAX_STREAMS_POOL Procedure
23.4.26 GET_MIN_STREAMS_POOL Procedure 23-29
23.4.27 GET_QUEUE_PARAMETER Procedure 23-30
23.4.28 GET_WATERMARK Procedure 23-32
23.4.29 GRANT_QUEUE_PRIVILEGE Procedure 23-33
23.4.30 GRANT_SYSTEM_PRIVILEGE Procedure 23-33
23.4.31 MIGRATE_QUEUE_TABLE Procedure 23-34
23.4.32 PURGE_QUEUE_TABLE Procedure 23-35
23.4.33 QUEUE_SUBSCRIBERS Function 23-36
23.4.34 REMOVE_SUBSCRIBER Procedure 23-37
23.4.35 REVOKE_QUEUE_PRIVILEGE Procedure 23-37
23.4.36 REVOKE_SYSTEM_PRIVILEGE Procedure 23-38
23.4.37 SCHEDULE_PROPAGATION Procedure 23-38
23.4.38 SET_QUEUE_PARAMETER Procedure 23-40
23.4.39 SET_MAX_STREAMS_POOL Procedure 23-43
23.4.40 SET_MIN_STREAMS_POOL Procedure 23-43
23.4.41 SET_WATERMARK Procedure 23-43
23.4.42 START_QUEUE Procedure 23-44
23.4.43 STOP_QUEUE Procedure 23-44
23.4.44 UNSCHEDULE_PROPAGATION Procedure 23-45
23.4.45 UNSET_QUEUE_PARAMETER Procedure 23-46
23.4.46 VERIFY_QUEUE_TYPES Procedure 23-48

24 DBMS_AQELM

24.1 DBMS_AQELM Security Model 24-1
24.2 Summary of DBMS_AQELM Subprograms 24-1
  24.2.1 SET_MAILHOST Procedure 24-1
  24.2.2 SET_MAILPORT Procedure 24-2
  24.2.3 SET_SENDFROM Procedure 24-2

25 DBMS_AQIN

25.1 DBMS_AQIN Security Model 25-1

26 DBMS_ASSERT

26.1 DBMS_ASSERT Operational Notes 26-1
26.2 Summary of DBMS_ASSERT Subprograms 26-1
  26.2.1 ENQUOTE_LITERAL Function 26-2
  26.2.2 ENQUOTE_NAME Function 26-2
  26.2.3 NOOP Functions 26-4
  26.2.4 QUALIFIED_SQL_NAME Function 26-4
27 DBMS_AUDIT_MGMT

27.1 DBMS_AUDIT_MGMT Overview
27.2 DBMS_AUDIT_MGMT Deprecated Subprograms
27.3 DBMS_AUDIT_MGMT Security Model
27.4 DBMS_AUDIT_MGMT Constants
27.5 DBMS_AUDIT_MGMT Views
27.6 DBMS_AUDIT_MGMT Subprogram Groups
  27.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms
  27.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms
27.7 Summary of DBMS_AUDIT_MGMT Subprograms
  27.7.1 ALTER_PARTITION_INTERVAL Procedure
  27.7.2 CLEAN_AUDIT_TRAIL Procedure
  27.7.3 CLEAR_AUDIT_TRAILPROPERTY Procedure
  27.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure
  27.7.5 CREATE_PURGE_JOB Procedure
  27.7.6 DEINIT_CLEANUP Procedure
  27.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure
  27.7.8 DROP_PURGE_JOB Procedure
  27.7.9 FLUSH_UNIFIED_AUDIT_TRAIL Procedure
  27.7.10 GET_AUDIT_COMMIT_DELAY Function
  27.7.11 GET_AUDIT_TRAILPROPERTY_VALUE Function
  27.7.12 GET_LAST_ARCHIVE_TIMESTAMP Function
  27.7.13 INIT_CLEANUP Procedure
  27.7.14 IS_CLEANUP_INITIALIZED Function
  27.7.15 LOAD_UNIFIED_AUDIT_FILES Procedure
  27.7.16 SET_AUDIT_TRAIL_LOCATION Procedure
  27.7.17 SET_AUDIT_TRAILPROPERTY Procedure
  27.7.18 SET_LAST_ARCHIVE_TIMESTAMP Procedure
  27.7.19 SET_PURGE_JOB_INTERVAL Procedure
  27.7.20 SET_PURGE_JOB_STATUS Procedure
  27.7.21 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure

28 DBMS_AUDIT_UTIL

28.1 DBMS_AUDIT_UTIL Overview
28.2 DBMS_AUDIT_UTIL Security Model

32.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms

32.4.1 DISABLE Procedures
32.4.2 ENABLE Procedures
32.4.3 GET_CLIENT_ATTRIBUTES Procedure
32.4.4 GET_P1_RESOURCES Procedure
32.4.5 OVERRIDE_PRIORITY Procedures
32.4.6 SET_CLIENT_SERVICE Procedure
32.4.7 SET_P1_RESOURCES Procedure

33 DBMS_AW_STATS

33.1 Using DBMS_AW_STATS
33.2 Summary of DBMS_AW_STATS Subprograms

33.2.1 ANALYZE Procedure
33.2.2 CLEAR Procedure

34 DBMS_BLOCKCHAIN_TABLE

34.1 DBMS_BLOCKCHAIN_TABLE Overview
34.2 DBMS_BLOCKCHAIN_TABLE Security Model
34.3 Summary of DBMS_BLOCKCHAIN_TABLE Subprograms

34.3.1 DELETE_EXPIRED_ROWS Procedure
34.3.2 GET_BYTES_FOR_ROW_HASH Procedure
34.3.3 GET_BYTES_FOR_ROW_SIGNATURE Procedure
34.3.4 SIGN_ROW Procedure
34.3.5 VERIFY_ROWS Procedure

35 DBMS_CAPTURE_ADM

35.1 DBMS_CAPTURE_ADM Overview
35.2 DBMS_CAPTURE_ADM Security Model
35.3 Summary of DBMS_CAPTURE_ADM Subprograms

35.3.1 ABORT_GLOBAL_INSTANTIATION Procedure
35.3.2 ABORT_SCHEMA_INSTANTIATION Procedure
35.3.3 ABORT_SYNC_INSTANTIATION Procedure
35.3.4 ABORT_TABLE_INSTANTIATION Procedure
35.3.5 ALTER_CAPTURE Procedure
35.3.6 ALTER_SYNC_CAPTURE Procedure
35.3.7 BUILD Procedure
35.3.8 CREATE_CAPTURE Procedure
35.3.9 CREATE_SYNC_CAPTURE Procedure
35.3.10 DROP_CAPTURE Procedure
35.3.11 INCLUDE.EXTRA_ATTRIBUTE Procedure 35-26
35.3.12 PREPARE_GLOBAL_INSTANTIATION Procedure 35-27
35.3.13 PREPARE_SCHEMA_INSTANTIATION Procedure 35-29
35.3.14 PREPARE_SYNC_INSTANTIATION Function 35-30
35.3.15 PREPARE_TABLE_INSTANTIATION Procedure 35-31
35.3.16 SET_PARAMETER Procedure 35-32
35.3.17 START_CAPTURE Procedure 35-49
35.3.18 STOP_CAPTURE Procedure 35-50

36 DBMS_CLOUD

36.1 DBMS_CLOUD Overview 36-1
36.2 Installing the DBMS_CLOUD Package 36-1
36.3 DBMS_CLOUD Security Model 36-2
36.4 DBMS_CLOUD Exceptions 36-2
36.5 Summary of DBMS_CLOUD Subprograms 36-2
  36.5.1 COPY_DATA Procedure 36-4
  36.5.2 COPY_DATA Procedure for Avro or Parquet Files 36-5
  36.5.3 CREATE_CREDENTIAL Procedure 36-6
  36.5.4 CREATE_EXTERNAL_TABLE Procedure 36-8
  36.5.5 CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files 36-10
  36.5.6 CREATE_EXTERNAL_PART_TABLE Procedure 36-11
  36.5.7 CREATE_HYBRID_PART_TABLE Procedure 36-13
  36.5.8 DELETE_ALL_OPERATIONS Procedure 36-14
  36.5.9 DELETE_FILE Procedure 36-15
  36.5.10 DELETE_OBJECT Procedure 36-15
  36.5.11 DROP_CREDENTIAL Procedure 36-16
  36.5.12 GET_OBJECT Procedure and Function 36-16
  36.5.13 LIST_FILES Function 36-18
  36.5.14 LIST_OBJECTS Function 36-19
  36.5.15 PUT_OBJECT Procedure 36-20
  36.5.16 UPDATE_CREDENTIAL Procedure 36-22
  36.5.17 VALIDATE_EXTERNAL_TABLE Procedure 36-23
  36.5.18 VALIDATE_EXTERNAL_PART_TABLE Procedure 36-24
  36.5.19 VALIDATE_HYBRID_PART_TABLE Procedure 36-25
36.6 DBMS_CLOUD Package File URI Formats 36-26
  36.6.1 Oracle Cloud Infrastructure Object Storage Native URI Format 36-26
  36.6.2 Oracle Cloud Infrastructure Object Storage Swift URI Format 36-27
  36.6.3 Oracle Cloud Infrastructure Object Storage URI Format Using Pre-
       Authenticated Request URL 36-28
  36.6.4 URI Format Using Public URL 36-29
  36.6.5 Oracle Cloud Infrastructure Object Storage Classic URI Format 36-30
36.6.6 Amazon S3 URI Format
36.6.7 Azure Blob Storage URI Format
36.7 DBMS_CLOUD Package Format Options
36.8 DBMS_CLOUD Avro and Parquet Support
  36.8.1 DBMS_CLOUD Package Format Options for Avro or Parquet
  36.8.2 DBMS_CLOUD Package Avro to Oracle Data Type Mapping
  36.8.3 DBMS_CLOUD Package Parquet to Oracle Data Type Mapping
  36.8.4 DBMS_CLOUD Package Avro and Parquet Complex Types
  36.8.5 DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping

37 DBMS_COMPARISON
  37.1 DBMS_COMPARISON Overview
  37.2 DBMS_COMPARISON Security Model
  37.3 DBMS_COMPARISON Constants
  37.4 DBMS_COMPARISON Views
  37.5 DBMS_COMPARISON Operational Notes
  37.6 DBMS_COMPARISON Data Structures
    37.6.1 COMPARISON_TYPE Record Type
  37.7 Summary of DBMS_COMPARISON Subprograms
    37.7.1 COMPARE Function
    37.7.2 CONVERGE Procedure
    37.7.3 CREATE_COMPARISON Procedure
    37.7.4 DROP_COMPARISON Procedure
    37.7.5 PURGE_COMPARISON Procedure
    37.7.6 RECHECK Function

38 DBMS_COMPRESSION
  38.1 DBMS_COMPRESSION Overview
  38.2 DBMS_COMPRESSION Security Model
  38.3 DBMS_COMPRESSION Constants
  38.4 DBMS_COMPRESSION Data Structures
    38.4.1 COMPREC Record Type
    38.4.2 COMPRECLIST Table Type
  38.5 Summary of DBMS_COMPRESSION Subprograms
    38.5.1 GET_COMPRESSION_RATIO Procedure
    38.5.2 GET_COMPRESSION_TYPE Function
39 DBMS_CONNECTION_POOL

39.1 Summary of DBMS_CONNECTION_POOL Subprograms 39-1
   39.1.1 ALTER_PARAM Procedure 39-1
   39.1.2 CONFIGURE_POOL Procedure 39-2
   39.1.3 START_POOL Procedure 39-4
   39.1.4 STOP_POOL Procedure 39-5
   39.1.5 RESTORE_DEFAULTS Procedure 39-5

40 DBMS_CQ_NOTIFICATION

40.1 DBMS_CQ_NOTIFICATION Overview 40-1
40.2 DBMS_CQ_NOTIFICATION Security Model 40-2
40.3 DBMS_CQ_NOTIFICATION Constants 40-2
40.4 DBMS_CQ_NOTIFICATION Operational Notes 40-3
40.5 DBMS_CQ_NOTIFICATION Examples 40-4
40.6 DBMS_CQ_NOTIFICATION Data Structures 40-11
   40.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type 40-11
   40.6.2 CQ_NOTIFICATION$_QUERY Object Type 40-12
   40.6.3 CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type 40-13
   40.6.4 CQ_NOTIFICATION$_TABLE Object Type 40-13
   40.6.5 CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type 40-14
   40.6.6 CQ_NOTIFICATION$_ROW Object Type 40-14
   40.6.7 CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type 40-14
   40.6.8 CQ_NOTIFICATION$_REG_INFO Object Type 40-15
40.7 Summary of DBMS_CQ_NOTIFICATION Subprograms 40-17
   40.7.1 CQ_NOTIFICATION_QUERYID Function 40-18
   40.7.2 DEREGISTER Procedure 40-18
   40.7.3 ENABLE_REG Procedure 40-19
   40.7.4 NEW_REG_START Function 40-19
   40.7.5 REG_END Procedure 40-20
   40.7.6 SET_ROWID_THRESHOLD Procedure 40-20

41 DBMS_CREDENTIAL

41.1 DBMS_CREDENTIAL Overview 41-1
41.2 DBMS_CREDENTIAL Security Model 41-1
41.3 DBMS_CREDENTIAL Operational Notes 41-2
41.4 Summary of DBMS_CREDENTIAL Subprograms 41-2
   41.4.1 CREATE_CREDENTIAL Procedure 41-3
   41.4.2 DISABLE_CREDENTIAL Procedure 41-5
   41.4.3 DROP_CREDENTIAL Procedure 41-5
## 42 DBMS_CRYPTO

- **42.1 DBMS_CRYPTO Overview** 42-1
- **42.2 DBMS_CRYPTO Security Model** 42-2
- **42.3 DBMS_CRYPTO Datatypes** 42-2
- **42.4 DBMS_CRYPTO Algorithms** 42-3
- **42.5 DBMS_CRYPTO Restrictions** 42-4
- **42.6 DBMS_CRYPTO Exceptions** 42-5
- **42.7 DBMS_CRYPTO Operational Notes** 42-5
- **42.8 DBMS_CRYPTO Examples** 42-7
- **42.9 Summary of DBMS_CRYPTO Subprograms** 42-8
  - **42.9.1 DECRYPT Function** 42-9
  - **42.9.2 DECRYPT Procedures** 42-10
  - **42.9.3 ENCRYPT Function** 42-10
  - **42.9.4 ENCRYPT Procedures** 42-11
  - **42.9.5 HASH Function** 42-12
  - **42.9.6 MAC Function** 42-13
  - **42.9.7 PKDECRYPT Function** 42-14
  - **42.9.8 PKENCRYPT Function** 42-14
  - **42.9.9 RANDOMBYTES Function** 42-15
  - **42.9.10 RANDOMINTEGER Function** 42-15
  - **42.9.11 RANDOMNUMBER Function** 42-16
  - **42.9.12 SIGN Function** 42-16
  - **42.9.13 VERIFY Function** 42-17

## 43 DBMS_CSX_ADMIN

- **43.1 DBMS_CSX_ADMIN Overview** 43-1
- **43.2 DBMS_CSX_ADMIN Security Model** 43-1
- **43.3 DBMS_CSX_ADMIN Constants** 43-1
- **43.4 Summary of DBMS_CSX_ADMIN Subprograms** 43-2
  - **43.4.1 GETTOKENTABLEINFO Procedure & Function** 43-2
  - **43.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure** 43-3
  - **43.4.3 NAMESPACEIDTABLE Function** 43-4
  - **43.4.4 PATHIDTABLE Function** 43-4
  - **43.4.5 QNAMEIDTABLE Function** 43-4
44  DBMS_CUBE

44.1 Using DBMS_CUBE 44-1
  44.1.1 DBMS_CUBE Security Model 44-2
44.2 Using SQL Aggregation Management 44-2
  44.2.1 Subprograms in SQL Aggregation Management 44-3
  44.2.2 Requirements for the Relational Materialized View 44-3
  44.2.3 Permissions for Managing and Querying Cube Materialized Views 44-4
  44.2.4 Example of SQL Aggregation Management 44-4
44.3 Upgrading 10g Analytic Workspaces 44-8
44.4 Summary of DBMS_CUBE Subprograms 44-13
  44.4.1 BUILD Procedure 44-14
  44.4.2 CREATE_EXPORT_OPTIONS Procedure 44-26
  44.4.3 CREATE_IMPORT_OPTIONS Procedure 44-29
  44.4.4 CREATE_MVIEW Function 44-30
  44.4.5 DERIVE_FROM_MVIEW Function 44-35
  44.4.6 DROP_MVIEW Procedure 44-36
  44.4.7 EXPORT_XML Procedure 44-38
  44.4.8 EXPORT_XML_TO_FILE Procedure 44-40
  44.4.9 IMPORT_XML Procedure 44-42
  44.4.10 INITIALIZE_CUBE_UPGRADE Procedure 44-44
  44.4.11 REFRESH_MVIEW Procedure 44-46
  44.4.12 UPGRADE_AW Procedure 44-48
  44.4.13 VALIDATE_XML Procedure 44-49

45  DBMS_CUBE_ADVISE

45.1 DBMS_CUBE_ADVISE Security Model 45-1
45.2 Summary of DBMS_CUBE_ADVISE Subprograms 45-1
  45.2.1 MV_CUBE_ADVICE Function 45-1
  45.2.2 SET_CNS_EXCEPTION_LOG Procedure 45-4
  45.2.3 TRACE Procedure 45-5

46  DBMS_CUBE_LOG

46.1 Using DBMS_CUBE_LOG 46-1
  46.1.1 DBMS_CUBE_LOG — Logging Types 46-2
  46.1.2 DBMS_CUBE_LOG — Logging Targets 46-2
  46.1.3 DBMS_CUBE_LOG — Verbosity Levels 46-3
  46.1.4 DBMS_CUBE_LOG Security Model 46-3
  46.1.5 DBMS_CUBE_LOG — Creating Cube Logs 46-3
  46.1.6 DBMS_CUBE_LOG — Cube Build Log 46-4
Chapter 46 DBMS_CUBE_LOG

46.1 DBMS_CUBE_LOG Subprograms
46.1.7 DBMS_CUBE_LOG — Cube Dimension Compile Log
46.1.8 DBMS_CUBE_LOG — Cube Operations Log
46.1.9 DBMS_CUBE_LOG — Cube Rejected Records Log

46.2 Summary of DBMS_CUBE_LOG Subprograms
46.2.1 DEFAULT_NAME Function
46.2.2 DISABLE Procedure
46.2.3 ENABLE Procedure
46.2.4 FLUSH Procedure
46.2.5 GET_LOG Procedure
46.2.6 GET_LOG_SPEC Function
46.2.7 GET_PARAMETER Function
46.2.8 LEVEL_HIGH Function
46.2.9 LEVEL_HIGHEST Function
46.2.10 LEVEL_LOW Function
46.2.11 LEVEL_LOWEST Function
46.2.12 LEVEL_MEDIUM Function
46.2.13 SET_LOG_SPEC Procedure
46.2.14 SET_PARAMETER Procedure
46.2.15 TABLE_CREATE Procedure
46.2.16 TARGET_FILE Function
46.2.17 TARGET_LOB Function
46.2.18 TARGET_TABLE Function
46.2.19 TARGET_TRACE Function
46.2.20 TYPE_BUILD Function
46.2.21 TYPE_DIMENSION_COMPILE Function
46.2.22 TYPE_OPERATIONS Function
46.2.23 TYPE_REJECTED_RECORDS Function
46.2.24 VERSION Function

Chapter 47 DBMS_DATA_MINING

47.1 DBMS_DATA_MINING Overview
47.2 DBMS_DATA_MINING Security Model
47.3 DBMS_DATA_MINING — Mining Functions
47.4 DBMS_DATA_MINING — Model Settings
47.4.1 DBMS_DATA_MINING — Algorithm Names
47.4.2 DBMS_DATA_MINING — Automatic Data Preparation
47.4.3 DBMS_DATA_MINING — Mining Function Settings
47.4.4 DBMS_DATA_MINING — Global Settings
47.4.5 DBMS_DATA_MINING — Algorithm Settings: ALGO_EXTENSIBLE_LANG
47.4.6 DBMS_DATA_MINING — Algorithm Settings: CUR Matrix Decomposition
47.4.7 DBMS_DATA_MINING — Algorithm Settings: Decision Tree 47-17
47.4.8 DBMS_DATA_MINING — Algorithm Settings: Expectation Maximization 47-18
47.4.9 DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis 47-22
47.4.10 DBMS_DATA_MINING — Algorithm Settings: Exponential Smoothing 47-22
47.4.11 DBMS_DATA_MINING — Algorithm Settings: Generalized Linear Models 47-26
47.4.12 DBMS_DATA_MINING — Algorithm Settings: k-Means 47-29
47.4.13 DBMS_DATA_MINING — Algorithm Settings: Naive Bayes 47-30
47.4.14 DBMS_DATA_MINING — Algorithm Settings: Neural Network 47-30
47.4.15 DBMS_DATA_MINING — Algorithm Settings: Non-Negative Matrix Factorization 47-33
47.4.16 DBMS_DATA_MINING — Algorithm Settings: O-Cluster 47-33
47.4.17 DBMS_DATA_MINING — Algorithm Settings: Random Forest 47-34
47.4.18 DBMS_DATA_MINING — Algorithm Constants and Settings: Singular Value Decomposition 47-35
47.4.19 DBMS_DATA_MINING — Algorithm Settings: Support Vector Machine 47-37
47.5 DBMS_DATA_MINING — Solver Settings 47-38
  47.5.1 DBMS_DATA_MINING — Solver Settings: ADMM 47-38
  47.5.2 DBMS_DATA_MINING — Solver Settings: LBFGS 47-39
47.6 DBMS_DATA_MINING Datatypes 47-39
  47.6.1 Deprecated Types 47-40
47.7 Summary of DBMS_DATA_MINING Subprograms 47-45
  47.7.1 ADD_COST_MATRIX Procedure 47-47
  47.7.2 ADD_PARTITION Procedure 47-50
  47.7.3 ALTER_REVERSE_EXPRESSION Procedure 47-51
  47.7.4 APPLY Procedure 47-54
  47.7.5 COMPUTE_CONFUSION_MATRIX Procedure 47-58
  47.7.6 COMPUTE_CONFUSION_MATRIX_PART Procedure 47-64
  47.7.7 COMPUTE_LIFT Procedure 47-70
  47.7.8 COMPUTE_LIFT_PART Procedure 47-75
  47.7.9 COMPUTE_ROC Procedure 47-80
  47.7.10 COMPUTE_ROC_PART Procedure 47-85
  47.7.11 CREATE_MODEL Procedure 47-89
  47.7.12 CREATE_MODEL2 Procedure 47-93
  47.7.13 Create Model Using Registration Information 47-95
  47.7.14 DROP_ALGORITHM Procedure 47-96
  47.7.15 DROP_PARTITION Procedure 47-96
  47.7.16 DROP_MODEL Procedure 47-97
  47.7.17 EXPORT_MODEL Procedure 47-97
  47.7.18 EXPORT_SERMODEL Procedure 47-100
  47.7.19 FETCH_JSON_SCHEMA Procedure 47-101
  47.7.20 GET_ASSOCIATION_RULES Function 47-102
  47.7.21 GET_FREQUENT_ITEMSETS Function 47-107
47.7.22 GET_MODEL_COST_MATRIX Function 47-109
47.7.23 GET_MODELDETAILS_AI Function 47-111
47.7.24 GET_MODELDETAILS_EM Function 47-112
47.7.25 GET_MODELDETAILS_EM_COMP Function 47-113
47.7.26 GET_MODELDETAILS_EM_PROJ Function 47-116
47.7.27 GET_MODELDETAILS_GLM Function 47-117
47.7.28 GET_MODELDETAILS_GLOBAL Function 47-120
47.7.29 GET_MODELDETAILS_KM Function 47-122
47.7.30 GET_MODELDETAILS_NB Function 47-124
47.7.31 GET_MODELDETAILS_NMF Function 47-126
47.7.32 GET_MODELDETAILS_OC Function 47-127
47.7.33 GET_MODEL_SETTINGS Function 47-129
47.7.34 GET_MODEL_SIGNATURE Function 47-130
47.7.35 GET_MODELDETAILS_SVD Function 47-132
47.7.36 GET_MODELDETAILS_SVM Function 47-134
47.7.37 GET_MODELDETAILS_XML Function 47-136
47.7.38 GET_MODELTRANSFORMATIONS Function 47-139
47.7.39 GET_TRANSFORMLIST Procedure 47-141
47.7.40 IMPORT_MODEL Procedure 47-144
47.7.41 IMPORT_SERMODEL Procedure 47-149
47.7.42 JSON Schema for R Extensible Algorithm 47-150
47.7.43 REGISTER_ALGORITHM Procedure 47-154
47.7.44 RANK_APPLY Procedure 47-155
47.7.45 REMOVE_COST_MATRIX Procedure 47-158
47.7.46 RENAME_MODEL Procedure 47-159

48 DBMS_DATA_MINING_TRANSFORM

48.1 DBMS_DATA_MINING_TRANSFORM Overview 48-1
48.2 DBMS_DATA_MINING_TRANSFORM Operational Notes 48-4
  48.2.1 DBMS_DATA_MINING_TRANSFORM — About Transformation Lists 48-6
  48.2.2 DBMS_DATA_MINING_TRANSFORM — About Stacking and Stack Procedures 48-8
  48.2.3 DBMS_DATA_MINING_TRANSFORM — Nested Data Transformations 48-9
48.3 DBMS_DATA_MINING_TRANSFORM Security Model 48-13
48.4 DBMS_DATA_MINING_TRANSFORM Datatypes 48-13
48.5 DBMS_DATA_MINING_TRANSFORM Constants 48-15
48.6 Summary of DBMS_DATA_MINING_TRANSFORM Subprograms 48-16
  48.6.1 CREATE_BIN_CAT Procedure 48-18
  48.6.2 CREATE_BIN_NUM Procedure 48-19
  48.6.3 CREATE_CLIP Procedure 48-21
  48.6.4 CREATE_COL_REM Procedure 48-23
48.6.5 CREATE_MISS_CAT Procedure
48.6.6 CREATE_MISS_NUM Procedure
48.6.7 CREATE_NORM_LIN Procedure
48.6.8 DESCRIBE_STACK Procedure
48.6.9 GET_EXPRESSION Function
48.6.10 INSERT_AUTOBIN_NUM_EQWIDTH Procedure
48.6.11 INSERT_BIN_CAT_FREQ Procedure
48.6.12 INSERT_BIN_NUM_EQWIDTH Procedure
48.6.13 INSERT_BIN_NUM_QTILE Procedure
48.6.14 INSERT_BIN_SUPER Procedure
48.6.15 INSERT_CLIP_TRIM_TAIL Procedure
48.6.16 INSERT_CLIP_WINSOR_TAIL Procedure
48.6.17 INSERT_MISS_CAT_MODE Procedure
48.6.18 INSERT_MISS_NUM_MEAN Procedure
48.6.19 INSERT_NORM_LIN_MINMAX Procedure
48.6.20 INSERT_NORM_LIN_SCALE Procedure
48.6.21 INSERT_NORM_LIN_ZSCORE Procedure
48.6.22 SET_EXPRESSION Procedure
48.6.23 SET_TRANSFORM Procedure
48.6.24 STACK_BIN_CAT Procedure
48.6.25 STACK_BIN_NUM Procedure
48.6.26 STACK_CLIP Procedure
48.6.27 STACK_COL_REM Procedure
48.6.28 STACK_MISS_CAT Procedure
48.6.29 STACK_MISS_NUM Procedure
48.6.30 STACK_NORM_LIN Procedure
48.6.31 XFORM_BIN_CAT Procedure
48.6.32 XFORM_BIN_NUM Procedure
48.6.33 XFORM_CLIP Procedure
48.6.34 XFORM_COL_REM Procedure
48.6.35 XFORM_EXPR_NUM Procedure
48.6.36 XFORM_EXPR_STR Procedure
48.6.37 XFORM_MISS_CAT Procedure
48.6.38 XFORM_MISS_NUM Procedure
48.6.39 XFORM_NORM_LIN Procedure
48.6.40 XFORM_STACK Procedure

49 DBMS_DATAPUMP

49.1 DBMS_DATAPUMP Overview
49.2 DBMS_DATAPUMP Security Model
52.6.1 DBMS_DBFS_CONTENT FEATURE_T Record Type
52.6.2 DBMS_DBFS_CONTENT MOUNT_T Record Type
52.6.3 DBMS_DBFS_CONTENT PATH_ITEM_T Record Type
52.6.4 DBMS_DBFS_CONTENT PROP_ITEM_T Record Type
52.6.5 PROPERTY_T Record Type
52.6.6 DBMS_DBFS_CONTENT STORE_T Record Type
52.6.7 DBMS_DBFS_CONTENT FEATURES_T Table Type
52.6.8 MOUNTS_T Table Type
52.6.9 DBMS_DBFS_CONTENT PATH_ITEMS_T Table Type
52.6.10 DBMS_DBFS_CONTENT PROP_ITEMS_T Table Type
52.6.11 DBMS_DBFS_CONTENT PROPERTIES_T Table Type
52.6.12 STORES_T Table Type
52.7 Summary of DBMS_DBFS_CONTENT Subprograms
52.7.1 CHECKACCESS Function
52.7.2 CHECKSPI Functions and Procedures
52.7.3 CREATEDIRECTORY Procedures
52.7.4 CREATEFILE Procedures
52.7.5 CREATELINK Procedures
52.7.6 CREATREFERENCE Procedures
52.7.7 DECODEFEATURES Function
52.7.8 DELETECONTENT Procedure
52.7.9 DELETEDIRECTORY Procedure
52.7.10 DELETEFILE Procedure
52.7.11 FEATURENAME Function
52.7.12 FLUSHSTATS Function
52.7.13 GETDEFAULTACL Procedure
52.7.14 GETDEFAULTASOF Procedure
52.7.15 GETDEFAULTCONTEXT Procedure
52.7.16 GETDEFAULTOWNER Procedure
52.7.17 GETDEFAULTPRINCIPAL Procedure
52.7.18 GETFEATURESBY Mount Function
52.7.19 GETFEATURESBYNAME Function
52.7.20 GETFEATURESBYPATH Function
52.7.21 GETPATH Procedures
52.7.22 GETPATHBMMOUNTID Function
52.7.23 GETPATHBSTOREID Function
52.7.24 GETPATHNOWAIT Procedures
52.7.25 GETSTOREBY Mount Function
52.7.26 GETSTOREBYNAME Function
52.7.27 GETSTOREBYPATH Function
52.7.28 GETSTATS Procedure
52.7.29 GETTRACE Function 52-43
52.7.30 GETVERSION Function 52-43
52.7.31 ISPATHLOCKED Procedure 52-44
52.7.32 LIST Function 52-44
52.7.33 LISTALLPROPERTIES Function 52-45
52.7.34 LISTALLCONTENT Function 52-45
52.7.35 LISTMOUNTS Function 52-45
52.7.36 LISTSTORES Function 52-46
52.7.37 LOCKPATH Procedure 52-46
52.7.38 MOUNTSTORE Procedure 52-47
52.7.39 NORMALIZEPATH Functions 52-47
52.7.40 PROPANY Functions 52-48
52.7.41 PROPERTIESH2T Function 52-49
52.7.42 PROPERTIEST2H Function 52-49
52.7.43 PROPNUMBER Function 52-50
52.7.44 PROPRAW Function 52-50
52.7.45 PROPTIMESTAMP Function 52-51
52.7.46 PROPVARCHAR2 Function 52-51
52.7.47 PURGEALL Procedure 52-51
52.7.48 PURGEPATH Procedure 52-52
52.7.49 PUTPATH Procedures 52-52
52.7.50 REGISTERSTORE Procedure 52-54
52.7.51 RENAMEPATH Procedures 52-55
52.7.52 RESTOREALL Procedure 52-55
52.7.53 RESTOREPATH Procedure 52-56
52.7.54 SETDEFAULTACL Procedure 52-56
52.7.55 SETDEFAULTASOF Procedure 52-57
52.7.56 SETDEFAULTCONTEXT Procedure 52-57
52.7.57 SETDEFAULTOWNER Procedure 52-58
52.7.58 SETDEFAULTPRINCIPAL Procedure 52-59
52.7.59 SETPATH Procedures 52-59
52.7.60 SETSTATS Procedure 52-60
52.7.61 SETTRACE Procedure 52-61
52.7.62 SPACEUSAGE Procedure 52-61
52.7.63 TRACE Procedure 52-61
52.7.64 TRACEENABLED Function 52-63
52.7.65 UNLOCKPATH Procedure 52-63
52.7.66 UNMOUNTSTORE Procedure 52-64
52.7.67 UNREGISTERSTORE Procedure 52-65

85 DBMS_HS_PASSTHROUGH

85.1 DBMS_HS_PASSTHROUGH Overview

85.2 DBMS_HS_PASSTHROUGH Operational Notes

85.3 Summary of DBMS_HS_PASSTHROUGH Subprograms

85.3.1 BIND_INOUT_VARIABLE Procedure

85.3.2 BIND_INOUT_VARIABLE_RAW Procedure

85.3.3 BIND_OUT_VARIABLE Procedure

85.3.4 BIND_OUT_VARIABLE_RAW Procedure

85.3.5 BIND_VARIABLE Procedure

85.3.6 BIND_VARIABLE_RAW Procedure

85.3.7 CLOSE_CURSOR Procedure

85.3.8 EXECUTE_IMMEDIATE Procedure

85.3.9 EXECUTE_NON_QUERY Function

85.3.10 FETCH_ROW Function

85.3.11 GET_VALUE Procedure
86  DBMS_ILM

86.1  DBMS_ILM Overview 86-1
86.2  DBMS_ILM Security Model 86-2
86.3  DBMS_ILM Constants 86-2
86.4  DBMS_ILM Exceptions 86-2
86.5  Summary of DBMS_ILM Subprograms 86-3
   86.5.1  ADD_TO_ILM Procedure 86-3
   86.5.2  ARCHIVESTATENAME Function 86-4
   86.5.3  EXECUTE_ILM Procedure 86-4
   86.5.4  EXECUTE_ILM_TASK Procedure 86-5
   86.5.5  PREVIEW_ILM Procedure 86-6
   86.5.6  REMOVE_FROM_ILM Procedure 86-6
   86.5.7  STOP_ILM Procedure 86-7

87  DBMS_ILM_ADMIN

87.1  DBMS_ILM_ADMIN Overview 87-1
87.2  DBMS_ILM_ADMIN Security Model 87-1
87.3  DBMS_ILM_ADMIN Constants 87-1
87.4  Summary of DBMS_ILM_ADMIN Subprograms 87-3
   87.4.1  CLEAR_HEAT_MAP_ALL Procedure 87-3
   87.4.2  CLEAR_HEAT_MAP_TABLE Procedure 87-4
   87.4.3  CUSTOMIZE_ILM Procedure 87-4
   87.4.4  DISABLE_ILM Procedure 87-5
   87.4.5  ENABLE_ILM Procedure 87-5
   87.4.6  SET_HEAT_MAP_ALL Procedure 87-5
   87.4.7  SET_HEAT_MAP_START Procedure 87-5
   87.4.8  SET_HEAT_MAP_TABLE Procedure 87-6

88  DBMS_IMMUTABLE_TABLE

88.1  DBMS_IMMUTABLE_TABLE Overview 88-1
88.2  DBMS_IMMUTABLE_TABLE Security Model 88-1
88.3  Summary of DBMS_IMMUTABLE_TABLE Subprograms 88-1
   88.3.1  DELETE_EXPIRED_ROWS Procedure 88-2
## DBMS_INMEMORY

89.1 DBMS_INMEMORY Overview 89-1
89.2 DBMS_INMEMORY Security Model 89-2
89.3 Summary of DBMS_INMEMORY Subprograms 89-2
  89.3.1 IME_DROP_EXPRESSIONS Procedure 89-2
  89.3.2 POPULATE Procedure 89-3
  89.3.3 REPOPULATE Procedure 89-4
  89.3.4 SEGMENT DEALLOCATE VERSIONS Procedure 89-4

## DBMS_INMEMORY_ADMIN

90.1 DBMS_INMEMORY_ADMIN Overview 90-1
90.2 DBMS_INMEMORY_ADMIN Security Model 90-3
90.3 DBMS_INMEMORY_ADMIN Operational Notes 90-3
90.4 Summary of DBMS_INMEMORY_ADMIN Subprograms 90-3
  90.4.1 AIM_GET_PARAMETER Procedure 90-4
  90.4.2 AIM_SET_PARAMETER Procedure 90-5
  90.4.3 FASTSTART_DISABLE Procedure 90-6
  90.4.4 FASTSTART_ENABLE Procedure 90-7
  90.4.5 FASTSTART_MIGRATE_STORAGE Procedure 90-9
  90.4.6 GET_FASTSTART_TABLESPACE Function 90-10
  90.4.7 IME_CAPTURE_EXPRESSIONS Procedure 90-11
  90.4.8 IME_CLOSE_CAPTURE_WINDOW Procedure 90-13
  90.4.9 IME_DROP_ALL_EXPRESSIONS Procedure 90-14
  90.4.10 IME_GET_CAPTURE_STATE Procedure 90-14
  90.4.11 IME_OPEN_CAPTURE_WINDOW Procedure 90-15
  90.4.12 IME_POPULATE_EXPRESSIONS Procedure 90-16
  90.4.13 POPULATE_WAIT Function 90-16

## DBMS_IOT

91.1 Summary of DBMS_IOT Subprograms 91-1
  91.1.1 BUILD_CHAIN_ROWS_TABLE Procedure 91-1
  91.1.2 BUILD_EXCEPTIONS_TABLE Procedure 91-2

### DBMS_PARALLEL_EXECUTE

120.1 DBMS_PARALLEL_EXECUTE Overview 120-1
120.2 DBMS_PARALLEL_EXECUTE Security Model 120-1
120.3 DBMS_PARALLEL_EXECUTE Constants 120-2
120.4 DBMS_PARALLEL_EXECUTE Views 120-3
120.5 DBMS_PARALLEL_EXECUTE Exceptions 120-3
120.6 DBMS_PARALLEL_EXECUTE Examples 120-3
120.7 Summary of DBMS_PARALLEL_EXECUTE Subprograms 120-6
  120.7.1 ADM_DROP_CHUNKS Procedure 120-7
  120.7.2 ADM_DROP_TASK Procedure 120-7
  120.7.3 ADM_TASK_STATUS Function 120-8
  120.7.4 ADM_STOP_TASK Procedure 120-8
  120.7.5 CREATE_TASK Procedure 120-9
  120.7.6 CREATE CHUNKS BY NUMBER_COL Procedure 120-9
  120.7.7 CREATE CHUNKS BY ROWID Procedure 120-10
  120.7.8 CREATE CHUNKS BY_SQL Procedure 120-10
  120.7.9 DROP_TASK Procedure 120-11
  120.7.10 DROP_CHUNKS Procedure 120-11
  120.7.11 GENERATE_TASK_NAME Function 120-11
  120.7.12 GET_NUMBER_COL_CHUNK Procedure 120-12
  120.7.13 GET_ROWID_CHUNK Procedure 120-13
  120.7.14 PURGE_PROCESSED_CHUNKS Procedure 120-14
  120.7.15 RESUME_TASK Procedures 120-14
  120.7.16 RUN_TASK Procedure 120-16
  120.7.17 SET CHUNK_STATUS Procedure 120-18
  120.7.18 STOP_TASK Procedure 120-18
  120.7.19 TASK_STATUS Procedure 120-19

### DBMS_PART

121.1 DBMS_PART Security Model 121-1
121.2 DBMS_PART Operational Notes 121-1
121.3 Summary of DBMS_PART Subprograms 121-1
## DBMS_PCLXUTIL

122.1 DBMS_PCLXUTIL Overview

122.2 DBMS_PCLXUTIL Security Model

122.3 DBMS_PCLXUTIL Operational Notes

122.4 DBMS_PCLXUTIL Rules and Limits

122.5 Summary of DBMS_PCLXUTIL Subprograms

122.5.1 BUILD_PART_INDEX Procedure

## DBMS_PDB

123.1 DBMS_PDB Overview

123.2 DBMS_PDB Security Model

123.3 Summary of DBMS_PDB Subprograms

123.3.1 CHECK_PLUG_COMPATIBILITY Function

123.3.2 DESCRIBE Procedure

123.3.3 EXPORTRMANBACKUP Procedure

123.3.4 RECOVER Procedure

123.3.5 REMOVE_LINK Procedure

123.3.6 SET_DATA_LINKED Procedure

123.3.7 SET_EXT_DATA_LINKED Procedure

123.3.8 SET_METADATA_LINKED Procedure

123.3.9 SET_PROFILE_EXPLICIT Procedure

123.3.10 SET_ROLE_EXPLICIT Procedure

123.3.11 SET_USER_EXPLICIT Procedure

## DBMS_PDB_ALTER_SHARING

124.1 DBMS_PDB_ALTER_SHARING Overview

124.2 DBMS_PDB_ALTER_SHARING Security Model

124.3 Summary of DBMS_PDB_ALTER_SHARING Subprograms

124.3.1 REMOVE_LINK Procedure

124.3.2 SET_DATA_LINKED Procedure

124.3.3 SET_EXT_DATA_LINKED Procedure

124.3.4 SET_METADATA_LINKED Procedure

124.3.5 SET_PROFILE_EXPLICIT Procedure

124.3.6 SET_ROLE_EXPLICIT Procedure
125 DBMS_PERF

125.1 DBMS_PERF Overview
125.2 DBMS_PERF Security Model
125.3 Summary of DBMS_PERF Subprograms
   125.3.1 REPORT_PERFHUB Function
   125.3.2 REPORT_SESSION Function
   125.3.3 REPORT_SQL Function

126 DBMS_PIPE

126.1 DBMS_PIPE Overview
126.2 DBMS_PIPE Security Model
126.3 DBMS_PIPE Constants
126.4 DBMS_PIPE Operational Notes
126.5 DBMS_PIPE Exceptions
126.6 DBMS_PIPE Examples
126.7 Summary of DBMS_PIPE Subprograms
   126.7.1 CREATE_PIPE Function
   126.7.2 NEXT_ITEM_TYPE Function
   126.7.3 PACK_MESSAGE Procedures
   126.7.4 PURGE Procedure
   126.7.5 RECEIVE_MESSAGE Function
   126.7.6 RESET_BUFFER Procedure
   126.7.7 REMOVE_PIPE Function
   126.7.8 SEND_MESSAGE Function
   126.7.9 UNIQUE_SESSION_NAME Function
   126.7.10 UNPACK_MESSAGE Procedures

127 DBMS_PLSQL_CODE_COVERAGE

127.1 DBMS_PLSQL_CODE_COVERAGE Overview
127.2 DBMS_PLSQL_CODE_COVERAGE Security Model
127.3 Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms
   127.3.1 CREATE_COVERAGE_TABLES Procedure
   127.3.2 START_COVERAGE Function
   127.3.3 STOP_COVERAGE Procedure
### DBMS_Predictive_Analytics

128.1 DBMS_Predictive_Analytics Overview 128-1
128.2 DBMS_Predictive_Analytics Security Model 128-1
128.3 Summary of DBMS_Predictive_Analytics Subprograms 128-2
  128.3.1 EXPLAIN Procedure 128-2
  128.3.2 PREDICT Procedure 128-4
  128.3.3 PROFILE Procedure 128-6

### DBMS_Preprocessor

129.1 DBMS_Preprocessor Overview 129-1
129.2 DBMS_Preprocessor Operating Notes 129-1
129.3 DBMS_Preprocessor Data Structures 129-2
  129.3.1 DBMS_Preprocessor SOURCE_LINES_T Table Type 129-2
129.4 Summary of DBMS_Preprocessor Subprograms 129-3
  129.4.1 GET_POST_PROCESSED_SOURCE Functions 129-3
  129.4.2 PRINT_POST_PROCESSED_SOURCE Procedures 129-4

### DBMS_Privilege_Capture

130.1 DBMS_Privilege_Capture Overview 130-1
130.2 DBMS_Privilege_Capture Security Model 130-1
130.3 DBMS_Privilege_Capture Constants 130-1
130.4 DBMS_Privilege_Capture Examples 130-2
130.5 Summary of DBMS_Privilege_Capture Subprograms 130-3
  130.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure 130-3
  130.5.2 CREATE_CAPTURE Procedure 130-4
  130.5.3 DELETE_RUN Procedure 130-5
  130.5.4 DISABLE_CAPTURE Procedure 130-5
  130.5.5 DROP_CAPTURE Procedure 130-6
  130.5.6 ENABLE_CAPTURE Procedure 130-6
  130.5.7 GENERATE_RESULT Procedure 130-7

### DBMS_Process

131.1 DBMS_Process Overview 131-1
131.2 DBMS_Process Security Model 131-1
131.3 Summary of DBMS_Process Subprograms 131-2
  131.3.1 CONFIGURE_POOL Procedure 131-2
  131.3.2 START_POOL Procedure 131-3
134.5.8 GET_OPATCH_LSINVENTORY 134-5
134.5.9 GET_OPATCH_OLAYS Function 134-6
134.5.10 GET_OPATCH_PREQS Function 134-6
134.5.11 GET_OPATCH_XSLT 134-6
134.5.12 GET_PATCH_DETAILS Function 134-6
134.5.13 GET_SQLPATCH_STATUS Procedure 134-7
134.5.14 IS_PATCH_INSTALLED Function 134-7
134.5.15 OPATCH_COMPARE_CURRENT Function 134-8
134.5.16 OPATCH_COMPARE_NODES Function 134-8
134.5.17 SET_CURRENT_OPINST Procedure 134-8

135 DBMS_RANDOM

135.1 DBMS_RANDOM Deprecated Subprograms 135-1
135.2 DBMS_RANDOM Security Model 135-1
135.3 DBMS_RANDOM Operational Notes 135-1
135.4 Summary of DBMS_RANDOM Subprograms 135-2
  135.4.1 INITIALIZE Procedure 135-2
  135.4.2 NORMAL Function 135-3
  135.4.3 RANDOM Function 135-3
  135.4.4 SEED Procedures 135-4
  135.4.5 STRING Function 135-4
  135.4.6 TERMINATE Procedure 135-5
  135.4.7 VALUE Functions 135-5

136 DBMS_REDACT

136.1 DBMS_REDACT Overview 136-1
136.2 DBMS_REDACT Security Model 136-1
136.3 DBMS_REDACT Constants 136-2
136.4 DBMS_REDACT Operating Procedures 136-3
136.5 Summary of DBMS_REDACT Subprograms 136-7
  136.5.1 ADD_POLICY Procedure 136-7
  136.5.2 ALTER_POLICY Procedure 136-13
  136.5.3 APPLY_POLICY_EXPR_TO_COL Procedure 136-18
  136.5.4 CREATE_POLICY_EXPRESSION Procedure 136-19
  136.5.5 DISABLE_POLICY Procedure 136-20
  136.5.6 DROP_POLICY Procedure 136-21
  136.5.7 DROP_POLICY_EXPRESSION Procedure 136-22
  136.5.8 ENABLE_POLICY Procedure 136-22
  136.5.9 UPDATE_FULL_REDACTION_VALUES Procedure 136-23
139.3 DBMS_REPAIR Constants 139-1
139.4 DBMS_REPAIR Operating Notes 139-2
139.5 DBMS_REPAIR Exceptions 139-3
139.6 DBMS_REPAIR Examples 139-4
139.7 Summary of DBMS_REPAIR Subprograms 139-4
  139.7.1 ADMIN_TABLES Procedure 139-5
  139.7.2 CHECK_OBJECT Procedure 139-5
  139.7.3 DUMP_ORPHAN_KEYS Procedure 139-7
  139.7.4 FIX_CORRUPT_BLOCKS Procedure 139-8
  139.7.5 ONLINE_INDEX_CLEAN Function 139-9
  139.7.6 REBUILD_FREELISTS Procedure 139-9
  139.7.7 SEGMENT_FIX_STATUS Procedure 139-10
  139.7.8 SKIP_CORRUPT_BLOCKS Procedure 139-11

140 DBMS_RESCONFIG

140.1 DBMS_RESCONFIG Overview 140-1
140.2 Summary of DBMS_RESCONFIG Subprograms 140-1
  140.2.1 ADDREPOSITORYRESCONFIG Procedure 140-2
  140.2.2 ADDRESCONFIG Procedure 140-2
  140.2.3 APPENDRESCONFIG Procedure 140-3
  140.2.4 DELETEREPOSITORYRESCONFIG Procedure 140-4
  140.2.5 DELETERESCONFIG Procedures 140-4
  140.2.6 GETLISTENERS Function 140-5
  140.2.7 GETREPOSITORYRESCONFIG Function 140-6
  140.2.8 GETREPOSITORYRESCONFIGPATHS Function 140-6
  140.2.9 GETRESCONFIG Function 140-6
  140.2.10 GETRESCONFIGPATHS Function 140-7
  140.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure 140-7

141 DBMS_RESOURCE_MANAGER

141.1 DBMS_RESOURCE_MANAGER Deprecated Subprograms 141-1
141.2 DBMS_RESOURCE_MANAGER Security Model 141-1
141.3 DBMS_RESOURCE_MANAGER Constants 141-2
141.4 Summary of DBMS_RESOURCE_MANAGER Subprograms 141-3
  141.4.1 BEGIN_SQL_BLOCK Procedure 141-5
  141.4.2 CALIBRATE_IO Procedure 141-5
  141.4.3 CLEAR_PENDING_AREA Procedure 141-7
  141.4.4 CREATE_CATEGORY Procedure 141-8
  141.4.5 CREATE_CDB_PLAN Procedure 141-8
141.4.6 CREATE_CDB_PLAN_DIRECTIVE Procedure 141-9
141.4.7 CREATE_CDB_PROFILE_DIRECTIVE Procedure 141-10
141.4.8 CREATE_CONSUMER_GROUP Procedure 141-11
141.4.9 CREATE.Pending_AREA Procedure 141-12
141.4.10 CREATE_PLAN Procedure 141-13
141.4.11 CREATE_PLAN_DIRECTIVE Procedure 141-14
141.4.12 CREATE_SIMPLE_PLAN Procedure 141-20
141.4.13 DELETE_CATEGORY Procedure 141-21
141.4.14 DELETE_CDB_PLAN Procedure 141-21
141.4.15 DELETE_CDB_PLAN_DIRECTIVE Procedure 141-22
141.4.16 DELETE_CDB_PROFILE_DIRECTIVE Procedure 141-22
141.4.17 DELETE_CONSUMER_GROUP Procedure 141-23
141.4.18 DELETE_PLAN Procedure 141-23
141.4.19 DELETE_PLAN_CASCADE Procedure 141-24
141.4.20 DELETE_PLAN_DIRECTIVE Procedure 141-24
141.4.21 DEQUEUE_PARALLEL_STATEMENT Procedure 141-24
141.4.22 END_SQL_BLOCK Procedure 141-25
141.4.23 SET_CONSUMER_GROUP_MAPPING Procedure 141-25
141.4.24 SET_CONSUMER_GROUP_MAPPING_PRI Procedure 141-26
141.4.25 SET_INITIAL_CONSUMER_GROUP Procedure 141-27
141.4.26 SUBMIT_PENDING_AREA Procedure 141-29
141.4.27 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure 141-29
141.4.28 SWITCH_CONSUMER_GROUP_FOR_USER Procedure 141-29
141.4.29 SWITCH_PLAN Procedure 141-30
141.4.30 UPDATE_CATEGORY Procedure 141-31
141.4.31 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure 141-31
141.4.32 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure 141-32
141.4.33 UPDATE_CDB_PLAN Procedure 141-33
141.4.34 UPDATE_CDB_PLAN_DIRECTIVE Procedure 141-34
141.4.35 UPDATE_CDB_PROFILE_DIRECTIVE Procedure 141-35
141.4.36 UPDATE_CONSUMER_GROUP Procedure 141-36
141.4.37 UPDATE_PLAN Procedure 141-37
141.4.38 UPDATE_PLAN_DIRECTIVE Procedure 141-38
141.4.39 VALIDATE_PENDING_AREA Procedure 141-42

142 DBMSRESOURCE MANAGER_PRIVS

142.1 Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms 142-1

142.1.1 GRANT_SWITCH_CONSUMER_GROUP Procedure 142-1
142.1.2 GRANT_SYSTEM_PRIVILEGE Procedure 142-2
142.1.3 REVOKE_SWITCH_CONSUMER_GROUP Procedure 142-3
143 DBMS_RESULT_CACHE

143.1 DBMS_RESULT_CACHE Security Model 143-1
143.2 DBMS_RESULT_CACHE Constants 143-1
143.3 Summary of DBMS_RESULT_CACHE Subprograms 143-2
  143.3.1 BLACK_LIST Function 143-2
  143.3.2 BLACK_LIST_ADD Procedure 143-2
  143.3.3 BLACK_LIST_CLEAR Procedure 143-3
  143.3.4 BLACK_LIST_REMOVE Procedure 143-3
  143.3.5 BYPASS Procedure 143-4
  143.3.6 FLUSH Function & Procedure 143-5
  143.3.7 INVALIDATE Functions & Procedures 143-5
  143.3.8 INVALIDATE_OBJECT Functions & Procedures 143-6
  143.3.9 MEMORY_REPORT Procedure 143-7
  143.3.10 STATUS Function 143-7

144 DBMS_RESUMABLE

144.1 DBMS_RESUMABLE Operational Notes 144-1
144.2 Summary of DBMS_RESUMABLE Subprograms 144-1
  144.2.1 ABORT Procedure 144-2
  144.2.2 GET_SESSION_TIMEOUT Function 144-2
  144.2.3 GET_TIMEOUT Function 144-3
  144.2.4 SET_SESSION_TIMEOUT Procedure 144-3
  144.2.5 SET_TIMEOUT Procedure 144-4
  144.2.6 SPACE_ERROR_INFO Function 144-4

145 DBMS_RLS

145.1 DBMS_RLS Overview 145-1
145.2 DBMS_RLS Security Model 145-2
145.3 DBMS_RLS Constants 145-2
145.4 DBMS_RLS Operational Notes 145-3
145.5 DBMS_RLS Rules and Limits 145-3
145.6 Summary of DBMS_RLS Subprograms 145-3
  145.6.1 ADD_GROUPED_POLICY Procedure 145-4
  145.6.2 ADD_POLICY Procedure 145-6
  145.6.3 ADD_POLICY_CONTEXT Procedure 145-10
  145.6.4 ALTER_POLICY Procedure 145-11
  145.6.5 ALTER_GROUPED_POLICY Procedure 145-12
146  DBMS_ROLLING

146.1  DBMS_ROLLING Overview 146-1
146.2  DBMS_ROLLING Security Model 146-2
146.3  Summary of DBMS_ROLLING Subprograms 146-2
   146.3.1  INIT_PLAN Procedure 146-3
   146.3.2  DESTROY_PLAN Procedure 146-3
   146.3.3  BUILD_PLAN Procedure 146-4
   146.3.4  SET_PARAMETER Procedure 146-4
   146.3.5  START_PLAN Procedure 146-8
   146.3.6  SWITCHOVER Procedure 146-9
   146.3.7  FINISH_PLAN Procedure 146-10
   146.3.8  ROLLBACK_PLAN Procedure 146-10

147  DBMS_ROWID

147.1  DBMS_ROWID Security Model 147-1
147.2  DBMS_ROWID Types 147-1
147.3  DBMS_ROWID Exceptions 147-2
147.4  DBMS_ROWID Operational Notes 147-3
147.5  DBMS_ROWID Examples 147-4
147.6  Summary of DBMS_ROWID Subprograms 147-4
   147.6.1  ROWID_BLOCK_NUMBER Function 147-5
   147.6.2  ROWID_CREATE Function 147-5
   147.6.3  ROWID_INFO Procedure 147-6
   147.6.4  ROWID_OBJECT Function 147-7
   147.6.5  ROWID_RELATIVE_FNO Function 147-8
   147.6.6  ROWID_ROW_NUMBER Function 147-9
   147.6.7  ROWID_TO_ABSOLUTE_FNO Function 147-9
   147.6.8  ROWID_TO_EXTENDED Function 147-10
148 DBMS_RULE

148.1 DBMS_RULE Overview
148.2 DBMS_RULE Security Model
148.3 Summary of DBMS_RULE Subprograms
   148.3.1 CLOSE_ITERATOR Procedure
   148.3.2 EVALUATE Procedure
   148.3.3 EVALUATE_EXPRESSION Procedure
   148.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure
   148.3.5 EVALUATE_RULE Procedure
   148.3.6 EVALUATE_RULE_ITERATOR Procedure
   148.3.7 GET_NEXT_HIT Function
   148.3.8 GET_NEXT_RESULT Function
   148.3.9 IS_FAST Procedure

149 DBMS_RULE_ADM

149.1 DBMS_RULE_ADM Overview
149.2 DBMS_RULE_ADM Security Model
149.3 Summary of DBMS_RULE_ADM Subprograms
   149.3.1 ADD_RULE Procedure
   149.3.2 ALTER_EVALUATION_CONTEXT Procedure
   149.3.3 ALTER_RULE Procedure
   149.3.4 CREATE_EVALUATION_CONTEXT Procedure
   149.3.5 CREATE_RULE Procedure
   149.3.6 CREATE_RULE_SET Procedure
   149.3.7 DROP_EVALUATIONCONTEXT Procedure
   149.3.8 DROP_RULE Procedure
   149.3.9 DROP_RULE_SET Procedure
   149.3.10 GRANT_OBJECT_PRIVILEGE Procedure
   149.3.11 GRANT_SYSTEM_PRIVILEGE Procedure
   149.3.12 REMOVE_RULE Procedure
   149.3.13 REVOKE_OBJECT_PRIVILEGE Procedure
   149.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure
150  DBMS_SCHEDULER

150.1  DBMS_SCHEDULER Deprecated Subprograms 150-1
150.2  DBMS_SCHEDULER Security Model 150-1
150.3  DBMS_SCHEDULER Rules and Limits 150-1
150.4  DBMS_SCHEDULER Operational Notes 150-2

Preface

This Preface contains these topics:

- Audience
- Related Documents
- Conventions

Audience

*Oracle Database PL/SQL Packages and Types Reference* is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents:

- *Oracle Database Development Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at http://shop.oracle.com/
To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN).

http://docs.oracle.com/

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.</td>
<td>When you specify this clause, you create an index-organized table.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Italic typeface indicates book titles or emphasis.</td>
<td>Oracle Database Concepts</td>
</tr>
<tr>
<td><strong>UPPERCASE monospace (fixed-width) font</strong></td>
<td>Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.</td>
<td>Ensure that the recovery catalog and target database do not reside on the same disk.</td>
</tr>
<tr>
<td><strong>lowercase monospace (fixed-width) font</strong></td>
<td>Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values.</td>
<td>You can specify this clause only for a NUMBER column.</td>
</tr>
<tr>
<td><strong>Note:</strong> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td></td>
<td>You can back up the database by using the BACKUP command.</td>
</tr>
<tr>
<td><strong>lowercase italic monospace (fixed-width) font</strong></td>
<td>Lowercase italic monospace font represents placeholders or variables.</td>
<td>Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enter sqlplus to start SQL*Plus.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The password is specified in the orapwd file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Back up the datafiles and control files in the /disk1/oracle/dbs directory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The department_id, department_name, and location_id columns are in the hr.departments table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set the QUERY_REWRITE_ENABLED initialization parameter to true.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The JRepUtil class implements these methods.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can specify the parallel_clause.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Run old_release.SQL where old_release refers to the release you installed prior to upgrading.</td>
</tr>
</tbody>
</table>
Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```sql
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[ ]</code></td>
<td>Anything enclosed in brackets is optional.</td>
<td>DECIMAL ([digits [ , precision ]])</td>
</tr>
<tr>
<td><code>{ }</code></td>
<td>Braces are used for grouping items.</td>
<td>{ENABLE</td>
</tr>
<tr>
<td>`</td>
<td>`</td>
<td>A vertical bar represents a choice of two options.</td>
</tr>
<tr>
<td><code>...</code></td>
<td>Ellipsis points mean repetition in syntax descriptions.</td>
<td>CREATE TABLE ... AS subquery;</td>
</tr>
<tr>
<td></td>
<td>In addition, ellipsis points can mean an omission in code examples or text.</td>
<td>SELECT col1, col2, ..., coln FROM employees;</td>
</tr>
<tr>
<td><strong>Other symbols</strong></td>
<td>You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (</td>
<td>), and ellipsis points (...) exactly as shown.</td>
</tr>
<tr>
<td><strong>Italics</strong></td>
<td>Italicized text indicates placeholders or variables for which you must supply particular values.</td>
<td>enter password</td>
</tr>
<tr>
<td><strong>UPPERCASE</strong></td>
<td>Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.</td>
<td>CREATE USER mjones IDENTIFIED BY ty3MU9;</td>
</tr>
<tr>
<td><strong>lowercase</strong></td>
<td>Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files. <strong>Note:</strong> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td>SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjones IDENTIFIED BY ty3MU9;</td>
</tr>
</tbody>
</table>
Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

This preface contains:

- Changes in Oracle Database Release 19c, Version 19.1

Changes in Oracle Database Release 19c, Version 19.1

The following are changes in Oracle Database PL/SQL Packages and Types Reference for Oracle Database release 19c, version 19.1.

- New Features
- Deprecated Features
- Desupported Features

See Oracle Database New Features Guide for a complete list of new features in this release.

New Features

This section lists the major new features in Oracle Database release 19c PL/SQL Packages and Types Reference.

The following features are new in Oracle Database release 19c, version 19.1:

- ANYTYPE TYPE

  The GETANYTYPEFROMPERSISTENT function replaces GETPERISTENT static function.

  See GETANYTYPEFROMPERSISTENT Function

- DBMS_ADDM

  Automatic Database Diagnostic Monitor (ADDM) support for pluggable databases (PDBs). You can now use ADDM to analyze AWR data in PDBs for identifying and resolving performance related issues. Two new parameters, CDB_TYPE_OVERRIDE and READ_ONLY_TYPE_OVERRIDE added to the following subprograms to the DBMS_ADDM package:
  - ANALYZE_DB Procedure
  - ANALYZE_INST Procedure
  - ANALYZE_PARTIAL Procedure
  - COMPARE_CAPTURE_REPL AY_REPORT Function
  - COMPARE_DATABASES Function
  - COMPARE_INSTANCES Function
• **COMPARE_REPLAY_REPLAY_REPORT Function**

• **REAL_TIME_ADDM_REPORT Function**

**DBMS_AUTO_INDEX**

The new package `DBMS_AUTO_INDEX` provides an interface for configuring auto indexes and generating reports containing the details of the executed automatic indexing operations in a database.

See "DBMS_AUTO_INDEX"

**DBMS_CREDENTIAL**

You can also use the `DBMS_CREDENTIAL.CREATE_CREDENTIAL` procedure to manage the credentials for cloud object storage. The credential parameter of `impdb` specifies the name of a credential object that contains the user name and password required to access an object store bucket. You can also specify a default credential using the database property `DEFAULT_CREDENTIAL`.

**DBMS_HADOOP**

Oracle Database now supports hybrid partitioned tables. A hybrid partitioned table is a partitioned table in which some partitions reside in the database and some partitions reside outside the database in external files, such as operating system files or Hadoop Distributed File System (HDFS) files.

A new procedure `CREATE_HYBRID_PARTITIONED_TABLE` is added to the `DBMS_HADOOP` package.

**DBMS_INMEMORY_ADMIN**

A new function `POPULATE_WAIT` is added to `DBMS_INMEMORY_ADMIN` package. This function ensures that the specified In-Memory objects have been populated before allowing application access.

**DBMS_MEMOPTIMIZE**

The following new subprograms are added to the `DBMS_MEMOPTIMIZE` package as part of the Memoptimized Rowstore fast ingest feature:

– `GET_APPLY_HWM_SEQID`
– `GET_WRITE_HWM_SEQID`
– `WRITE_END`

See "DBMS_MEMOPTIMIZE"

**DBMS_MEMOPTIMIZE_ADMIN**

The new package `DBMS_MEMOPTIMIZE_ADMIN` provides an interface for flushing the Memoptimized Rowstore data buffered in the large pool to disk.

See "DBMS_MEMOPTIMIZE_ADMIN"

**DBMS_METADATA**

The following new transform parameters which are used by the metadata layer of datapump are added to the `DBMS_METADATA.SET_TRANSFORM_PARAM` procedure:

– `OMIT_ENCRYPTION_CLAUSE`
– `DWCS_CVT_IOTS`
– `DWCS_CVT_CONSTRAINTS`
• CONSTRAINT_USE_DEFAULT_INDEXES
• CONSTRAINT_NAME_FROM_INDEXES

• DBMS_MVIEW

Oracle Database now supports hybrid partitioned tables. A hybrid partitioned table is a partitioned table in which some partitions reside in the database and some partitions reside outside the database in external files, such as operating system files or Hadoop Distributed File System (HDFS) files.

A new parameter, SKIP_EXT_DATA, is added to the DBMS_MVIEW.REFRESH procedure.

• DBMS_SQLQ

The new package DBMS_SQLQ provides an interface for configuring quarantine thresholds for SQL statements and their execution plans. The SQL statements that cross the quarantine thresholds are quarantined and are not allowed to run again in a database.

See “DBMS_SQLQ”

• DBMS_SQLDIAG

New SQL Repair Advisor function

DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR

The new SQL Repair Advisor function DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR creates a diagnostic task, executes it, and accepts SQL patch recommendation for a SQL statement that is generating a critical error. This function helps users to diagnose and fix problems.

• DBMS_SODA

DBMS_SODA is a PL/SQL package implementing Simple Oracle Document Access (SODA) which allows you to use the Oracle Database as a NoSQL document store. Additional functions and features are added in this release.

• DBMS_STATS

A new boolean parameter REALTIME_STATS is added to GET_TABLE_STATS and GET_COLUMN_STATS procedures.

• DBMS_XPLAN

New COMPARE_PLANS function added to the DBMS_XPLAN package. This function compares each plan in a list with a reference plan and returns the report.

• Key-based Messaging

The following new parameters are added to the GET_QUEUE_PARAMETER, SET_QUEUE_PARAMETER, and UNSET_QUEUE_PARAMETER procedures of the DBMS_AQADM package as part of the Key-based messaging feature:

– Sharded queue parameters
  * SHARD_NUM
  * KEY_BASED_ENQUEUE
  * STICKY_DEQUEUE

– Key-based parameters
  * AQ$KEY_TO_SHARD_MAP
  * AQ$GET_KEY_SHARD_INST

See "DBMS_AQADM"
Changes in Oracle Database Release 19c, Version 19.9

The following features are new in Oracle Database release 19c, version 19.9:

- **Support for DBMS_CRYPTO Asymmetric Key Operations**
  Starting with this release, the DBMS_CRYPTO PL/SQL package supports asymmetric key operations, in addition to the existing support for symmetric key operations. To implement the support for asymmetric key operations, the following procedures have been added to the DBMS_CRYPTO package:
  - PKENCRYPT
  - PKDECRYPT
  - SIGN
  - VERIFY

  See DBMS_CRYPTO.

Changes in Oracle Database Release 19c, Version 19.10

The following features are new in Oracle Database release 19c, version 19.10:

- **DBMS_CLOUD**
  The DBMS_CLOUD package provides a comprehensive support for working with data in Object Storage.

- Blockchain tables are append-only tables in which only insert operations are allowed. Deleting rows is either prohibited or restricted based on time. Rows in a blockchain table are made tamper-resistant by special sequencing & chaining algorithms. Users can verify that rows have not been tampered. A hash value that is part of the row metadata is used to chain and validate rows. Blockchain tables enable you to implement a centralized ledger model where all participants in the blockchain network have access to the same tamper-resistant ledger. The following new packages are available in this release:
  - DBMS_BLOCKCHAIN_TABLE
  - DBMS_USER_CERTS

- DBMS_LOGMNR subprograms ADD_LOGFILE Procedure and START_LOGMNR Procedure modified to support per-PDB Capture for Oracle Autonomous Database.

Changes in Oracle Database Release 19c, Version 19.11

The following features are new in Oracle Database release 19c, version 19.11:

- **DBMS_IMMUTABLE_TABLE**
  Immutable tables are read-only tables that protect data against unauthorized modification. They also prevent against accidental data modifications that may be caused by human errors. The DBMS_IMMUTABLE_TABLE package allows you to delete the expired rows in an immutable table.

- New subprograms are added to DBMS_SODA and SODA Types.

- A new procedure, ACCHK_VIEWS, is added to the DBMS_APP_CONT_ADMIN package. This procedure is available for the 19c release only.
Deprecation Features

List of deprecated features in Oracle Database release 19c version 19.1 PL/SQL Packages and Types Reference.

- **DBMS_SESSION.IS_ROLE_ENABLED** function is deprecated.

  Use **DBMS_SESSION.CURRENT_IS_ROLE_ENABLED** or **DBMS_SESSION.SESSION_IS_ROLE_ENABLED** function instead.

- Starting with Oracle Database 19c, customer use of the **SERVICE_NAMES** parameter is deprecated. It can be desupported in a future release.

  The use of the **SERVICE_NAMES** parameter is no longer actively supported. It must not be used for high availability (HA) deployments. It is not supported to use service names parameter for any HA operations. This restriction includes FAN, load balancing, **FAILOVER_TYPE**, **FAILOVER_RESTORE**, **SESSION_STATE_CONSISTENCY**, and any other uses.

  To manage your services, Oracle recommends that you use the **SRVCTL** or **GDSCTL** command line utilities, or the **DBMS_SERVICE** package.

Desupported Features

This section lists the desupported features in Oracle Database release 19c version 19.1 PL/SQL Packages and Types Reference.

The following features are desupported in this release:

- The ability to create flat file dictionary dumps of pluggable databases (PDBs) is desupported in Oracle Database 19c.

  In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is now desupported. With Oracle Database 19c and later releases, Oracle recommends that you call **DBMS_LOGMNR.START_LOGMNR**, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of **START_LOGMNR** are enhanced to support mining of individual PDBs.

- Desupport of **CONTINUOUS_MINE** option

  The **continuous_mine** option for the **DBMS_LOGMNR.START_LOGMNR** package is desupported in Oracle Database 19c, and is no longer available. The **CONTINUOUS_MINE** functionality of the **LogMiner** package is obsolete. It was deprecated in Oracle Database 12c Release 2 (12.2). There is no replacement functionality.

Desupport of Oracle Streams

Starting in Oracle Database 19c, the Oracle Streams feature is desupported. Use Oracle GoldenGate to replace all replication features of Oracle Streams.

- Oracle Multimedia

  Starting in Oracle Database 19c, the Oracle Multimedia feature is desupported. Use Oracle SecureFiles with open source or third-party products for metadata extraction and for image processing and conversion instead of Oracle Multimedia.
See Also:
For more information, see Oracle Database Upgrade Guide

- MAX_CONNECTIONS attribute of LOG_ARCHIVE_DEST_n Desupported
  The MAX_CONNECTIONS attribute of the LOG_ARCHIVE_DEST_n parameters for Oracle Data Guard Redo Transport is obsolete. It is desupported in Oracle Database 19c.
  The MAX_CONNECTIONS attribute can interfere with the new Redo Transport Streaming mechanism introduced in Oracle Database 11g, and increase the time necessary to resolve gaps. To prevent these types of errors, Oracle has desupported and removed this attribute.

- Desupport of Extended Datatype Support (EDS)
  The Extended Datatype Support (EDS) feature is desupported in Oracle Database 19c. All Data types that the EDS feature supported are now supported natively by both Logical Standby and Oracle GoldenGate.
  The Extended Datatype Support (EDS) feature provides a mechanism for logical standbys to support certain Oracle data types that lack native redo-based support. For example, EDS was used to replicate tables with a SDO_GEOMETRY column. However, starting with Oracle Database 12c Release 2 (12.2), there are no EDS-supported Oracle data types that are not supported natively, either by Logical standby, or by Oracle GoldenGate. This feature is desupported with Oracle Database 19c (19.1).

- The initialization parameter O7_DICTIONARY_ACCESSIBILITY is desupported in Oracle Database 19c.
  The O7_DICTIONARY_ACCESSIBILITY parameter controlled restrictions on System Privileges from accessing SYS owned objects. It was retained to enable certain backward compatibility for earlier release applications. Desupporting obsolete features enables Oracle to focus on security across all features and functionality. Oracle recommends that you manage system privileges in accordance with standard security best practices.
Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN ('SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
                 'LOGSTBY_ADMINISTRATOR', 'ORDSYS',
                 'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
                 'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
                 'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MODATA',
                 'SI информтн_schema', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- **Package Overview**
- **Summary of Oracle Supplied PL/SQL Packages and Types**

See Also:

Oracle Database Development Guide for information on how to create your own packages
1.1 Package Overview

A package is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

1.1.1 Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```sql
CREATE PACKAGE name AS  -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
BEGIN
    -- initialization statements
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

1.1.2 Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

1.1.3 Creating New Packages

To create packages and store them permanently in an Oracle database, use the CREATE PACKAGE and CREATE PACKAGE BODY statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:
1. Create the package specification with the `CREATE PACKAGE` statement.

You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

**Note:**

It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

You can declare and define program objects in the package body.

- You must define public objects declared in the package specification.
- You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

**See Also:**

- *Oracle Database PL/SQL Language Reference*
- *Oracle Database Development Guide* for more information on creating new packages
- *Oracle Database Concepts* for more information on storing and executing packages

### 1.1.3.1 Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.
1.3.1.1 Creating a New Package: Example

The following example shows a package specification for a package named EMPLOYEE_MANAGEMENT. The package contains one stored function and two stored procedures.

```sql
CREATE PACKAGE employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                     mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                     deptno NUMBER) RETURN NUMBER;
  PROCEDURE fire_emp (emp_id NUMBER);
  PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```sql
CREATE PACKAGE BODY employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                     mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                     deptno NUMBER) RETURN NUMBER IS
    new_empno    NUMBER(10);
    BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
                              hiredate, sal, comm, deptno);
      RETURN (new_empno);
    END hire_emp;
  PROCEDURE fire_emp(emp_id IN NUMBER) AS
    BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
        raise_application_error(-20011, 'Invalid Employee Number: ' || TO_CHAR(emp_id));
      END IF;
    END fire_emp;
  PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
    BEGIN
      -- If employee exists, then update salary with increase.
      UPDATE emp
        SET sal = sal + sal_incr
        WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
```
raise_application_error(-20011, 'Invalid Employee Number: ' || TO_CHAR(emp_id));
END IF;
END sal_raise;
END employee_management;

**Note:**

If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
    > START WITH 8000 INCREMENT BY 10;
```

1.1.4 Referencing Package Contents

When you want to reference the types, items, and subprograms declared in a package specification, use the dot notation.

For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

1.2 Summary of Oracle Supplied PL/SQL Packages and Types

PL/SQL packages are supplied with the Oracle server that extend database functionality and provide PL/SQL access to SQL features.

These packages, listed in the following table, run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

**Note:**

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

**Table 1-1  Summary of Oracle Supplied PL/SQL Packages**

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APEX_APPLICATION</td>
<td>For a complete description of all the packages that ship with Oracle Application Express, see <em>Oracle Application Express API Reference</em></td>
</tr>
<tr>
<td>APEX_ZIP</td>
<td></td>
</tr>
<tr>
<td>CTX_ADM</td>
<td>Lets you administer servers and the data dictionary</td>
</tr>
</tbody>
</table>
Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTX_ANL</td>
<td>The CTX_ANL package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.</td>
</tr>
<tr>
<td>CTX_CLS</td>
<td>Lets you generate CTXRULE rules for a set of documents</td>
</tr>
<tr>
<td>CTX_DDL</td>
<td>Lets you create and manage the preferences, section lists and stopgroups required for Text indexes</td>
</tr>
<tr>
<td>CTX_DOC</td>
<td>Lets you request document services</td>
</tr>
<tr>
<td>CTX_ENTITY</td>
<td>The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text.</td>
</tr>
<tr>
<td>CTX_OUTPUT</td>
<td>Lets you manage the index log</td>
</tr>
<tr>
<td>CTX_QUERY</td>
<td>Lets you generate query feedback, count hits, and create stored query expressions</td>
</tr>
<tr>
<td>CTX_REPORT</td>
<td>Lets you create various index reports</td>
</tr>
<tr>
<td>CTX_THES</td>
<td>Lets you to manage and browse thesauri</td>
</tr>
<tr>
<td>CTX_ULEXER</td>
<td>For use with the user-lexer</td>
</tr>
<tr>
<td>DBMS_ADDM</td>
<td>Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor</td>
</tr>
<tr>
<td>DBMS_ADVANCED_REWRITE</td>
<td>Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite</td>
</tr>
<tr>
<td>DBMS_ADVISOR</td>
<td>Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements</td>
</tr>
<tr>
<td>DBMS_ALERT</td>
<td>Provides support for the asynchronous notification of database events</td>
</tr>
<tr>
<td>DBMS_APP_CONT</td>
<td>The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.</td>
</tr>
<tr>
<td>DBMS_APPLICATION_INFO</td>
<td>Lets you register an application name with the database for auditing or performance tracking purposes</td>
</tr>
<tr>
<td>DBMS_AQ</td>
<td>Provides administrative procedures to start, stop, and configure an apply process</td>
</tr>
<tr>
<td>DBMS_AQADM</td>
<td>Lets you add a message (of a predefined object type) onto a queue or to dequeue a message</td>
</tr>
<tr>
<td>DBMS_AQELM</td>
<td>Lets you perform administrative functions on a queue or queue table for messages of a predefined object type</td>
</tr>
<tr>
<td>DBMS_AQIN</td>
<td>Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP</td>
</tr>
<tr>
<td>DBMS_ASSERT</td>
<td>Plays a part in providing secure access to the Oracle JMS interfaces</td>
</tr>
<tr>
<td>DBMS_ASSERT</td>
<td>Provides an interface to validate properties of the input value</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_AUDIT_UTIL</td>
<td>The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.</td>
</tr>
<tr>
<td>DBMS_AUDIT_MGMT</td>
<td>The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail.</td>
</tr>
<tr>
<td>DBMS_AUTO_REPORT</td>
<td>The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.</td>
</tr>
<tr>
<td>DBMS_AUTO_SQLTUNE</td>
<td>The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task.</td>
</tr>
<tr>
<td>DBMS_AUTO_TASK_ADMIN</td>
<td>Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls.</td>
</tr>
<tr>
<td>DBMS_AW_STATS</td>
<td>Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions.</td>
</tr>
<tr>
<td>DBMS_BLOCKCHAIN_TABLE</td>
<td>A blockchain table is an append-only table designed for centralized blockchain applications.</td>
</tr>
<tr>
<td>DBMS_CAPTURE_ADM</td>
<td>Describes administrative procedures to start, stop, and configure a capture process; used in Replication.</td>
</tr>
<tr>
<td>DBMS_CLOUD</td>
<td>This package provides comprehensive support for working with data in Object Storage.</td>
</tr>
<tr>
<td>DBMS_COMPARISON</td>
<td>Provides interfaces to compare and converge database objects at different databases.</td>
</tr>
<tr>
<td>DBMS_COMPRESSION</td>
<td>Provides an interface to facilitate choosing the correct compression level for an application.</td>
</tr>
<tr>
<td>DBMS_CONNECTION_POOL</td>
<td>Provides an interface to manage the Database Resident Connection Pool.</td>
</tr>
<tr>
<td>DBMS_CQ_NOTIFICATION</td>
<td>Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.</td>
</tr>
<tr>
<td>DBMS_CREDENTIAL</td>
<td>The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.</td>
</tr>
<tr>
<td>DBMS_CRYPTO</td>
<td>Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms.</td>
</tr>
<tr>
<td>DBMS_CSX_ADMIN</td>
<td>Provides an interface to customize the setup when transporting a tablespace containing binary XML data.</td>
</tr>
<tr>
<td>DBMS_CUBE</td>
<td>Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_CUBE_ADVISE</td>
<td>Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite</td>
</tr>
<tr>
<td>DBMS_CUBE_LOG</td>
<td>DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.</td>
</tr>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Provides subroutines that can be used to prepare data for Oracle Data Mining</td>
</tr>
<tr>
<td>DBMS_DATAPUMP</td>
<td>Lets you move all, or part of, a database between databases, including both data and metadata</td>
</tr>
<tr>
<td>DBMS_DB_VERSION</td>
<td>The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.</td>
</tr>
<tr>
<td>DBMS_DBCOMP</td>
<td>The DBMS_DBCOMP package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases.</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT</td>
<td>Provides an interface comprising a file system-like abstraction backed by one or more Store Providers</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT_SPI</td>
<td>Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers</td>
</tr>
<tr>
<td>DBMS_DBFS_HS</td>
<td>Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables</td>
</tr>
<tr>
<td>DBMS_DBFS_SFS</td>
<td>Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package</td>
</tr>
<tr>
<td>DBMS_DDL</td>
<td>Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs</td>
</tr>
<tr>
<td>DBMS_DEBUG</td>
<td>Implements server-side debuggers and provides a way to debug server-side PL/SQL program units</td>
</tr>
<tr>
<td>DBMS_DEBUG_JDWP</td>
<td>The DBMS_DEBUG_JDWP provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).</td>
</tr>
<tr>
<td>DBMS_DEBUG_JDWP_CUSTOM</td>
<td>The DBMS_DEBUG_JDWP_CUSTOM package is a PL/SQL package that provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).</td>
</tr>
<tr>
<td>DBMS_DESCRIBE</td>
<td>Describes the arguments of a stored procedure with full name translation and security checking</td>
</tr>
<tr>
<td>DBMS_DG</td>
<td>Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_DIMENSION</td>
<td>Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition</td>
</tr>
<tr>
<td>DBMS_DISTRIBUTED_TRUST_ADMIN</td>
<td>Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted</td>
</tr>
<tr>
<td>DBMS_DNFS</td>
<td>The DBMS_DNFS package provides an interface to assist in creating a database using files in the backup set.</td>
</tr>
<tr>
<td>DBMS_DST</td>
<td>The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.</td>
</tr>
<tr>
<td>DBMS_EDITIONS_UTILITIES</td>
<td>The DBMS_EDITIONS_UTILITIES package provides helper functions for edition related operations.</td>
</tr>
<tr>
<td>DBMS_EPG</td>
<td>Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener</td>
</tr>
<tr>
<td>DBMS_ERRLOG</td>
<td>Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back</td>
</tr>
<tr>
<td>DBMS_FGA</td>
<td>Provides fine-grained security functions</td>
</tr>
<tr>
<td>DBMS_FILE_GROUP</td>
<td>One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories</td>
</tr>
<tr>
<td>DBMS_FILE_TRANSFER</td>
<td>Lets you copy a binary file within a database or to transfer a binary file between databases</td>
</tr>
<tr>
<td>DBMS_FLASHBACK</td>
<td>Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)</td>
</tr>
<tr>
<td>DBMS_FLASHBACK_ARCHIVE</td>
<td>Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.</td>
</tr>
<tr>
<td>DBMS_FREQUENT_ITEMSET</td>
<td>Enables frequent itemset counting</td>
</tr>
<tr>
<td>DBMS_FS</td>
<td>The DBMS_FS package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.</td>
</tr>
<tr>
<td>DBMS_GOLDENGATE_AUTH</td>
<td>The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.</td>
</tr>
<tr>
<td>DBMS_HADOOP</td>
<td>The DBMS_HADOOP package provides a PL/SQL procedure called CREATE_EXTDDL_FOR_HIVE(), that creates an Oracle external table for a given hive table.</td>
</tr>
<tr>
<td>DBMS_HANG_MANAGER</td>
<td>The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.</td>
</tr>
<tr>
<td>DBMS_HEAT_MAP</td>
<td>The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace.</td>
</tr>
</tbody>
</table>
Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_HIERARCHY</td>
<td>Contains functions and procedures for validating the data in tables used by analytic views and hierarchies and for creating a log table.</td>
</tr>
<tr>
<td>DBMS_HM</td>
<td>Contains constants and procedure declarations for health check management</td>
</tr>
<tr>
<td>DBMS_HPROF</td>
<td>Provides an interface for profiling the execution of PL/SQL applications</td>
</tr>
<tr>
<td>DBMS_HS_PARALLEL</td>
<td>Enables parallel processing for heterogeneous targets access</td>
</tr>
<tr>
<td>DBMS_HS_PASSTHROUGH</td>
<td>Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems</td>
</tr>
<tr>
<td>DBMS_ILM</td>
<td>The DBMS_ILM package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.</td>
</tr>
<tr>
<td>DBMS_ILM_ADMIN</td>
<td>The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution.</td>
</tr>
<tr>
<td>DBMS_IMMUTABLE_TABLE</td>
<td>The DBMS_IMMUTABLE_TABLE package allows you to delete the expired rows in an immutable table.</td>
</tr>
<tr>
<td>DBMS_INMEMORY</td>
<td>The DBMS_INMEMORY package provides an interface for In-Memory Column Store (IM column store) functionality.</td>
</tr>
<tr>
<td>DBMS_INMEMORY_ADMIN</td>
<td>The DBMS_INMEMORY_ADMIN package provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).</td>
</tr>
<tr>
<td>DBMS_IOT</td>
<td>Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command</td>
</tr>
<tr>
<td>DBMS_JAVA</td>
<td>Provides a PL/SQL interface for accessing database functionality from Java</td>
</tr>
<tr>
<td>DBMS_JOB</td>
<td>Schedules and manages jobs in the job queue (Deprecated)</td>
</tr>
<tr>
<td>DBMS_JSON</td>
<td>Provides an interface for data-guide operations</td>
</tr>
<tr>
<td>DBMS_LDAP</td>
<td>Provides functions and procedures to access data from LDAP servers</td>
</tr>
<tr>
<td>DBMS_LDAP_UTL</td>
<td>Provides the Oracle Extension utility functions for LDAP</td>
</tr>
<tr>
<td>DBMS_LIBCACHE</td>
<td>Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution</td>
</tr>
<tr>
<td>DBMS_LOB</td>
<td>Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILE (read-only)</td>
</tr>
<tr>
<td>DBMS_LOCK</td>
<td>Lets you request, convert and release locks through Oracle Lock Management services</td>
</tr>
<tr>
<td>DBMS_LOGMNR</td>
<td>Provides functions to initialize and run the log reader</td>
</tr>
<tr>
<td>DBMS_LOGMNR_D</td>
<td>Queries the dictionary tables of the current database, and creates a text based file containing their contents</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY</td>
<td>Describes procedures for configuring and managing the logical standby database environment</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY_CONTEXT</td>
<td>You can use the procedures provided in the DBMS_LOGSTDBY_CONTEXT package to set and retrieve various parameters associated with LSBY_APPLY_CONTEXT.</td>
</tr>
<tr>
<td>DBMS_METADATA</td>
<td>Lets callers easily retrieve complete database object definitions (metadata) from the dictionary</td>
</tr>
<tr>
<td>DBMS_METADATA_DIFF</td>
<td>Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.</td>
</tr>
<tr>
<td>DBMS_MGD_ID_UTL</td>
<td>Provides a set of utility subprograms</td>
</tr>
<tr>
<td>DBMS_MGWADM</td>
<td>Describes the Messaging Gateway administrative interface; used in Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_MGWMSG</td>
<td>Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MONITOR</td>
<td>Let you use PL/SQL for controlling additional tracing and statistics gathering</td>
</tr>
<tr>
<td>DBMS_MVIEW</td>
<td>Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.</td>
</tr>
<tr>
<td>DBMS_MVIEW_STATS</td>
<td>The DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACL_ADMIN</td>
<td>Provides the interface to administer the network Access Control List (ACL)</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACLUTILITY</td>
<td>The DBMS_NETWORK_ACLUTILITY package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.</td>
</tr>
<tr>
<td>DBMS_ODCI</td>
<td>Returns the CPU cost of a user function based on the elapsed time of the function</td>
</tr>
<tr>
<td>DBMS_OPTIM_BUNDLE</td>
<td>The DBMS_OPTIM_BUNDLE package is used to manage the installed but disabled module bug fixes which cause an execution plan change.</td>
</tr>
<tr>
<td>DBMS_OUTLN</td>
<td>Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG</td>
</tr>
<tr>
<td>DBMS_OUTPUT</td>
<td>Accumulates information in a buffer so that it can be retrieved later</td>
</tr>
<tr>
<td>DBMS_PARALLEL_EXECUTE</td>
<td>Enables the user to incrementally update table data in parallel</td>
</tr>
<tr>
<td>DBMS_PART</td>
<td>The DBMS_PART package provides an interface for maintenance and management operations on partitioned objects.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_PCLXUTIL</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
<tr>
<td>DBMS_PDB</td>
<td>The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface specify which database objects are application common objects.</td>
</tr>
<tr>
<td>DBMS_PDB_ALTER_SHARING</td>
<td>In an application container with a pre-installed application, the DBMS_PDB_ALTER_SHARING package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.</td>
</tr>
<tr>
<td>DBMS_PERF</td>
<td>The DBMS_PERF package provides and interface to generate active reports for monitoring database performance.</td>
</tr>
<tr>
<td>DBMS_PIPE</td>
<td>Provides a DBMS pipe service which enables messages to be sent between sessions</td>
</tr>
<tr>
<td>DBMS_PLSQL_CODE_COVERAGE</td>
<td>The DBMS_PLSQL_CODE_COVERAGE package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.</td>
</tr>
<tr>
<td>DBMS_PREDICTIVE_ANALYTICS</td>
<td>Provides subroutines that implement automatic data mining operations for predict, explain, and profile</td>
</tr>
<tr>
<td>DBMS_PREPROCESSOR</td>
<td>Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form</td>
</tr>
<tr>
<td>DBMS_PRIVILEGE_CAPTURE</td>
<td>The DBMS_PRIVILEGE_CAPTURE package provides an interface to database privilege analysis.</td>
</tr>
<tr>
<td>DBMS_PROCESS</td>
<td>The DBMS_PROCESS package provides an interface to manage the prespawned servers.</td>
</tr>
<tr>
<td>DBMS_PROFILER</td>
<td>Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks</td>
</tr>
<tr>
<td>DBMS_PROPAGATION_ADM</td>
<td>Provides administrative procedures for configuring propagation from a source queue to a destination queue</td>
</tr>
<tr>
<td>DBMS_QOPATCH</td>
<td>The DBMS_QOPATCH package provides an interface to view the installed database patches.</td>
</tr>
<tr>
<td>DBMS_RANDOM</td>
<td>Provides a built-in random number generator</td>
</tr>
<tr>
<td>DBMS_REDACT</td>
<td>The DBMS_REDACT package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by lowprivileged users or an application.</td>
</tr>
<tr>
<td>DBMS_REDEFINITION</td>
<td>Lets you perform an online reorganization of tables</td>
</tr>
<tr>
<td>DBMS_REFRESH</td>
<td>Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option</td>
</tr>
<tr>
<td>DBMS_REPAIR</td>
<td>Provides data corruption repair procedures</td>
</tr>
<tr>
<td>DBMS_RESCONFIG</td>
<td>Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER</td>
<td>Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER_PRIVS</td>
<td>Maintains privileges associated with resource consumer groups</td>
</tr>
<tr>
<td>DBMS_RESULT_CACHE</td>
<td>Provides an interface to operate on the Result Cache</td>
</tr>
<tr>
<td>DBMS_RESUMABLE</td>
<td>Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution</td>
</tr>
<tr>
<td>DBMS_RLS</td>
<td>Provides row level security administrative interface</td>
</tr>
<tr>
<td>DBMS_ROLLING</td>
<td>The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion.</td>
</tr>
<tr>
<td>DBMS_ROWID</td>
<td>Provides procedures to create rowids and to interpret their contents</td>
</tr>
<tr>
<td>DBMS_RULE</td>
<td>Describes the subprograms that enable the evaluation of a rule set for a specified event.</td>
</tr>
<tr>
<td>DBMS_RULE_ADM</td>
<td>Provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.</td>
</tr>
<tr>
<td>DBMS_SCHEDULER</td>
<td>Provides a collection of scheduling functions that are callable from any PL/SQL program</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Lets you issue alerts when some threshold has been violated</td>
</tr>
<tr>
<td>DBMS_SERVICE</td>
<td>Lets you create, delete, activate and deactivate services for a single instance</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures</td>
</tr>
<tr>
<td>DBMS_SHARED_POOL</td>
<td>Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism</td>
</tr>
<tr>
<td>DBMS_SODA</td>
<td>Implements Simple Oracle Document Access (SODA) which allows you to use the Oracle Database as a NoSQL document store.</td>
</tr>
<tr>
<td>DBMS_SPACE</td>
<td>Provides segment space information not available through standard SQL</td>
</tr>
<tr>
<td>DBMS_SPACE_ADMIN</td>
<td>Provides tablespace and segment space administration not available through the standard SQL</td>
</tr>
<tr>
<td>DBMS_SPD</td>
<td>The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).</td>
</tr>
<tr>
<td>DBMS_SPM</td>
<td>Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements</td>
</tr>
<tr>
<td>DBMS_SQL</td>
<td>Lets you use dynamic SQL to access the database</td>
</tr>
<tr>
<td>DBMS_SQL_MONITOR</td>
<td>The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_SQL_TRANSLATOR</td>
<td>The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.</td>
</tr>
<tr>
<td>DBMS_SQLDIAG</td>
<td>Provides an interface to the SQL Diagnosability functionality</td>
</tr>
<tr>
<td>DBMS_SQLPA</td>
<td>Provides an interface to implement the SQL Performance Analyzer.</td>
</tr>
<tr>
<td>DBMS_SQLTUNE</td>
<td>Provides the interface to tune SQL statements</td>
</tr>
<tr>
<td>DBMS_STAT_FUNCS</td>
<td>Provides statistical functions</td>
</tr>
<tr>
<td>DBMS_STATS</td>
<td>Provides a mechanism for users to view and modify optimizer statistics gathered for database objects</td>
</tr>
<tr>
<td>DBMS_STORAGE_MAP</td>
<td>Communicates with FMON to invoke mapping operations</td>
</tr>
<tr>
<td>DBMS_SYNC_REFRESH</td>
<td>The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.</td>
</tr>
<tr>
<td>DBMS_TDB</td>
<td>Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.</td>
</tr>
<tr>
<td>DBMS_TF</td>
<td>The DBMS_TF package contains utilities for POLYMORPHIC TABLE functions (PTFs) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.</td>
</tr>
<tr>
<td>DBMS_TNS</td>
<td>The DBMS_TNS package provides the RESOLVE_TNSNAME function to resolve a TNS name and return the corresponding Oracle Net8 connection string.</td>
</tr>
<tr>
<td>DBMS_TRACE</td>
<td>Provides routines to start and stop PL/SQL tracing</td>
</tr>
<tr>
<td>DBMS_TRANSACTION</td>
<td>Provides access to SQL transaction statements from stored procedures and monitors transaction activities</td>
</tr>
<tr>
<td>DBMS_TRANSFORM</td>
<td>Provides an interface to the message format transformation features of Oracle Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_TSDP_MANAGE</td>
<td>The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database.</td>
</tr>
<tr>
<td>DBMS_TSDP_PROTECT</td>
<td>The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. The DBMS_TSDP_PROTECT package is available with the Enterprise Edition only.</td>
</tr>
<tr>
<td>DBMS_TTS</td>
<td>Checks if the transportable set is self-contained</td>
</tr>
<tr>
<td>DBMS_TYPES</td>
<td>Consists of constants, which represent the built-in and user-defined types</td>
</tr>
<tr>
<td>DBMS_UMF</td>
<td>The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_USER_CERTS</td>
<td>The DBMS_USER_CERTS package allows you add and delete certificates.</td>
</tr>
<tr>
<td>DBMS_UTILITY</td>
<td>Provides various utility routines</td>
</tr>
<tr>
<td>DBMS_WARNING</td>
<td>Provides the interface to query, modify and delete current system or session settings</td>
</tr>
<tr>
<td>DBMS_WM</td>
<td>Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_CAPTURE</td>
<td>Configures the Workload Capture system and produce the workload capture data.</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPLAY</td>
<td>Provides an interface to replay and report on a record of a workload on a production or test system</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPOSITORY</td>
<td>Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines</td>
</tr>
<tr>
<td>DBMS_XA</td>
<td>Contains the XA/Open interface for applications to call XA interface in PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB</td>
<td>Describes Resource Management and Access Control interface for PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB_ADMIN</td>
<td>Provides an interface to implement XMLIndex administration operation</td>
</tr>
<tr>
<td>DBMS_XDB_CONFIG</td>
<td>The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.</td>
</tr>
<tr>
<td>DBMS_XDB_CONSTANTS</td>
<td>The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants.</td>
</tr>
<tr>
<td>DBMS_XDB_REPOS</td>
<td>The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.</td>
</tr>
<tr>
<td>DBMS_XDBRESOURCE</td>
<td>Provides an interface to operate on the XDB resource's metadata and contents</td>
</tr>
<tr>
<td>DBMS_XDB_VERSION</td>
<td>Describes the versioning interface</td>
</tr>
<tr>
<td>DBMS_XDBT</td>
<td>Describes how an administrator can create a Context index on the XML DB hierarchy and configure it for automatic maintenance</td>
</tr>
<tr>
<td>DBMS_XDBZ</td>
<td>Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)</td>
</tr>
<tr>
<td>DBMS_XEVENT</td>
<td>Provides event-related types and supporting subprograms</td>
</tr>
<tr>
<td>DBMS_XMLODOM</td>
<td>Explains access to XMLType objects</td>
</tr>
<tr>
<td>DBMS_XMLGEN</td>
<td>Converts the results of a SQL query to a canonical XML format</td>
</tr>
<tr>
<td>DBMS_XMLINDEX</td>
<td>Provides an interface to implement asynchronous indexing and apply node referencing</td>
</tr>
<tr>
<td>DBMS_XMLPARSER</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DBMS_XMLQUERY</td>
<td>Provides database-to-XMILType functionality</td>
</tr>
<tr>
<td>DBMS_XMLSAVE</td>
<td>Provides XML-to-database-type functionality</td>
</tr>
</tbody>
</table>
Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_XMLSCHEMA</td>
<td>Explains procedures to register and delete XML schemas</td>
</tr>
<tr>
<td>DBMS_XMLSTORE</td>
<td>Provides the ability to store XML data in relational tables</td>
</tr>
<tr>
<td>DBMS_XMLTRANSLATIONS</td>
<td>Provides an interface to perform translations so that strings can be searched or displayed in various languages</td>
</tr>
<tr>
<td>DBMS_XPLAN</td>
<td>Describes how to format the output of the EXPLAIN PLAN command</td>
</tr>
<tr>
<td>DBMS_XSLPROCESSOR</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DEBUG_EXTPROC</td>
<td>Lets you debug external procedures on platforms with debuggers that attach to a running process</td>
</tr>
<tr>
<td>HTF</td>
<td>Hypertext functions generate HTML tags</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext procedures generate HTML tags</td>
</tr>
<tr>
<td>OWA_CACHE</td>
<td>Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications</td>
</tr>
<tr>
<td>OWA_COOKIE</td>
<td>Provides an interface for sending and retrieving HTTP cookies from the client's browser</td>
</tr>
<tr>
<td>OWA_CUSTOM</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
<tr>
<td>OWA_IMAGE</td>
<td>Provides an interface to access the coordinates where a user clicked on an image</td>
</tr>
<tr>
<td>OWA_OPT_LOCK</td>
<td>Contains subprograms that impose optimistic locking strategies so as to prevent lost updates</td>
</tr>
<tr>
<td>OWA_PATTERN</td>
<td>Provides an interface to locate text patterns within strings and replace the matched string with another string</td>
</tr>
<tr>
<td>OWA_SEC</td>
<td>Provides an interface for custom authentication</td>
</tr>
<tr>
<td>OWA_TEXT</td>
<td>Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.</td>
</tr>
<tr>
<td>OWA_UTIL</td>
<td>Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table</td>
</tr>
<tr>
<td>SDO_CS</td>
<td>Provides functions for coordinate system transformation</td>
</tr>
<tr>
<td>SDO_CSW_PROCESS</td>
<td>Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)</td>
</tr>
<tr>
<td>SDO_GCDR</td>
<td>Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses</td>
</tr>
<tr>
<td>SDO_GEOM</td>
<td>Provides functions implementing geometric operations on spatial objects</td>
</tr>
<tr>
<td>SDO_GEOR</td>
<td>Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata</td>
</tr>
</tbody>
</table>
Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDO_GEOR_ADMIN</td>
<td>Contains subprograms for administrative operations related to GeoRaster.</td>
</tr>
<tr>
<td>SDO_GEOR_UTL</td>
<td>Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data</td>
</tr>
<tr>
<td>SDO_LRS</td>
<td>Provides functions for linear referencing system support</td>
</tr>
<tr>
<td>SDO_MIGRATE</td>
<td>Provides functions for migrating spatial data from previous releases</td>
</tr>
<tr>
<td>SDO_NET</td>
<td>Provides functions and procedures for working with data modeled as nodes and links in a network</td>
</tr>
<tr>
<td>SDO_NET_MEM</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_OLS</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_PC_PKG</td>
<td>Contains subprograms to support the use of point clouds in Spatial</td>
</tr>
<tr>
<td>SDO_SAM</td>
<td>Contains functions and procedures for spatial analysis and data mining</td>
</tr>
<tr>
<td>SDO_TIN_PKG</td>
<td>Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial</td>
</tr>
<tr>
<td>SDO_TOPO</td>
<td>Provides procedures for creating and managing Spatial topologies</td>
</tr>
<tr>
<td>SDO_TOPO_MAP</td>
<td>Contains subprograms for editing Spatial topologies using a cache (TopoMap object)</td>
</tr>
<tr>
<td>SDO_TUNE</td>
<td>Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial</td>
</tr>
<tr>
<td>SDO_UTIL</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SDO_WFS_LOCK</td>
<td>Contains subprograms for WFS support for registering and unregistering feature tables</td>
</tr>
<tr>
<td>SDO_WFS_PROC</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SEM_API</td>
<td>Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.</td>
</tr>
<tr>
<td>SEM_PERF</td>
<td>Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.</td>
</tr>
<tr>
<td>SEM_RDFCTX</td>
<td>Contains subprograms for managing extractor policies and semantic indexes created for documents</td>
</tr>
<tr>
<td>SEM_RDFS_A</td>
<td>Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UTL_COLL</td>
<td>Enables PL/SQL programs to use collection locators to query and update</td>
</tr>
<tr>
<td>UTL_COMPRESS</td>
<td>Provides a set of data compression utilities</td>
</tr>
<tr>
<td>UTL_DBWS</td>
<td>Provides database Web services</td>
</tr>
<tr>
<td>UTL_ENCODE</td>
<td>Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts</td>
</tr>
<tr>
<td>UTL_FILE</td>
<td>Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system file I/O</td>
</tr>
<tr>
<td>UTL_HTTP</td>
<td>Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges</td>
</tr>
<tr>
<td>UTL_I18N</td>
<td>Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications</td>
</tr>
<tr>
<td>UTL_INETADDR</td>
<td>Provides a procedure to support internet addressing</td>
</tr>
<tr>
<td>UTL_IDENT</td>
<td>Specifies which database or client PL/SQL is running</td>
</tr>
<tr>
<td>UTL_LMS</td>
<td>Retrieves and formats error messages in different languages</td>
</tr>
<tr>
<td>UTL_MAIL</td>
<td>A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt</td>
</tr>
<tr>
<td>UTL_NLA</td>
<td>Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs</td>
</tr>
<tr>
<td>UTL_RAW</td>
<td>Provides SQL functions for manipulating RAW datatypes</td>
</tr>
<tr>
<td>UTL_RECOMP</td>
<td>Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels</td>
</tr>
<tr>
<td>UTL_REF</td>
<td>Enables a PL/SQL program to access an object by providing a reference to the object</td>
</tr>
<tr>
<td>UTL_SMTP</td>
<td>Provides PL/SQL functionality to send emails</td>
</tr>
<tr>
<td>UTL_RPADV</td>
<td>Provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment</td>
</tr>
<tr>
<td>UTL_TCP</td>
<td>Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world</td>
</tr>
<tr>
<td>UTL_URL</td>
<td>Provides escape and unescape mechanisms for URL characters</td>
</tr>
<tr>
<td>WPG_DOCLOAD</td>
<td>Provides an interface to download files, both BLOBs and BFILEs</td>
</tr>
<tr>
<td>ANYDATA TYPE</td>
<td>A self-describing data instance type containing an instance of the type plus a description</td>
</tr>
<tr>
<td>ANYDATASET TYPE</td>
<td>Contains a description of a given type plus a set of data instances of that type</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ANYTYPE TYPE</td>
<td>Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions.</td>
</tr>
<tr>
<td>Oracle Database Advanced Queuing Types</td>
<td>Describes the types used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBFS Content Interface Types</td>
<td>Describes public types defined to support the DBMS_DBFS_CONTENT interface.</td>
</tr>
<tr>
<td>Database URI Type</td>
<td>Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package.</td>
</tr>
<tr>
<td>Expression Filter Types</td>
<td>Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td>Describes JMS types so that a PL/SQL application can use JMS queues of JMS types.</td>
</tr>
<tr>
<td>LOGICAL CHANGE RECORD TYPES</td>
<td>Describes LCR types, which are message payloads that contain information about changes to a database.</td>
</tr>
<tr>
<td>MG_ID Package Types</td>
<td>Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types.</td>
</tr>
<tr>
<td>POLYMORPHIC TABLE FUNCTION (PTF) Package Types</td>
<td>Describes types defined in the DBMS_TF package to support PTF.</td>
</tr>
<tr>
<td>RULES TYPES</td>
<td>Describes the types used with rules, rule sets, and evaluation contexts.</td>
</tr>
<tr>
<td>RULES Manager Types</td>
<td>Rules Manager is supplied with one predefined type and a public synonym.</td>
</tr>
<tr>
<td>SODA Types</td>
<td>Describes the SODA Types.</td>
</tr>
<tr>
<td>UTL Streams Types</td>
<td>Describes abstract streams types used with Oracle XML functionality.</td>
</tr>
<tr>
<td>XMLType</td>
<td>Describes the types and functions used for native XML support in the server.</td>
</tr>
</tbody>
</table>
The Oracle Application Express supplies PL/SQL packages for application developers who are building database-centric web applications using Oracle Application Express.

For a complete description of all the packages that ship with Oracle Application Express, see the Oracle Application Express API Reference.
The CTX_ADM package lets you administer the Oracle Text data dictionary.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX_ADM in the Oracle Text Reference.
The `CTX_ANL` package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.

A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

For a complete description of this package within the context of Oracle Text, see `CTX_ANL` in the Oracle Text Reference.
The **CTX_CLS** package enables generation of CTXRULE rules for a set of documents.

For a complete description of this package within the context of Oracle Text, see **CTX_CLS** in the Oracle Text Reference.
The CTX_DDL package lets you create and manage the preferences, section groups, and stoplists required for Text indexes.

Note that you must install this package in order to use it.

For complete description of this package within the context of Oracle Text, see CTX_DDL in the Oracle Text Reference.
The \texttt{CTX\_DOC} package lets you request document services.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see \texttt{CTX\_DOC} in the Oracle Text Reference.
The `CTX_ENTITY` package enables you to search for terms that are unknown to you without specifying a particular search text.

It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

For the complete description of this package within the context of Oracle Text, see `CTX_ENTITY` in the *Oracle Text Reference*. 
This Oracle Text package lets you manage the index log.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the Oracle Text Reference.
This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the Oracle Text Reference.
This Oracle Text package lets you create various index reports.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the Oracle Text Reference.
This Oracle Text package lets you to manage and browse thesauri.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX.THES in the Oracle Text Reference.
This Oracle Text package is for use with the user-lexer.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the Oracle Text Reference.
The `DBMS_ADDM` package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_ADDM Subprograms

### See Also:
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about “Automatic Workload Repository in Oracle Real Application Clusters Environments”
- *Oracle Database Performance Tuning Guide* for more information about “Automatic Performance Diagnostics”

### 14.1 DBMS_ADDM Security Model

The `DBMS_ADDM` package runs with the caller's permission, not the definer's, and then applies the security constraints required by the `DBMS_ADVISOR` package.

### See Also:
- The `DBMS_ADVISOR` package for more information about “Security Model”.

### 14.2 Summary of DBMS_ADDM Subprograms

The table in this topic lists and describes the DBMS_ADDM subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE_DB Procedure</td>
<td>Creates an ADDM task for analyzing in database analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_INST Procedure</td>
<td>Creates an ADDM task for analyzing in instance analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_PARTIAL Procedure</td>
<td>Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it</td>
</tr>
</tbody>
</table>
Table 14-1  (Cont.) DBMS_ADDM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPARE_CAPTURE_REPLAY_REPORT Function</td>
<td>Produces a Compare Period ADDM report comparing the performance of a capture to a replay</td>
</tr>
<tr>
<td>COMPARE_DATABASES Function</td>
<td>Produces a Compare Period ADDM report for a database-wide performance comparison</td>
</tr>
<tr>
<td>COMPARE_INSTANCES Function</td>
<td>Produces a Compare Period ADDM report for an instance-level performance comparison</td>
</tr>
<tr>
<td>COMPARE_REPLAY_REPLAY_REPORT Function</td>
<td>Produces a Compare Period ADDM report comparing the performance of a replay to another replay</td>
</tr>
<tr>
<td>DELETE Procedure</td>
<td>Deletes an already created ADDM task (of any kind)</td>
</tr>
<tr>
<td>DELETE_FINDING_DIRECTIVE Procedure</td>
<td>Deletes a finding directive</td>
</tr>
<tr>
<td>DELETE_PARAMETER_DIRECTIVE Procedure</td>
<td>Deletes a parameter directive</td>
</tr>
<tr>
<td>DELETE_SEGMENT_DIRECTIVE Procedure</td>
<td>Deletes a segment directive</td>
</tr>
<tr>
<td>DELETE_SQL_DIRECTIVE Procedure</td>
<td>Deletes a SQL directive</td>
</tr>
<tr>
<td>GET_ASH_QUERY Function</td>
<td>Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding</td>
</tr>
<tr>
<td>GET_REPORT Function</td>
<td>Retrieves the default text report of an executed ADDM task</td>
</tr>
<tr>
<td>INSERT_FINDING_DIRECTIVE Procedure</td>
<td>Creates a directive to limit reporting of a specific finding type.</td>
</tr>
<tr>
<td>INSERT_PARAMETER_DIRECTIVE Procedure</td>
<td>Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter</td>
</tr>
<tr>
<td>INSERT_SEGMENT_DIRECTIVE Procedure</td>
<td>Creates a directive to prevent ADDM from creating actions to &quot;run Segment Advisor&quot; for specific segments</td>
</tr>
<tr>
<td>INSERT_SQL_DIRECTIVE Procedure</td>
<td>Creates a directive to limit reporting of actions on specific SQL</td>
</tr>
<tr>
<td>REAL_TIME_ADDM_REPORT Function</td>
<td>Produces a real-time report of ADDM activity</td>
</tr>
</tbody>
</table>

14.2.1 ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (  
  task_name           IN OUT VARCHAR2,  
  begin_snapshot      IN     NUMBER,  
  end_snapshot        IN     NUMBER,  
  db_id               IN     NUMBER := NULL);  
```
Parameters

Table 14-2  ANALYZE_DB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```sql
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

14.2.2 ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_INST (  
  task_name IN OUT VARCHAR2,  
  begin_snapshot IN NUMBER,  
  end_snapshot IN NUMBER,  
  cdb_type_override IN VARCHAR2,  
  read_only_type_override IN VARCHAR2,  
  instance_number IN NUMBER := NULL,  
  db_id IN NUMBER := NULL);
```
Parameters

Table 14-3  ANALYZE_INST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>cdb_type_override</td>
<td>Overrides the type of CDB that ADDM determines for doing analysis. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>· AUTONOMOUS OLTP—autonomous OLTP inside a PDB</td>
</tr>
<tr>
<td></td>
<td>· AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB</td>
</tr>
<tr>
<td></td>
<td>· PDB—a regular PDB</td>
</tr>
<tr>
<td></td>
<td>· CDB ROOT—the root of a CDB</td>
</tr>
<tr>
<td></td>
<td>· NON-CDB—a system that is not CDB or PDB</td>
</tr>
<tr>
<td></td>
<td>· AUTO—allows ADDM to decide the type of CDB to override based on the data</td>
</tr>
<tr>
<td>read_only_type_override</td>
<td>Overrides the type of CDB ADDM determines for analysis. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>· READ-WRITE—a regular database or the primary database in a data guard configuration</td>
</tr>
<tr>
<td></td>
<td>· READ-ONLY—a database open in read-only mode, such as an active data guard standby</td>
</tr>
<tr>
<td></td>
<td>· AUTO—allows ADDM to decide the type of CDB to override based on the data</td>
</tr>
<tr>
<td>instance_number</td>
<td>Number of the instance to analyze. By default it is the instance currently connected</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the ANALYZE_DB procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable tname:
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END

To see a report:

SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;

Note that the return type of a report is a **CLOB**, formatted to fit line size of 80.

### 14.2.3 ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

#### Syntax

```sql
DBMS_ADDM.ANALYZE_PARTIAL (  
  task_name           IN OUT VARCHAR2,
  instance_numbers    IN     VARCHAR2,
  begin_snapshot      IN     NUMBER,
  end_snapshot        IN     NUMBER,
  db_id               IN     NUMBER := NULL);  
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>instance_numbers</td>
<td>Comma separated list of instance numbers to analyze</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

#### Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

#### Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```sql
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_mode_task';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```
To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a `CLOB`, formatted to fit line size of 80.

### 14.2.4 COMPARE_CAPTURE_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

**Syntax**

```sql
DBMS_ADDMCOMPARE_CAPTURE_REPLAY_REPORT (replay_id IN NUMBER,
report_type IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

**Return Values**

A `CLOB` containing a compare period ADDM report

### 14.2.5 COMPARE_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

**Syntax**

```sql
DBMS_ADDM.COMPARE_DATABASES (base_dbid IN NUMBER := NULL,
base_begin_snap_id IN NUMBER,
base_end_snap_id IN NUMBER,
comp_dbid IN NUMBER := NULL,
```

Chapter 14

**Summary of DBMS_ADDM Subprograms**
Parameters

Table 14-6  COMPARE_DATABASES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.6 COMPARE_INSTANCES Function

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_INSTANCES (  
    base_dbid             IN NUMBER := NULL,  
    base_instance_id      IN NUMBER,  
    base_begin_snap_id    IN NUMBER,  
    base_end_snap_id      IN NUMBER,  
    comp_dbid             IN NUMBER := NULL,  
    comp_instance_id      IN NUMBER,  
    comp_begin_snap_id    IN NUMBER,  
    comp_end_snap_id      IN NUMBER,  
    report_type           IN VARCHAR2 := 'HTML')  
RETURN CLOB;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_instance_id</td>
<td>Instance number of the database instance to include from the base period</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_instance_id</td>
<td>Instance number of the database instance to include from the comparison period</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.7 COMPARE_REPLAY_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
    replay_id1            IN NUMBER,
    replay_id2            IN NUMBER,
    report_type           IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

Parameters

Table 14-8  COMPARE_REPLAY_REPLAY_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
</tbody>
</table>
Table 14-8  (Cont.) COMPARE_REPLAY_REPLAY_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id2</td>
<td>Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.8 DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

```sql
DBMS_ADDM.DELETE (task_name IN VARCHAR2);
```

Parameters

Table 14-9  DELETE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be deleted</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN
    DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

14.2.9 DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```sql
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (task_name IN VARCHAR2,
                                    dir_name IN VARCHAR2);
```

ORACLE
14.2.10 DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
    task_name   IN VARCHAR2,
    dir_name    IN VARCHAR2);
```

Parameters

Table 14-11  DELETE_PARAMETER_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

Examples

```
BEGIN
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

14.2.11 DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
    task_name   IN VARCHAR2,
    dir_name    IN VARCHAR2);
```
Parameters

Table 14-12 DELETE_SEGMENT_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

14.2.12 DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (  
  task_name IN VARCHAR2,  
  dir_name IN VARCHAR2);
```

Parameters

Table 14-13 DELETE_SQL_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

14.2.13 GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding.

For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding’s impact or the finding’s specific activity.

Syntax

```
DBMS_ADDM.GET_ASH_QUERY (  
  task_name IN VARCHAR2,  
  finding_id IN NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 14-14 GET_ASH_QUERY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>
### 14.2.14 GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

**Syntax**

```
DBMS_ADDM.GET_REPORT (  
    task_name           IN VARCHAR2)  
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

**Examples**

Set long 1000000  
Set pagesize 50000  
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;

### 14.2.15 INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (  
    task_name             IN VARCHAR2,  
    dir_name              IN VARCHAR2,  
    finding_name          IN VARCHAR2,  
    min_active_sessions   IN NUMBER := 0,  
    min_perc_impact       IN NUMBER := 0);  
```
Parameters

Table 14-16  INSERT_FINDING_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>finding_name</td>
<td>Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_perc_impact</td>
<td>Minimal number for the &quot;percent impact&quot; of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```sql
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
    NULL,
    'Undersized SGA directive',
    'Undersized SGA',
    2,
    10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

14.2.16 INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```sql
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (  
  task_name IN VARCHAR2,  
  dir_name IN VARCHAR2,  
  parameter_name IN VARCHAR2);  
```
Parameters

Table 14-17  INSERT_PARAMETER_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>parameter_name</td>
<td>Specifies the parameter to use. Valid parameter names appear in $PARAMETER.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT does not show these actions.

```sql
var tname varchar2(60);
BEGIN
    DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
        NULL,
        'my Parameter directive',
        'sga_target');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

14.2.17 INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to “run Segment Advisor” for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```sql
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (  
    task_name IN VARCHAR2,  
    dir_name IN VARCHAR2,  
    owner_name IN VARCHAR2,  
    object_name IN VARCHAR2 := NULL,  
    sub_object_name IN VARCHAR2 := NULL);
```

```sql
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (  
    task_name IN VARCHAR2,  
    dir_name IN VARCHAR2,  
    object_number IN NUMBER);
```
Parameters

Table 14-18  INSERT_SEGMENT_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for &quot;like&quot; constraints.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>sub_object_name</td>
<td>Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>object_number</td>
<td>Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
   DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
         'my Segment directive',
         'SCOTT');
   :tname := 'my_instance_analysis_mode_task';
   DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

14.2.18 INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (  
   task_name   IN VARCHAR2,  
   dir_name    IN VARCHAR2,  
   sql_id      IN VARCHAR2,  
   min_active_sessions IN NUMBER := 0,  
   min_response_time   IN NUMBER := 0);
```
Parameters

Table 14-19  INSERT_SQL_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_response_time</td>
<td>Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

var tname VARCHAR2(60);
BEGIN
   DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
   :tname := 'my_instance_analysis_mode_task';
   DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;

To see a report containing all actions regardless of the directive:

SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;

14.2.19 REAL_TIME_ADDM_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over GV$ is possible.

Syntax

DBMS_ADDM.REAL_TIME_ADDM_REPORT ()
RETURN CLOB;

Return Values

CLOB containing a real-time ADDM report
DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also:
Oracle Database Data Warehousing Guide for more information about query rewrite

This chapter contains the following topics:

• DBMS_ADVANCED_REWRITE Security Model
• Summary of DBMS_ADVANCED_REWRITE Subprograms

15.1 DBMS_ADVANCED_REWRITE Security Model

Default privileges are not granted to anyone for access to DBMS_ADVANCED_REWRITE Security Model procedures. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

GRANT CREATE MATERIALIZED VIEW TO er;

15.2 Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists the DBMS_ADVANCED_REWRITE subprograms and briefly describes them.
Table 15-1  DBMS_ADVANCED_REWRITE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_REWRITE_EQUIVALENCE Procedure</td>
<td>Changes the mode of the rewrite equivalence declaration to the mode you specify</td>
</tr>
<tr>
<td>BUILD_SAFE_REWRITE_EQUIVALENCE Procedure</td>
<td>Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure</td>
</tr>
<tr>
<td>DECLARE_REWRITE_EQUIVALENCE Procedures</td>
<td>Creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance</td>
</tr>
<tr>
<td>DROP_REWRITE_EQUIVALENCE Procedure</td>
<td>Drops the specified rewrite equivalence declaration</td>
</tr>
<tr>
<td>VALIDATE_REWRITE_EQUIVALENCE Procedure</td>
<td>Validates the specified rewrite equivalence declaration using the same validation method as described with the validate parameter</td>
</tr>
</tbody>
</table>

15.2.1 ALTER_REWRITE_EQUIVALENCE Procedure

This table list the all the package subprograms in alphabetical order.

Syntax

```sql
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name            VARCHAR2,
    rewrite_mode    VARCHAR2);
```

Parameters

Table 15-2  ALTER_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
### 15.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure.

It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

### 15.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance.

The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted` and `stale_tolerated` modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in `trusted` and `stale_tolerated` integrity modes.

#### Syntax

```sql
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE ( 
  name VARCHAR2, 
  source_stmt VARCHAR2, 
  destination_stmt VARCHAR2,
)```

---

Table 15-2  (Cont.) ALTER_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rewrite_mode</td>
<td>The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>
destination_stmt VARCHAR2,
validate BOOLEAN := TRUE,
rewrite_mode VARCHAR2 := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (name VARCHAR2,
source_stmt CLOB,
destination_stmt CLOB,
validate BOOLEAN := TRUE,
rewrite_mode VARCHAR2 := 'TEXT_MATCH');

Parameters

Table 15-3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.</td>
</tr>
<tr>
<td>source_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.</td>
</tr>
<tr>
<td>destination_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format.</td>
</tr>
<tr>
<td>validate</td>
<td>A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.</td>
</tr>
</tbody>
</table>

<td>The checksum analysis for the rewrite equivalence failed</td>
</tr>
<tr>
<td>ORA-30393</td>
<td>A query block in the statement did not write</td>
</tr>
<tr>
<td>ORA-30396</td>
<td>Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater</td>
</tr>
</tbody>
</table>

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.
15.2.4 DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```sql
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
    name        VARCHAR2);
```

Parameters

Table 15-5  DROP_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to drop. The name can be of the form <code>owner.name</code>, where <code>owner</code> complies with the rules for a schema name, and <code>name</code> compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>

15.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration.

It uses the same validation method as described with the VALIDATE parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure".

Syntax

```sql
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
    name         VARCHAR2);
```

Parameters

Table 15-6  VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to validate. The name can be of the form <code>owner.name</code>, where <code>owner</code> complies with the rules for a schema name, and <code>name</code> compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the <code>source_stmt</code> and <code>destination_stmt</code> of the specified equivalence declaration.</td>
</tr>
</tbody>
</table>
DBMS_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS_ADDM)
- SQL Performance Analyzer (DBMS_SQLPA)
- SQL Repair Advisor (DBMS_SQLDIAG)
- SQL Tuning Advisor (DBMS_SQLTUNE)
- Compression Advisor (DBMS_COMPRESSION.GET_COMPRESSION_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS_ADVISOR subprograms.

This chapter contains the following topics:

- DBMS_ADVISOR Deprecated Subprograms
- DBMS_ADVISOR Security Model
- Summary of DBMS_ADVISOR Subprograms

See Also:

- Oracle Database Administrator’s Guide to learn about Segment Advisor
- Oracle Database 2 Day + Performance Tuning Guide to learn how to use SQL Access Advisor in Enterprise Manager
- Oracle Database SQL Tuning Guide to learn more about SQL Access Advisor

16.1 DBMS_ADVISOR Deprecated Subprograms

The section lists programs that are deprecated with Oracle Database 11g.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.
The following subprograms are deprecated:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedure
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedure
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure

16.2 DBMS_ADVISOR Security Model

The ADVISOR privilege is required to use the DBMS_ADVISOR package.

16.3 Summary of DBMS_ADVISOR Subprograms

This topic lists and describes the subprograms in the DBMS_ADVISOR package.

In the following table, the Used in column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
<th>Used in</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_SQLWKLD_REF Procedure</td>
<td>Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td>ADD_SQLWKLD_STATEMENT Procedure</td>
<td>Adds a single statement to a workload</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td>ADD_STS_REF Procedure</td>
<td>Establishes a link between the current SQL Access Advisor task and a SQL tuning set</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td>CANCEL_TASK Procedure</td>
<td>Cancels a currently executing task operation</td>
<td>Segment Advisor, SQL Access Advisor</td>
</tr>
<tr>
<td>COPY_SQLWKLD_TO_STS Procedure</td>
<td>Copies the contents of a SQL workload object to a SQL tuning set</td>
<td>SQL Access Advisor</td>

<td></td>
</tr>
</tbody>
</table>
16.3.1 ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object.

**Note:**
This procedure is deprecated starting in Oracle Database 11g.

The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use `ADD_STS_REF` instead of `ADD_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

**Syntax**

```sql
DBMS_ADVISOR.ADD_SQLWKLD_REF (  
  task_name              IN VARCHAR2,  
  workload_name          IN VARCHAR2,  
  is_sts                 IN NUMBER :=0);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure <code>DELETE_REFERENCE</code>.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>• 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
  workload_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';  
  workload_name := 'My Workload';  
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
END;  
```
16.3.2 ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

**Syntax**

```sql
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (  
    workload_name          IN VARCHAR2,  
    module                 IN VARCHAR2,  
    action                 IN VARCHAR2,  
    cpu_time               IN NUMBER := 0,  
    elapsed_time           IN NUMBER := 0,  
    disk_reads             IN NUMBER := 0,  
    buffer_gets            IN NUMBER := 0,  
    rows_processed         IN NUMBER := 0,  
    optimizer_cost         IN NUMBER := 0,  
    executions             IN NUMBER := 1,  
    priority               IN NUMBER := 2,  
    last_execution_date    IN DATE := 'SYSDATE',  
    stat_period            IN NUMBER := 0,  
    username               IN VARCHAR2,  
    sql_text               IN CLOB);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>module</td>
<td>An optional business application module that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>action</td>
<td>An optional application action that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>The total CPU time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>The total elapsed time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>The total disk-read operations that are consumed by the SQL statement.</td>
</tr>
</tbody>
</table>
### Table 16-3  (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer_gets</td>
<td>The total buffer-get operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>The average number of rows processed by the SQL statement.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>The cost value calculated by the optimizer.</td>
</tr>
<tr>
<td>executions</td>
<td>The total execution count of the SQL statement. This value should be greater than zero.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>last_execution_date</td>
<td>The date and time at which the SQL statement last executed. If the value is NULL, then the database uses the current date and time.</td>
</tr>
<tr>
<td>stat_period</td>
<td>Time interval in seconds from which statement statistics were calculated.</td>
</tr>
<tr>
<td>username</td>
<td>The database user that executed the SQL statement. Because a user name is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott or Scott as a match for SCOTT.</td>
</tr>
<tr>
<td>sql_text</td>
<td>The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.</td>
</tr>
</tbody>
</table>

### Usage Notes

You cannot modify or delete a workload when it is currently referenced by an active task. A task is considered active if it is not in its initial state. See **RESET_TASK Procedure** for directions on setting a task to its initial state.

The **ADD_SQLWKLD_STATEMENT** procedure accepts several parameters that may be ignored by the caller. The database only uses the **disk_reads**, **buffer_gets**, and **optimizer_cost** parameters to sort workload data when actual analysis occurs. Therefore, actual values are only necessary when the **order_list** task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter **order_list**. The **order_list** parameter accepts any combination of the keys:

- **cpu_time**
- **elapsed_time**
- **buffer_gets**
- **optimizer_cost**
- **disk_reads**
- **executions**
- **priority**

The **optimizer_cost** key, which is a typical setting of **priority**, indicates that SQL Access Advisor sorts the workload data by **priority** and **optimizer_cost**, and processes the highest
cost statements first. Any statements that you add to the workload must include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, then choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,1,'SH','SELECT
        AVG(amount_sold) FROM sh.sales');
END;
/
```

16.3.3 ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set.

The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use ADD_STS_REF for any STS-based advisor runs. The older method of using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL tuning set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.ADD_STS_REF(
    task_name       IN VARCHAR2 NOT NULL,
    sts_owner       IN VARCHAR2,
    workload_name   IN VARCHAR2 NOT NULL);
```
Parameters

Table 16-4  ADD_STS_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.</td>
</tr>
</tbody>
</table>

Examples

DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');

16.3.4 CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate.

This call performs a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

DBMS_ADVISOR.CANCEL_TASK (
  task_name IN VARCHAR2);

Parameters

Table 16-5  CANCEL_TASK Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Usage Notes

A cancel command restores the task to its condition prior to the start of the canceled operation. Therefore, a canceled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.
Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/

16.3.5 COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (workload_name IN VARCHAR2, sts_name IN VARCHAR2, import_mode IN VARCHAR2 := 'NEW');

Parameters

**Table 16-6  COPY_SQLWKLD_TO_STS Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name to copy.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The SQL tuning set name into which the SQL Workload object will be copied.</td>
</tr>
</tbody>
</table>
Table 16-6 (Cont.) COPY_SQLWKLD_TO_STS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import_mode</td>
<td>Specifies the handling of the target SQL tuning set. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>· APPEND</td>
</tr>
<tr>
<td></td>
<td>Causes SQL Workload data to be appended to the target SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>· NEW</td>
</tr>
<tr>
<td></td>
<td>Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported.</td>
</tr>
<tr>
<td></td>
<td>· REPLACE</td>
</tr>
<tr>
<td></td>
<td>Causes any existing data in the target SQL tuning set to be purged prior to the workload copy.</td>
</tr>
<tr>
<td></td>
<td>In all cases, if the specified SQL tuning set does not exist, it will be created.</td>
</tr>
</tbody>
</table>

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

```
BEGIN
    DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/ 
```

16.3.6 CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (  
    buffer IN CLOB,  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

Parameters

Table 16-7 CREATE_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>A CLOB buffer containing report or script information.</td>
</tr>
<tr>
<td>location</td>
<td>The name of the directory that will contain the output file. You must use the alias as defined by the CREATE DIRECTORY statement. The Advisor translates the alias into the actual directory location.</td>
</tr>
</tbody>
</table>
Table 16-7  (Cont.) CREATE_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The name of the output file. The file name can only contain the name and an optional file type of the form filename.filetype.</td>
</tr>
</tbody>
</table>

Usage Notes

You must embed all formatting within the CLOB.

The database restricts file access within stored procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    v_task_id NUMBER;
    v_task_name VARCHAR2(30);
    v_workload_name VARCHAR2(30);
BEGIN
    v_task_name := 'My Task';
    v_workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(
        advisor_name => DBMS_ADVISOR.SQLACCESS_ADVISOR,
        task_id => v_task_id,
        task_name => v_task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(
        workload_name => v_workload_name,
        description => 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(
        task_name => v_task_name,
        workload_name => v_workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(
        workload_name => v_workload_name,
        module => 'MONTHLY',
        action => 'ROLLUP',
        cpu_time => 100,
        elapsed_time => 400,
        disk_reads => 5041,
        buffer_gets => 103,
        rows_processed => 640445,
        optimizer_cost => 680000,
        executions => 2,
        priority => 1,
        last_execution_date => SYSDATE,
        stat_period => 1,
        username => 'SH',
        sql_text => 'SELECT AVG(amount_sold) FROM sh.sales' );
16.3.7 CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

DBMS_ADVISOR.CREATE_OBJECT (  
  task_name IN VARCHAR2,  
  object_type IN VARCHAR2,  
  attr1 IN VARCHAR2 := NULL,  
  attr2 IN VARCHAR2 := NULL,  
  attr3 IN VARCHAR2 := NULL,  
  attr4 IN CLOB := NULL,  
  attr5 IN VARCHAR2 := NULL,  
  object_id OUT NUMBER,  
  attr6 IN VARCHAR2 := NULL,  
  attr7 IN VARCHAR2 := NULL,  
  attr8 IN VARCHAR2 := NULL,  
  attr9 IN VARCHAR2 := NULL,  
  attr10 IN VARCHAR2 := NULL);

Parameters

Table 16-8  CREATE_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_type</td>
<td>Specifies the external object type.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr6</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr7</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr8</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr9</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr10</td>
<td>Advisor-specific data.</td>
</tr>
</tbody>
</table>
The attribute parameters have different values depending upon the object type. See Oracle Database Administrator's Guide for details regarding these parameters and object types.

**Return Values**

Returns the new object identifier.

**Usage Notes**

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator's Guide for further information regarding the Segment Advisor.

**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL, 'SELECT * FROM TEST_TAB', NULL, obj_id, NULL, NULL, NULL, NULL, NULL);
END;
/
```

### 16.3.8 CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user.

A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.
Syntax

DBMS_ADVISOR.CREATE_SQLWKLD (  
    workload_name           IN OUT VARCHAR2,  
    description              IN VARCHAR2 := NULL,  
    template                 IN VARCHAR2 := NULL,  
    is_template              IN VARCHAR2 := 'FALSE');

Parameters

Table 16-9 CREATE_SQLWKLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies an optional workload description. Descriptions can be up to 256 characters.</td>
</tr>
<tr>
<td>template</td>
<td>An optional SQL Workload name of an existing workload data object or data object template.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.</td>
</tr>
</tbody>
</table>

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

DECLARE  
    workload_name VARCHAR2(30);  
BEGIN  
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/

Chapter 16
Summary of DBMS_ADVISOR Subprograms
16.3.9 CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
    advisor_name    IN VARCHAR2,
    task_id         OUT NUMBER,
    task_name       IN OUT VARCHAR2,
    task_desc       IN VARCHAR2 := NULL,
    template        IN VARCHAR2 := NULL,
    is_template     IN VARCHAR2 := 'FALSE',
    how_created     IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
    advisor_name    IN VARCHAR2,
    task_name       IN VARCHAR2,
    task_desc       IN VARCHAR2 := NULL,
    template        IN VARCHAR2 := NULL,
    is_template     IN VARCHAR2 := 'FALSE',
    how_created     IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
    parent_task_name IN VARCHAR2,
    rec_id           IN NUMBER,
    task_id          OUT NUMBER,
    task_name        IN OUT VARCHAR2,
    task_desc        IN VARCHAR2,
    template         IN VARCHAR2);
```

Parameters

Table 16-10 CREATE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>task_id</td>
<td>A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.</td>
</tr>
<tr>
<td>task_name</td>
<td>Specifies a new task name. Names must be unique among all tasks for the user.</td>
</tr>
<tr>
<td>task_desc</td>
<td>When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>template</td>
<td>Specifies an optional task description. Descriptions can be up to 256 characters in length.</td>
</tr>
<tr>
<td></td>
<td>An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.</td>
</tr>
</tbody>
</table>
Table 16-10  (Cont.) CREATE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_template</td>
<td>An optional value that allows the user to set the newly created task as</td>
</tr>
<tr>
<td></td>
<td>template. Valid values are: TRUE and FALSE.</td>
</tr>
<tr>
<td>how_created</td>
<td>An optional value that identifies how the source was created.</td>
</tr>
</tbody>
</table>

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is
permanently associated with the original advisor. By default, tasks are created using built-in
default settings. To create a task using the parameter settings of an existing task or task
template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the
`advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OlTP`
  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`
  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`
  Parameters are preset to favor a hybrid application environment where both OLTP and
data warehouse operations may occur. For the SQL Access Advisor, this is the default
template.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/```
16.3.10 DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

![Note]

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD (    workload_name        IN VARCHAR2);
```

Parameters

**Table 16-11  DELETE_SQLWKLD Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the `RESET_TASK Procedure` to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
16.3.11 DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

**Note:**
This procedure is deprecated starting in Oracle Database 11g.

Use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

**Syntax**

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
    task_name        IN VARCHAR2,
    workload_name    IN VARCHAR2,
    is_sts           IN NUMBER :=0);
```

**Parameters**

**Table 16-12 DELETE_SQLWKLD_REF Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>• 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

**Examples**

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
```

16.3.12 DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

Note:
This procedure has been deprecated.

Syntax

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (  
workload_name IN VARCHAR2,  
sql_id IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (  
workload_name IN VARCHAR2,  
search IN VARCHAR2,  
deleted OUT NUMBER);

Parameters

Table 16-13  DELETE_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
<tr>
<td>deleted</td>
<td>Returns the number of statements deleted by the searched deleted operation.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure to set a task to its initial state.

Examples

DECLARE  
    workload_name VARCHAR2(30);  
    deleted NUMBER;  
    id NUMBER;  
BEGIN
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
    100, 400, 5041, 103, 640445, 680000, 2,
    1, SYSDATE, 1, 'SH', 'SELECT
    AVG(amount_sold)
    FROM sh.sales');

SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
WHERE workload_name = 'My Workload';

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

16.3.13 DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL
 tuning set.

Use DELETE_STS_REF for any STS-based advisor runs. The older method of using
DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility.
Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas
DELETE_SQLWKLD_REF does not.

Syntax

DBMS_ADVISOR.DELETE_STS_REF (
    task_name IN VARCHAR2 NOT NULL,
    sts_owner IN VARCHAR2,
    workload_name IN VARCHAR2 NOT NULL);

Parameters

Table 16-14  DELETE_STS_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL,</td>
</tr>
<tr>
<td></td>
<td>in which case the advisor assumes the SQL tuning set to be owned by the</td>
</tr>
<tr>
<td></td>
<td>currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be unlinked. A workload consists of one or</td>
</tr>
<tr>
<td></td>
<td>more SQL statements, plus statistics and attributes that fully describe each</td>
</tr>
<tr>
<td></td>
<td>statement. The database stores a workload as a SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>The wildcard % is supported as a workload name. The rules of use are</td>
</tr>
<tr>
<td></td>
<td>identical to the SQL LIKE operator. For example, to remove all links to SQL</td>
</tr>
<tr>
<td></td>
<td>tuning set objects, use the wildcard % as the STS_NAME.</td>
</tr>
</tbody>
</table>
16.3.14 DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

DBMS_ADVISOR.DELETE_TASK (task_name IN VARCHAR2);

Parameters

Table 16-15  DELETE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be deleted from the repository. The</td>
</tr>
<tr>
<td></td>
<td>wildcard % is supported as a TASK_NAME. The rules of use are identical to</td>
</tr>
<tr>
<td></td>
<td>the LIKE operator. For example, to delete all tasks for the current user,</td>
</tr>
<tr>
<td></td>
<td>use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_</td>
</tr>
<tr>
<td></td>
<td>TASK operation will not delete any tasks marked as READONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/

16.3.15 EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.
Syntax

DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2,
    execution_type    IN VARCHAR2             := NULL,
    execution_name    IN VARCHAR2             := NULL,
    execution_params  IN dbms_advisor.argList := NULL,
    execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;

Parameters

Table 16-16  EXECUTE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>
| execution_type | The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values:  
  • EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.  
  • TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.  
  • ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan. |
| execution_name | A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function. |
| execution_params | A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following:  
  DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'hr') |
| execution_desc | A 256-length string describing the execution. |

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.
**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

**16.3.16 GET_REC_ATTRIBUTES Procedure**

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

**Syntax**

```sql
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
    workload_name         IN VARCHAR2,
    rec_id                IN NUMBER,
    action_id             IN NUMBER,
    attribute_name        IN VARCHAR2,
    value                 OUT VARCHAR2,
    owner_name            IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute to change.</td>
</tr>
<tr>
<td>value</td>
<td>The buffer to receive the requested attribute value.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Optional owner name of the target task. This permits access to task data not owned by the current user.</td>
</tr>
</tbody>
</table>

**Return Values**

The requested attribute value is returned in the `value` argument.
Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,64045,680000,2,
        1,SYSDATE,1,'SH','SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/

16.3.17 GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

DBMS_ADVISOR.GET_TASK_REPORT (task_name IN VARCHAR2, type IN VARCHAR2 := 'TEXT',
    level IN VARCHAR2 := 'TYPICAL',
    section IN VARCHAR2 := 'ALL',
    owner_name IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    object_id IN NUMBER := NULL)
RETURN CLOB;

Parameters

Table 16-18   GET_TASK_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task from which the script will be created.</td>
</tr>
<tr>
<td>type</td>
<td>The only valid value is TEXT.</td>
</tr>
<tr>
<td>level</td>
<td>The possible values are BASIC, TYPICAL, and ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Advisor-specific report sections.</td>
</tr>
</tbody>
</table>
Table 16-18  (Cont.) GET_TASK_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the buffer receiving the script.

16.3.18 GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to a file.

The output script contains all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (  
    task_name          IN VARCHAR2  
    type               IN VARCHAR2 := 'IMPLEMENTATION',  
    rec_id             IN NUMBER   := NULL,  
    act_id             IN NUMBER   := NULL,  
    owner_name         IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    object_id          IN NUMBER   := NULL)  
RETURN CLOB;
```

Parameters

Table 16-19  GET_TASK_SCRIPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.</td>
</tr>
<tr>
<td>act_id</td>
<td>Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.</td>
</tr>
</tbody>
</table>
Table 16-19  (Cont.) GET_TASK_SCRIPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>An optional task owner name.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    buf CLOB;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100, 400, 5041, 103, 640445, 680000, 2,
        1, SYSDATE, 1, 'SH', 'SELECT
        AVG(amount_sold)
        FROM sh.sales');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

16.3.19 IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified Advisor task.

Syntax

```sql
DBMS_ADVISOR.IMPLEMENT_TASK (task_name IN VARCHAR2,
```
rec_id       IN NUMBER := NULL,
exit_on_error IN BOOLEAN := NULL);

Parameters

### Table 16-20 IMPLEMENT_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation ID.</td>
</tr>
<tr>
<td>exit_on_error</td>
<td>An optional Boolean to exit on the first error.</td>
</tr>
</tbody>
</table>

16.3.20 IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (    workload_name IN VARCHAR2,
    import_mode IN VARCHAR2 := 'NEW',
    priority IN NUMBER := 2,
    saved_rows OUT NUMBER,
    failed_rows OUT NUMBER);
```

Parameters

### Table 16-21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>
Table 16-21  (Cont.) IMPORT_SQLWKLD_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>The default value is NEW.</td>
<td></td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number or rows that were not saved due to syntax or validation errors</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

DECLARE
  workload_name VARCHAR2(30);
saved NUMBER;
failed NUMBER;
BEGIN
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved, failed);
END;
/
16.3.21 IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

**Note:**
This procedure is deprecated starting in Oracle Database 11g.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
    workload_name       IN VARCHAR2,
    import_mode         IN VARCHAR2 := 'NEW',
    priority            IN NUMBER := 2,
    saved_rows          OUT NUMBER,
    failed_rows         OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>The default value is NEW. Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows saved as output parameters.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');

    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved, failed);
END;
/

16.3.22 IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
    workload_name     IN VARCHAR2,  
    sts_name          IN VARCHAR2,  
    import_mode       IN VARCHAR2 := 'NEW',  
    priority          IN NUMBER := 2,  
    saved_rows        OUT NUMBER,  
    failed_rows       OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
    workload_name     IN VARCHAR2,  
    sts_owner         IN VARCHAR2,  
    sts_name          IN VARCHAR2,  
    import_mode       IN VARCHAR2 := 'NEW',  
    priority          IN NUMBER := 2,  
    saved_rows        OUT NUMBER,  
    failed_rows       OUT NUMBER);
Parameters

Table 16-23  IMPORT_SQLWKLD_STS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The optional owner of the SQL tuning set.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The name of an existing SQL tuning set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>· APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>· NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>· REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
```
16.3.23 IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload.

This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

Note:
This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (  
    workload_name         IN VARCHAR2,  
    import_mode           IN VARCHAR2 := 'NEW',  
    priority              IN NUMBER := 2,  
    sumadv_id             IN NUMBER,  
    saved_rows            OUT NUMBER,  
    failed_rows           OUT NUMBER);  

Parameters

Table 16-24  IMPORT_SQLWKLD_SUMADV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
</tbody>
</table>

The default value is NEW.
Table 16-24  (Cont.) IMPORT_SQLWKLD_SUMADV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>sumadv_id</td>
<td>Specifies the Summary Advisor workload identifier number.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

DECLARE
workload_name VARCHAR2(30);
saved NUMBER;
failed NUMBER;
sumadv_id NUMBER;
BEGIN
workload_name := 'My Workload';
sumadv_id := 394;

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH. %');
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
                                 saved, failed);
END;
/

16.3.24 IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2 := 'NEW',
    owner_name            IN VARCHAR2,
    table_name            IN VARCHAR2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>table_name</td>
<td>Specifies the name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the workload object.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See `RESET_TASK Procedure` to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH', 'USER_WORKLOAD', saved, failed);
END;
/
```

16.3.25 INTERRUPT_TASK Procedure

This procedure stops a currently executing task.

The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```sql
DBMS_ADVISOR.INTERRUPT_TASK (task_name IN VARCHAR2);
```

Parameters

**Table 16-26  INTERRUPT_TASK Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be interrupted.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
```
While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

### 16.3.26 MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

#### Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (  
    task_name          IN VARCHAR2  
    id                 IN NUMBER,  
    action             IN VARCHAR2);  
```

#### Parameters

**Table 16-27  MARK_RECOMMENDATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>id</td>
<td>The recommendation identifier number assigned by the Advisor.</td>
</tr>
<tr>
<td>action</td>
<td>The recommendation action setting. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</td>
</tr>
<tr>
<td></td>
<td>• REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</td>
</tr>
</tbody>
</table>

#### Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

#### Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
```
attribute VARCHAR2(100);
rec_id NUMBER;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    rec_id := 1;
    DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/

16.3.27 QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

DBMS_ADVISOR.QUICK_TUNE (advisor_name           IN VARCHAR2,
                          task_name              IN VARCHAR2,
                          attr1                  IN CLOB,
                          attr2                  IN VARCHAR2 := NULL,
                          attr3                  IN NUMBER := NULL,
                          template               IN VARCHAR2 := NULL,
                          implement              IN BOOLEAN := FALSE,
                          description            IN VARCHAR2 := NULL);

Parameters

Table 16-28 QUICK_TUNE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Name of the Advisor that will perform the analysis.</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
</tbody>
</table>
Table 16-28  (Cont.) QUICK_TUNE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr1</td>
<td>Advisor-specific attribute in the form of a CLOB variable.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific attribute in the form of a VARCHAR2 variable.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific attribute in the form of a NUMBER.</td>
</tr>
<tr>
<td>template</td>
<td>Name of an existing task or template from which the initial settings need to be copied.</td>
</tr>
<tr>
<td>implement</td>
<td>Flag specifying whether to implement the task.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the task.</td>
</tr>
</tbody>
</table>

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```sql
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

16.3.28 RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point.

Resetting the workload has the effect of removing all journal and log messages, and recalculating necessary volatility and usage statistics.

Tip:

This procedure is deprecated starting in Oracle Database 11g.
Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (     
    workload_name       IN VARCHAR2);
```

Parameters

**Table 16-29  RESET_SQLWKLD Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

**16.3.29 RESET_TASK Procedure**

This procedure re-initializes the metadata for the specified task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK (    
    task_name       IN VARCHAR2);
```
Parameters

Table 16-30  RESET_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/

16.3.30 SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Note:
This procedure is deprecated starting in Oracle Database 11g.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (  
    parameter IN VARCHAR2,  
    value IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (  
    parameter IN VARCHAR2,  
    value IN NUMBER);
```
Parameters

Table 16-31  SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

BEGIN
   DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/

16.3.31 SET_DEFAULT_TASK_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a task or a template.

A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (advisor_name        IN VARCHAR2
parameter           IN VARCHAR2,
value               IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (advisor_name        IN VARCHAR2
parameter           IN VARCHAR2,
value               IN NUMBER);
Parameters

Table 16-32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number.</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR, 'VALID_TABLE_LIST', 'SH.%');
END;
/

16.3.32 SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (workload_name IN VARCHAR2, parameter IN VARCHAR2, value IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (workload_name IN VARCHAR2, parameter IN VARCHAR2, value IN NUMBER);
### Parameters

#### Table 16-33 SET_SQLWKLD_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

#### Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

#### Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
END;
/```

### 16.3.33 SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

#### Syntax

```sql
DBMS_ADVISOR.SET_TASK_PARAMETER (  
    task_name IN VARCHAR2,  
    parameter IN VARCHAR2,  
    value IN VARCHAR2);  

DBMS_ADVISOR.SET_TASK_PARAMETER (  
    task_name IN VARCHAR2,  
    parameter IN VARCHAR2,  
    value IN NUMBER);  
```
Parameters

### Table 16-34 SET_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A task cannot be modified unless it is in its initial state. See **RESET_TASK Procedure** to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 16-35 lists SQL Access Advisor task parameters.
Table 16-35  SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ANALYSIS_SCOPE     | A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are:  
  - **ALL**: Short name for specifying INDEX, MVIEW, TABLE, and PARTITION.  
  - **EVALUATION**: Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone.  
  - **INDEX**: Allows the SQL Access Advisor to recommend index structure changes.  
  - **MVIEW**: Allows the SQL Access Advisor to recommend materialized view and log changes.  
  - **PARTITION**: Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options.  
  - **TABLE**: Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning.  
Using the new keywords, the following combinations are valid:  
  - **INDEX**  
  - **MVIEW**  
  - **INDEX, PARTITION**  
  - **INDEX, MVIEW, PARTITION**  
  - **INDEX, TABLE, PARTITION**  
  - **MVIEW, PARTITION**  
  - **MVIEW, TABLE, PARTITION**  
  - **INDEX, MVIEW, TABLE, PARTITION**  
  - **TABLE, PARTITION**  
  - **EVALUATION**  
The default value is INDEX. The data type is STRINGLIST. |
| CREATION_COST      | When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored. The data type is STRING. |
| DAYS_TO_EXPIRE     | Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The data type is NUMBER. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are:  
  - an integer in the range of 0 to 2147483647  
  - ADVISOR_UNLIMITED  
  - ADVISOR_UNUSED  
The default value is 30. |
| DEF_EM_TEMPLATE    | Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values. The default value is SQLACCESS_EMTASK. The data type is STRING. |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>

<tbody>
<tr>
<td><strong>DEF_INDEX_OWNER</strong></td>
<td>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- Existing schema name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>- ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td><strong>DEF_INDEX_TABLESPACE</strong></td>
<td>Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>- ADVISOR_UNUSED No tablespace clause will be present in the script for indexes.</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td><strong>DEF_MVIEW_OWNER</strong></td>
<td>Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- Existing schema name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>- ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRING.</td>
</tr>

</tbody>
</table>
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DML_VOLATILITY</td>
<td>When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The data type is STRING. See the related parameter refresh_mode.</td>
</tr>
</tbody>
</table>
| END_TIME            | Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:  
  - DD is the numeric date  
  - MM is the numeric month  
  - YYYY is the numeric year  
  - HH is the hour in 24 hour format  
  - MI is the minute  
  - SS is the second  
The data type is STRING. |
| EVALUATION_ONLY     | This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are:  
  - FALSE  
  - TRUE  
The default value is FALSE. The data type is STRING. |
| EXECUTION_TYPE      | This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are:  
  - FULL => FULL  
  - INDEX_ONLY => INDEX  
  - MVIEWONLY => MVIEW  
  - MVIEW_LOG_ONLY => MVIEW_LOG_ONLY  
The type of recommendations that is desired. Possible values:  
  - FULL All supported recommendation types will be considered.  
  - INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations.  
  - MVIEWONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations.  
  - MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations.  
The default value is FULL. The data type is STRING. |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENT_EXIT_ON_ERROR</td>
<td>When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to <strong>TRUE</strong>, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>TRUE</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>FALSE</strong></td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>TRUE</strong>. The data type is <strong>STRING</strong>.</td>
</tr>
<tr>
<td>INDEX_NAME_TEMPLATE</td>
<td>Specifies the method by which new index names are formed. If the <strong>TASK_ID</strong> is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the <strong>TASK_ID</strong> in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are:</td>
</tr>
<tr>
<td></td>
<td>• Any literal value up to 22 characters.</td>
</tr>
<tr>
<td></td>
<td>• <strong>TABLE</strong> Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.</td>
</tr>
<tr>
<td></td>
<td>• <strong>TASK_ID</strong> Causes the current task identifier number to be inserted in hexadecimal form.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SEQ</strong> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</td>
</tr>
<tr>
<td></td>
<td>The default template is <strong>table_IDX$$_task_idsequence</strong>. The data type is <strong>STRING</strong>.</td>
</tr>
<tr>
<td>INVALID_ACTION_LIST</td>
<td>Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• single action</td>
</tr>
<tr>
<td></td>
<td>• comma-delimited action list</td>
</tr>
<tr>
<td></td>
<td>• <strong>ADVISOR_UNUSED</strong></td>
</tr>
<tr>
<td></td>
<td>The default value is <strong>ADVISOR_UNUSED</strong>. The data type is <strong>STRINGLIST</strong>.</td>
</tr>
</tbody>
</table>
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| INVALID_MODULE_LIST     | Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are:  
  - single application  
  - comma-delimited module list  
  - ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
| INVALID_SQLSTRING_LIST  | Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are:  
  - single string  
  - comma-delimited string list  
  - ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
| INVALID_USERNAME_LIST   | Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are:  
  - single user name  
  - comma-delimited user name list  
  - ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **JOURNALING**          | Controls the logging of messages to the journal ([DBA_ADVISOR_JOURNAL](#) and [USER_ADVISOR_JOURNAL](#) views). The higher the setting, the more information is logged to the journal. Possible values are:  
  - UNUSED: no journal messages  
  - FATAL: explanation of fatal conditions  
  - ERROR: explanation of errors  
  - WARNING: explanation of warnings  
  - INFORMATION: information message  
  - INFORMATION2: common information  
  - INFORMATION3: common information  
  - INFORMATION4: common information  
  - INFORMATION5: common information  
  - INFORMATION6: common information  

Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least.  
The default value is INFORMATION. The data type is NUMBER. |
| **LIMITED_PARTITION_SCHEMES** | User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are:  
  - An integer in the range of 1 to 10  
  - ADVISOR_UNUSED  

The default value is ADVISOR_UNUSED. The data type is NUMBER. |
| **MAX_NUMBER_PARTITIONS** | Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are:  
  - An integer in the range of 1 to 4294967295  
  - ADVISOR_UNLIMITED  
  - ADVISOR_UNUSED  

The default value is ADVISOR_UNLIMITED. The data type is NUMBER. |
| **MODE**                | Specifies the mode by which Access Advisor will operate during an analysis. Valid values are:  
  - LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.  
  - COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.  

The default value is COMPREHENSIVE. The data type is STRING. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| MVIEW_NAME_TEMPLATE    | Specifies the method by which new materialized view names are formed. If the `TASK_ID` is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the `TASK_ID` in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:  
  - Any literal value up to 22 characters.  
  - `TASK_ID` Causes the current task identifier number to be inserted in hexadecimal form.  
  - `SEQ` Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.  
  
The default template is: `MV$$_task_id$sequence`. The data type is `STRING`. |
| ORDER_LIST             | This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using `ORDER_LIST` values. A comma must separate multiple order keys. Possible values are:  
  - `BUFFER_GETS` Sets the order using the SQL statement's buffer-get count value.  
  - `CPU_TIME` Sets the order using the SQL statement's CPU time value.  
  - `DISK_READS` Sets the order using the SQL statement's disk-read count value.  
  - `ELAPSED_TIME` Sets the order using the SQL statement's elapsed time value.  
  - `EXECUTIONS` Sets the order using the SQL statement's execution frequency value.  
  - `OPTIMIZER_COST` Sets the order using the SQL statement's optimizer cost value.  
  - `I/O` Sets the order using the SQL statement's I/O count value.  
  - `PRIORITY` Sets the order using the user-supplied business priority value.  
  All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is `PRIORITY, OPTIMIZER_COST`. The data type is `STRINGLIST`. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PARTITION_NAME_TEMPLATE | Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:  
  - Any literal value up to 22 characters.  
  - table - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.  
  - task_id - Causes the current task identifier number to be inserted in hexadecimal form.  
  - sequence - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.  
  The default template is PTN$$_table_task_idsequence. The data type is STRING. |
| PARTITIONING_GOAL    | Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The data type is STRING.                                                                                                                                                                                                 |
| PARTITIONING_TYPES   | Specifies the type of partitioning used. Possible values are RANGE and HASH. The data type is STRING.                                                                                                                                                                                                                                         |
| RANKING_MEASURE      | Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are:  
  - BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.  
  - CPU_TIME Sets the order using the SQL statement's CPU time value.  
  - DISK_READS Sets the order using the SQL statement's disk-read count value.  
  - ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.  
  - EXECUTIONS Sets the order using the SQL statement's elapsed time value.  
  - OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.  
  - PRIORITY Sets the order using the user-supplied business priority value.  
  All values are accessed in descending order, where a high value is considered more interesting than a low value.  
  The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST. |
| RECOMMEND_MV_EXACT_TEXT_MATCH | When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE.  
  The possible values are:  
  - TRUE  
  - FALSE  
  The default value is TRUE. The data type is STRING. |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| RECOMMENDED_TABLESPACES      | Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are:  
  - TRUE  
  - FALSE (the default)  
  The data type is STRING.                                                                                                                   |
| REFRESH_MODE                  | Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are:  
  - ON_DEMAND  
  - ON_COMMIT  
  The default value is ON_DEMAND. The data type is STRING.                                                                                   |
| REPORT_DATE_FORMAT           | This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The data type is STRING.                                                                                      |
| SHOW_RETAINS                  | Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are:  
  - TRUE  
  - FALSE  
  The default value is TRUE. The data type is STRING.                                                                                         |
| SQL_LIMIT                     | Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table hr.employees are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are:  
  - An integer in the range of 1 to 2147483647  
  - ADVISOR_UNLIMITED  
  - ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is NUMBER.                                                                                   |
| START_TIME                    | Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:  
  - DD is the numeric date  
  - MM is the numeric month  
  - YYYY is the numeric year  
  - HH is the hour in 24 hour format  
  - MI is the minute  
  - SS is the second  
  The data type is STRING.                                                                                                                   |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **STORAGE_CHANGE**| Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the **STORAGE_CHANGE** value to the space quantity currently used by existing access structures. A negative **STORAGE_CHANGE** value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values:  
  - Any valid integer including negative values, zero and positive values. The default value is **ADVISOR_UNLIMITED**. The data type is **NUMBER**. |
| **TIME_LIMIT**     | Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values:  
  - An integer in the range of 1 to 10,000  
  - **ADVISOR_UNLIMITED**  
  The default value is 720 (12 hours). The data type is **NUMBER**. Note that specifying **ADVISOR_UNLIMITED** has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes. |
| **VALID_ACTION_LIST** | Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.  
  An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.  
  During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.  
  The possible values are:  
  - single action  
  - comma-delimited action list  
  - **ADVISOR_UNUSED**  
  The default value is **ADVISOR_UNUSED**. The data type is **STRINGLIST**. |
| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |}
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|}
| VALID_MODULE_LIST      | Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are:  
  - single application
  - comma-delimited module list
  - ADVISOR_UNUSED
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
| VALID_SQLSTRING_LIST   | Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are:  
  - single string
  - comma-delimited string list
  - ADVISOR_UNUSED
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
| VALID_TABLE_LIST       | Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is:  
  - schema.table
  - schema
  - schema.% (equivalent to schema)
  - comma-delimited action list
  - ADVISOR_UNUSED
  The possible values are:  
  - single table reference
  - comma-delimited reference list
  - ADVISOR_UNUSED
  The default value is ADVISOR_UNUSED. The data type is TABLELIST. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| VALID_USERNAME_LIST  | Contains a fully qualified list of user names that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name does not match a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are: * single user name * comma-delimited user name list * ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST.                                      |
| WORKLOAD_SCOPE       | Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.  
  FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.  
  PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.  
  The data type is STRING.                                                                                   |

Segment Advisor Parameters

Table 16-36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 16-36  Segment Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| MODE        | The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:  
  • LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository  
  • COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics |
| TIME_LIST   | The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.                     |
| RECOMMEND_ALL | Whether to generate recommendations for all segments.  
  The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink. |

Examples

DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
BEGIN
task_name := 'My Task';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST', 'SH.%,SCOTT.EMP');
END;
/

Undo Advisor Task Parameters

Table 16-37 lists the input task parameters that can be set in the Undo Advisor using the `SET_TASK_PARAMETER` procedure.

**Table 16-37  Undo Advisor Task Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGET_OBJECTS</td>
<td>The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.</td>
</tr>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>BEGIN_TIME_SEC</td>
<td>The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
<tr>
<td>END_TIME_SEC</td>
<td>The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
tname  VARCHAR2(30);
oid    NUMBER;
BEGIN
  DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
  DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 16-38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure.

Table 16-38 ADDM Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>DB_ID</td>
<td>The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.</td>
</tr>
<tr>
<td>INSTANCE</td>
<td>The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.</td>
</tr>
<tr>
<td>INSTANCES</td>
<td>If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, &quot;1, 3, 5&quot;). By default, all instances are analyzed.</td>
</tr>
<tr>
<td>DBIO_EXPECTED</td>
<td>The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.</td>
</tr>
</tbody>
</table>

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

DECLARE
  tid NUMBER;
  tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

16.3.34 TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into multiple views and to restate the materialized view to be optimized for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```sql
DBMS_ADVISOR.TUNE_MVIEW (    task_name IN OUT VARCHAR2,    mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 16-39  TUNE_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name for querying the results in a catalog view. If not specified, the database generates a task name, and then returns.</td>
</tr>
<tr>
<td>mv_create_stmt</td>
<td>The original materialized view creation statement.</td>
</tr>
</tbody>
</table>

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one for the implementation, and the other for undoing the implementation. The output is accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to print the TUNE_MVIEW results into a script file for later execution.

Table 16-40  USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>The name of the materialized view owner.</td>
</tr>
<tr>
<td>TASK_NAME</td>
<td>The name of the task. This name serves as a key to access the set of recommendations.</td>
</tr>
<tr>
<td>SCRIPT_TYPE</td>
<td>Recommendation ID that indicates whether the row is for the IMPLEMENTATION or UNDO script.</td>
</tr>
<tr>
<td>ACTION_ID</td>
<td>Action ID used as the command order number.</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options:</td>
</tr>
<tr>
<td></td>
<td>· CREATE MATERIALIZED VIEW LOG</td>
</tr>
<tr>
<td></td>
<td>· ALTER MATERIALIZED VIEW LOG FORCE</td>
</tr>
<tr>
<td></td>
<td>· [CREATE</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

DECLARE
    v_tname VARCHAR2(30);
BEGIN
    v_tname := 'mview_task';
    DBMS_ADVISOR.TUNE_MVIEW(
        task_name => v_tname,
        mv_create_stmt => 'CREATE MATERIALIZED VIEW omv REFRESH WITH ROWID AS SELECT * FROM orders');
END;

You can view the results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example (sample output included):

SET LINESIZE 120
COL TASK_NAME FORMAT a20
COL STATEMENT FORMAT a40
SELECT *
FROM  USER_TUNE_MVIEW
WHERE  TASK_NAME='mview_task'
AND    SCRIPT_TYPE='IMPLEMENTATION';

TASK_NAME ACTION_ID SCRIPT_TYPE STATEMENT
-------------------- ---------- --------------
mview_task 1 IMPLEMENTATION CREATE MATERIALIZED VIEW LOG ON "OE"."ORDERS" WITH ROWID
mview_task 2 IMPLEMENTATION ALTER MATERIALIZED VIEW LOG FORCE ON "OE"."ORDERS" ADD ROWID
mview_task 3 IMPLEMENTATION CREATE MATERIALIZED VIEW OE.OMV REFRESH FAST WITH ROWID DISABLE QUERY REWRITE

Alternatively, you can save the output results in an external script file as in the following example:

CREATE DIRECTORY TUNE_RESULTS_DIR AS '/tmp';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS_DIR TO PUBLIC;
BEGIN
    DBMS_ADVISOR.CREATE_FILE(
        buffer => DBMS_ADVISOR.GET_TASK_SCRIPT( task_name => 'mview_task'),
        location => 'TUNE_RESULTS_DIR')
The preceding statement will save the results in /tmp/mview_create.sql.

**See Also:**
*Oracle Database SQL Tuning Guide* for more information about using the TUNE_MVIEW procedure

### 16.3.35 UPDATE_OBJECT Procedure

This procedure updates an existing task object.

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

**Syntax**

```sql
DBMS_ADVISOR.UPDATE_OBJECT (  
    task_name       IN VARCHAR2  
    object_id       IN NUMBER,  
    attr1           IN VARCHAR2 := NULL,  
    attr2           IN VARCHAR2 := NULL,  
    attr3           IN VARCHAR2 := NULL,  
    attr4           IN CLOB := NULL,  
    attr5           IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
</tbody>
</table>
The attribute parameters have different values depending upon the object type. See Oracle Database Administrator's Guide for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL, 'SELECT * FROM SH.SALES',obj_id);
    DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL, 'SELECT count(*) FROM SH.SALES');
END;
/
```

See Also:

Oracle Database Administrator’s Guide for further information regarding the Segment Advisor

16.3.36 UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```sql
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES ( 
    task_name IN VARCHAR2, 
    rec_id IN NUMBER, 
    action_id IN NUMBER, 
    attribute_name IN VARCHAR2, 
    value IN VARCHAR2); 
```
### Parameters

**Table 16-42 UPDATE_REC_ATTRIBUTES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be changed. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>- owner The new owner of the object.</td>
</tr>
<tr>
<td></td>
<td>- name The new name of the object.</td>
</tr>
<tr>
<td></td>
<td>- tablespace The new tablespace for the object.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the new value for the recommendation attribute.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Recommendation attributes cannot be modified unless the task has successfully executed.

**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT
    AVG(amount_sold)
    FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    attribute := 'SH';

    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/```
16.3.37 UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

Note:
This procedure is deprecated starting in Oracle Database 11g.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (  
    workload_name        IN VARCHAR2,  
    new_name             IN VARCHAR2 := NULL,  
    description          IN VARCHAR2 := NULL,  
    read_only            IN VARCHAR2 := NULL,  
    is_template          IN VARCHAR2 := NULL,  
    how_created          IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new workload object name. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30</td>
</tr>
<tr>
<td>description</td>
<td>A new workload description. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the description will not be changed. Names can be up to</td>
</tr>
<tr>
<td></td>
<td>256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Set to TRUE so it cannot be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>TRUE if workload is to be used as a template.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the workload creation.</td>
</tr>
<tr>
<td></td>
<td>If the value is NULL or contains the value ADVISOR_UNUSED, the source will</td>
</tr>
<tr>
<td></td>
<td>not be changed.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
        100, 400, 5041, 103, 640445, 680000, 2,  
        1, SYSDATE, 1, 'SH', 'SELECT
```
AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/

16.3.38 UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (    workload_name  IN VARCHAR2,
    sql_id          IN NUMBER,
    application     IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL,
    priority        IN NUMBER := NULL,
    username        IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (    workload_name  IN VARCHAR2,
    search         IN VARCHAR2,
    updated        OUT NUMBER,
    application    IN VARCHAR2 := NULL,
    action         IN VARCHAR2 := NULL,
    priority       IN NUMBER := NULL,
    username       IN VARCHAR2 := NULL);
```

### Parameters

**Table 16-44  UPDATE_SQLWKLD_STATEMENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement.</td>
</tr>
<tr>
<td>updated</td>
<td>Returns the number of statements changed by a searched update.</td>
</tr>
</tbody>
</table>
### Table 16-44 (Cont.) UPDATE_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application</td>
<td>Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a user name is an Oracle identifier, the username value must be entered exactly like it is stored in the database. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. The database does not recognize the user scott as a match for SCOTT.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

### Examples

```sql
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100,400,5041,103,640445,680000,2, 1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
  FROM sh.sales WHERE promo_id = 10');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/```
16.3.39 UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```sql
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (  
  task_name          IN VARCHAR2  
  new_name           IN VARCHAR2 := NULL,  
  description        IN VARCHAR2 := NULL,  
  read_only          IN VARCHAR2 := NULL,  
  is_template        IN VARCHAR2 := NULL,  
  how_created        IN VARCHAR2 := NULL);  
```

Parameters

**Table 16-45  UPDATE_TASK_ATTRIBUTES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,  
  task_name);  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');  
```

Chapter 16
Summary of DBMS_ADVISOR Subprograms

16-68
END;
/

DBMS_ALERT

**DBMS_ALERT** supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples
- Summary of DBMS_ALERT Subprograms

### 17.1 DBMS_ALERT Overview

This scenario describes a possible use of the DBMS_ALERT package.

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (**WAITONE**) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (**SIGNAL**) whenever the trigger is fired.

### 17.2 DBMS_ALERT Security Model

Security on this package can be controlled by granting **EXECUTE** on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. **EXECUTE** privilege on this cover package can then be granted rather than on this package.

### 17.3 DBMS_ALERT Constants

The **DBMS_ALERT** package uses the constants listed and described in this topic.

**Table 17-1   DBMS_ALERT Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXWAIT</td>
<td>INTEGER</td>
<td>86400000</td>
<td>The maximum time to wait for an alert (1000 days which is essentially forever).</td>
</tr>
</tbody>
</table>
17.4 DBMS_ALERT Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

17.5 DBMS_ALERT Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 17-2 shows the messages and the procedures that can raise them.

17.6 DBMS_ALERT Operational Notes

This topic lists notes related to general and specific applications. Also, a list of DBMS_ALERT error messages is provided.

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the WAITANY procedure.
- An application can also supply an optional timeout parameter to the WAITONE or WAITANY procedures. A timeout of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the DBMS_PIPE package may provide a useful alternative.

See Also:

DBMS_PIPE

- If the transaction is rolled back after the call to SIGNAL, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the prior alert, but before the data was read for that prior alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
– Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the \texttt{SET_DEFAULTS} procedure.

– \texttt{WAITANY} procedure. If you use the \texttt{WAITANY} procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10001</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10015</td>

<tr>
<td>ORU-10025</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10037</td>
<td>WAITONE</td>
</tr>
</tbody>
</table>

### 17.7 DBMS_ALERT Examples

In this example, suppose that you want to graph average salaries by department, for all employees. Your application needs to know whenever \texttt{EMP} is changed.

Your application would look similar to this code:

```sql
DBMS_ALERT REGISTER('emp_table_alert');
<<readagain>>:
/* ... read the emp table and graph it */
DBMS_ALERT WAITONE('emp_table_alert', :message, :status);
if status = 0 then goto <<readagain>>; else
/* ... error condition */
```

The \texttt{EMP} table would have a trigger similar to this:

```sql
CREATE TRIGGER emp trig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
    DBMS_ALERT SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```sql
DBMS_ALERT REMOVE('emp_table_alert');
```
This reduces the amount of work required by the alert signaller. If a session exits (or
dies) while registered alerts exist, the alerts are eventually cleaned up by future users
of this package.

The example guarantees that the application always sees the latest data, although it
may not see every intermediate value.

17.8 Summary of DBMS_ALERT Subprograms

This table lists the DBMS_ALERT subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Table 17-3</th>
<th>DBMS_ALERT Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>REGISTER</td>
<td>Receives messages from an alert</td>
</tr>
<tr>
<td>REMOVE</td>
<td>Disables notification from an alert</td>
</tr>
<tr>
<td>REMOVEALL</td>
<td>Removes all alerts for this session from the registration list</td>
</tr>
<tr>
<td>SET_DEFAULTS</td>
<td>Sets the polling interval</td>
</tr>
<tr>
<td>SIGNAL</td>
<td>Signals an alert (send message to registered sessions)</td>
</tr>
<tr>
<td>WAITANY</td>
<td>Waits timeout seconds to receive alert message from an alert registered for session</td>
</tr>
<tr>
<td>WAITONE</td>
<td>Waits timeout seconds to receive message from named alert</td>
</tr>
</tbody>
</table>

17.8.1 REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
    name      IN  VARCHAR2,
    cleanup   IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Table 17-4</th>
<th>REGISTER Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>name</td>
<td>Name of the alert in which this session is interested</td>
</tr>
<tr>
<td>cleanup</td>
<td>Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE.</td>
</tr>
</tbody>
</table>
WARNING:
Alert names beginning with ‘ORA$’ are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes
A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

17.8.2 REMOVE Procedure
This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax
DBMS_ALERT.REMOVE (name IN VARCHAR2);

Parameters

Table 17-5  REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert (caseInsensitive) to be removed from registration list.</td>
</tr>
</tbody>
</table>

Usage Notes
Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

17.8.3 REMOVEALL Procedure
This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax
DBMS_ALERT.REMOVEALL;
17.8.4 SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (  
sensitivity  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitivity</td>
<td>Polling interval, in seconds, to sleep between polls. The default interval is five seconds.</td>
</tr>
</tbody>
</table>

17.8.5 SIGNAL Procedure

This procedure signals an alert. The effect of the SIGNAL call only occurs when the transaction in which it is made commits. If the transaction rolls back, SIGNAL has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (  
    name     IN  VARCHAR2,  
    message  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to signal.</td>
<td>Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.</td>
</tr>
<tr>
<td>message</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
17.8.6 WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (  
    name      OUT  VARCHAR2,  
    message   OUT  VARCHAR2,  
    status    OUT  INTEGER,  
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Returns the name of the alert that occurred.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>status</td>
<td>Values returned: 0 - alert occurred 1 - timeout occurred</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.</td>
</tr>
</tbody>
</table>

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.

17.8.7 WAITONE Procedure

This procedure waits for a specific alert to occur.

An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (  
    name      IN   VARCHAR2,  
```
message OUT VARCHAR2,
status OUT INTEGER,
timeout IN NUMBER DEFAULT MAXWAIT);

Parameters

Table 17-9 WAITONE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to wait for.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>status</td>
<td>Values returned:</td>
</tr>
<tr>
<td></td>
<td>0 - alert occurred</td>
</tr>
<tr>
<td></td>
<td>1 - timeout occurred</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum time to wait for an alert. If the named alert does not occur before timeout seconds, this returns a status of 1.</td>
</tr>
</tbody>
</table>
The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

See Also:

Oracle Database Development Guide for explanations of application continuity and Transaction Guard, and the relationship between these two features:

- "Using Transaction Guard"

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_APP_CONT Subprograms

18.1 DBMS_APP_CONT Overview

The DBMS_APP_CONT package can be used to solve this example issue.

Problem Description

One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

GET_LTXID_OUTCOME

The purpose of the GET_LTXID_OUTCOME Procedure is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.
18.2 DBMS_APP_CONT Security Model

Applications must have the **EXECUTE** privilege on the **DBMS_APP_CONT** package.

To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user;
```

18.3 Summary of DBMS_APP_CONT Subprograms

The **DBMS_APP_CONT** package contains the **GET_LTXID_OUTCOME** Procedure.

### Table 18-1  DBMS_APP_CONT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_LTXID_OUTCOME Procedure</td>
<td>Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.</td>
</tr>
</tbody>
</table>

18.3.1 GET_LTXID_OUTCOME Procedure

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

**Syntax**

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (
  client_ltxid    IN    RAW,
  committed       OUT   BOOLEAN,
  user_call_completed OUT BOOLEAN)
```

**Parameters**

### Table 18-2  GET_LTXID_OUTCOME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_ltxid</td>
<td>Client-side logical transaction ID. Obtain the LTXID from the previous failed session using the client driver provided APIs - getLTXID for JDBC, and LogicalTransactionId for ODP.net., and OCI_ATTR_GET with LTXID for OCI.</td>
</tr>
</tbody>
</table>
Table 18-2 (Cont.) GET_LTXID_OUTCOME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>committed</td>
<td>Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.</td>
</tr>
<tr>
<td>user_call_completed</td>
<td>Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter.</td>
</tr>
</tbody>
</table>

Exceptions

Table 18-3 GET_LTXID_OUTCOME Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-14950 - SERVER_AHEAD</td>
<td>The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14951 - CLIENT_AHEAD</td>
<td>The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.</td>
</tr>
<tr>
<td>ORA-14906 - SAME_SESSION</td>
<td>Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14909 - COMMIT_BLOCKED</td>
<td>Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.</td>
</tr>
<tr>
<td>ORA-14952 - ERROR</td>
<td>The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.</td>
</tr>
</tbody>
</table>
This package provides a collection dba level admin operations in relation to Application Continuity.

This chapter contains the following topics:

- DBMS_APP_CONT_ADMIN Security Model
- Summary of DBMS_APP_CONT_ADMIN Subprograms

### 19.1 DBMS_APP_CONT_ADMIN Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT_ADMIN` package.

### 19.2 Summary of DBMS_APP_CONT_ADMIN Subprograms

This topic lists the `DBMS_APP_CONT_ADMIN` subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCHK_SET Procedure</td>
<td>This procedure enables or disables data collection for acchk protection for your application when using Application Continuity or Transparent Application Continuity. The <code>DISABLE_TIME</code> parameter is used to extend the runtime. Default is 10 minutes.</td>
</tr>
<tr>
<td>ACCHK_VIEWS Procedure</td>
<td>This procedure creates the views for ACCHK protected analyses. Use this procedure before you start using ACCHK.</td>
</tr>
<tr>
<td>ADD_SQL_CONNECTION_TEST Procedure</td>
<td>This procedure adds a new connection test that is used during draining sessions before planned maintenance begins.</td>
</tr>
<tr>
<td>DELETE_SQL_CONNECTION_TEST Procedure</td>
<td>This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.</td>
</tr>
<tr>
<td>DISABLE_CONNECTION_TEST Procedure</td>
<td>This procedure disables usage of a connection test during draining of sessions.</td>
</tr>
<tr>
<td>ENABLE_CONNECTION_TEST Procedure</td>
<td>This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.</td>
</tr>
</tbody>
</table>

### 19.2.1 ACCHK_SET Procedure

This procedure enables or disables data collection for acchk protection reports for your application when using Application Continuity or Transparent Application Continuity. The `DISABLE_TIME` parameter is used to extend the runtime. Default value is 10 minutes.

Enabling or disabling data collection applies to the level connected, that is, a CDB or a PDB.
• acchk is enabled/disabled at your CDB if connected to the container.
• acchk is enabled/disabled at your PDB only when connected to the PDB.

Data collection applies to new sessions only.

Once enabled, data is collected for the workload run under this service. You can then view this data in the ACCHK_REPORTs and can also be mined in the ACCHK views.

Syntax

```sql
DBMS_APP_CONT_ADMIN.ACCHK_SET (
    enabled                  IN BOOLEAN,
    disable_time_in_seconds  DEFAULT 600);
```

Parameters

<table>
<thead>
<tr>
<th>Table 19-2</th>
<th>ACCHK_SET Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
</tbody>
</table>
| enabled      | This parameter is used to enable or disable data collection at a CDB or PDB level.  
|              | - TRUE-enables data collection at this level.  
|              | - FALSE-explicitly disables data collection. |
| disable_time_in_seconds | Optional parameter used to disable ACCHK tracing automatically in a given number of seconds.  
|              | The maximum value that you can specify is 3600 seconds.  
|              | The default value is 600 seconds. |

Usage Notes

• This procedure is owned by SYS at CDB$ROOT or PDB level, or by SYS when not multitenant
• The acchk activation is enabled across all instances of RAC supporting that service.
• Enabling is persistent to allow for failover and restart tests, that is, implementation uses ALTER SESSION SET EVENTS ..... SCOPE=BOTH. The enable is per database. For Data Guard, enable and disable must be at each database.

Examples

Application Continuity Protection Check is not enabled by default. Follow this procedure to enable or disable ACCHK and generate reports to check protection level for the applications.

1. Grant read access to the users, who will run the Application Continuity Protection Check report and views, using the ACCHK_READ role:

```sql
GRANT ACCHK_READ TO USER;
```
2. Enable Application Continuity tracing for your applications using the `dbms_app_cont_admin.acchk_set(true)` procedure:

```
SQL> execute dbms_app_cont_admin.acchk_set(true);
```

By default, `ACCHK` is disabled automatically after 600 seconds. You can specify a lower number to reduce the auto disable time. For example, to disable `ACCHK` after 300 seconds:

```
SQL> dbms_app_cont_admin.acchk_set(true,300);
```

The `dbms_app_cont_admin.acchk_set(true)` procedure enables Application Continuity tracing at the database level to which you are connected. If you are connected at the CDB level, then tracing is enabled for the CDB, and if you are connected at the PDB level, then tracing is enabled for the PDB.

**Note:**

Set the `COMPATIBLE` parameter to 12.2.0 or greater. If the `COMPATIBLE` parameter was previously set to a lower value, then the `ACCHK_VIEWS` procedure creates the `ACCHK` views and roles when you run the procedure for the first time after updating the `COMPATIBLE` parameter.

3. To disable Application Continuity tracing for new sessions in your applications:

```
SQL> execute dbms_app_cont_admin.acchk_set(false);
```

**Note:**

The tracing will not be disabled for the current sessions until the sessions are terminated.

### 19.2.2 ACCHK_VIEWS Procedure

This procedure creates the views for `ACCHK` protected analysis. Call this procedure at PDB level or CDB root level before using any other `ACCHK` procedure. This procedure must be called once on each PDB or CDB root as required. This procedure is available for the 19c release only.

**Syntax**

```
DBMS_APP_CONT_ADMIN.ACCHK_VIEWS ( )
```

### 19.2.3 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not
covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

**Syntax**

```
DBMS_APP_CONT_ADMIN.ADD_SQL_CONNECTION_TEST (  
  connection_test          IN VARCHAR2  
  service_name             IN VARCHAR2   DEFAULT NULL);
```

**Parameters**

**Table 19-3  ADD_SQL_CONNECTION_TEST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The `ADD_SQL_CONNECTION_TEST` Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

**19.2.4 DELETE_SQL_CONNECTION_TEST Procedure**

This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.

**Syntax**

```
DBMS_APP_CONT_ADMIN.DELETE_SQL_CONNECTION_TEST (  
  connection_test          IN VARCHAR2  
  service_name             IN VARCHAR2   DEFAULT NULL);
```

**Parameters**

**Table 19-4  DELETE_SQL_CONNECTION_TEST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
</tbody>
</table>
Table 19-4  (Cont.) DELETE_SQL_CONNECTION_TEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier. If the optional SERVICE_NAME qualifier is provided, only the test for that service name is deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

If you are not certain if a test should be deleted, you can disable the test using DISABLE_CONNECTION_TEST Procedure. Only custom SQL tests can be deleted. Predefined tests cannot be deleted. Check for latest updates on service qualifier availability.

This procedure is owned by SYS at CDB$ROOT or PDB level, or SYS for when not multitenant.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

19.2.5 DISABLE_CONNECTION_TEST Procedure

This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```sql
DBMS_APP_CONT_ADMIN.DISABLE_CONNECTION_TEST (  
    connection_test_type      IN VARCHAR2,  
    connection_test           IN VARCHAR2,  
    service_name              IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 19-5  DISABLE_CONNECTION_TEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST_TYPE</td>
<td>The permitted values are:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_APP_CONT_ADMIN.SQL_TEST</td>
</tr>
<tr>
<td></td>
<td>• DBMS_APP_CONT_ADMIN.PING_TEST</td>
</tr>
<tr>
<td></td>
<td>• DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST</td>
</tr>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
<tr>
<td></td>
<td>This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. A disable at service name level takes precedence over an enable at PDB level. That is the PDB can be enabled, and the service disabled.</td>
</tr>
</tbody>
</table>
### Usage Notes
This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

#### 19.2.6 ENABLE_CONNECTION_TEST Procedure

This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

**Syntax**

```sql
DBMS_APP_CONT_ADMIN.ENABLE_CONNECTION_TEST (  
  connection_test_type     IN VARCHAR2,  
  connection_test          IN VARCHAR2,  
  service_name             IN VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| CONNECTION_TEST_TYPE | The connection type used when managing connection tests for draining before planned maintenance. See ADD, DELETE, ENABLE, DISABLE procedures for connection tests. The permitted values are:  
  • DBMS_APP_CONT_ADMIN.SQL_TEST  
  • DBMS_APP_CONT_ADMIN.PING_TEST  
  • DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST |
| CONNECTION_TEST     | The SQL text used to test and drain connections at the RDBMS before planned maintenance starts.  
  This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST. |
| SERVICE_NAME        | Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled. |

### Usage Notes
- This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level
• **ENABLE_CONNECTION_TEST** enables a connection test for draining sessions during planned maintenance. The enable operation applies to all RAC instances where the **PDB** is open. It persists across database restarts.

• This procedure is owned by **SYS** and is granted to users for execution at **CDB$ROOT** or **PDB** levels, or when not multitenant, at dictionary level.
Application developers can use the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_APPLICATION_INFO Subprograms

20.1 DBMS_APPLICATION_INFO Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V$SESSION and V$SQLAREA views.

20.2 DBMS_APPLICATION_INFO Security Model

No further privileges are required. The DBMSAPIN.SQL script is already run as a part of standard database creation.

Note:

The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.

20.3 DBMS_APPLICATION_INFO Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the SYS version of the package. The public synonym for DBMS_APPLICATION_INFO can then be changed to point to the DBA's version of the package.
20.4 Summary of DBMS_APPLICATION_INFO Subprograms

This table lists and describes the DBMS_APPLICATION_INFO package subprograms.

**Table 20-1  DBMS_APPLICATION_INFO Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ_CLIENT_INFO Procedure</td>
<td>Reads the value of the client_info field of the current session.</td>
</tr>
<tr>
<td>READ_MODULE Procedure</td>
<td>Reads the values of the module and action fields of the current session.</td>
</tr>
<tr>
<td>SET_ACTION Procedure</td>
<td>Sets the name of the current action within the current module.</td>
</tr>
<tr>
<td>SET_CLIENT_INFO Procedure</td>
<td>Sets the client_info field of the session.</td>
</tr>
<tr>
<td>SET_MODULE Procedure</td>
<td>Sets the name of the module that is currently running to a new module.</td>
</tr>
<tr>
<td>SET_SESSION_LONGOPS Procedure</td>
<td>Sets a row in the V$SESSION_LONGOPS table.</td>
</tr>
</tbody>
</table>

20.4.1 READ_CLIENT_INFO Procedure

This procedure reads the value of the client_info field of the current session.

**Syntax**

```sql
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (client_info OUT VARCHAR2);
```

**Parameters**

**Table 20-2  READ_CLIENT_INFO Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Last client information value supplied to the SET_CLIENT_INFO procedure.</td>
</tr>
</tbody>
</table>

20.4.2 READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

**Syntax**

```sql
DBMS_APPLICATION_INFO.READ_MODULE (module_name OUT VARCHAR2, action_name OUT VARCHAR2);
```
Parameters

Table 20-3  READ_MODULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Last value that the module name was set to by calling SET_MODULE.</td>
</tr>
<tr>
<td>action_name</td>
<td>Last value that the action name was set to by calling SET_ACTION or SET_MODULE.</td>
</tr>
</tbody>
</table>

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';
```

```
SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)
1 row selected.
```

20.4.3 SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (column_name IN VARCHAR2);
```

Parameters

Table 20-4  SET_ACTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_name</td>
<td>The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>
Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to `NULL` after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to `NULL`, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```sql
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS BEGIN
  -- balance transfer transaction
  DBMS_APPLICATION_INFO.SET_ACTION(
    action_name => 'transfer from chk to sav');
  UPDATE chk SET bal = bal + :amt
    WHERE acct# = :acct;
  UPDATE sav SET bal = bal - :amt
    WHERE acct# = :acct;
  COMMIT;
  DBMS_APPLICATION_INFO.SET_ACTION(null);
END;
```

20.4.4 SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
  client_info IN VARCHAR2);
```

Parameters

### Table 20-5  SET_CLIENT_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Supplies any additional information about the client application. This information is stored in the <code>VSSESSION</code> view. Information exceeding 64 bytes is truncated.</td>
</tr>
</tbody>
</table>

**Note:**

`CLIENT_INFO` is readable and writable by any user. For storing secured application attributes, you can use the application context feature.
20.4.5 SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_MODULE (
    module_name IN VARCHAR2,
    action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

Example

```sql
CREATE or replace PROCEDURE add_employee(
    name VARCHAR2,
    salary NUMBER,
    manager NUMBER,
    title VARCHAR2,
    commission NUMBER,
    department NUMBER) AS
BEGIN
    DBMS_APPLICATION_INFO.SET_MODULE(
        module_name => 'add_employee',
        action_name => 'insert into emp');
    INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
    DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

20.4.6 SET_SESSION_LONGOPS Procedure

This procedure sets a row in the $VSESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as
parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (  
  rindex      IN OUT BINARY_INTEGER,  
  slno        IN OUT BINARY_INTEGER,  
  op_name     IN     VARCHAR2       DEFAULT NULL,  
  target      IN     BINARY_INTEGER DEFAULT 0,  
  context     IN     BINARY_INTEGER DEFAULT 0,  
 sofar        IN     NUMBER         DEFAULT 0,  
  totalwork   IN     NUMBER         DEFAULT 0,  
  target_desc IN     VARCHAR2       DEFAULT 'unknown target',  
  units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rindex</td>
<td>A token which represents the <code>v$session_longops</code> row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.</td>
</tr>
<tr>
<td>slno</td>
<td>Saves information across calls to <code>set_session_longops</code>: It is for internal use and should not be modified by the caller.</td>
</tr>
<tr>
<td>op_name</td>
<td>Specifies the name of the long running task. It appears as the OPNAME column of <code>v$session_longops</code>. The maximum length is 64 bytes.</td>
</tr>
<tr>
<td>target</td>
<td>Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>context</td>
<td>Any number the client wants to store. It appears in the CONTEXT column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>sofar</td>
<td>Any number the client wants to store. It appears in the SOFAR column of <code>v$session_longops</code>. This is typically the amount of work which has been done so far.</td>
</tr>
<tr>
<td>totalwork</td>
<td>Any number the client wants to store. It appears in the TOTALWORK column of <code>v$session_longops</code>. This is typically an estimate of the total amount of work needed to be done in this long running operation.</td>
</tr>
<tr>
<td>target_desc</td>
<td>Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the TARGET_DESC field of <code>v$session_longops</code>. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>
Table 20-7  (Cont.) SET_SESSION_LONGOPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure’s progress.

DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;
    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target
        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
The DBMS_APPLY_ADM package provides subprograms to configure and manage Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_APPLY_ADM Subprograms

See Also:

Oracle Database XStream Guide for more information about XStream outbound servers and inbound servers

21.1 DBMS_APPLY_ADM Overview

The DBMS_APPLY_ADM package provides interfaces to start, stop, and configure Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

Note:

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as apply components. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.
21.2 DBMS_APPLY_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

**Note:**

The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

**See Also:**

- Oracle Database XStream Guide for information about configuring an XStream administrator
21.3 DBMS_APPLY_ADM Deprecated Subprograms

The \texttt{NONE} value for the \texttt{commit_serialization} apply component parameter is deprecated. It is replaced by the \texttt{DEPENDENT_TRANSACTIONS} value.

\begin{itemize}
  \item \textbf{Note:}\hspace{1cm}
  Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.
\end{itemize}

\begin{itemize}
  \item \textbf{See Also:}\hspace{1cm}
  \texttt{SET_PARAMETER} Procedure
\end{itemize}

21.4 Summary of DBMS_APPLY_ADM Subprograms

This table topic lists and describes the DBMS_APPLY_ADM subprograms.

\textbf{Table 21-1}   DBMS_APPLY_ADM Package Subprograms

\begin{tabular}{|l|l|}
  \hline
  Subprogram & Description                                    \\
  \hline
  \texttt{ALTER_APPLY Procedure} & Alters an apply component                             \\
  \texttt{CLEAR_KEY_COLUMNS Procedure} & Removes the key columns that were used as the substitute primary key by the \texttt{SET_KEY_COLUMNS} procedure \\
  \texttt{COMPARE_OLD_VALUES Procedure} & Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply \\
  \texttt{CREATE_APPLY Procedure} & Creates an apply component                             \\
  \texttt{CREATE_OBJECT_DEPENDENCY Procedure} & Creates an object dependency                          \\
  \texttt{DELETE_ALL_ERRORS Procedure} & Deletes all the error transactions for the specified apply component \\
  \texttt{DELETE_ERROR Procedure} & Deletes the specified error transaction                \\
  \texttt{DROP_APPLY Procedure} & Drops an apply component                               \\
  \texttt{DROP_OBJECT_DEPENDENCY Procedure} & Drops an object dependency                            \\
  \texttt{EXECUTE_ALL_ERRORS Procedure} & Reexecutes the error transactions for the specified apply component \\
  \texttt{EXECUTE_ERROR Procedure} & Reexecutes the specified error transaction            \\
  \texttt{GET_ERROR_MESSAGE Function} & Returns the message payload from the error queue for the specified message number and transaction identifier \\
  \hline
\end{tabular}
Table 21-1  (Cont.) DBMS_APPLY_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HANDLE_COLLISIONS</td>
<td>Enables or disables basic conflict resolution for an apply process and a table</td>
</tr>
<tr>
<td>SET_DML_CONFLICT_HANDLER Procedure</td>
<td>Adds, modifies, or removes a prebuilt DML conflict handler for INSERT, UPDATE, or DELETE conflicts on the specified object</td>
</tr>
<tr>
<td>SET_DML_HANDLER Procedure</td>
<td>Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database</td>
</tr>
<tr>
<td>SET_ENQUEUE_DESTINATION Procedure</td>
<td>Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule</td>
</tr>
<tr>
<td>SET_EXECUTE Procedure</td>
<td>Specifies whether a message that satisfies the specified rule is executed by an apply component</td>
</tr>
<tr>
<td>SET_GLOBAL_INSTANTIATION_SCN Procedure</td>
<td>Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas</td>
</tr>
<tr>
<td>SET_KEY_COLUMNS Procedures</td>
<td>Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist</td>

<td>Stops the apply component from applying any messages and rolls back any unfinished transactions being applied</td>
</tr>
</tbody>
</table>

Note:

All procedures commit unless specified otherwise. However, the GET_ERROR_MESSAGE function does not commit.
21.4.1 ALTER_APPLY Procedure

This procedure alters an apply component.

Syntax

```sql
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name                IN  VARCHAR2,
    rule_set_name             IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
    message_handler           IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
    ddl_handler               IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
    apply_user                IN  VARCHAR2  DEFAULT NULL,
    apply_tag                 IN  RAW       DEFAULT NULL,
    remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
    negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 21-2 ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</td>
</tr>
<tr>
<td></td>
<td>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.</td>
</tr>
</tbody>
</table>
Table 21-2  (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue. If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply component. See &quot;Usage Notes&quot; in the CREATE_APPLY Procedure for more information about a message handler procedure.</td>
</tr>
<tr>
<td>remove_message_handler</td>
<td>If TRUE, then the procedure removes the message handler for the specified apply component. If FALSE, then the procedure retains any message handler for the specified apply component. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>ddl_handler</td>
<td>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See &quot;Usage Notes&quot; in the CREATE_APPLY Procedure for more information about a DDL handler procedure.</td>
</tr>
<tr>
<td>remove_ddl_handler</td>
<td>If TRUE, then the procedure removes the DDL handler for the specified apply component. If FALSE, then the procedure retains any DDL handler for the specified apply component. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>
Table 21-2  (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| apply_user | The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:  
  • The necessary privileges to perform DML and DDL changes on the apply objects  
  • EXECUTE privilege on the rule sets used by the apply component  
  • EXECUTE privilege on all rule-based transformation functions used in the rule set  
  • EXECUTE privilege on all apply handler procedures  
These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package.  
Note: If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically. |
| apply_tag | A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply component is not changed. The following is an example of a tag with a hexadecimal value of 17:  
HEXTORAN('17') |
Table 21-2  (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_apply_tag</td>
<td>If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure retains any apply tag for the specified apply component.</td>
</tr>
<tr>
<td></td>
<td>If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>precommit_handler</td>
<td>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</td>
</tr>
<tr>
<td></td>
<td>An internal commit directive is enqueued in the following ways:</td>
</tr>
<tr>
<td></td>
<td>· When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</td>
</tr>
<tr>
<td></td>
<td>· When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.</td>
</tr>
<tr>
<td></td>
<td>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.</td>
</tr>
<tr>
<td></td>
<td>The precommit handler procedure must conform to the following restrictions:</td>
</tr>
<tr>
<td></td>
<td>· Any work that commits must be an autonomous transaction.</td>
</tr>
<tr>
<td></td>
<td>· Any rollback must be to a named savepoint created in the procedure.</td>
</tr>
<tr>
<td></td>
<td>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</td>

</table>
Table 21-2   (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [schema_name].rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If TRUE, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue. If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply component. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Automatic Restart of Apply Components
- The ALTER_APPLY Procedure and XStream Outbound Servers
- The ALTER_APPLY Procedure and XStream Inbound Servers

Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler
The ALTER_APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The apply_user parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: message_handler, ddl_handler, and precommit_handler.

  The client application can perform custom processing of the LCRs instead if necessary.
- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the apply_tag parameter.

The ALTER_APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.

21.4.2 CLEAR_KEY_COLUMNS Procedure

This procedure removes the key columns that were used as the substitute primary key by the SET_KEY_COLUMNS procedure.

Syntax

```
DBMS_APPLY_ADM.CLEAR_KEY_COLUMNS(
    apply_name IN VARCHAR2 DEFAULT NULL);
```

Parameter

Table 21-3  CLEAR_KEY_COLUMNS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

The CLEAR_KEY_COLUMNS Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The CLEAR_KEY_COLUMNS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The CLEAR_KEY_COLUMNS Procedure and CDBs

This procedure removes the columns that are used as a substitute primary key. You must perform the CLEAR_KEY_COLUMNS procedure in the appropriate PDB.
21.4.3 COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply.

This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

Syntax

```sql
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name         IN VARCHAR2,
    column_list         IN VARCHAR2,
    operation           IN VARCHAR2 DEFAULT 'UPDATE',
    compare             IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name         IN VARCHAR2,
    column_table        IN DBMS_UTILITY.LNAME_ARRAY,
    operation           IN VARCHAR2 DEFAULT 'UPDATE',
    compare             IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 21-4  COMPARE_OLD_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries. Specify * to include all nonkey columns.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
</tbody>
</table>
| operation | The name of the operation, which can be specified as:  
  - UPDATE for UPDATE operations  
  - DELETE for DELETE operations  
  - * for both UPDATE and DELETE operations |
| compare | If compare is TRUE, the old values of the specified columns are compared during apply.  
If compare is FALSE, the old values of the specified columns are not compared during apply. |
**Table 21-4 (Cont.) COMPARE_OLD_VALUES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- **Conflict Detection**

  By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the `COMPARE_OLD_VALUES` procedure, specify the set of columns in the `column_list` or `column_table` parameter, and set the `compare` parameter to `FALSE`.

  In addition, when the `compare_key_only` apply component parameter is set to `Y`, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the `compare_key_only` apply component parameter is set to `N`, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

**Note:**

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
- This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

**See Also:**

- `SET_PARAMETER Procedure` for more information about the `compare_key_only` apply component parameter

The `COMPARE_OLD_VALUES` Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.
The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.4 CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```sql
DBMS_APPLY_ADM.CREATE_APPLY(
    queue_name              IN  VARCHAR2,
    apply_name              IN  VARCHAR2,
    rule_set_name           IN  VARCHAR2  DEFAULT NULL,
    message_handler         IN  VARCHAR2  DEFAULT NULL,
    ddl_handler             IN  VARCHAR2  DEFAULT NULL,
    apply_user              IN  VARCHAR2  DEFAULT NULL,
    apply_database_link     IN  VARCHAR2  DEFAULT NULL,
    apply_tag               IN  RAW       DEFAULT '00',
    apply_captured          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler       IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
    source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. Note: The apply_name setting cannot be altered after the apply component is created.</td>
</tr>
</tbody>
</table>
Table 21-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply component. See &quot;Usage Notes&quot; for more information about a message handler procedure.</td>
</tr>
<tr>
<td>ddl_handler</td>
<td>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See &quot;Usage Notes&quot; for more information about a DDL handler procedure.</td>
</tr>
</tbody>
</table>
Table 21-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_user</td>
<td>The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.</td>
</tr>
<tr>
<td></td>
<td>The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.</td>
</tr>
<tr>
<td></td>
<td>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</td>
</tr>
<tr>
<td></td>
<td>• The necessary privileges to perform DML and DDL changes on the apply objects</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on the rule sets used by the apply component</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on all rule-based transformation functions used in the rule set</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on all apply handler procedures</td>
</tr>
<tr>
<td></td>
<td>These privileges can be granted directly to the apply user, or they can be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>You can use the DBMS_XSTREAM_AUTH package to grant and revoke administrative privileges in XStream configuration. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The apply_database_link setting cannot be altered after the apply component is created.</td>
</tr>
</tbody>
</table>
Table 21-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_tag</td>
<td>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply component generates redo entries with NULL tags.</td>
</tr>
<tr>
<td>apply_captured</td>
<td>Either TRUE or FALSE. If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Replication capture process. If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Replication capture process, such as persistent LCRs or user messages. To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components. <strong>Note:</strong> The apply_captured setting cannot be altered after the apply component is created.</td>
</tr>
</tbody>
</table>
### Table 21-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| precommit_handler    | A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.  
An internal commit directive is enqueued in the following ways:  
- When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.  
- When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.  
- When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.  
For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component.  
The precommit handler procedure must conform to the following restrictions:  
- Any work that commits must be an autonomous transaction.  
- Any rollback must be to a named savepoint created in the procedure.  
If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.  
See "Usage Notes" for more information about a precommit handler procedure. |
| negative_rule_set_name | The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.  
If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default.  
If you specify NULL, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter.  
An error is returned if the specified rule set does not exist.  
If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first. |
Table 21-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply component is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically. The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the DBA_APPLY_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

Usage Notes

The following sections describe usage notes for this procedure:

- DBA Role Requirement
- Handler Procedure Names
- Message Handler and DDL Handler Procedure
- Precommit Handler Procedure
- The CREATE_APPLY Procedure and XStream Outbound Servers
- The CREATE_APPLY Procedure and XStream Inbound Servers

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the apply_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the apply_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the apply_user to SYS.

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- [schema_name.]procedure_name
- [schema_name.]package_name.procedure_name

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.
The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

**Message Handler and DDL Handler Procedure**

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

---

**Precommit Handler Procedure**

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (    parameter_name IN NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

**The CREATE_APPLY Procedure and XStream Outbound Servers**

This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the `DBMS_XSTREAM_ADM` package.

**The CREATE_APPLY Procedure and XStream Inbound Servers**

The following usage notes apply to this procedure and XStream inbound servers:

- The `CREATE_APPLY` procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

- When creating an inbound server using the `CREATE_APPLY` procedure, set the `applycaptured` parameter to `TRUE`. Inbound servers only process LCRs captured by a capture process.
Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

### 21.4.5 CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

**Note:**

An error is raised if `NULL` is specified for either of the procedure parameters.

**See Also:**

- DROP_OBJECT_DEPENDENCY Procedure

**Syntax**

```sql
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
    object_name         IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);
```

**Parameters**

**Table 21-6  CREATE_OBJECT_DEPENDENCY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object_name</code></td>
<td>The name of the child database object, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>parent_object_name</code></td>
<td>The name of the parent database object, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.departments</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:
21.4.6 DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

```sql
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
    apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.7 DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```sql
DBMS_APPLY_ADM.DELETE_ERROR(
    local_transaction_id  IN  VARCHAR2);
```
Parameter

Table 21-8  DELETE_ERROR Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

The DELETE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.8 DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```sql
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 21-9  DROP_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Replication or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>
Usage Notes
The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

The DROP_APPLY Procedure and XStream Outbound Servers

When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers

When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

21.4.9 DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if NULL is specified for either of the procedure parameters.
Syntax

DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
    object_name         IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);

Parameters

Table 21-10   DROP_OBJECT_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as [schema_name.]object_name. For example, hr.departments. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.10 EXECUTE_ALL_ERRORS Procedure

This procedure re-executes the error transactions in the error queue for the specified apply component.

The transactions are re-executed in commit SCN order. Error re-execution stops if an error is raised.

Syntax

DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
    apply_name       IN  VARCHAR2  DEFAULT NULL,
    execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
Parameters

Table 21-11  EXECUTE_ALL_ERRORS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are re-executed.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure re-executes the transactions in the security context of the current user. If FALSE, then the procedure re-executes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
- The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.11 EXECUTE_ERROR Procedure

This procedure re-executes the specified error transaction in the error queue.

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id  IN  VARCHAR2,
    execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
    user_procedure        IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 21-12  EXECUTE_ERROR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure re-executes the transaction in the security context of the current user. If FALSE, then the procedure re-executes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify NULL to execute the error transaction without running a user procedure. See Also: “Usage Notes” for more information about the user procedure</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The User Procedure
- The EXECUTE_ERROR Procedure and XStream Outbound Servers
- The EXECUTE_ERROR Procedure and XStream Inbound Servers

The User Procedure

You must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [schema_name.]package_name.procedure_name
- [schema_name.]procedure_name

If the procedure is in a package, then the package_name must be specified. The user who invokes the EXECUTE_ERROR procedure must have EXECUTE privilege on the specified procedure. Also, if the schema_name is not specified, then the user who invokes the EXECUTE_ERROR procedure is the default.

For example, suppose the procedure_name has the following properties:

- strmadmin is the schema_name.
- fix_errors is the package_name.
- fix_hr_errors is the procedure_name.
In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    in_anydata                    IN      ANYDATA,
    error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
    error_message_number          IN      NUMBER,
    messaging_default_processing  IN OUT  BOOLEAN,
    out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- **in_anydata**: The `ANYDATA` encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- **error_record**: The row in the `DBA_APPLY_ERROR` data dictionary view that identifies the transaction
- **error_message_number**: The message number of the `ANYDATA` object in the `in_anydata` parameter, starting at 1
- **messaging_default_processing**: If `TRUE`, then the apply component continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers.
  
  If `FALSE`, then the apply component skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.
- **out_anydata**: The `ANYDATA` object processed by the user procedure and used by the apply component if `messaging_default_processing` is `TRUE`.

If an LCR is executed using the `EXECUTE LCR` member procedure in the user procedure, then the LCR is executed directly, and the `messaging_default_processing` parameter should be set to `FALSE`. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction.
- Do not modify `LONG`, `LONG RAW` or `LOB` column data in an LCR.
- If the `ANYDATA` object in the `in_anydata` parameter is a row LCR, then the `out_anydata` parameter must be row LCR if the `messaging_default_processing` parameter is set to `TRUE`.
- If the `ANYDATA` object in the `in_anydata` parameter is a DDL LCR, then the `out_anydata` parameter must be DDL LCR if the `messaging_default_processing` parameter is set to `TRUE`.
• The user who runs the user procedure must have the SELECT or READ privilege on the DBA_APPLY_ERROR data dictionary view.

**Note:**

LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

### 21.4.12 GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

**See Also:**

- SET_ENQUEUE_DESTINATION Procedure
- SET_EXECUTE Procedure

**Syntax**

```sql
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number          IN   NUMBER,
    local_transaction_id    IN   VARCHAR2,
    destination_queue_name  OUT  VARCHAR2,
    execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number          IN   NUMBER,
    local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```
Parameters

Table 21-13  GET_ERROR_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_number</td>
<td>The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.</td>
</tr>
<tr>
<td>local_transaction_id</td>
<td>Identifier of the error transaction for which to return a message.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.</td>
</tr>
<tr>
<td>execute</td>
<td>Contains TRUE if the message should be executed.</td>
</tr>
<tr>
<td></td>
<td>Contains FALSE if the message should not be executed.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.13 HANDLE_COLLISIONS

This procedure enables or disables basic conflict resolution for an apply process and a table.

Syntax

```sql
DBMS_APPLY_ADM.HANDLE_COLLISIONS(
    apply_name    IN  VARCHAR2,
    enable        IN  BOOLEAN,
    object        IN  VARCHAR2,
    source_object IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 21-14  HANDLE_COLLISIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process.</td>
</tr>
</tbody>
</table>
**Table 21-14  (Cont.) HANDLE_COLLISIONS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| enable    | **If** TRUE, then the following conflict resolution methods are used:  
· When a conflict is detected for a row that exists in the table, the data in the row LCR overwrites the data in the table.  
· When a conflict is detected for a row that does not exist in the table, the data in the row LCR is ignored.  
**If** FALSE then it disables conflict resolution set by this procedure for the specified apply process and object.  
**If** NULL, then removes any explicit table-level setting for collision handling for the specified apply process and object. |
| object    | The schema and name of the target table, specified as `[schema_name.]table_name` for the change of the setting.  
For example, if you are changing the setting for table `employees` owned by user `hr`, then specify `hr.employees`. If the schema is not specified, then the current user is the default. |
| source_object | The schema and object name of the source table, specified as `[schema_name.]table_name` for the table where the change originated.  
For example, if the change originated at the `employees` table owned by user `hr`, then specify `hr.employees`. If the schema is not specified, then the current user is the default. |

### 21.4.14 SET_DML_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt DML conflict handler for **INSERT**, **UPDATE**, or **DELETE** conflicts on the specified object.

This procedure is overloaded. The **column_list** and **column_table** parameters are mutually exclusive.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name             IN  VARCHAR2,
    conflict_handler_name  IN  VARCHAR2,
    object                 IN  VARCHAR2  DEFAULT NULL,
    operation_name         IN  VARCHAR2  DEFAULT NULL,
    conflict_type          IN  VARCHAR2  DEFAULT NULL,
    method_name            IN  VARCHAR2  DEFAULT NULL,
    column_list            IN  VARCHAR2  DEFAULT NULL,
    resolution_column      IN  VARCHAR2  DEFAULT NULL,
    source_object          IN  VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name             IN  VARCHAR2,
    conflict_handler_name  IN  VARCHAR2,
    object                 IN  VARCHAR2  DEFAULT NULL,
    operation_name         IN  VARCHAR2  DEFAULT NULL,
    conflict_type          IN  VARCHAR2  DEFAULT NULL,
    method_name            IN  VARCHAR2  DEFAULT NULL,
    column_table           IN  DBMS_UTILITY.LNAME_ARRAY,
```
Parameters

Table 21-15 SET_DML_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process.</td>
</tr>
<tr>
<td>conflict_handler_name</td>
<td>The name of the conflict handler.</td>
</tr>
<tr>
<td>object</td>
<td>The schema and name of the target table, specified as [schema name.]table name for which a conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>• INSERT</td>
</tr>
<tr>
<td></td>
<td>• UPDATE</td>
</tr>
<tr>
<td></td>
<td>• DELETE</td>
</tr>
<tr>
<td></td>
<td>In order to set up conflict handlers for different operations on the same table, you must make one call per operation.</td>
</tr>
<tr>
<td>conflict_type</td>
<td>Type of update conflict handler to create.</td>
</tr>
<tr>
<td></td>
<td>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</td>
</tr>
<tr>
<td></td>
<td>• ROW_EXISTS: A row with the same primary key already exists in the database for an insert or update.</td>
</tr>
<tr>
<td></td>
<td>• ROW_MISSING: A row with the same primary key cannot be found for an update or delete.</td>
</tr>
</tbody>
</table>
Table 21-15  SET_DML_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method_name</td>
<td>Type of update conflict handler to create.</td>
</tr>
</tbody>
</table>

You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:

- **DELTA**: If the conflict type is ROW_EXISTS and the LCR is an update, then take the difference between the old and new values of the column in the LCR and add it to the current value of the column in the target database. The columns in the column group must be of type NUMBER.
- **IGNORE**: Silently ignores the LCR and can be used for all conflict types.
- **MAXIMUM**: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for ROW_EXISTS and only applies to inserts and updates.
- **MINIMUM**: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for ROW_EXISTS and only applies to inserts and updates.
- **OVERWRITE**: Applies the column list from the source database, overwriting the column values at the destination database. An INSERT with ROW_EXISTS is converted to an UPDATE. An UPDATE with ROW_MISSING is converted to an INSERT. A DELETE with ROW_MISSING is ignored.
- **RECORD**: Enqueue the LCR into the error queue. Can be used for all conflict types and can only be specified for a column group that contains all the columns in the table.
- **MAX_AND_EQUALS**: Applies the column list from the source database if the value of resolution column is greater than or equal to the value of the column in the database.
- **MIN_AND_EQUALS**: Applies the column list from the source database if the value of resolution column is less than or equal to the value of the column in the database.

If NULL, then the procedure removes any existing conflict handler with the same object_name, resolution_group, and conflict_type. If a conflict handler already exists with the same object_name and resolution_column and conflict_type, then the existing handler is replaced.
### Table 21-15  (Cont.) SET_DML_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| column_list    | A comma-separated list of the column names for which the conflict handler is called. The same column cannot be in more than one column list (for a given apply_name, object_name, operation_name and conflict_type). Specify * for the default column group, which includes all the columns in the table that are not already specified in another column list (for a given apply_name, object_name, operation_name and conflict_type). If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. You cannot use a column_list if you use a * in the object_name. The only time you can use multiple column groups is when you are specifying a conflict handler for insert or update for ROW_EXISTS. Note: Prebuilt conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the column_list parameter. This parameter must be set to '*' in the following cases:  
  - The operation_name is DELETE.  
  - The method_name is RECORD.  
  - The operation_name is UPDATE and the conflict_type is ROW_MISSING. |
| column_table   | An array of column names for which the conflict handler is called. This parameter is the same as the column_list parameter, but it uses an array instead of a list for the column names. Note: The column_list and column_table parameters are mutually exclusive.                                                                                                                                                      |
| resolution_column | For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is the one tested to determine whether the current row or the LCR has the smaller value. The resolution column must be one of the columns listed in the column_list or column_table parameter. You can specify NULL for other resolution methods.                                                                                                           |
| source_object  | The schema and object name of the source table, specified as [schema_name.]table_name for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.                                                                                                   |

### Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Conflict Handler
- Removing an Existing Conflict Handler
**Series of Actions for Conflicts**

If an conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate conflict handler to resolve the conflict
2. If no conflict handler is specified or if the conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, object name, and operation name to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

See Also:

"Signature of a DML Handler Procedure or Error Handler Procedure" for information about setting an error handler

**Procedure DML Handlers for Conflicts**

If you cannot use a prebuilt conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

See Also:

SET_DML_HANDLER Procedure
A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED

The **set_dml_conflict_handler** Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The **set_dml_conflict_handler** Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Table 21-16  Valid Combinations of Parameters

<table>
<thead>
<tr>

<td>ROW_MISSING</td>
<td>RECORD</td>
</tr>
<tr>
<td></td>
<td></td>
<td>IGNORE</td>
</tr>
</tbody>
</table>

Example

The following is an example for setting a conflict handler for the employees table in the hr schema:

```sql
DECLARE
  cols  DBMS_UTILS.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name => 'appl1',
    conflict_handler_name => 'emp_handler_update',
    object => 'hr.employees',
    operation_name => 'UPDATE',
  );
END;
```
conflict_type => 'ROW_EXISTS',
method_name => 'MAXIMUM',
resolution_column => 'salary',
column_table => cols);
END;
/

This example sets a conflict handler named emp_handler_update that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.

21.4.15 SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

DBMS_APPLY_ADM.SET_DML_HANDLER(
object_name IN VARCHAR2,
object_type IN VARCHAR2,
operation_name IN VARCHAR2,
error_handler IN BOOLEAN DEFAULT FALSE,
user_procedure IN VARCHAR2,
apply_database_link IN VARCHAR2 DEFAULT NULL,
apply_name IN VARCHAR2 DEFAULT NULL,
assemble_lobs IN BOOLEAN DEFAULT TRUE);

Parameters

Table 21-17  SET_DML_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>

<td>If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- Run the SET_DML_HANDLER Procedure at the Destination Database
- Procedure DML Handlers and Error Handlers
- The apply_name Parameter
- Signature of a DML Handler Procedure or Error Handler Procedure
- LOB Assembly
- The SET_DML_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_HANDLER Procedure and XStream Inbound Servers

Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

**Note:**
Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.
In this case, the apply_hr apply component uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

**Signature of a DML Handler Procedure or Error Handler Procedure**

You can use the SET_DML_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `hr` is the `schema_name`.
- `apply_pkg` is the `package_name`.
- `employees_default` is the `procedure_name`.

In this case, specify the following:

`hr.apply_pkg.employees_default`

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).
The procedure specified in the user_procedure parameter must have the following signature:

PROCEDURE user_procedure (
    parameter_name IN ANYDATA);

Here, user_procedure stands for the name of the procedure and parameter_name stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

See Also:

Logical Change Record TYPES for more information about LCRs

The procedure you create for error handling must have the following signature:

PROCEDURE user_procedure ( 
    message            IN  ANYDATA, 
    error_stack_depth  IN  NUMBER, 
    error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY, 
    error_messages     IN  emsg_array);

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The emsg_array value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

LOB Assembly

Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.
The SET_DML_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_DML_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.16 SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is an ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name               IN  VARCHAR2,
    destination_queue_name  IN  VARCHAR2);

Parameters

Table 21-18  SET_ENQUEUE_DESTINATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the queue into which the apply component enqueues the message. Specify the queue in the form [schema_name.]queue_name. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
- Considerations for the SET_ENQUEUE_DESTINATION Procedure
- The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
- The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.17 SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.
A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is an `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, an apply component does not execute the message and does not send the message to any apply handler.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_EXECUTE(
    rule_name  IN  VARCHAR2,
    execute    IN  BOOLEAN);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>execute</code></td>
<td>If <code>TRUE</code>, then the procedure removes the name-value pair with the name <code>APPLY$_EXECUTE</code> for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name <code>APPLY$_EXECUTE</code> exists for the rule, then no action is taken. If <code>FALSE</code>, then the procedure adds a name-value pair to the rule's action context. The name is <code>APPLY$_EXECUTE</code> and the value is <code>NO</code>. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name <code>APPLY$_EXECUTE</code>, then it is removed, and a new one with the value <code>NO</code> is added. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- Considerations for the SET_EXECUTE Procedure
- The SET_EXECUTE Procedure and XStream Outbound Servers
- The SET_EXECUTE Procedure and XStream Inbound Servers

**Considerations for the SET_EXECUTE Procedure**

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.
The SET_EXECUTE Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

21.4.18 SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```sql
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 21-20  SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
</tbody>
</table>
Table 21-20 (Cont.) SET_GLOBAL_INSTANTIATION_SCN Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. <strong>Note:</strong> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, if you want to do the instantiation for a specific container than you must specify both source_database and source_root_name. If you want to do the instantiation for all the containers in the CDB, specify the source_root_name for the database and leave the source_database name as NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_SCHEMA_INSTANTIATION_SCN Procedure
- SET_TABLE_INSTANTIATION_SCN Procedure
- LCR$_DDL_RECORD Type for more information about DDL LCRs

Instantiation SCNs and DDL LCRs
If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have object_owner, base_table_owner, and base_table_name specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a command_type of CREATE USER.

The recursive Parameter

If the recursive parameter is set to TRUE, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the SET_SCHEMA_INSTANTIATION_SCN procedure to set the instantiation SCN for each schema, and it uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to FALSE, then this procedure does not set the instantiation SCN for any schemas or tables.

Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the SYS or SYSTEM schemas.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also:

Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs
In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

### 21.4.19 SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

#### Syntax

```sql
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name          IN  VARCHAR2,
    column_list          IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name           IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name          IN  VARCHAR2,
    column_table         IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name           IN  VARCHAR2  DEFAULT NULL);
```

#### Parameters

**Table 21-21** SET_KEY_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the table specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names. If the <code>column_list</code> parameter is empty or <code>NULL</code>, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a <code>NULL</code>. If the <code>column_table</code> parameter is empty or <code>NULL</code>, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The following usage notes apply to this procedure:
• Considerations for the SET_KEY_COLUMNS Procedure

• Duplicate Rows and Substitute Primary Key Columns

• The SET_KEY_COLUMNS Procedure and XStream Outbound Servers

• The SET_KEY_COLUMNS Procedure and XStream Inbound Servers

• The SET_KEY_COLUMNS Procedure and CDBs

Considerations for the SET_KEYOLUMNS Procedure

The following are considerations for using this procedure:

• When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.

• Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

• Unlike true primary keys, columns specified as substitute key column columns can contain NULLS. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.

• Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.

• If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the SET_KEY_COLUMNS procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the allow_duplicate_rows apply component parameter is set to Y, meet the following requirements to keep the table data synchronized at the source and destination databases:

• Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.

• Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the allow_duplicate_rows apply component parameter is set to Y, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a
change that changes all of the duplicate rows at the source database also changes all the
duplicate rows at the destination database when the row LCRs resulting from the change are
applied.

For example, suppose a table at a source database has two duplicate rows. An update is
performed on the duplicate rows, resulting in two row LCRs. At the destination database, one
row LCR is applied to one of the duplicate rows. At this point, the rows are no longer
duplicate at the destination database because one of the rows has changed. When the
second row LCR is applied at the destination database, the rows are duplicate again.
Similarly, if a delete is performed on these duplicate rows at the source database, then both
rows are deleted at the destination database when the row LCRs resulting from the source
change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with
rows in the table during apply using the substitute primary key columns. If substitute primary
key columns are specified for a table with duplicate rows at a destination database, and the
allow_duplicate_rows apply component parameter is set to Y, then an update performed on
duplicate rows at the source database can result in different changes when the row LCRs are
applied at the destination database. Specifically, if the update does not change one of the
columns specified as a substitute primary key column, then the same duplicate row can be
updated multiple times at the destination database, while other duplicate rows might not be
updated.

Also, if the substitute key columns do not identify each row in the table at the destination
database uniquely, then a row LCR identified with multiple rows can update any one of the
rows. In this case, the update in the row LCR might not be applied to the correct row in the
table at the destination database.

An apply component ignores substitute primary key columns when it determines whether
rows in a table are duplicates. An apply component determines that rows are duplicates only
if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW
columns). Therefore, an apply component always raises an error if a single update or delete
changes two or more nonduplicate rows in a table.

For example, consider a table with columns c1, c2, and c3 on which the SET_KEY_COLUMNS
procedure is used to designate column c1 as the substitute primary key. If two rows have the
same key value for the c1 column, but different value for the c2 or c3 columns, then an apply
component does not treat the rows as duplicates. If an update or delete modifies more than
one row because the c1 values in the rows are the same, then the apply component raises an
error regardless of the setting for the allow_duplicate_rows apply component parameter.

See Also:

SET_PARAMETER Procedure for more information about the
allow_duplicate_rows apply component parameter

The SET_KEY_COLUMNS Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_KEY_COLUMNS Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

The SET_KEY_COLUMNS Procedure and CDBs
This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.

### 21.4.20 SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

#### Syntax

```sql
DBMS_APPLY_ADM.SET_PARAMETER (apply_name  IN  VARCHAR2,
parameter   IN  VARCHAR2,
value       IN  VARCHAR2  DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

#### Apply Component Parameters

The following table lists the parameters for an apply component.

> **Note:**

`OPTIMIZE_PROGRESS_TABLE` is desupported in the Oracle Database 19c Release and is no longer available.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| allow_duplicate_rows  | Y or N          | N       | If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows. If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Usage Notes" and "Duplicate Rows and Substitute Primary Key Columns"
| apply_sequence_nextval| Y or N          | N for apply processes; Y for XStream outbound servers and XStream inbound servers | Controls whether the apply component checks and adjusts sequence values. If Y, then the apply component checks and adjusts sequence values. For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values. For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values. If N, then the apply component does not check or adjust sequence values. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure. **See Also:** "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** `SET_PARAMETER Procedure` for information about the `capture_sequence_nextval capture process parameter`
### Table 21-23  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>batchsql_mode</td>
<td>DEPENDENT, DEPENDENT_EAGER, or SEQUENTIAL</td>
<td>DEPENDENT</td>
<td>Determines the batching method used to generate batch transactions for reordering. This parameter can be set to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- DEPENDENT - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. An executing batch has no unresolved dependencies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- DEPENDENT_EAGER - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. A batch can be executed when there are unresolved dependencies. The apply server waits for dependencies to be resolved before executing an LCR.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- SEQUENTIAL - Batch transactions in a sequential manner. COMMIT.Serialization = FULL runs in this mode regardless of the Oracle GoldenGate BATCHSQL mode.</td>
</tr>
<tr>
<td>cdgranularity</td>
<td>ROW or COLGROUP</td>
<td>COLGROUP for XStream In ROW for Oracle GoldenGate</td>
<td>Specifies the conflict detection granularity. This parameter can be set to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- ROW - Conflict resolution is applied for all column groups if there is a conflict for any column group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- COLGROUP - Conflict resolution is applied for column groups that have a conflict. Conflict resolution is not applied for column groups that do not have a conflict.</td>
</tr>
</tbody>
</table>

**Note:** This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.

**Note:** This parameter is intended for XStream and Oracle GoldenGate. Do not set this parameter for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| commit_serialization | DEPENDENT_TRANSACTIONS  | DEPENDENT_TRANSACTIONS or FULL | The order in which applied transactions are committed. Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database. You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings:

- **DEPENDENT_TRANSACTIONS** - The apply component can commit nondependent transactions in any order. Performance is best if you specify DEPENDENT_TRANSACTIONS.
- **FULL** - The apply component commits applied transactions in the order in which they were committed at the source database.

Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.

If you specify DEPENDENT_TRANSACTIONS, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:

1. Transaction A
2. Transaction B

At the destination database, these transactions might be committed in the opposite order:

1. Transaction B
2. Transaction A

If you specify DEPENDENT_TRANSACTIONS and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add RELY constraints to account for the application constraints. See Oracle Database Data Warehousing Guide for information about RELY constraints. |

<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply component is restarted immediately after stopping because it reached a limit. When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APnn) remains the same.</td>
</tr>
<tr>
<td>eager_size</td>
<td>A positive integer</td>
<td>9500</td>
<td>The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than eager_size LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than eager_size LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes. Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter max_parallelism limits the maximum number of apply servers that can be used for an apply process. This apply parameter is relevant only if its value is less than the value of the txn_lcr_spill_threshold apply parameter. When the value of txn_lcr_spill_threshold is lower than the value of eager_size, transactions spill to disk before eager apply begins. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations.</td>

Table 21-23  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grouptransops</td>
<td>A positive integer from 1 to 10000</td>
<td>250 for apply processes and XStream inbound servers. 10000 for XStream outbound servers</td>
<td>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction. This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. <strong>Note:</strong> This parameter is intended for XStream outbound servers and inbound servers. An Oracle Apply process ignores this parameter unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See the &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
</tbody>
</table>
### Table 21-23  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handlecollisions</td>
<td>Y or N</td>
<td>N</td>
<td>This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading. This parameter should be set to N for normal replication activity. It should be set to Y only when data is being loaded (instantiated) and replication is enabled. If Y, then does the equivalent of OVERWRITE for INSERT, UPDATE and DELETE operations that get ROW_EXISTS errors, and ignores UPDATE and DELETE operations that get ROW_MISSING errors. Specifically, the apply component performs the following actions when this parameter is set to Y: • If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update. • If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and the a row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values. • If the operation is a delete and the row does not exist, then the change is ignored. If N then it disables the above settings. <strong>Note:</strong> This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Replication environment.</td>
</tr>
<tr>

</tr>
<tr>
<td>----------------</td>
<td>----------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>parallelism</td>
<td>A positive integer</td>
<td>4</td>
<td>The number of apply servers that can concurrently apply transactions. The reader server and the apply server process names are ASnn, where nn can include letters and numbers. The total number of ASnn processes is the value of the parallelism parameter plus one. For example, if parallelism is set to 4, then an apply component uses a total of five ASnn processes. In this case, there is one reader server and four apply servers. Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the PROCESSES initialization parameter is set appropriately when you set the parallelism parameter. <strong>Note:</strong> When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
</tbody>
</table>
### Table 21-23  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallelism_interval</td>
<td>0 or a positive integer</td>
<td>0</td>
<td>The parallelism interval is the interval in seconds at which the current workload activity is computed. The apply component calculates the mean throughput every $5 \times \text{parallelism_interval}$ seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers. The parallelism interval is used only if the parallelism parameter is set to a value greater than one and the max_parallelism parameter value is greater than the parallelism parameter value. <strong>Note:</strong> This parameter is intended for an XStream In environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>

</table>
Table 21-23  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| txn_lcr_spill_threshold     | A positive integer or INFINITE | 10000   | The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:  
1. Reads the first 10,000 messages in the transaction into memory  
2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000  
3. Reads the next 100 messages in the transaction into memory  
4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100  
5. Reads the next 100 messages in the transaction into memory  
The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.  
If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction. |

Usage Notes
The following usage notes apply to this procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- The SET_PARAMETER Procedure and Replication
- The SET_PARAMETER Procedure and XStream Outbound Servers
- The SET_PARAMETER Procedure and XStream Inbound Servers

Delays Are Possible Before New Parameter Settings Take Effect
When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers
For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting
For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and Replication
You can use the following parameters in Replication if you enable XStream performance optimizations for Oracle Replication using the procedure DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS:

- apply_sequence_nextval
- compute_lcr_dep_on_arrival
- eager_size
- grouptransops
- max_parallelism
The SET_PARAMETER Procedure and XStream Outbound Servers

Outbound servers ignore the settings for the following apply parameters:

- allow_duplicate_rows
- commit_serialization
- compare_key_only
- compute_lcr_dep_on_arrival
- disable_on_error
- eager_size
- enable_xstream_table_stats
- grouptransops
- handlecollisions
- optimize_self_updates
- parallelism
- parallelism_interval
- preserve_encryption
- rtrim_on_implicit_conversion
- suppresstriggers

The **commit_serialization** parameter is always set to **FULL** for an outbound server, and the **parallelism** parameter is always set to **1** for an outbound server.

You can use the other apply parameters with outbound servers.

---

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

The SET_PARAMETER Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- ignore_transaction
You can use all of the other apply component parameters with inbound servers.
The default setting for the compare_key_only parameter for an inbound server is Y.
The default setting for the parallelism parameter for an inbound server is 4.

Note:
Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

### 21.4.21 SET_REPERROR_HANDLER Procedure

This procedure specifies how a particular error is handled based on its error number.
You can choose between several predefined actions for a given error.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_REPERROR_HANDLER(
  apply_name           IN  VARCHAR2,
  object               IN  VARCHAR2,
  error_number         IN  NUMBER,
  method               IN  VARCHAR2,
  source_object        IN  VARCHAR2  DEFAULT NULL,
  max_retries          IN  NUMBER    DEFAULT NULL,
  delay_csecs          IN  NUMBER    DEFAULT 6000);
```

**Parameters**

**Table 21-24  SET_REPERROR_HANDLER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process.</td>
</tr>
<tr>
<td>object</td>
<td>The schema and name of the target table, specified as [schema name.]table name for which an error handler is being added, modified, or removed. The table must exist. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>error_number</td>
<td>The error handling number. If 0, then use the default for all error handling for object.</td>
</tr>
</tbody>
</table>
Table 21-24  (Cont.) SET_REPERROR_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>Specifies the action to take when the given error_number occurs. If NULL, remove the error handler for error_number. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>• ABEND: Stop the apply process when the error occurs.</td>
</tr>
<tr>
<td></td>
<td>• RECORD: Move the LCR to the error queue when the error is encountered.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE: Silently ignore the error and do not apply the LCR.</td>
</tr>
<tr>
<td></td>
<td>• RETRY: Retry the LCR max_retries times.</td>
</tr>
<tr>
<td></td>
<td>• RETRY_TRANSACTION: Retry the transaction max_retries times. Wait delay_csecs centiseconds before each retry. RECORD_TRANSACTION: Move the entire transaction to the error queue if this error occurs.</td>
</tr>
<tr>
<td>source_object</td>
<td>The schema and object name of the source table, specified as [schema_name.]table_name for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Maximum number of times to retry for RETRY and RETRY_TRANSACTION actions in method. Must be specified with either the RETRY or RETRY_TRANSACTION.</td>
</tr>
<tr>
<td>delay_csecs</td>
<td>The number of centiseconds between retries for RETRY and RETRY_TRANSACTION action in method.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- **Priority of Error Handlers**

Priority of Error Handlers

Any conflict handling specified by SET_UPDATE_CONFLICT_HANDLER or SET_DML_CONFLICT_HANDLER is tried before the actions specified by SET_REPERROR_HANDLER. The PL/SQL procedure specified by SET_DML_HANDLER is called to handle the error if none of the previously mentioned methods resolve it.

21.4.22 SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.
Syntax

DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
    source_schema_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT FALSE,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 21-25  SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_schema_name</td>
<td>The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables. Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs
- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure
- SET_TABLE_INSTANTIATION_SCN Procedure
- LCR$_DDL_RECORD Type for more information about DDL LCRs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.
The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also:

Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

21.4.23 SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

Syntax

```sql
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 21-26  SET_TABLE_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database. Note: This parameter must be NULL when the procedure is invoked from the root of a CDB.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and LCRs
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE
For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `ALTER TABLE` or `CREATE TRIGGER`.

**Note:**

The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

**See Also:**

- `SET_GLOBAL_INSTANTIATION_SCN Procedure`
- `SET_SCHEMA_INSTANTIATION_SCN Procedure`
- `LCR$_ROW_RECORD Type` for more information about row LCRs
- `LCR$_DDL_RECORD Type` for more information about DDL LCRs

The `SET_TABLE_INSTANTIATION_SCN Procedure` and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:**

`Oracle Database XStream Guide` for more information about outbound servers and instantiation SCNs

The `SET_TABLE_INSTANTIATION_SCN Procedure` and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

**The `SET_TABLE_INSTANTIATION_SCN Procedure` and CDBs**

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.
21.4.24 SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name  IN  VARCHAR2,
    method_name  IN  VARCHAR2,
    resolution_column  IN  VARCHAR2,
    column_list  IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 21-27  SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The schema and name of the table, specified as [schema_name.]object_name, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>method_name</td>
<td>Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</td>
</tr>
<tr>
<td></td>
<td>• MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>• MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>• OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database.</td>
</tr>
<tr>
<td></td>
<td>• DISCARD: Retains the column list from the destination database, discarding the column list from the source database.</td>
</tr>
<tr>
<td>resolution_column</td>
<td>Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter.</td>
</tr>
<tr>
<td></td>
<td>NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.</td>
</tr>
</tbody>
</table>
Table 21-27 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. <strong>Note:</strong> Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the column_list parameter.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. <strong>Note:</strong> Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Update Conflict Handler
- Removing an Existing Update Conflict Handler
- Series of Actions for Conflicts
- Procedure DML Handlers for Conflicts
- A Column Can Be in Only One Column List
- Update Conflict Handlers and Non-Oracle Databases
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify NULL for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error.

3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue.

See Also:

“Signature of a DML Handler Procedure or Error Handler Procedure” for information about setting an error handler.

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

See Also:

`SET_DML_HANDLER` Procedure

A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

Update Conflict Handlers and Non-Oracle Databases

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```sql
DECLARE
    cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
    cols(1) := 'salary';
    cols(2) := 'commission_pct';
```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER('hr.employees', 'MAXIMUM', 'salary', cols);
END;
/

This example sets a conflict handler that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.

21.4.25 SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependency to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The attribute_list and attribute_table parameters are mutually exclusive.

Syntax

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_table IN DBMS_UTILITY.NAME_ARRAY);

Parameters

Table 21-28  SET_VALUE_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dependency_name</td>
<td>The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If NULL, an error is raised.</td>
</tr>
</tbody>
</table>
Table 21-28  (Cont.) SET_VALUE_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the table, specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default. If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised. If NULL, then attribute_list and attribute_table also must be NULL.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries.</td>
</tr>
<tr>
<td>attribute_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.NAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

21.4.26 START_APPLY Procedure

This procedure directs the apply component to start applying messages.

Syntax

```sql
DBMS_APPLY_ADM.START_APPLY(
    apply_name  IN  VARCHAR2);
```

Parameter

Table 21-29  START_APPLY Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- **Apply Component Status**
- **The START_APPLY Procedure and XStream Outbound Servers**
- **The START_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is `ENABLED`, then the apply component is started upon database instance startup. An apply component (an `nnn`) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

**The START_APPLY Procedure and XStream Outbound Servers**

This procedure functions the same way for apply processes and outbound servers.

**The START_APPLY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

### 21.4.27 STOP_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

**Syntax**

```sql
DBMS_APPLY_ADM.STOP_APPLY(
    apply_name  IN  VARCHAR2,
    force       IN  BOOLEAN   DEFAULT FALSE);
```

**Parameters**

**Table 21-30  STOP_APPLY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply component parameter. See &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:
- Apply Component Status
- Queue Subprograms Have No Effect on Apply Component Status
- The STOP_APPLY force Parameter and the commit_serialization Apply Parameter
- The STOP_APPLY Procedure and XStream Outbound Servers
- The STOP_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply component.

The STOP_APPLY force Parameter and the commit_serialization Apply Parameter

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

<table>
<thead>
<tr>
<th>force</th>
<th>commit_serialization</th>
<th>Apply Component Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>FULL</td>
<td>The apply component stops immediately and does not apply any unfinished transactions.</td>
</tr>
<tr>
<td>TRUE</td>
<td>DEPENDENT_TRANSACTIONS</td>
<td>When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.</td>
</tr>
<tr>
<td>FALSE</td>
<td>FULL</td>
<td>The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.</td>
</tr>
<tr>
<td>FALSE</td>
<td>DEPENDENT_TRANSACTIONS</td>
<td>Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.</td>
</tr>
</tbody>
</table>

For example, assume that the commit_serialization apply component parameter is set to DEPENDENT_TRANSACTIONS and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply component stops.

A different scenario would result if the commit_serialization apply component parameter is set to FULL. For example, assume that the commit_serialization apply component parameter is set to FULL and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transactions B and C are applied before the apply component stops.
parameter is set to \texttt{FALSE}, then transaction B is applied before the apply component stops, and transaction C is rolled back.

\begin{quote}
\textbf{See Also:}

\end{quote}

The \texttt{STOP\_APPLY Procedure} and XStream Outbound Servers
This procedure functions the same way for apply processes and outbound servers.

The \texttt{STOP\_APPLY Procedure} and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Advanced Queuing (AQ).

This chapter contains the following topics:

• Security Model
• Constants
• Data Structures
• Operational Notes
• Summary of DBMS_AQ Subprograms

See Also:

• Oracle Database Advanced Queuing User’s Guide
• Oracle Database Advanced Queuing (AQ) Types for information about TYPES to use with DBMS_AQ.

22.1 DBMS_AQ Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQ and DBMS_AQADM.

Queue Security

To enqueue or dequeue, users need EXECUTE rights on DBMS_AQ and either ENQUEUE or DEQUEUE privileges on target queues, or ENQUEUE_ANY/DEQUEUE_ANY system privileges. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the EXECUTE right on DBMS_AQ.

See Also:

Oracle Database Advanced Queuing User’s Guide for more information on queue privileges and access control.
OCI Applications and Queue Access

For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the ENQUEUE ANY QUEUE or DEQUEUE ANY QUEUE system privileges. The EXECUTE right of DBMS_AQ is not checked against the session user's rights.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also:

- DBMS_AQADM
- Oracle Database Advanced Queuing User’s Guide for more information on security required for propagation

22.2 DBMS_AQ Constants

This topic describes the constants used by DBMS_AQ.

The DBMS_AQ package uses the constants shown in the following table.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

Note:

The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

### 22.3 DBMS_AQ Data Types

This topic lists and describes DBMS_AQ data types.

### Table 22-2  DBMS_AQ Data Structures

<table>
<thead>
<tr>
<th>Data Structures</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_NAME</td>
<td>Names database objects</td>
</tr>
<tr>
<td>TYPE_NAME</td>
<td>Defines queue types</td>
</tr>
</tbody>
</table>
### Table 22-2  (Cont.) DBMS_AQ Data Structures

<table>
<thead>
<tr>
<th>Data Structures</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Database Advanced Queuing PL/SQL Callback</td>
<td>Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification</td>
</tr>
</tbody>
</table>

### OBJECT_NAME

The object_name data structure names database objects. It applies to queues, queue tables, agent names, and object types.

**Syntax**

```plaintext
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

**Usage Notes**

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 128 bytes long. Queue names and queue table names can be up to 122 bytes long. Maximum length of agent names and subscriber names can be 128 characters with datablock size greater than 2k. For 2k datablock size, maximum length for subscriber is 128 bytes.

### TYPE_NAME

The type_name data structure defines queue types.

**Syntax**

```plaintext
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

**Attributes**

### Table 22-3  Type Name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Maximum number of attributes in the object type is limited to 900.</td>
</tr>
</tbody>
</table>
Table 22-3  (Cont.) Type Name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;RAW&quot;</td>
<td>To store payload of type RAW, Oracle Database Advanced Queuing creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Database Advanced Queuing. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Database Advanced Queuing administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.</td>
</tr>
</tbody>
</table>

Oracle Database Advanced Queuing PL/SQL Callback

The plsqlcallback data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```sql
procedure plsqlcallback(
    context  IN  RAW,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR,
    payload  IN  RAW,
    payloadl IN  NUMBER);
```

Attributes

Table 22-4  Oracle Database Advanced Queuing PL/SQL Callback Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>Specifies the context for the callback function that was passed by dbms_aq.register. See AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>reginfo</td>
<td>See AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>descr</td>
<td>See AQ$_DESCRIPTOR Type</td>
</tr>
<tr>
<td>payload</td>
<td>If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.</td>
</tr>
<tr>
<td>payloadl</td>
<td>Specifies the length of payload. If payload is null, payloadl = 0.</td>
</tr>
</tbody>
</table>
If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN RAW,
    reginfo  IN SYS.AQ$_REG_INFO,
    descr    IN SYS.AQ$_DESCRIPTOR,
    payload  IN VARCHAR2,
    payloadl IN NUMBER);
```

## 22.4 DBMS_AQ Operational Notes

This topic lists various DBMS_AQ operational notes.

### DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the DBMS_AQIN package to use these interfaces.

## 22.5 Summary of DBMS_AQ Subprograms

The DBMS_AQ package uses subprograms described in this table.

### Table 22-5  DBMS_AQ Package Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_AGENT Procedure</td>
<td>Creates an entry for an Oracle Database Advanced Queuing agent in the LDAP directory</td>
</tr>
<tr>
<td>DEQUEUE Procedure</td>
<td>Dequeues a message from the specified queue</td>
</tr>
<tr>
<td>DEQUEUE_ARRAY Function</td>
<td>Dequeues an array of messages from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedure</td>
<td>Adds a message to the specified queue</td>
</tr>
<tr>
<td>ENQUEUE_ARRAY Function</td>
<td>Adds an array of messages to the specified queue</td>
</tr>
<tr>
<td>LISTEN Procedures</td>
<td>Listen to one or more queues on behalf of a list of agents</td>
</tr>
<tr>
<td>POST Procedure</td>
<td>Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications</td>
</tr>
<tr>
<td>REGISTER Procedure</td>
<td>Registers for message notifications</td>
</tr>
<tr>
<td>UNBIND_AGENT Procedure</td>
<td>Removes an entry for an Oracle Database Advanced Queuing agent from the LDAP directory</td>
</tr>
<tr>
<td>UNREGISTER Procedure</td>
<td>Unregisters a subscription which turns off notification</td>
</tr>
</tbody>
</table>

**Note:**

DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.
22.5.1 BIND_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

Syntax

DBMS_AQ.BIND_AGENT(
    agent        IN SYS.AQ$_AGENT,
    certificate  IN VARCHAR2 default NULL);

Parameters

Table 22-6 BIND_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be registered in LDAP server.</td>
</tr>
<tr>
<td>certificate</td>
<td>Location (LDAP distinguished name) of the &quot;organizationalperson&quot; entry in LDAP whose digital certificate (attribute usercertificate) is to be used for this agent. Example: &quot;cn=OE, cn=ACME, cn=com&quot; is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.</td>
</tr>
</tbody>
</table>

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (usercertificate) of the OrganizationalPerson entity. The distinguished name for this OrganizationalPerson must be specified when binding the agent.

22.5.2 DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

DBMS_AQ.DEQUEUE ( 
    queue_name          IN      VARCHAR2, 
    dequeue_options     IN      dequeue_options_t, 
    message_properties  OUT     message_properties_t, 
    payload             OUT     "<ADT_1>" 
    msgid               OUT     RAW); 

Parameters

Table 22-7 DEQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue.</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>See DEQUEUE_OPTIONS_T Type.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type.</td>
</tr>
</tbody>
</table>
Table 22-7  (Cont.) DEQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of type_name refer to TYPE_NAME in DBMS_AQ Data Types.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message.</td>
</tr>
</tbody>
</table>

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.

- correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

- deq_condition

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corid and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: tab.user_data.orderstatus='EXPRESS'

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the msgid and correlation ID in dequeue_options.

The database-consistent read mechanism is applicable for queue operations. For example, a BROWSE call may not see a message that is enqueued after the beginning of the browsing transaction.

The default NAVIGATION parameter during dequeue is NEXT_MESSAGE. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the FIRST_MESSAGE navigation option when the first message in the queue needs to be processed by every dequeue command.
This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

---

**Note:**

It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

---

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See `DEQUEUE_OPTIONS_T Type` for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure`.
- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure`.

### 22.5.3 DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

**Syntax**

```
DBMS_AQ.DEQUEUE_ARRAY (  
quuid_name             IN   VARCHAR2,  
dequeue_options       IN   dequeue_options_t,  
array_size             IN   pls_integer,  
message_properties_array OUT  message_properties_array_t,  
payload_array          OUT  "<COLLECTION_1>"  
);  
```
msgid_array  OUT  msgid_array_t,
error_array  OUT  error_array_t)
RETURN pls_integer;

Parameters

Table 22-8  DEQUEUE_ARRAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name from which messages are dequeued (same as single-row dequeue).</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>The set of options which will be applied to all messages in the array (same as single-row dequeue).</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to dequeue. For buffered messages, array_size should be 1.</td>
</tr>
<tr>
<td>message_properties</td>
<td>A record containing an array corresponding to each message property. See MESSAGE_PROPERTIES_ARRAY_T Type.</td>
</tr>
<tr>
<td>_array</td>
<td>Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of dequeued payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, varray or nested table in its PL/SQL representation. Users can dequeue RAW and ADT payloads.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeque by message_id is not supported. See DEQUEUE Procedure for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also:

ENQUEUE_OPTIONS_T Type

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.
DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

22.5.4 ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

DBMS_AQ.ENQUEUE (  
    queue_name          IN      VARCHAR2,
    enqueue_options     IN      enqueue_options_t,
    message_properties  IN      message_properties_t,
    payload             IN       "<ADT_1>",
   msgid               OUT     RAW);  

Parameters

Table 22-9  ENQUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of type_name refer to TYPE_NAME in DBMS_AQ Data Types.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.</td>
</tr>
</tbody>
</table>

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying sequence_deviation for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.
Note:
The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See `MESSAGE_PROPERTIES_T Type` for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure`.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure`.

### 22.5.5 ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

**Syntax**

```sql
DBMS_AQ.ENQUEUE_ARRAY ( queue_name                IN   VARCHAR2,
                         enqueue_options           IN   enqueue_options_t,
                         array_size                IN   pls_integer,
                         message_properties_array  IN   message_properties_array_t,
                         payload_array             IN   <COLLECTION_1>,
                         msgid_array               OUT  msgid_array_t,
                         error_array               OUT  error_array_t)
RETURN pls_integer;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name in which messages are enqueued (same as single-row enqueue).</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See <code>ENQUEUE_OPTIONS_T Type</code>.</td>
</tr>
<tr>
<td>array_size</td>
<td></td>
</tr>
<tr>
<td>message_properties_array</td>
<td></td>
</tr>
<tr>
<td>payload_array</td>
<td></td>
</tr>
<tr>
<td>msgid_array</td>
<td></td>
</tr>
<tr>
<td>error_array</td>
<td></td>
</tr>
</tbody>
</table>
Table 22-10 (Cont.) ENQUEUE_ARRAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array_size</td>
<td>The number of elements to enqueue. For buffered messages, array_size should be 1.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, VARRAY, or nested table in its PL/SQL representation. Users can enqueue RAW and ADT payloads.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

22.5.6 LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```sql
DBMS_AQ.LISTEN (    
    agent_list            IN    AQ$_AGENT_LIST_T,  
    wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,  
    agent                 OUT   SYS.AQ$_AGENT);  

DBMS_AQ.LISTEN (    
    agent_list            IN    AQ$_AGENT_LIST_T,  
    wait                  IN    BINARY_INTEGER DEFAULT FOREVER,  
    listen_delivery_mode  IN    PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,  
    agent                 OUT   SYS.AQ$_AGENT,  
    message_delivery_mode OUT   PLS_INTEGER);  
```

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;

Parameters

Table 22-11 LISTEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_list</td>
<td>List of agents to listen for</td>
</tr>
<tr>
<td>wait</td>
<td>Time out for the listen call in seconds. By default, the call will block forever.</td>
</tr>
</tbody>
</table>
Table 22-11  (Cont.) LISTEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listen_delivery_mode</td>
<td>The caller specifies whether it is interested in persistent, buffered</td>
</tr>
<tr>
<td></td>
<td>messages or both types of messages, specifying a delivery mode of</td>
</tr>
<tr>
<td></td>
<td>DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or</td>
</tr>
<tr>
<td></td>
<td>DBMS_AQ.PERSISTENT_OR_BUFFERED</td>
</tr>
<tr>
<td>agent</td>
<td>Agent with a message available for consumption</td>
</tr>
<tr>
<td>message_delivery_mode</td>
<td>Returns the message type along with the queue and consumer for which there</td>
</tr>
<tr>
<td></td>
<td>is a message</td>
</tr>
</tbody>
</table>

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note:

You cannot call LISTEN on nonpersistent queues.

22.5.7 POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```sql
DBMS_AQ.POST(
    post_list IN SYS.AQ$_POST_INFO_LIST,
    post_count IN NUMBER);
```
Parameters

Table 22-12 POST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>post_list</td>
<td>Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.</td>
</tr>
<tr>
<td>post_count</td>
<td>Specifies the number of entries in the post_list.</td>
</tr>
</tbody>
</table>

Usage Notes
This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

22.5.8 REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```sql
DBMS_AQ.REGISTER (
    reg_list     IN  SYS.AQ$_REG_INFO_LIST,
    count        IN  NUMBER);
```

Parameters

Table 22-13 REGISTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
– Start time – when to start grouping (Default is current time)

• If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

• If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also:

DBMS_AQELM for more information on e-mail and HTTP notifications

22.5.9 UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
    agent   IN SYS.AQ$_AGENT);
```

Parameters

Table 22-14  BIND_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be removed from the LDAP server</td>
</tr>
</tbody>
</table>

22.5.10 UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
    reg_list   IN SYS.AQ$_REG_INFO_LIST,
    reg_count  IN NUMBER);
```

Parameters

Table 22-15  UNREGISTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>reg_count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.
The **DBMS_AQADM** package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

See Also:

- *Oracle Database Advanced Queuing User's Guide*
- *Oracle Database Advanced Queuing (AQ) Types* for information about the TYPES to use with DBMS_AQADM

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_AQADM Subprograms

### 23.1 DBMS_AQADM Security Model

Initially, only **SYS** and **SYSTEM** have execution privilege for the procedures in **DBMS_AQADM** and **DBMS_AQ**. Users who have been granted **EXECUTE** rights to **DBMS_AQ** and **DBMS_AQADM** are able to create, manage, and use queues in their own schemas. The **MANAGE_ANY AQ** system privilege is used to create and manage queues in other schemas and can be granted and revoked through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE respectively. Starting from Oracle Database 12c Release 2, **MANAGE_ANY** privilege will not allow access to **SYS** owned queues by users other than **SYS**.

**User Roles**

The database administrator has the option of granting the system privileges **ENQUEUE_ANY** and **DEQUEUE_ANY**, exercising DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising DBMS_AQADM.GRANT_QUEUE_PRIVILEGE and DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE. Starting from Oracle Database 12c Release 2, **ENQUEUE_ANY** and **DEQUEUE_ANY** privileges will not allow access to **SYS** owned queues by users other than **SYS**.
Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

Queue Table Migration

The MIGRATE_QUEUE_TABLE procedure requires that the EXECUTE privilege on DBMS_AQADM be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the EXECUTE privilege as soon as the migration is done.

23.2 DBMS_AQADM Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.
Table 23-1  Enumerated Types in the Administrative Interface

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>0, 1, 2...INFINITE</td>
</tr>
<tr>
<td>message_grouping</td>
<td>TRANSACTIONAL, NONE</td>
</tr>
<tr>
<td>queue_type</td>
<td>NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE</td>
</tr>
</tbody>
</table>

See Also:

For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

23.3 DBMS_AQADM Subprogram Groups

This section lists and describes the DBMS_AQADM subprogram groups.

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms
- Privilege Subprograms
- Queue Subprograms
- Subscriber Subprograms
- Propagation Subprograms
- Miscellaneous Subprograms
- Oracle Database Advanced Queuing Agent Subprograms
- Alias Subprograms

23.3.1 DBMS_AQADM Queue Table Subprograms

This section lists and describes the DBMS_AQADM Queue Table subprograms.

Table 23-2  Queue Table Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_QUEUE_TABLE Procedure</td>
<td>Alters the existing properties of a queue table</td>

23.4.1 ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```sql
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
    alias          IN VARCHAR2,
    obj_location   IN VARCHAR2);
```

Parameters

Table 23-11  ADD_ALIAS_TO_LDAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Name of the alias. Example: west_shipping.</td>
</tr>
<tr>
<td>obj_location</td>
<td>The distinguished name of the object (queue, agent or connection factory) to which alias refers.</td>
</tr>
</tbody>
</table>
Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.

23.4.2 ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```sql
DBMS_AQADM.ADD_SUBSCRIBER (  
queue_name      IN    VARCHAR2,
subscriber      IN    sys.aq$_agent,
rule            IN    VARCHAR2 DEFAULT NULL,
transformation  IN    VARCHAR2 DEFAULT NULL
queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 23-12 ADD_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being defined.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE, propagation is from queue-to-queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.</td>
</tr>
</tbody>
</table>
Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

rule => 'PRIORITY <= 3 AND CORRID = 'FROM JAPAN''

Note that these are all single quotation marks.

23.4.3 ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

Syntax

```sql
DBMS_AQADM.ALTER_AQ_AGENT (
    agent_name                IN VARCHAR2,
    certificate_location      IN VARCHAR2 DEFAULT NULL,
    enable_http               IN BOOLEAN DEFAULT FALSE,
    enable_smtp               IN BOOLEAN DEFAULT FALSE,
    enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 23-13 ALTER_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>
23.4.4 ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
    queue_name IN VARCHAR2,
    destination IN VARCHAR2 DEFAULT NULL,
    duration IN NUMBER DEFAULT NULL,
    next_time IN VARCHAR2 DEFAULT NULL,
    latency IN NUMBER DEFAULT 60,
    destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
23.4.5 ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE (
  queue_name        IN    VARCHAR2,
  max_retries       IN    NUMBER   DEFAULT NULL,
  retry_delay       IN    NUMBER   DEFAULT NULL,
  retention_time    IN    NUMBER   DEFAULT NULL,
  auto_commit       IN    BOOLEAN  DEFAULT TRUE,
  comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Name of the queue that is to be altered</td>
</tr>
<tr>
<td><code>max_retries</code></td>
<td>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$. A message is moved to an exception queue if RETRY_COUNT is greater than <code>max_retries</code>. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION or SHUTDOWN ABORT on the instance), then RETRY_COUNT is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td><code>retry_delay</code></td>
<td>Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td><code>retention_time</code></td>
<td>Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.</td>
</tr>
<tr>
<td><code>auto_commit</code></td>
<td>TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.</td>
</tr>
</tbody>
</table>
23.4.6 ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE_TABLE (  
    queue_table          IN   VARCHAR2,  
    comment              IN   VARCHAR2       DEFAULT NULL,  
    primary_instance     IN   BINARY_INTEGER DEFAULT NULL,  
    secondary_instance   IN   BINARY_INTEGER DEFAULT NULL,  
    replication_mode     IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created.</td>
</tr>
<tr>
<td>comment</td>
<td>Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode. DBMS_AQADM.NONE if queue is being altered to not be replicated. The default value is NULL.</td>
</tr>
</tbody>
</table>

23.4.7 ALTER_SHARDED_QUEUE Procedure

This procedure provides user the ability to alter a sharded queue.

See Also:

Oracle® Database Advanced Queuing User's Guide for information about sharded queues

Syntax

```sql
PROCEDURE ALTER_SHARDED_QUEUE (  
    queue_name             IN VARCHAR2,  
    max_retries            IN NUMBER         DEFAULT NULL,  
    comment                IN VARCHAR2       DEFAULT NULL,  
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,  
    replication_mode       IN BINARY_INTEGER DEFAULT NULL);
```
Parameters

Table 23-17 ALTER_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This parameter specifies the name of the sharded queue. A maximum of 128 characters are allowed.</td>
</tr>
<tr>
<td>max_retries</td>
<td>The maximum number of retries allowed.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment of the queue.</td>
</tr>
<tr>
<td>queue_properties</td>
<td>Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode or else DBMS_AQADM.NONE. Default is NULL.</td>
</tr>
</tbody>
</table>

23.4.8 ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

DBMS_AQADM.ALTER_SUBSCRIBER (    queue_name     IN    VARCHAR2,    subscriber     IN    sys.aq$_agent,    rule           IN    VARCHAR2    transformation IN    VARCHAR2);

Parameters

Table 23-18 ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being altered. See &quot;AQ__AGENT Type&quot;.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values
for rule and transformation for a subscriber can be obtained from the
`schema.AQ$queue_table_R` and `schema.AQ$queue_table_S` views.

### 23.4.9 CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

**Syntax**

```sql
DBMS_AQADM.CREATE_AQ_AGENT (
    agent_name                IN VARCHAR2,
    certificate_location      IN VARCHAR2 DEFAULT NULL,
    enable_http               IN BOOLEAN DEFAULT FALSE,
    enable_smtp               IN BOOLEAN DEFAULT FALSE,
    enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

**Parameters**

**Table 23-19 CREATE_AQ_AGENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent’s certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>

**Usage Notes**

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Database Advanced Queuing Internet agents.
23.4.10 CREATE_NP_QUEUE Procedure

This procedure creates a nonpersistent RAW queue.

Note:

Nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

Syntax

DBMS_AQADM.CREATE_NP_QUEUE (
    queue_name              IN        VARCHAR2,
    multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
    comment                 IN        VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.
23.4.11 CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```sql
DBMS_AQADM.CREATE_QUEUE (
    queue_name          IN       VARCHAR2,
    queue_table         IN       VARCHAR2,
    queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
    max_retries         IN       NUMBER           DEFAULT NULL,
    retry_delay         IN       NUMBER           DEFAULT 0,
    retention_time      IN       NUMBER           DEFAULT 0,
    dependency_tracking IN       BOOLEAN          DEFAULT FALSE,
    comment             IN       VARCHAR2         DEFAULT NULL,
    auto_commit         IN       BOOLEAN          DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>queue_table</td>
<td>Name of the queue table that will contain the queue.</td>
</tr>
<tr>
<td>queue_type</td>
<td>Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is (2^{31} - 1).</td>
</tr>
<tr>
<td></td>
<td>A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td></td>
<td>Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time, in seconds, before this message is scheduled for processing again after an application rollback.</td>
</tr>
<tr>
<td></td>
<td>The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
</tbody>
</table>
### Table 23-21  (Cont.) CREATE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention_time</td>
<td>Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.</td>
</tr>
<tr>
<td>dependency_tracking</td>
<td>Reserved for future use. FALSE is the default. TRUE is not permitted in this release.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

#### Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

### 23.4.12 CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

#### Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (  
  queue_table          IN      VARCHAR2, 
  queue_payload_type   IN      VARCHAR2, 
  storage_clause       IN      VARCHAR2  DEFAULT NULL, 
  sort_list            IN      VARCHAR2  DEFAULT NULL, 
  multiple_consumers   IN      BOOLEAN  DEFAULT FALSE, 
  message_grouping     IN      BINARY_INTEGER DEFAULT NONE, 
  comment              IN      VARCHAR2  DEFAULT NULL, 
  auto_commit          IN      BOOLEAN  DEFAULT TRUE, 
  primary_instance     IN      BINARY_INTEGER DEFAULT 0, 
  secondary_instance   IN      BINARY_INTEGER DEFAULT 0, 
  compatible           IN      VARCHAR2  DEFAULT NULL, 
  secure               IN      BOOLEAN  DEFAULT FALSE, 
  replication_mode     IN      BINARY_INTEGER DEFAULT NONE);
```

#### Parameters

<tr>
<td>storage_clause</td>
<td>Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
<tr>
<td>sort_list</td>
<td>The columns to be used as the sort key in ascending order. This parameter has the following format: <code>sort_column_1, sort_column_2</code> The allowed column names are priority, enq_time, and commit_time. If both columns are specified, then sort_column_1 defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation.msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified. When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See also “Priority and Ordering of Messages” in Oracle Database Advanced Queuing User’s Guide for information about message ordering in Oracle Database Advanced Queuing.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>message_grouping</td>
<td>Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>
### Table 23-22  (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| auto_commit     | TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.  
Note: This parameter has been deprecated. |
| primary_instance| The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance.  
The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance. |
| secondary_instance| The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance. |
| compatible      | The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0. |
| secure          | This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users. |
| replication_mode| DBMS_AQADM.REPLICATION_MODE if queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE. |

### Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- \$queue_table_name_e, a default exception queue associated with the queue table
- \$queue_table_name, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- \$queue_table_name_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- \$queue_table_name_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- \$queue_table_name_s, a table for storing information about the subscribers
- \$queue_table_name_r, a table for storing information about rules on subscriptions
aq$$_queue_table_name_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only CLOB and BLOB can be propagated using Oracle Database Advanced Queuing propagation in Oracle8i release 8.1.5 or later. See the Oracle Database Advanced Queuing User's Guide for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

### 23.4.13 CREATE_SHARDED_QUEUE Procedure

The CREATE_SHARDED_QUEUE API creates a queue and its queue table as appropriate for a sharded queue. This API cannot be used to create unsharded queues. Sharded queues must be created using this single integrated API that will automatically set AQ properties as needed.

Sharded queues may be either a single consumer or a multi-consumer queue.

#### Syntax

```
PROCEDURE CREATE_SHARDED_QUEUE (  
    queue_name             IN VARCHAR2,  
    storage_clause         IN VARCHAR2       DEFAULT NULL,  
    multiple_consumers     IN BOOLEAN        DEFAULT FALSE,  
    max_retries            IN NUMBER         DEFAULT NULL,  
    comment                IN VARCHAR2       DEFAULT NULL,  
    queue_payload_type     IN VARCHAR2       DEFAULT JMS_TYPE,  
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,  
    replication_mode       IN BINARY_INTEGER DEFAULT NONE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This required parameter specifies the name of the new queue. Maximum of 128 characters allowed.</td>
</tr>
</tbody>
</table>
Table 23-23 (Cont.) CREATE_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>storage_clause</td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE statement. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>max_retries</td>
<td>This optional parameter limits the number of times that a dequeue can reattempted on a message after a failure. The maximum value of max_retries is (2^{31} - 1). After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td>comment</td>
<td>This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>queue_payload_type</td>
<td>Payload can be RAW, DBMS_AQADM.JMS_TYPE, or an object type. Default is DBMS_AQADM.JMS_TYPE.</td>
</tr>
<tr>
<td>queue_properties</td>
<td>Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if Queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.</td>
</tr>
</tbody>
</table>

23.4.14 CREATE_EXCEPTION_QUEUE Procedure

The CREATE_EXCEPTION_QUEUE API creates an exception queue for a sharded queue.

Syntax

```sql
PROCEDURE CREATE_EXCEPTION_QUEUE(
    sharded_queue_name IN VARCHAR2,
    exception_queue_name IN VARCHAR2 DEFAULT NULL
);
```
### Parameters

**Table 23-24  CREATE_EXCEPTION_QUEUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sharded_queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>exception_queue_name</td>
<td>The name of the exception queue.</td>
</tr>
</tbody>
</table>

#### 23.4.15 DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

**Syntax**

```
DBMS_AQADM.DEL_ALIAS_FROM_LDAP(
    alias IN VARCHAR2);
```

**Parameters**

**Table 23-25  DEL_ALIAS_FROM_LDAP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>The alias to be removed.</td>
</tr>
</tbody>
</table>

#### 23.4.16 DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

**Syntax**

```
DBMS_AQADM.DISABLE_DB_ACCESS (
    agent_name    IN VARCHAR2,
    db_username   IN VARCHAR2)
```

**Parameters**

**Table 23-26  DISABLE_DB_ACCESS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the **ENABLE_DB_ACCESS Procedure**.
23.4.17 DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```sql
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (  
    queue_name            IN   VARCHAR2,  
    destination           IN   VARCHAR2 DEFAULT NULL,  
    destination_queue     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>

23.4.18 DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

Syntax

```sql
DBMS_AQADM.DROP_AQ_AGENT (  
    agent_name                IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent</td>
</tr>
</tbody>
</table>
23.4.19 DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

DBMS_AQADM.DROP_QUEUE (  
    queue_name   IN    VARCHAR2,  
    auto_commit  IN    BOOLEAN DEFAULT TRUE);  

Parameters

Table 23-29  DROP_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be dropped.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

23.4.20 DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table   IN    VARCHAR2,  
    force         IN    BOOLEAN DEFAULT FALSE,  
    auto_commit   IN    BOOLEAN DEFAULT TRUE);  

Parameters

Table 23-30  DROP_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be dropped.</td>
</tr>
<tr>
<td>force</td>
<td>FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.</td>
</tr>
</tbody>
</table>
### Table 23-30  (Cont.) DROP_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

#### Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the force option is used, in which case this is done automatically.

### 23.4.21 DROP_SHARDED_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system.

You must stop the queue before calling DROP_SHARDED_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_SHARDED_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

#### Syntax

```sql
DBMS_AQADM.DROP_SHARDED_QUEUE(
    queue_name IN VARCHAR2,
    force IN BOOLEAN DEFAULT FALSE )
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This required parameter specifies the name of the sharded queue.</td>
</tr>
<tr>
<td>force</td>
<td>The sharded queue is dropped even if the queue is not stopped.</td>
</tr>
</tbody>
</table>

### 23.4.22 ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

#### Syntax

```sql
DBMS_AQADM.ENABLE_DB_ACCESS (
    agent_name IN VARCHAR2,
    db_username IN VARCHAR2)
```
Parameters

Table 23-32 ENABLE_DB_ACCESS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specified the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

The $SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.

23.4.23 ENABLE_JMS_TYPES Procedure

Enqueue JMS types and XML types.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (queue_table IN VARCHAR2);
```

Parameters

Table 23-33 ENABLE_JMS_TYPES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be enabled for JMS and XML types.</td>
</tr>
</tbody>
</table>

23.4.24 ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (queue_name IN VARCHAR2,
   destination IN VARCHAR2 DEFAULT NULL,
   destination_queue IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 23-34  ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>

23.4.25 GET_MAX_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MAX_STREAMS_POOL (
    value OUT NUMBER);
```

Parameters

Table 23-35  GET_MAX_STREAMS_POOL Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>

23.4.26 GET_MIN_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MIN_STREAMS_POOL (
    value OUT NUMBER);
```

Parameters

Table 23-36  GET_MIN_STREAMS_POOL Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
23.4.27 GET_QUEUE_PARAMETER Procedure

This procedure allows user to get different parameters for sharded queues at queue or database level.

For database level the queue_name should be NULL. Note that queue overrides database level parameter values.

See Also:
Oracle® Database Advanced Queuing User’s Guide for information about sharded queues

Syntax

```sql
PROCEDURE GET_QUEUE_PARAMETER(
queue_name          IN VARCHAR2,
param_name          IN VARCHAR2,
param_value         OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>param_name</td>
<td>The name of the parameter. Table 23-38 and Table 23-39 describe the valid parameter names.</td>
</tr>
<tr>
<td>param_value</td>
<td>The value of the parameter.</td>
</tr>
</tbody>
</table>

Table 23-38 Sharded queue parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Scope</th>
<th>Allowed Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARD_NUM</td>
<td>Queue level</td>
<td>[1, UB4MAXVAL]</td>
<td>Maximum number of shards allowed for the queue.</td>
</tr>
</tbody>
</table>
Table 23-38  (Cont.) Sharded queue parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Scope</th>
<th>Allowed Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY_BASED_ENQUEUE</td>
<td>Queue level</td>
<td>[0,1]</td>
<td>When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set. When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.</td>
</tr>
<tr>
<td>STICKY_DEQUEUE</td>
<td>Queue level</td>
<td>[0,1]</td>
<td>When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set. When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.</td>
</tr>
</tbody>
</table>

Table 23-39   Key-based Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Scope</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AQ$KEY_TO_SHARD_MAP</td>
<td>Queue level</td>
<td>Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped.</td>
</tr>
</tbody>
</table>
### Table 23-39 (Cont.) Key-based Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Scope</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AQ$GET_KEY_SHARD_INST</td>
<td>Queue level</td>
<td>Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.</td>
</tr>
</tbody>
</table>

### Example 23-1  Key to shard mapping

Users can explicitly map a new key to an existing shard or to a new shard.

To map a key value 'RED' to a shard with id 0 for queue named MY_SHQ1, submit the following:

```sql
execute dbms_aqadm.set_queue_parameter('MY_SHQ1', 'AQ$KEY_TO_SHARD_MAP=RED', 0);
```

If a key is being enqueued which has not been explicitly mapped to a shard, then one of the shards is chosen at random and mapped to that key permanently. Once a key is mapped to shard, the mapping cannot be changed.

To get the shard identifier for a key which is mapped already, submit the following:

```sql
declare pval number;
begin
    dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD=RED', pval);
    dbms_output.put_line('The key RED is mapped to shard id ' || pval);
END;
/
```

### Example 23-2  Key to instance mapping

User sharding performs best when cross instance enqueues are not involved. To know the instance where a key can be enqueued without any cross instance enqueue, submit the following:

```sql
declare pval number;
begin
    dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD_INST=RED', pval);
    dbms_output.put_line('The key RED is owned by instance id ' || pval);
END;
/
```

### 23.4.28 GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

**Syntax**

```sql
DBMS_AQADM.GET_WATERMARK (wmvalue IN NUMBER);
```
23.4.29 GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are `ENQUEUE` or `DEQUEUE`. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```sql
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (  
    privilege IN VARCHAR2,  
    queue_name IN VARCHAR2,  
    grantee IN VARCHAR2,  
    grant_option IN BOOLEAN := FALSE);
```

Parameters

Table 23-41   GRANT_QUEUE_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to grant. The options are <code>ENQUEUE</code>, <code>DEQUEUE</code>, and <code>ALL</code>. <code>ALL</code> means both <code>ENQUEUE</code> and <code>DEQUEUE</code>.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.</td>
</tr>
<tr>
<td>grant_option</td>
<td>Specifies if the access privilege is granted with the <code>GRANT</code> option or not. If the privilege is granted with the <code>GRANT</code> option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is <code>FALSE</code>.</td>
</tr>
</tbody>
</table>

23.4.30 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles.

The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. Initially, only `SYS` and `SYSTEM` can use this procedure successfully.

Note:

Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.
Syntax

```sql
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (  
  privilege IN VARCHAR2,  
  grantee IN VARCHAR2,  
  admin_option IN BOOLEAN := FALSE);
```

Parameters

Table 23-42  GRANT_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.</td>
</tr>
<tr>
<td>grantees</td>
<td>Grantee(s). The grantees can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>admin_option</td>
<td>Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantees is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.</td>
</tr>
</tbody>
</table>

Note:

Starting from Oracle Database 12c Release 2, MANAGE_ANY, ENQUEUE_ANY, and DEQUEUE_ANY privileges will not allow access to SYS owned queues by users other than SYS.

23.4.31 MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```sql
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
  queue_table IN VARCHAR2,  
  compatible IN VARCHAR2);
```
Parameters

Table 23-43   MIGRATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be migrated.</td>
</tr>
<tr>
<td>compatible</td>
<td>Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.</td>
</tr>
</tbody>
</table>

23.4.32 PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```sql
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table        IN   VARCHAR2,
    purge_condition    IN   VARCHAR2,
    purge_options      IN   aq$_purge_options_t);
```

Where type `aq$_purge_options_t` is described in Oracle Database Advanced Queuing (AQ) Types.

Parameters

Table 23-44   PURGE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies the name of the queue table to be purged.</td>
</tr>
<tr>
<td>purge_condition</td>
<td>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of <code>aq$queue_table_name</code> view. When specifying the <code>purge_condition</code>, qualify the column names in <code>aq$queue_table_name</code> view with <code>qtview</code>. To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or '' (two single quotes).</td>
</tr>
</tbody>
</table>
Table 23-44  (Cont.) PURGE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge_options</td>
<td>Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter.</td>
</tr>
<tr>
<td></td>
<td>· If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</td>
</tr>
<tr>
<td></td>
<td>· delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can purge selected messages from the queue table by specifying a purge_condition. Table 23-44 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.
- A trace file is generated in the udump destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one purge_queue_table call depending on the number of messages in the queue table.

23.4.33 QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$_subscriber_list_t.

Each element of the collection is of type sys.aq$_agent. This functionality is provided for 8.1-compatible queues by the AQ$queue_table_name_S view.

Syntax

```sql
DBMS_AQADM.QUEUE_SUBSCRIBERS (queue_name IN VARCHAR2);
```

RETURN aq$_subscriber_list_t IS
Parameters

Table 23-45 QUEUE_SUBSCRIBERS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the queue whose subscribers are to be printed.</td>
</tr>
</tbody>
</table>

23.4.34 REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (  
    queue_name        IN         VARCHAR2,  
    subscriber         IN         sys.aq$_agent);
```

Parameters

Table 23-46 REMOVE_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent who is being removed. See AQ$_AGENT Type.</td>
</tr>
</tbody>
</table>

23.4.35 REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (  
    privilege         IN      VARCHAR2,  
    queue_name        IN      VARCHAR2,  
    grantee           IN      VARCHAR2);
```

Parameters

Table 23-47 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.</td>
</tr>
</tbody>
</table>
Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the `GRANT` option are revoked if the grantor's privileges are revoked.

23.4.36 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY` and `MANAGE_ANY`. The `ADMIN` option for a system privilege cannot be selectively revoked. Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (    
  privilege       IN   VARCHAR2,    
  grantee         IN   VARCHAR2);
```

Parameters

Table 23-48  REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to revoke. The options are <code>ENQUEUE_ANY</code>, <code>DEQUEUE_ANY</code>, and <code>MANAGE_ANY</code>. The <code>ADMIN</code> option for a system privilege cannot be selectively revoked.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.</td>
</tr>
</tbody>
</table>

Note:

Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

23.4.37 SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (    
  queue_name      IN   VARCHAR2,    
  destination     IN   VARCHAR2 DEFAULT NULL,    
  start_time      IN   DATE     DEFAULT SYSDATE,    
  duration        IN   NUMBER   DEFAULT NULL,    
  next_time       IN   VARCHAR2 DEFAULT NULL,    
);```
Parameters

Table 23-49  SCHEDULE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 390 bytes, and if the name is not fully qualified, then the default domain name is used. The pattern <code>schema.queue@dblink</code> is used.</td>
</tr>
<tr>
<td>start_time</td>
<td>Initial start time for the propagation window for messages from the source queue to the destination.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, <code>next_time</code> should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code>.</td>
</tr>
</tbody>
</table>
Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in either the same or different queues, the message is propagated to all of them at the same time.

Oracle extensions for JMS such as JMS propagation and remote subscribers are not currently supported for sharded queues. Propagation between sharded and non-sharded queues is not supported.

23.4.38 SET_QUEUE_PARAMETER Procedure

This procedure allows user to set different parameters for sharded queues at queue or database level. For database level the queue_name should be NULL. Note that queue overrides database level parameter values.

See Also:

Oracle® Database Advanced Queuing User’s Guide for information about sharded queues

Syntax

PROCEDURE  SET_QUEUE_PARAMETER(
    queue_name          IN VARCHAR2,
    param_name          IN VARCHAR2,
    param_value         IN NUMBER);

Parameters

Table 23-50  SET_QUEUE_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>

<tbody>
<tr>
<td>AQ$GET_KEY_SHARD_INST</td>
<td>Queue level</td>
<td>Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.</td>
</tr>
</tbody>
</table>

Example 23-3  Create a sharded queue with key based enqueues

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure `DBMS_AQADM.SET_QUEUE_PARAMETER` is called after `CREATE_SHARDED_QUEUE`.

```sql
execute
    sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');
```

```sql
execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'KEY_BASED_ENQUEUE', 1);
```

Example 23-4  Create a sharded queue with sticky dequeues

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure `DBMS_AQADM.SET_QUEUE_PARAMETER` is called after `CREATE_SHARDED_QUEUE`.

```sql
execute
    sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');
```

```sql
execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'STICKY_DEQUEUE', 1);
```

Example 23-5  Setting or changing the number of shards

Once a queue is created, it can have a maximum of 5 shards by default. Applications can change the number of shards as needed using the PL/SQL procedure `DBMS_AQADM.SET_QUEUE_PARAMETER`.

```sql
execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'SHARD_NUM', 200);
```

Note:

Odd numbered shard identifiers are reserved for internal use. In the above example, the 200 shard identifiers used will be 0, 2, 4, ..., 398.
23.4.39 SET_MAX_STREAMS_POOL Procedure

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

Syntax

```sql
DBMS_AQADM.SET_MAX_STREAMS_POOL (
    value IN NUMBER);
```

Parameters

Table 23-53 SET_MAX_STREAMS_POOL Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>

23.4.40 SET_MIN_STREAMS_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

Syntax

```sql
DBMS_AQADM.SET_MIN_STREAMS_POOL (
    value IN NUMBER);
```

Parameters

Table 23-54 SET_MIN_STREAMS_POOL Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>

23.4.41 SET_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

Syntax

```sql
DBMS_AQADM.SET_WATERMARK (
    wmvalue IN NUMBER);
```

Parameters

Table 23-55 SET_WATERMARK Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
23.4.42 START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```sql
DBMS_AQADM.START_QUEUE (  
  queue_name      IN     VARCHAR2,  
  enqueue         IN     BOOLEAN DEFAULT TRUE,  
  dequeue         IN     BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be enabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
</tbody>
</table>

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

23.4.43 STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```sql
DBMS_AQADM.STOP_QUEUE (  
  queue_name      IN   VARCHAR2,  
  enqueue         IN   BOOLEAN DEFAULT TRUE,  
  dequeue         IN   BOOLEAN DEFAULT TRUE,  
  wait            IN   BOOLEAN DEFAULT TRUE,  
  free_memory     IN   BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be disabled</td>
</tr>
</tbody>
</table>
### Table 23-57 (Cont.) STOP_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enqueue</td>
<td>Specifies whether <code>ENQUEUE</code> should be disabled on this queue. <code>TRUE</code> means disable <code>ENQUEUE</code>. This is the default. <code>FALSE</code> means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether <code>DEQUEUE</code> should be disabled on this queue. <code>TRUE</code> means disable <code>DEQUEUE</code>. This is the default. <code>FALSE</code> means do not alter the current setting.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies whether to wait for the completion of outstanding transactions. <code>TRUE</code> means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. <code>FALSE</code> means return immediately either with a success or an error.</td>
</tr>
<tr>
<td>free_memory</td>
<td>Specifies whether the queue should be stopped.</td>
</tr>
</tbody>
</table>

### Usage Notes

By default, this call disables both `ENQUEUE` and `DEQUEUE`. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

### 23.4.44 UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

#### Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (  
    queue_name         IN  VARCHAR2,
    destination        IN  VARCHAR2 DEFAULT NULL
    destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code>, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code>.</td>
</tr>
</tbody>
</table>
23.4.45 UNSET_QUEUE_PARAMETER Procedure

This procedure allows user to unset different parameters for sharded queues at queue or database level.

For database level the queue_name should be NULL. Note that queue overrides database level parameter values.

See Also:

Oracle® Database Advanced Queuing User’s Guide for information about sharded queues

Syntax

```sql
PROCEDURE UNSET_QUEUE_PARAMETER(
    queue_name          IN VARCHAR2,
    param_name          IN VARCHAR2);;
```

Parameters

Table 23-59  UNSET_QUEUE_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

23.4.46 VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types.

The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

**Syntax**

```sql
DBMS_AQADM.VERIFY_QUEUE_TYPES (  
src_queue_name    IN    VARCHAR2,  
dest_queue_name   IN    VARCHAR2,  
destination       IN    VARCHAR2 DEFAULT NULL,  
rc                OUT   BINARY_INTEGER);
```

**Parameters**

Table 23-62  VERIFY_QUEUE_TYPES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>dest_queue_name</td>
<td>Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>rc</td>
<td>Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in rc.</td>
</tr>
</tbody>
</table>
Note:

- `SYS.AQS_MESSAGE_TYPES` can have multiple entries for the same source queue, destination queue, and database link, but with different transformations.
- `VERIFY_QUEUE_TYPES` check happens once per AQ propagation schedule and not for every propagated message send.
- In case the payload of the queue is modified then the existing propagation schedule between source and destination queue needs to be dropped and recreated.
DBMS_AQELM

The package provides subprograms to manage the configuration of Oracle Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

See Also:
Oracle Database Advanced Queuing User's Guide for detailed information about DBMS_AQELM

This chapter contains the following topics:
- Security Model
- Summary of DBMS_AQELM Subprograms

24.1 DBMS_AQELM Security Model

You need the administrator role AQ_ADMINISTRATOR_ROLE to run all procedures in DBMS_AQELM.

24.2 Summary of DBMS_AQELM Subprograms

This section lists and briefly describes the DBMS_AQELM subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_MAILHOST Procedure</td>
<td>Sets the host name for the SMTP server that the database will use to send out e-mail notifications</td>
</tr>
<tr>
<td>SET_MAILPORT Procedure</td>
<td>Sets the port number for the SMTP server</td>
</tr>
<tr>
<td>SET_SENDFROM Procedure</td>
<td>Sets the sent-from e-mail address</td>
</tr>
</tbody>
</table>

24.2.1 SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (mailto
                          IN VARCHAR2);
```
Parameters

Table 24-2    SET_MAILHOST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

24.2.2 SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

DBMS_AQELM.SET_MAILPORT (    
    mailport  IN NUMBER);  

Parameters

Table 24-3    SET_MAILPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

24.2.3 SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

DBMS_AQELM.SET_SENDFROM (    
    sendfrom  IN VARCHAR2);
Parameters

Table 24-4  SET_SENDFROM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELS package should set the sent-from address before registering for e-mail notifications.
25

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

See Also:
Oracle Database Advanced Queuing User’s Guide for detailed information about DBMS_AQIN

This chapter contains the following topic:
• Security Model

25.1 DBMS_AQIN Security Model

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces.

Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

GRANT EXECUTE ON DBMS_AQIN to user;

You must have EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. You can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINISTRATOR_ROLE.

See Also:
Oracle Database Advanced Queuing User’s Guide for more information on accessing standard and Oracle JMS applications.
The DBMS_ASSERT package provides an interface to validate properties of the input value.

See Also:
Oracle Database PL/SQL Language Reference for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:
- Operational Notes
- Summary of DBMS_ASSERT Subprograms

26.1 DBMS_ASSERT Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

26.2 Summary of DBMS_ASSERT Subprograms

This section describes the subprograms of the DBMS_ASSERT package.

Table 26-1   DBMS_ASSERT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENQUOTE_LITERAL Function</td>
<td>Enquotes a string literal</td>
</tr>
<tr>
<td>ENQUOTE_NAME Function</td>
<td>Ensures that a string is enclosed by quotation marks, then checks that the result is a valid SQL identifier.</td>
</tr>
<tr>
<td>NOOP Functions</td>
<td>Returns the value without any checking</td>
</tr>
<tr>
<td>QUALIFIED_SQL_NAME</td>
<td>Verifies that the input string is a qualified SQL name</td>
</tr>
<tr>
<td>SCHEMA_NAME Function</td>
<td>Verifies that the input string is an existing schema name</td>
</tr>
<tr>
<td>SIMPLE_SQL_NAME Function</td>
<td>Verifies that the input string is a simple SQL name</td>
</tr>
<tr>
<td>SQL_OBJECT_NAME Function</td>
<td>Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object</td>
</tr>
</tbody>
</table>
26.2.1 ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

**Syntax**

```sql
DBMS_ASSERT.ENQUOTE_LITERAL (str VARCHAR2) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.

26.2.2 ENQUOTE_NAME Function

This function encloses the provided string in double quotes (quotation marks). No additional quotes are added if the string was already in quotes (quotation marks). The quoted string is then checked to see if it is a valid (quoted) simple SQL name.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference.

**Syntax**

```sql
DBMS_ASSERT.ENQUOTE_NAME (str VARCHAR2, capitalize BOOLEAN DEFAULT TRUE) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
<tr>
<td>capitalize</td>
<td>If TRUE or defaulted, alphabetic characters of str which was not in quotes are translated to upper case</td>
</tr>
</tbody>
</table>

**Usage Notes**

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.
Examples

-- This procedure creates a single column table in the createOneColumnTable's schema.
create or replace procedure createOneColumnTable(proposedTableName varchar2) is
BEGIN
  IF (proposedTableName is NULL) THEN
    raise value_error;
  END IF;

  -- The use of ENQUOTE_NAME ensures that the table will be created in the
  -- definer's schema and not in some other schema even if the definer has
  -- privileges to create tables in other schemas.
  EXECUTE IMMEDIATE 'create table ' ||
    DBMS_ASSERT.ENQUOTE_NAME(proposedTableName) || ' (c1 number)';
END;
/

-- Examples of ENQUOTE_NAME showing input/output relationships
BEGIN
  -- 'eMp' becomes "EMP" since it is unquoted
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('eMp'));
END;
/

BEGIN
  -- For quoted strings, the case is preserved
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME("EmP"));
END;
/

BEGIN
  -- Invalid identifier example
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('SCOTT."EMP"'));
END;
/

BEGIN
  -- CHR(0) examples
  -- The following examples illustrates that CHR(0), the NULL character, cannot appear
  -- in the string; such a string poses a SQL injection risk.
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('BAD' || CHR(0) || 'IDENTIFIER'));
END;
/

BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME("SCOTT' || CHR(0) || '.EMP");
END;
/

-- Oracle allows a period (.) to be a part of a quoted string
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME("SCOTT.EMP"));
END;
/
The single quotation mark ('), as opposed to a double quotation mark, can appear in the string.

Note: In Oracle, a single quotation mark is specified in a literal using two single quotes. The first quotation mark escapes the second quotation mark in the same way that backslash (\) in POSIX is an escape character.

```sql
BEGIN
    dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"O''LEARY"'));
END;
/
```

### 26.2.3 NOOP Functions

This function returns the value without any checking.

**Syntax**

```sql
DBMS_ASSERT.NOOP (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

### 26.2.4 QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

**Syntax**

```sql
DBMS_ASSERT.QUALIFIED_SQL_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA44004: *string is not a qualified SQL name*
Usage Notes

A qualified SQL name `<qualified name>` can be expressed by the following grammar:

- `<local qualified name>` ::= `<simple name>` { '.' `<simple name>` }
- `<database link name>` ::= `<local qualified name>` ['@' `<connection string>`]
- `<connection string>` ::= `<simple name>`
- `<qualified name>` ::= `<local qualified name>` ['@' `<database link name>`]

26.2.5 SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (  
    str       VARCHAR2 CHARACTER SET ANY_CS)  
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

26.2.6 SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (  
    str       VARCHAR2 CHARACTER SET ANY_CS)  
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
<td></td>
</tr>
</tbody>
</table>

Exceptions
ORA44003: string is not a simple SQL name

Usage Notes
- The input value must meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with " inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

26.2.7 SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```sql
DBMS_ASSERT.SQL_OBJECT_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 26-8  SQL_OBJECT_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions
ORA44002: Invalid object name

Usage Notes
The use of synonyms requires that the base object exists.
The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

This chapter contains the following topics:

- DBMS_AUDIT_MGMT Overview
- DBMS_AUDIT_MGMT Deprecated Subprograms
- DBMS_AUDIT_MGMT Security Model
- DBMS_AUDIT_MGMT Constants
- DBMS_AUDIT_MGMT Views
- Subprogram Groups
- Summary of DBMS_AUDIT_MGMT Subprograms

See Also:

- Oracle Database Security Guide regarding verifying security access with auditing
- Oracle Database Upgrade Guide regarding migrating to unified auditing

27.1 DBMS_AUDIT_MGMT Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

In a mixed mode environment, when AUDIT_TRAIL is set to DB, database records are written to the AUD$ table. In a unified auditing environment, audit records are written to a read-only table in the AUDSYS schema. The contents of this table are available from the UNIFIED_AUDIT_TRAIL data dictionary view. When AUDIT_TRAIL is set to OS, audit records are written to operating system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the UNIFIED_AUDIT_TRAIL views.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.
If you have not yet migrated to unified auditing, the **DBMS_AUDIT_MGMT** package provides a subprogram that allows you to move the database audit trail tables out of the **SYSTEM** tablespace. This improves overall database performance by reducing the load on the **SYSTEM** tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the **DBMS_AUDIT_MGMT** subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The **DBMS_AUDIT_MGMT** subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The **DBMS_AUDIT_MGMT** package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The **DBMS_AUDIT_MGMT** subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

See Also:

*Oracle Database Security Guide* for a detailed description of unified auditing

### 27.2 DBMS_AUDIT_MGMT Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following have been deprecated from the **DBMS_AUDIT_MGMT** package starting in Oracle Database 12c release 12.2:

- **DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL** procedure
- **AUDIT_TRAIL_WRITE** mode of the **AUDIT_TRAIL_PROPERTY** parameter of the **DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY** procedure

These are no longer necessary because audit records now bypass the common logging infrastructure queues and are directly written to a new internal relational table.

### 27.3 DBMS_AUDIT_MGMT Security Model

All **DBMS_AUDIT_MGMT** subprograms require the user to have **EXECUTE** privilege over the **DBMS_AUDIT_MGMT** package. The **SYSDBA** and **AUDIT_ADMIN** roles have **EXECUTE** privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the **EXECUTE** privilege on the **DBMS_AUDIT_MGMT** package and be granted the **AUDIT_ADMIN** role.
Executions of the DBMS_AUDIT_MGMT subprograms are always audited.

27.4 DBMS_AUDIT_MGMT Constants

The DBMS_AUDIT_MGMT package defines several constants that can be used for specifying parameter values.

These constants shown in the following tables:

- Table 27-1
- Table 27-2
- Table 27-3

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. The following table lists the audit trail type constants.

Table 27-1 DBMS_AUDIT_MGMT Constants - Audit Trail Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_ALL</td>
<td>PLS_INTEGER</td>
<td>All audit trail types. This includes the standard database audit trail (SYS.AUD$, SYS.FGA_LOG$ and unified audit trail tables), operating system (OS) audit trail, and XML audit trail.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_AUD_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database audit records in the SYS.AUD$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_DB_STD</td>
<td>PLS_INTEGER</td>
<td>Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FGA_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FILES</td>
<td>PLS_INTEGER</td>
<td>Both operating system (OS) and XML audit trails</td>
</tr>
<tr>
<td>AUDIT_TRAIL_OS</td>
<td>PLS_INTEGER</td>
<td>Operating system audit trail. This refers to the audit records stored in operating system files.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_UNIFIED</td>
<td>PLS_INTEGER</td>
<td>Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as UNIFIED_AUDIT_TRAIL.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_XML</td>
<td>PLS_INTEGER</td>
<td>XML audit trail. This refers to the audit records stored in XML files.</td>
</tr>
</tbody>
</table>

Audit trail properties determine the audit configuration settings. The following table lists the constants related to audit trail properties.
Table 27-2  DBMS_AUDIT_MGMT Constants - Audit Trail Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_WRITE_MODE</td>
<td>PLS_INTEGER</td>
<td>Note: This procedure has been deprecated starting in Oracle Database 12c release 12.2. A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUED_WRITE indicates that the audit record can be queued and persisting can be done according to the database's flushing strategy. See Also Oracle Database Security Guide</td>
</tr>
<tr>
<td>CLEAN_UP_INTERVAL</td>
<td>PLS_INTEGER</td>
<td>Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail.</td>
</tr>
<tr>
<td>DB_DELETE_BATCH_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.</td>
</tr>
<tr>
<td>FILE_DELETE_BATCH_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.</td>
</tr>
<tr>
<td>OS_FILE_MAX_AGE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created.</td>
</tr>
<tr>
<td>OS_FILE_MAX_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened.</td>
</tr>
</tbody>
</table>

The audit trail purge job cleans the audit trail. The following table lists the constants related to purge job status values.

Table 27-3  DBMS_AUDIT_MGMT Constants - Purge Job Status

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_JOB_DISABLE</td>
<td>PLS_INTEGER</td>
<td>Disables a purge job</td>
</tr>
<tr>
<td>PURGE_JOB_ENABLE</td>
<td>PLS_INTEGER</td>
<td>Enables a purge job</td>
</tr>
</tbody>
</table>

27.5 DBMS_AUDIT_MGMT Views

DBMS_AUDIT_MGMT views are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

These views listed in the following table.
### Table 27-4 Views used by DBMS_AUDIT_MGMT

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA_AUDIT_MGMT_CLEAN_EVENTS</td>
<td>Displays the cleanup event history</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CLEANUP_JOBS</td>
<td>Displays the currently configured audit trail purge jobs</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CONFIG_PARAMS</td>
<td>Displays the currently configured audit trail properties</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_LAST_ARCH_TS</td>
<td>Displays the last archive timestamps set for the audit trails</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Database Reference* for more information on these views

### 27.6 DBMS_AUDIT_MGMT Subprogram Groups

The `DBMS_AUDIT_MGMT` package subprograms can be grouped into two categories: Audit Trail Management Subprograms and Audit Trail Cleanup Subprograms.

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms

#### 27.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

### Table 27-5 Audit Trail Management Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARTITION_INTERVAL Procedure</td>
<td>Changes the unified audit internal relational table’s partition interval</td>
</tr>
<tr>
<td>CLEAR_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td>FLUSH_UNIFIED_AUDIT_TRAIL Procedure</td>
<td>Writes the unified audit trail records in the SGA queue to disk (deprecated starting with Oracle Database 12c release 12.2)</td>
</tr>
<tr>
<td>GET_AUDIT_TRAIL_PROPERTY_VALUE Function</td>
<td>Returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure</td>
</tr>
<tr>
<td>GET_LAST_ARCHIVE_TIMESTAMP Function</td>
<td>Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance</td>
</tr>
<tr>
<td>LOAD_UNIFIED_AUDIT_FILES Procedure</td>
<td>Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_LOCATION Procedure</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
</tbody>
</table>
Table 27-5  (Cont.) Audit Trail Management Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Sets an audit trail property for the audit trail type that you specify</td>
</tr>
<tr>
<td>SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Sets a timestamp indicating when the audit records or files were last archived</td>
</tr>
<tr>
<td>TRANSFER_UNIFIED_AUDIT_RECORDS Procedure</td>
<td>Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD$UNIFIED relational table</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

27.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

Table 27-6  Audit Trail Cleanup Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_AUDIT_TRAIL Procedure</td>
<td>Deletes audit trail records or files that have been archived</td>
</tr>
<tr>
<td>CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
</tr>
<tr>
<td>CREATE_PURGE_JOB Procedure</td>
<td>Creates a purge job for periodically deleting the audit trail records or files</td>
</tr>
<tr>
<td>DEINIT_CLEANUP Procedure</td>
<td>Undoes the setup and initialization performed by the INIT_CLEANUP Procedure</td>
</tr>
<tr>
<td>DROP_OLD_UNIFIED_AUDIT_TABLES Procedure</td>
<td>Drops old unified audit tables following the cloning of a pluggable database (PDB)</td>
</tr>
<tr>
<td>DROP_PURGE_JOB Procedure</td>
<td>Drops the purge job created using the CREATE_PURGE_JOB Procedure</td>
</tr>
<tr>
<td>INIT_CLEANUP Procedure</td>
<td>Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records or files</td>
</tr>
<tr>
<td>IS_CLEANUP_INITIALIZED Function</td>
<td>Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type</td>
</tr>
<tr>
<td>SET_PURGE_JOB_INTERVAL Procedure</td>
<td>Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify</td>
</tr>
<tr>
<td>SET_PURGE_JOB_STATUS Procedure</td>
<td>Enables or disables the purge job that you specify</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.
# 27.7 Summary of DBMS_AUDIT_MGMT Subprograms

This table lists and describes the subprograms of the DBMS_AUDIT_MGMT package.

## Table 27-7  DBMS_AUDIT_MGMT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARTITION_INTERVAL Procedure</td>
<td>Changes the unified audit internal relational table’s partition interval</td>
</tr>
<tr>
<td>CLEAN_AUDIT_TRAIL Procedure</td>
<td>Deletes audit trail records that have been archived</td>
</tr>
<tr>
<td>CLEAR_AUDIT_TRAILPROPERTY Procedure</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td>CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
</tr>
<tr>
<td>CREATE_PURGE_JOB Procedure</td>
<td>Creates a purge job for periodically deleting the audit trail records</td>
</tr>
<tr>
<td>DEINIT_CLEANUP Procedure</td>
<td>Undoes the setup and initialization performed by the INIT_CLEANUP Procedure</td>
</tr>
<tr>
<td>DROP_OLD_UNIFIED_AUDIT_TABLES Procedure</td>
<td>Drops old unified audit tables following the cloning of a pluggable database (PDB)</td>
</tr>
<tr>
<td>DROP_PURGE_JOB Procedure</td>
<td>Drops the purge job created using the CREATE_PURGE_JOB Procedure</td>
</tr>
<tr>
<td>FLUSH_UNIFIED_AUDIT_TRAIL Procedure</td>
<td>Writes the unified audit trail records in the SGA queue to disk</td>
</tr>
<tr>
<td>GET_AUDIT_COMMIT_DELAY Function</td>
<td>Returns the audit commit delay time as the number of seconds. This is the maximum time that it takes to COMMIT an audit record to the database audit trail.</td>
</tr>
<tr>
<td>GET_AUDIT_TRAILPROPERTY_VALUE Function</td>
<td>Returns the property value set by the SET_AUDIT_TRAILPROPERTY Procedure</td>
</tr>
<tr>
<td>GET_LAST_ARCHIVE_TIMESTAMP Function</td>
<td>Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance</td>
</tr>
<tr>
<td>INIT_CLEANUP Procedure</td>
<td>Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records</td>
</tr>
<tr>
<td>IS_CLEANUP_INITIALIZED Function</td>
<td>Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type</td>
</tr>
<tr>
<td>LOAD_UNIFIED_AUDIT_FILES Procedure</td>
<td>Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_LOCATION Procedure</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAILPROPERTY Procedure</td>
<td>Sets the audit trail properties for the audit trail type that you specify</td>
</tr>
<tr>
<td>SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Sets a timestamp indicating when the audit records were last archived</td>
</tr>
<tr>
<td>SET_PURGE_JOB_INTERVAL Procedure</td>
<td>Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify</td>
</tr>
<tr>
<td>SET_PURGE_JOB_STATUS Procedure</td>
<td>Enables or disables the purge job that you specify</td>
</tr>
</tbody>
</table>
Table 27-7  (Cont.) DBMS_AUDIT_MGMT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSFER_UNIFIED_AUDIT_RECORD S Procedure</td>
<td>Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD$UNIFIED relational table</td>
</tr>
</tbody>
</table>

27.7.1 ALTER_PARTITION_INTERVAL Procedure

This procedure changes the unified audit internal relational table’s partition interval.

Syntax

```
DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
    interval_number          IN BINARY_INTEGER,
    interval_frequency       IN VARCHAR2);
```

Parameters

Table 27-8  ALTER_PARTITION_INTERVAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval_number</td>
<td>Sets how often the database creates partitions for the unified audit internal relational table. For example, to specify that the partition is created every two days, you must enter 2.</td>
</tr>
<tr>
<td>interval_frequency</td>
<td>Sets the frequency for the value that was set in the interval_number setting. For example, for a partition to be created every two days, with interval_number set to 2, you must set interval_frequency to DAY. Supported values are YEAR, MONTH, and DAY.</td>
</tr>
</tbody>
</table>

Usage Notes

- The interval frequency that you choose depends on the rate of audit records that are generated in your database. The default setting is for one month. If you have a high audit record rate and are using the default, then too many audit records may be generated in the same partition. In this case, you should change the interval frequency to a more frequent interval, such as one month or one day. If the audit record rate generation is not so high, then you may want to keep it at the default of one month.

Example

The following example sets the partition interval to occur every two months.

```
BEGIN
    DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
        interval_number       => 2,
        interval_frequency    => 'MONTH');
END;
```
27.7.2 CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records.

The CLEAN_AUDIT_TRAIL procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type IN PLS_INTEGER,
    use_last_arch_timestamp IN BOOLEAN DEFAULT TRUE,
    container IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id IN NUMBER DEFAULT NULL,
    container_guid IN VARCHAR2 DEFAULT NULL);

Parameters

Table 27-9  CLEAN_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 27-1.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
</tbody>
</table>

Note: This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the AUDIT_FILE_DEST parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
• For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the *.*.aud files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

See Also:

"AUDIT_SYSLOG_LEVEL" in the Oracle Database Reference

• When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (*.xml) from the current audit directory.

Oracle database maintains a book-keeping file (adx_$ORACLE_SID.txt) for the XML audit files. This file is not removed by the cleanup procedure.

• If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `TRUE`:
  – If you set the `database_id` value for the cleanup operation, then this value is used with the last archive timestamp while `CLEAN_AUDIT_TRAIL` runs. However, for the unified audit records that are present during the cleanup of spillover operating system audit files, the `database_id` value is ignored. Cleanup for operating system audit files is based on the last archive timestamp only. If you want to have the `database_id` value used for the cleanup operation of unified audit trail records that are present in the spillover operating system audit files, then load the contents of these files into database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.
  
  – If you do not set the `database_id` value for the cleanup operation, then `CLEAN_AUDIT_TRAIL` uses the database ID of the current database container. This ID is used along with the last archive timestamp value while cleaning up the unified audit records that are present in the database tables. However, for unified audit records that are present in the spillover operating system audit records, this database ID is not used and cleanup of these records is based on the last archive timestamp value only. If you want to include the database ID value in the cleanup of unified audit records that are present in the spillover operating system audit files, then load the contents of these files by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.

• If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `FALSE`:
  – If you set the `database_id` value for the cleanup operation, then this value is used while `CLEAN_AUDIT_TRAIL` cleans up the unified audit trail records that are present in database tables. However, the `database_id` value is not used for the cleanup of unified audit trail records that are present in spillover operating system files. If want the `database_id` value to be used in the `CLEAN_AUDIT_TRAIL` operation of unified audit records that are present in spillover operating system audit files, then load the contents of these files to the database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`. 
If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges all unified audit records irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside.

**Examples**

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
  DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    use_last_arch_timestamp => TRUE);
END;
```

### 27.7.3 CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the specified audit trail property.

Audit trail properties are set using the `SET_AUDIT_TRAIL_PROPERTY` Procedure.

The `CLEAR_AUDIT_TRAIL_PROPERTY` procedure can optionally reset the property value to it's default value through the `use_default_values` parameter.

**Syntax**

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    audit_trail_type        IN PLS_INTEGER,
    audit_trail_property    IN PLS_INTEGER,
    use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

**Parameters**

**Table 27-10**  CLEAR_AUDIT_TRAIL_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_type</code></td>
<td>The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 27-1</td>
</tr>
<tr>
<td><code>audit_trail_property</code></td>
<td>The audit trail property whose value needs to be cleared. You cannot clear the value for the <code>CLEANUP_INTERVAL</code> property. Audit trail properties are listed in Table 27-2</td>
</tr>
<tr>
<td><code>use_default_values</code></td>
<td>Specifies whether the default value of the <code>audit_trail_property</code> should be used in place of the cleared value. A value of <code>TRUE</code> causes the default value of the parameter to be used. A value of <code>FALSE</code> causes the <code>audit_trail_property</code> to have no value. The default value for this parameter is <code>FALSE</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the `OS_FILE_MAX_SIZE` property.
You can also use this procedure to reset an audit trail property to its default value. You need to set `use_default_values` to `TRUE` when invoking the procedure.

- The `DB_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `DB_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `DB_DELETE_BATCH_SIZE` is still assumed. This is because audit records are always deleted in batches.
- The `FILE_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `FILE_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `FILE_DELETE_BATCH_SIZE` is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the `CLEANUP_INTERVAL` property.
- You cannot clear the value for the `AUDIT_TRAIL_WRITE_MODE` property.

Examples

The following example calls the `CLEAR_AUDIT_TRAIL_PROPERTY` procedure to clear the value for the audit trail property, `OS_FILE_MAX_SIZE`. The procedure uses a value of `FALSE` for the `USE_DEFAULT_VALUES` parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```
BEGIN
    DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
        AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
        AUDIT_TRAIL_PROPERTY => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
        USE_DEFAULT_VALUES => FALSE );
END;
```

### 27.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure.

**Syntax**

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type IN PLS_INTEGER,
    rac_instance_number IN PLS_INTEGER DEFAULT NULL,
    container IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id IN NUMBER DEFAULT NULL,
    container_guid IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 27-1  CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 27-1.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases. You can find the instance number by issuing the SHOW PARAMETER INSTANCE_NUMBER command in SQL*Plus.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
</tbody>
</table>

Note: This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
  DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    rac_instance_number => 1);
END;
```

Related Topics

- SET_LAST_ARCHIVE_TIMESTAMP Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.
27.7.5 CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records. This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the CREATE_PURGE_JOB procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_purge_interval  IN PLS_INTEGER,
    audit_trail_purge_name      IN VARCHAR2,
    use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE,
    container                   IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 27-1.</td>
</tr>
<tr>
<td>audit_trail_purge_interval</td>
<td>The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.</td>
</tr>
<tr>
<td>audit_trail_purge_name</td>
<td>A name to identify the purge job.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.
Examples

The following example calls the CREATE_PURGE_JOB procedure to create a cleanup job called CLEANUP, for all audit trail types. It sets the audit_trail_purge_interval parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the use_last_arch_timestamp parameter value to TRUE. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
  DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type             =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    audit_trail_purge_interval   =>  100 /* hours */,
    audit_trail_purge_name       =>  'CLEANUP',
    use_last_arch_timestamp      =>  TRUE);
END;
```

27.7.6 DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the INIT_CLEANUP Procedure. The DEINIT_CLEANUP procedure clears the value of the default_cleanup_interval parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type  IN PLS_INTEGER,
    container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 27-1</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot invoke this procedure for AUDIT_TRAIL_UNIFIED. Doing so will raise ORA-46250: Invalid value for argument 'AUDIT_TRAIL_TYPE'

Examples

The following example clears the default_cleanup_interval parameter setting for the standard database audit trail:

```
BEGIN
  DBMS_AUDIT_MGMT.DEINIT_CLEANUP;
END;
```
Audit Trail Type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;

Related Topics

• INIT_CLEANUP Procedure
  This procedure sets up the audit management infrastructure and a default cleanup
  interval for the audit trail records.

27.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable
database (PDB).

Syntax

DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES(
    container_guid    IN VARCHAR2) ;

Parameters

Table 27-14  DROP_OLD_UNIFIED_AUDIT_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>Container GUID of the old unified audit tables</td>
</tr>
</tbody>
</table>

Usage Notes

When a pluggable database gets cloned, the unified audit tables get newly created in
the new pluggable database. To drop the old unified audit tables, use the
DROP_OLD_UNIFIED_AUDIT_TABLES by specifying the old GUID of the PDB from which
the clone was created. You can query the historical GUIDs from the DBA_PDB_HISTORY
view for the given PDB.

Examples

BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (           
        container_guid => 'E4721865A9321CB5E043EFA9E80A2D77');
END;

27.7.8 DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB
Procedure. The name of the purge job is passed as an argument.

Syntax

DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
    audit_trail_purge_name    IN VARCHAR2) ;
Parameters

Table 27-15  DROP_PURGE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATEPURGE_JOB Procedure.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

```sql
BEGIN
    DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
        AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');
END;
```

Related Topics

- CREATE_PURGE_JOB Procedure
  This procedure creates a purge job for periodically deleting the audit trail records.

27.7.9 FLUSH_UNIFIED_AUDIT_TRAIL Procedure

This deprecated procedure writes the unified audit trail records in the SGA queue to disk.

Note:

This procedure has been deprecated starting in Oracle Database 12c release 12.2.

Syntax

```sql
DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL (
    flush_type      IN BINARY_INTEGER   DEFAULT FLUSH_CURRENT_INSTANCE,
    container       IN BINARY_INTEGER   DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 27-16  FLUSH_UNIFIED_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_type</td>
<td>Takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>• FLUSH_CURRENT_INSTANCE - Flushes the audit records from SGA queues in that particular RAC instance</td>
</tr>
<tr>
<td></td>
<td>• FLUSH_ALL_INSTANCES - Flushes the audit records from SGA queues in all the RAC instances</td>
</tr>
</tbody>
</table>
Table 27-16  (Cont.) FLUSH_UNIFIED_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>The containers where the SGA queues should be flushed. It takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>· CONTAINER_CURRENT -Flushes the audit records from SGA queues in that particular PDB</td>
</tr>
<tr>
<td></td>
<td>· CONTAINER_ALL -Flushes the audit records from SGA queues in all the active PDBs.</td>
</tr>
</tbody>
</table>

27.7.10 GET_AUDIT_COMMIT_DELAY Function

This function returns the audit commit delay time as the number of seconds. Audit commit delay time is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
RETURN NUMBER;
```

27.7.11 GET_AUDIT_TRAIL_PROPERTY_VALUE Function

This procedure returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
    audit_trail_type IN PLS_INTEGER,
    audit_trail_property IN PLS_INTEGER)
RETURN NUMBER;
```

Parameters

Table 27-17  GET_AUDIT_TRAIL_PROPERTY_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 27-1.</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being queried. Audit trail properties are listed in Table 27-2.</td>
</tr>
</tbody>
</table>

Return Values

If the property value is cached in SGA memory, this function will return the value set by the SET_AUDIT_TRAIL_PROPERTY Procedure. Else it will return NULL.
The GET_AUDIT_TRAIL_PROPERTY_VALUE function may return an ORA-46250 error if the audit trail property value has been set to DBMS_AUDIT_MGMT.CLEAN_UP_INTERVAL. To find the cleanup interval of the purge job, query SYS.DAM_CLEANUP_JOBS.

Examples

The following example prints the property value of OS_FILE_MAX_AGE set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

SET_AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
  OS_MAX_AGE_VAL NUMBER;
BEGIN
  OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE);
  IF OS_MAX_AGE_VAL is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
      OS_MAX_AGE_VAL);
  END IF;
END;

Related Topics

• SET_AUDIT_TRAIL_PROPERTY Procedure
  This procedure sets an audit trail property for the audit trail type that is specified.

27.7.12 GET_LAST_ARCHIVE_TIMESTAMP Function

This procedure returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance.

Syntax

DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP (audit_trail_type IN PLS_INTEGER) RETURN TIMESTAMP;

Parameters

Table 27-18  GET_LAST_ARCHIVE_TIMESTAMP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 27-1.</td>
</tr>
</tbody>
</table>

Return Values

In a database that is opened for READ WRITE, since there will no timestamp stored in SGA memory, this function will return NULL. But in a database that is opened for READ ONLY, if a timestamp is set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure, the timestamp will be returned. Else it will return NULL.
Usage Notes

This function will return **NULL** on a database that is opened **READ WRITE**. Use `DBA_AUDIT_MGMT_LAST_ARCH_TS` view to check the timestamp set in such a case.

Examples

The following example prints the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure on a **READ ONLY** database.

```sql
SET SERVEROUTPUT ON
DECLARE
    LAT_TS TIMESTAMP;
BEGIN
    LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
        audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
    IF LAT_TS is not NULL THEN
        DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
    END IF;
END;
```

Related Topics

- **SET_LAST_ARCHIVE_TIMESTAMP** Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

27.7.13 **INIT_CLEANUP** Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

If the audit trail tables are in the **SYSTEM** tablespace, then the procedure moves them to the **SYSAUX** tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the **SYSAUX** tablespace by default. If you are not using unified auditing, refer to *Oracle Database Upgrade Guide* for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the **SYSTEM** tablespace enhances overall database performance. The **INIT_CLEANUP** procedure moves the audit trail tables to the **SYSAUX** tablespace. If the **SET_AUDIT_TRAIL_LOCATION** Procedure has already moved the audit tables elsewhere, then no tables are moved.

The **SET_AUDIT_TRAIL_LOCATION** Procedure enables you to specify an alternate target tablespace for the database audit tables.

The **INIT_CLEANUP** procedure is currently not relevant for the **AUDIT_TRAIL_OS**, **AUDIT_TRAIL_XML**, and **AUDIT_TRAIL_FILES** audit trail types. No preliminary set up is required for these audit trail types.

I See Also:

Table 27-1 for a list of all audit trail types
This procedure also sets a default cleanup interval for the audit trail records.

### Syntax

```sql
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type          IN PLS_INTEGER,
    default_cleanup_interval  IN PLS_INTEGER,
    container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_type</code></td>
<td>The audit trail type for which the clean up operation needs to be initialized.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 27-1 except <code>AUDIT_TRAIL_UNIFIED</code></td>
</tr>
<tr>
<td><code>default_cleanup_interval</code></td>
<td>The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.</td>
</tr>
<tr>
<td><code>container</code></td>
<td>Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all Open and Available pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code>, this initializes the audit trails for clean up in all the Open and Available pluggable databases, otherwise this initializes the audit trail in the connected PDB only. When you add a new PDB you need to initialize the audit trails for clean up in the new PDB using the <code>CONTAINER_CURRENT</code> option.</td>
</tr>
</tbody>
</table>

### Usage Notes

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the `SYSAUX` tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the `SYSAUX` tablespace for frequent write operations.
- You can change the `default_cleanup_interval` later using the `SET_AUDIT_TRAIL_PROPERTY` Procedure.
- If you do not wish to move the audit trail tables to the `SYSAUX` tablespace, then you should use the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure to move the audit trail tables to another tablespace before calling the `INIT_CLEANUP` procedure.
- Invoking this procedure with `AUDIT_TRAIL_UNIFIED` results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

### See Also:

"SET_AUDIT_TRAIL_LOCATION Procedure"
Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

BEGIN
  DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval => 12 /* hours */);
END;

See Also:

Table 27-1 for a list of all audit trail types

27.7.14 IS_CLEANUP_INITIALIZED Function

This function checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type.

The IS_CLEANUP_INITIALIZED function returns TRUE if the procedure has already been run for the audit trail type. It returns FALSE if the procedure has not been run for the audit trail type.

This function is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

See Also:

Table 27-1 for a list of all audit trail types

Syntax

DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
  audit_trail_type IN PLS_INTEGER
  container       IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
RETURN BOOLEAN;

Parameters

Table 27-20  IS_CLEANUP_INITIALIZED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the function needs to be called. Note that this does not apply to AUDIT_TRAIL_UNIFIED. Audit trail types are listed in Table 27-1</td>
</tr>
</tbody>
</table>
Table 27-20  (Cont.) IS_CLEANUP_INITIALIZED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
<tr>
<td></td>
<td>· When CONTAINER is set to CONTAINER_ALL, this function returns the initialization status of all the pluggable databases. The function returns FALSE even if one of the PDBs is not initialized.</td>
</tr>
<tr>
<td></td>
<td>· When CONTAINER is set to CONTAINER_CURRENT, this returns the initialization status of the connected PDB.</td>
</tr>
</tbody>
</table>

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```
BEGIN
  IF NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD) THEN
    DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval  => 12 /* hours */);
  END IF;
END;
```

Related Topics

- **INIT_CLEANUP Procedure**
  This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

27.7.15 LOAD_UNIFIED_AUDIT_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

See Also:

*Oracle Database Security Guide* for information about moving the OS audit trail records into the unified audit trail

Syntax

```
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES (
  container IN BINARY_INTEGER);
```
Parameters

Table 27-21  LOAD_UNIFIED_AUDIT_FILES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_CURRENT - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in only current PDB</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_ALL - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in the respective PDBs, but for all the active PDBs</td>
</tr>
</tbody>
</table>

27.7.16 SET_AUDIT_TRAIL_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET_AUDIT_TRAIL_LOCATION procedure is not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The AUDIT_FILE_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

See Also:

- Table 27-1 for a list of all audit trail types
- AUDIT_FILE_DEST in the Oracle Database Reference

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type        IN PLS_INTEGER,
    audit_trail_location_value  IN VARCHAR2);
```

Parameters

Table 27-22  SET_AUDIT_TRAIL_LOCATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the audit trail location needs to be set.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 27-1</td>
</tr>
<tr>
<td>audit_trail_location_value</td>
<td>Target location or tablespace for the audit trail records</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply:

- By default, audit trail records are written to the SYSAUX tablespace. You can change the tablespace location to a user tablespace using this procedure. However, the designated tablespace must be an automatic storage space management (ASSM) tablespace.

- This procedure is valid for the following `audit_trail_type` values:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`
  - `AUDIT_TRAIL_UNIFIED`

- For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, you should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.

- This procedure involves data movement across tablespaces. For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, this can be a resource-intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.

- You optionally can specify an encrypted tablespace for the audit trail location.

- When `AUDIT_TRAIL_TYPE` is `AUDIT_TRAIL_UNIFIED`, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource-intensive for the unified audit trail.

- The `UNIFIED_AUDIT_TRAIL` data dictionary view is built on top of an internal relational table. This table is an interval partitioned table (irrespective of database editions) with a default interval of 1 month. This setting means that when you execute the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure, only newly created partitions of the internal table are created in the new tablespace that is set as part of this procedure. Existing partitions of this table remain in the earlier tablespace (SYSAUX is the default tablespace for this internal table). If you want to change this table's partition interval, then use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure.

Examples

The following example moves the database audit trail tables, `AUD$` and `FGA_LOG$`, from the current tablespace to a user-created tablespace called `RECORDS`:

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value => 'RECORDS');
END;
```

27.7.17 SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets the properties `OS_FILE_MAX_SIZE`, `OS_FILE_MAX_AGE`, and `FILE_DELETE_BATCH_SIZE` for operating system (OS) and XML audit trail types. The
OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE_DELETE_BATCH_SIZE property specifies the number of audit trail files that are deleted in one batch.

The procedure sets the properties DB_DELETE_BATCH_SIZE and CLEANUP_INTERVAL for the database audit trail type. DB_DELETE_BATCH_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_property        IN PLS_INTEGER,
    audit_trail_property_value  IN PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the property needs to be set. Audit trail types are listed in Table 27-1</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being set. Audit trail properties are listed in Table 27-2</td>
</tr>
</tbody>
</table>
Table 27-23  (Cont.) SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_property_value</td>
<td>The value of the property specified using audit_trail_property. The following are valid values for audit trail properties:</td>
</tr>
<tr>
<td></td>
<td>• OS_FILE_MAX_SIZE can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. OS_FILE_MAX_SIZE is measured in kilobytes (KB).</td>
</tr>
<tr>
<td></td>
<td>• OS_FILE_MAX_AGE can have a minimum value of 1 and a maximum value of 497. The default value is 5. OS_FILE_MAX_AGE is measured in days.</td>
</tr>
<tr>
<td></td>
<td>• DB_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. DB_DELETE_BATCH_SIZE is measured as the number of audit records that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>• FILE_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. FILE_DELETE_BATCH_SIZE is measured as the number of audit files that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>• CLEANUP_INTERVAL can have a minimum value of 1 and a maximum value of 999. The default value is set using the INIT_CLEANUP Procedure. CLEANUP_INTERVAL is measured in hours.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

• The audit trail properties for which you do not explicitly set values use their default values.

• If you have set both the OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

For example, let us take a scenario where OS_FILE_MAX_SIZE is 10000 and OS_FILE_MAX_AGE is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.

• The DB_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.

• The DB_DELETE_BATCH_SIZE property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
The `FILE_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.

The `FILE_DELETE_BATCH_SIZE` property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the `GEN0` background process for a long time.

In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is `SYSaux`. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

### Examples

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_SIZE` property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
        audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
        audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
        audit_trail_property_value  =>  102400 /* 100MB*/);
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_AGE` property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
        audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
        audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
        audit_trail_property_value  =>  5 /* days */);
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `DB_DELETE_BATCH_SIZE` property for the `AUDIT_TRAIL_AUD_STD` audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the `SYS.AUD$` table in batches of size 100000.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
        audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
        audit_trail_property        =>  DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
        audit_trail_property_value  =>  100000 /* delete batch size */);
END;
```

### 27.7.18 SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

The `CLEAN_AUDIT_TRAIL` Procedure uses this timestamp to decide on the audit records to be deleted.
Syntax

DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type IN PLS_INTEGER,
    last_archive_time IN TIMESTAMP,
    rac_instance_number IN PLS_INTEGER DEFAULT NULL,
    container IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id IN NUMBER DEFAULT NULL,
    container_guid IN VARCHAR2 DEFAULT NULL);

Parameters

Table 27-24  SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 27-1.</td>
</tr>
<tr>
<td>last_archive_time</td>
<td>The TIMESTAMP value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number parameter is not accepted when AUDIT_TRAIL_TYPE has values:</td>
</tr>
<tr>
<td></td>
<td>· audit_trail_all</td>
</tr>
<tr>
<td></td>
<td>· audit_trail_aud_std</td>
</tr>
<tr>
<td></td>
<td>· audit_trail_db_std</td>
</tr>
<tr>
<td></td>
<td>· audit_trail_fga_std</td>
</tr>
<tr>
<td></td>
<td>· audit_trail_unified</td>
</tr>
<tr>
<td>Set rac_instance_number to 1 for a single-instance database.</td>
<td></td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
<tr>
<td>Note: This parameter has been deprecated but is currently retained for backward compatibility.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- The last_archive_time must be specified in Coordinated Universal Time (UTC) when the audit trail types are AUDIT_TRAIL_AUD_STD, AUDIT_TRAIL_FGA_STD, or AUDIT_TRAIL_UNIFIED. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The last_archive_time must be specified as the local time zone time when the audit trail types are AUDIT_TRAIL_OS or AUDIT_TRAIL_XML. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification.
Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the `CLEAN_AUDIT_TRAIL` Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2012 14:10:10.0.

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type     => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    last_archive_time    => TO_TIMESTAMP('12-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
    rac_instance_number  => 1);
END;
```

27.7.19 SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the `CLEAN_AUDIT_TRAIL` Procedure is called for the purge job specified.

The purge job must have already been created using the `CREATE_PURGE_JOB` Procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  audit_trail_purge_name      IN VARCHAR2,
  audit_trail_interval_value  IN PLS_INTEGER) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the interval is being set. This is the purge job name that you specified with the <code>CREATE_PURGE_JOB</code> Procedure.</td>
</tr>
<tr>
<td>audit_trail_interval_value</td>
<td>The interval, in hours, at which the clean up procedure should be called. This value modifies the <code>audit_trail_purge_interval</code> parameter set using the <code>CREATE_PURGE_JOB</code> Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to modify the `audit_trail_purge_interval` parameter set using the `CREATE_PURGE_JOB` Procedure.
Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```
BEGIN
  DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
    AUDIT_TRAIL_PURGE_NAME       => 'CLEANUP',
    AUDIT_TRAIL_INTERVAL_VALUE   => 24 );
END;
```

Related Topics

- CLEAN_AUDIT_TRAIL Procedure
  This procedure deletes audit trail records.

27.7.20 SET_PURGE_JOB_STATUS Procedure

This procedure enables or disables the specified purge job.

The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
  audit_trail_purge_name    IN VARCHAR2,
  audit_trail_status_value  IN PLS_INTEGER) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the status is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
<tr>
<td>audit_trail_status_value</td>
<td>One of the values specified in Table 27-3. The value PURGE_JOB_ENABLE enables the specified purge job. The value PURGE_JOB_DISABLE disables the specified purge job.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the SET_PURGE_JOB_STATUS procedure to enable the CLEANUP purge job.

```
BEGIN
  DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
    audit_trail_purge_name => 'CLEANUP',
    audit_trail_status_value => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
```
27.7.21 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure

This procedure transfers unified audit records that were in a pre-upgraded Oracle database to an internal relational table that is designed to improve read performance.

In the pre-upgraded Oracle database, these records resided in the common logging infrastructure (CLI) SGA back-end tables.

Syntax

```
DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS (
    container_guid       IN VARCHAR2   DEFAULT NULL);
```

Parameters

**Table 27-27 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>The GUID of the container of the associated CLI back-end table. This back-end table contains the audit records from the pre-upgraded Oracle database. If you omit this setting, then the GUID of the current container is used.</td>
</tr>
</tbody>
</table>

Usage Notes

- It is not mandatory to run `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` after an upgrade, but for better read performance of the unified audit trail, Oracle highly recommends that you run this procedure.
- The `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` is designed to be a one-time operation, to be performed after you upgrade from Oracle Database 12c release 12.1.
- There is one CLI back-end table per GUID of the container. You can find the GUIDs for containers by querying the `PDB_GUID` column of the `DBA_PDB_HISTORY` data dictionary view. Execute the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure by passing each of these GUIDs one by one to ensure that you move the unified audit records from these CLI back-end tables to the `AUDSYS.AUD$UNIFIED` table.
- In a multitenant environment, you must run the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure only in the container to which the transfer operation applies, whether it is the root or an individual PDB. You cannot run this procedure in the root, for example, to transfer audit records in a PDB.
- If you have a high rate of audit record generation and your database supports partitioning, then you may want to use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure to alter the partition interval setting for the internal relational table. See `ALTER_PARTITION_INTERVAL Procedure` for more information.
The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.

This chapter contains the following topics:

- DBMS_AUDIT_UTIL Overview
- DBMS_AUDIT_UTIL Security Model
- DBMS_AUDIT_UTIL Views
- Summary of DBMS_AUDIT_UTIL Subprograms

### 28.1 DBMS_AUDIT_UTIL Overview

The functions in the DBMS_AUDIT_UTIL package enable you to format the output of queries to the RLS_INFO column of several audit trail views so that the output appear in separate rows.

These functions use a cursor to find and format each row of the corresponding view. To use the functions in this package, include the function in a query to one of the following views:

- DBA_FGA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_FGA function
- DBA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_STD function
- UNIFIED_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_UNI function
- V$XML_AUDIT_TRAIL dynamic view, for the DECODE_RLS_INFO_ATRAIL_XML function

### 28.2 DBMS_AUDIT_UTIL Security Model

All DBMS_AUDIT_UTIL subprograms require the user to have EXECUTE privilege on the DBMS_AUDIT_UTIL package.

The SYSDBA administrative privilege and AUDIT_ADMIN and AUDIT_VIEWER roles have the EXECUTE privilege on the DBMS_AUDIT_UTIL package by default. An auditor can view audit data after being granted the AUDIT_VIEWER role.

Oracle strongly recommends that only audit administrators have the EXECUTE privilege on the DBMS_AUDIT_UTIL package and be granted the AUDIT_VIEWER role.

### 28.3 DBMS_AUDIT_UTIL Views

The views in this section display the audit information used by the DBMS_AUDIT_UTIL package function.

Table 28-1 displays the DBMS_AUDIT_UTIL views.
### 28.4 Summary of DBMS_AUDIT_UTIL Subprograms

This table lists the DBMS_AUDIT_UTIL subprograms and their descriptions.

#### Table 28-2 DBMS_AUDIT_UTIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_FGA Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_STD Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the DBA_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_UNI Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the UNIFIED_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_XML Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the V$XML_AUDIT_TRAIL dynamic view</td>
</tr>
</tbody>
</table>

### 28.4.1 DECODE_RLS_INFO_ATRAIL_FGA Function

This function reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple fine-grained audit policies in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

*See Also:*  
Oracle Database Security Guide regarding fine-grained auditing
Syntax

```
DECODE_RLS_INFO_ATRAIL_FGA(
    IN_CURSOR      REF CURSOR               IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_FGA` function are the same as the columns in the `DBA_FGA_AUDIT_TRAIL` data dictionary view. See `Oracle Database Reference` for more information about this view.

Usage Notes

- To use this function, include it in a query to the `DBA_FGA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See `Oracle Database Reference` for more information about the `DBA_FGA_AUDIT_TRAIL` data dictionary view.

Example

```
SELECT DB_USER, OBJECT_NAME, SQL_TEXT,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA(
            CURSOR (SELECT * FROM DBA_FGA_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `DBA_FGA_AUDIT_TRAIL.RLS_INFO` column.

### 28.4.2 DECODE_RLS_INFO_ATRAIL_STD Function

This function reformats the output for queries to the `RLS_INFO` column of the `DBA_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple standard audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

See Also:

- `Oracle Database Security Guide` regarding auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_STD(
    IN_CURSOR      REF CURSOR               IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_STD` function are the same as the columns in the `DBA_AUDIT_TRAIL` data dictionary view. See `Oracle Database Reference` for more information about this view.
Usage Notes

- To use this function, include it in a query to the `DBA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See `Oracle Database Reference` for more information about the `DBA_AUDIT_TRAIL` data dictionary view.

Example

```sql
SELECT USERNAME, USERHOST, ACTION, OBJ_NAME, OBJ_PRIVILEGE,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD
            (CURSOR (SELECT * FROM DBA_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `DBA_AUDIT_TRAIL.RLS_INFO` column

28.4.3 DECODE_RLS_INFO_ATRAIL_UNI Function

This function reformats the output for queries to the `RLS_INFO` column of the `UNIFIED_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple audit records from unified audit policies. It returns the output in separate rows.

See Also:

- Oracle Database Security Guide regarding unified auditing

Syntax

```sql
DECODE_RLS_INFO_ATRAIL_UNI(
    IN_CURSOR                  REF CURSOR               IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_UNI` function are the same as the columns in the `UNIFIED_AUDIT_TRAIL` data dictionary view. See `Oracle Database Reference` for more information about this view.

Usage Notes

- To use this function, include it in a query to the `UNIFIED_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See `Oracle Database Reference` for more information about the `UNIFIED_AUDIT_TRAIL` data dictionary view.
Example

SELECT DBUSERNAME, ACTION_NAME, OBJECT_NAME, SQL_TEXT,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI
          (CURSOR (SELECT * FROM UNIFIED_AUDIT_TRAIL)));

Return Values

A piped row with decoded values of UNIFIED_AUDIT_TRAIL.RLS_INFO column

28.4.4 DECODE_RLS_INFO_ATRAIL_XML Function

This function reformats the output for queries to the RLS_INFO column of the V$XML_AUDIT_TRAIL dynamic view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple XML audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

See Also:

Oracle Database Security Guide regarding auditing

Syntax

DECODE_RLS_INFO_ATRAIL_XML(
   IN_CURSOR                  REF CURSOR               IN)
RETURN PIPELINED ROW;

Parameters

Except for the IN_CURSOR parameter, the parameters for the DECODE_RLS_INFO_ATRAIL_XML function are the same as the columns in the V$XML_AUDIT_TRAIL data dictionary view. See Oracle Database Reference for more information about this view.

Usage Notes

• To use this function, include it in a query to the V$XML_AUDIT_TRAIL dynamic view, using a cursor similar to the example shown in the following section.
• See Oracle Database Reference for more information about the V$XML_AUDIT_TRAIL dynamic view.

Example

SELECT OBJECT_NAME, SQL_TEXT
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML
          (CURSOR (SELECT * FROM V$XML_AUDIT_TRAIL)));

Return Values

A piped row with decoded values of V$XML_AUDIT_TRAIL.RLS_INFO column
The **DBMS_AUTO_SQLTUNE** package is the interface for managing the Automatic SQL Tuning task. Unlike **DBMS_SQLTUNE**, the **DBMS_AUTO_SQLTUNE** package requires the DBA role.

The chapter contains the following topics:

- **DBMS_AUTO_SQLTUNE Overview**
- **DBMS_AUTO_SQLTUNE Security Model**
- **Summary of DBMS_AUTO_SQLTUNE Subprograms**

### 29.1 DBMS_AUTO_SQLTUNE Overview

The **DBMS_AUTO_SQLTUNE** package is the interface to SQL Tuning Advisor (**DBMS_SQLTUNE**) when run within the AutoTask framework.

The database creates the automated system task **SYS_AUTO_SQL_TUNING_TASK** as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the **SET_AUTO_TUNING_TASK_PARAMETER** API to set the **ACCEPT_SQL_PROFILES** parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the **DBA_ADVISOR_EXECUTIONS** view for information about task executions. To view reports that span multiple executions, use the **REPORT_AUTO_TUNING_TASK** Function.

### 29.2 DBMS_AUTO_SQLTUNE Security Model

This package is available to users with the DBA role. For other users, you must grant the **EXECUTE** privilege on the package explicitly. Note that the **EXECUTE_AUTO_TUNING_TASK** procedure is an exception: only **SYS** can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the **ADVISOR** privilege to have access to this package.

### 29.3 Summary of DBMS_AUTO_SQLTUNE Subprograms

The **DBMS_AUTO_SQLTUNE** package contains **EXECUTE**, **REPORT**, and **SET** subprograms.
### Table 29-1  DBMS_AUTO_SQLTUNE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE_AUTO_TUNING_TASK Function and Procedure</td>
<td>Executes the Automatic SQL Tuning task immediately (SYS only)</td>
</tr>
<tr>
<td>REPORT_AUTO_TUNING_TASK Function</td>
<td>Displays a text report of the automatic tuning task's history</td>
</tr>
<tr>
<td>SET_AUTO_TUNING_TASK_PARAMETER Procedures</td>
<td>Changes a task parameter value for the daily automatic runs</td>
</tr>
</tbody>
</table>

#### 29.3.1 EXECUTE_AUTO_TUNING_TASK Function and Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS_AUTO_SQL_TUNING_TASK).

Both the function and the procedure run in the context of a new task execution. The difference is that the function returns the name of the new execution.

**Syntax**

```sql
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN DBMS_ADVISOR.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;

DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN DBMS_ADVISOR.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL);
```

**Parameters**

**Table 29-2  EXECUTE_AUTO_TUNING_TASK Function and Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>
Usage Notes

Only SYS can invoke this subprogram. A tuning task can be executed multiple times without having to reset it.

Examples

EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK('SYS_AUTO_SQL_TUNING_TASK');

29.3.2 REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec    IN   VARCHAR2   := NULL,
    end_exec      IN   VARCHAR2   := NULL,
    type          IN   VARCHAR2   := 'TEXT',
    level         IN   VARCHAR2   := 'TYPICAL',
    section       IN   VARCHAR2   := ALL,
    object_id     IN   NUMBER     := NULL,
    result_limit  IN   NUMBER     := NULL)
RETURN CLOB;

Parameters

Table 29-3  REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of the beginning task execution to use. If NULL, the report is</td>
</tr>
<tr>
<td></td>
<td>generated for the most recent task execution.</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of the ending task execution to use. If NULL, the report is</td>
</tr>
<tr>
<td></td>
<td>generated for the most recent task execution.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a</td>
</tr>
<tr>
<td></td>
<td>text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: simple version of the report. Just show info about the actions</td>
</tr>
<tr>
<td></td>
<td>taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: show information about every statement analyzed, including</td>
</tr>
<tr>
<td></td>
<td>requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>• ALL: highly detailed report level, also provides annotations about</td>
</tr>
<tr>
<td></td>
<td>statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Section of the report to include:</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY: summary information</td>
</tr>
<tr>
<td></td>
<td>• FINDINGS: tuning findings</td>
</tr>
<tr>
<td></td>
<td>• PLAN: explain plans</td>
</tr>
<tr>
<td></td>
<td>• INFORMATION: general information</td>
</tr>
<tr>
<td></td>
<td>• ERROR: statements with errors</td>
</tr>
<tr>
<td></td>
<td>• ALL: all sections</td>
</tr>
</tbody>
</table>
Table 29-3  (Cont.) REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.

Examples

-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
   'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
   'TYPICAL', 'FINDINGS', 5)
FROM DUAL;

29.3.3 SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER for SYS_AUTO_SQL_TUNING_TASK.

Syntax

```sql
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```
### Parameters

**Table 29-4  SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</td>
</tr>
<tr>
<td></td>
<td>• MODE: tuning scope (comprehensive, limited)</td>
</tr>
<tr>
<td></td>
<td>• USERNAME: user name under which the statement is parsed</td>
</tr>
<tr>
<td></td>
<td>• DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>• EXECUTION_DAYS_TO_EXPIRE: number of days until the task execution is deleted</td>
</tr>
<tr>
<td></td>
<td>• DEFAULT_EXECUTION_TYPE: default execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function and Procedure</td>
</tr>
<tr>
<td></td>
<td>• TIME_LIMIT: global timeout in seconds</td>
</tr>
<tr>
<td></td>
<td>• LOCAL_TIME_LIMIT: per-statement timeout in seconds</td>
</tr>
<tr>
<td></td>
<td>• TEST_EXECUTE:</td>
</tr>
<tr>
<td></td>
<td>• FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
</tr>
<tr>
<td></td>
<td>• AUTO - test-execute for an automatically chosen time proportional to the tuning time</td>
</tr>
<tr>
<td></td>
<td>• OFF - do not test-execute</td>
</tr>
<tr>
<td></td>
<td>• BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_FILTER: object filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE1: first ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE2: second ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE3: third ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RESUME_FILTER: extra filter for SQL tuning sets besides BASIC_FILTER</td>
</tr>
<tr>
<td></td>
<td>• SQL_LIMIT: maximum number of SQL statements to tune</td>
</tr>
<tr>
<td></td>
<td>• SQL_PERCENTAGE: percentage filter of SQL tuning set statements</td>
</tr>
<tr>
<td>The following parameters are supported for the automatic tuning task only:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ACCEPT_SQL_PROFILES: whether the task should accept SQL profiles automatically (TRUE or FALSE)</td>
</tr>
<tr>
<td></td>
<td>• MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum</td>
</tr>
<tr>
<td></td>
<td>• MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.</td>
</tr>
<tr>
<td>value</td>
<td>New value of the specified parameter</td>
</tr>
</tbody>
</table>
The **DBMS_AUTO_INDEX** package provides the interface for managing auto indexes in an Oracle database.

This chapter contains the following topics:

- **DBMS_AUTO_INDEX Overview**
- **Summary of DBMS_AUTO_INDEX Subprograms**

### 30.1 DBMS_AUTO_INDEX Overview

The **DBMS_AUTO_INDEX** package is the interface for configuring auto indexes and generating reports of auto indexing operations in an Oracle database.

### 30.2 Summary of DBMS_AUTO_INDEX Subprograms

This table lists the **DBMS_AUTO_INDEX** package subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CONFIGURE Procedure</strong></td>
<td>Configures settings related to automatic indexing.</td>
</tr>
<tr>
<td><strong>DROP_AUTO_INDEXES Procedure</strong></td>
<td>This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting.</td>
</tr>
<tr>
<td><strong>DROP_SECONDARY_INDEXES Procedure</strong></td>
<td>Deletes all the indexes, except the ones used for constraints, from a schema or a table.</td>
</tr>
<tr>
<td><strong>REPORT_ACTIVITY Function</strong></td>
<td>Returns a report of the automatic indexing operations executed during a specific period in a database.</td>
</tr>
<tr>
<td><strong>REPORT_LAST_ACTIVITY Function</strong></td>
<td>Returns a report of the last automatic indexing operation executed in a database.</td>
</tr>
</tbody>
</table>

### 30.2.1 CONFIGURE Procedure

This procedure configures settings related to automatic indexing.

**Syntax**

```sql
DBMS_AUTO_INDEX.CONFIGURE (
    parameter_name IN VARCHAR2,
    parameter_value IN VARCHAR2,
    allow IN BOOLEAN DEFAULT TRUE);
```
Table 30-2  CONFIGURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_name</td>
<td>Automatic indexing configuration setting. It can have one of the following values:</td>
</tr>
<tr>
<td>AUTO_INDEX_MODE</td>
<td>Modes of operation of auto indexes. It can have one of the following values:</td>
</tr>
<tr>
<td>IMPLEMENT</td>
<td>In this mode, new auto indexes are created as visible indexes and any existing invisible auto indexes are also set to visible indexes. In this mode, auto indexes are available to be used in SQL statements.</td>
</tr>
<tr>
<td>REPORT ONLY</td>
<td>In this mode, new auto indexes are created as invisible indexes and are not available to be used in SQL statements.</td>
</tr>
<tr>
<td>OFF</td>
<td>Setting the mode to OFF prevents new auto indexes from being considered and created. However, it does not disable existing auto indexes.</td>
</tr>
<tr>
<td>AUTO_INDEX_SCHEMA</td>
<td>Schemas to include or exclude from using auto indexes. Its value is case-sensitive and can include wildcards. Its behavior is controlled by the allow parameter.</td>
</tr>
<tr>
<td>AUTO_INDEX_RETENTION_FOR_AUTO</td>
<td>Number of days for which the unused auto</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>indexes are retained in the database, after which they are deleted. Default value is 373 days.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• AUTO_INDEX_RETENTION_FOR_MANUAL: Number of days for which the unused manually created indexes (non-auto indexes) are retained in the database, after which they are deleted. When it is set to NULL, the manually created indexes are not deleted by the automatic indexing process. Default value is NULL.</td>
</tr>
<tr>
<td></td>
<td>• AUTO_INDEX_REPORT_RETENTION: Number of days for which automatic indexing logs are retained in the database before they are deleted. As automatic indexing report is generated based on these logs, automatic indexing report cannot be generated for a period beyond the value specified for AUTO_INDEX_REPORT_RETENTION. Default value is 31 days.</td>
</tr>
<tr>
<td></td>
<td>• AUTO_INDEX_DEFAULT_TABLESPACE: Tablespace to use to store auto indexes. Default is NULL, which means the default permanent tablespace specified during the database creation is used to store auto indexes.</td>
</tr>
<tr>
<td></td>
<td>• AUTO_INDEX_SPACE_BUDGET: Percentage of tablespace size to use for auto indexes. This configuration setting can be used only when the default tablespace specified during the database creation is used for storing auto indexes.</td>
</tr>
<tr>
<td></td>
<td>• AUTO_INDEX_COMPRESSION: Values to enable and disable advanced index compression for auto indexes. The supported values are: – ON: to enable advanced index compression for auto indexes – OFF: to disable advanced index compression for auto indexes The default value is OFF.</td>
</tr>
</tbody>
</table>

**parameter_value**

Value for the configuration setting specified in **parameter_name**.

When it is set to NULL, the configuration setting is assigned the default value.
Table 30-2  (Cont.) CONFIGURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| allow     | This parameter is applicable only for the AUTO_INDEX_SCHEMA configuration setting and it can have one of the following values:  
  - TRUE: Add the specified schema to the inclusion list.  
  - FALSE: Add the specified schema to the exclusion list.  
  - NULL: Remove the specified schema from the list to which it is currently added.  
  Refer to the description of the AUTO_INDEX_SCHEMA configuration setting for more information about the inclusion list and the exclusion list. |

Examples

These examples are based on the assumption that the inclusion list and the exclusion list are initially empty.

The following example adds the SH and HR schemas to the exclusion list, so that only the SH and HR schemas cannot use auto indexes.

begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'SH',
    allow => FALSE);

  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow => FALSE);
end;

The following example removes the HR schema from the exclusion list, so that it can also use auto indexes. Now, only the SH schema cannot use auto indexes, because it is the only schema added to the exclusion list.

begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow => NULL);
end;

The following example removes all the schemas from the exclusion list, so that all the schemas can use auto indexes.

begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => NULL,
    allow => TRUE);
end;
The following example adds the HR schema to the inclusion list, so that only the HR schema can use auto indexes.

```
BEGIN
  DBMS_AUTO_INDEX.configure(
    parameter_name  => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow           => TRUE);
END;
```

The following example sets the retention period for auto indexes to 90 days.

```
BEGIN
  DBMS_AUTO_INDEX.configure(
    parameter_name  => 'AUTO_INDEX_RETENTION_FOR_AUTO',
    parameter_value => '90');
END;
```

The following example sets the retention period for auto indexes to the default value of 373 days.

```
BEGIN
  DBMS_AUTO_INDEX.configure(
    parameter_name  => 'AUTO_INDEX_RETENTION_FOR_AUTO',
    parameter_value => NULL);
END;
```

### 30.2.2 DROP_AUTO_INDEXES Procedure

This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting.

**Syntax**

```sql
DBMS_AUTO_INDEX.DROP_AUTO_INDEXES (
  owner           IN  VARCHAR2 DEFAULT NULL,
  index_name      IN  VARCHAR2 DEFAULT NULL,
  allow_recreate  IN  BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The name of the index owner.</td>
</tr>
<tr>
<td>index_name</td>
<td>The name of the index.</td>
</tr>
<tr>
<td>allow_recreate</td>
<td>Set this parameter to allow or disallow automatic creation of the dropped index again.</td>
</tr>
</tbody>
</table>

**Examples**

Drop a single index and allow recreate:

```sql
EXEC DBMS_AUTO_INDEX.drop_auto_indexes('SH','"SYS_AI_612ud3j5ngf0c"',TRUE);
```

Drop all indexes owned by SH and allow recreate:

```sql
EXEC DBMS_AUTO_INDEX.drop_auto_indexes(NULL,NULL,TRUE);
```
exec dbms_auto_index.drop_auto_indexes('SH',NULL,TRUE);

Drop all indexes owned by HR, disallowing recreate and then change the recreation status back to allow:
exec dbms_auto_index.drop_auto_indexes('HR',NULL);
exec dbms_auto_index.drop_auto_indexes('HR', NULL, TRUE);

Usage Notes
- If the values of the parameters owner and index_name are explicitly set to NULL, all auto indexes which the user has privileges on will be dropped.
- If owner is explicitly specified and index_name is set to NULL, all auto indexes within the given schema will be dropped. The dropped indexes are not recreated automatically by the system by default. Set allow_recreate parameter to TRUE to change this behavior.
- This procedure updates the allow_recreate status associated with the dropped indexes from FALSE to TRUE and vice-versa.

30.2.3 DROP_SECONDARY_INDEXES Procedure

This procedure deletes all the indexes, except the ones used for constraints, from a schema or a table.

Syntax

```
DBMS_AUTO_INDEX.DROP_SECONDARY_INDEXES (  
    ownname    IN  VARCHAR2 DEFAULT NULL,  
    tabname    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 30-4  DROP_SECONDARY_INDEXES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ownname   | (Optional) Name of the schema from which all the indexes need to be deleted.  
            | **Note:** The indexes used for constraints are not deleted. |
| tabname   | (Optional) Name of the table from which all the indexes need to be deleted.  
            | **Note:** The indexes used for constraints are not deleted. |

Examples

The following example deletes all the indexes, except the ones used for constraints, from the SH schema.

```
begin  
    dbms_auto_index.drop_secondary_indexes('SH');  
end;
```
The following example deletes all the indexes, except the ones used for constraints, from the EMP table in the HR schema.

```
begin
    dbms_auto_index.drop_secondary_indexes('HR', 'EMP');
end;
```

The following example deletes all the indexes, except the ones used for constraints, for which the user has the delete privileges from all the schemas in a database.

```
begin
    dbms_auto_index.drop_secondary_indexes;
end;
```

### 30.2.4 REPORT_ACTIVITY Function

This function returns a report of the automatic indexing operations executed during a specific period in a database.

**Syntax**

```
DBMS_AUTO_INDEX.REPORT_ACTIVITY (
    activity_start  IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP - 1,
    activity_end    IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP,
    type            IN  VARCHAR2 DEFAULT 'TEXT',
    section         IN  VARCHAR2 DEFAULT 'ALL',
    level           IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>Time starting from which the executed automatic indexing operations are considered for the report. If NULL is specified, the last executed automatic indexing operation is considered for the report. If no value is specified for this parameter, then the current time minus one day (24 hours) is considered at the start time.</td>
</tr>
<tr>
<td>end_time</td>
<td>Time till which the executed automatic indexing operations are considered for the report. If no value is specified, then the current time is considered as the end time.</td>
</tr>
<tr>
<td>type</td>
<td>Format of the report. It can have one of the following values: TEXT, HTML, XML. The default value is TEXT.</td>
</tr>
</tbody>
</table>

---

**Table 30-5  REPORT_ACTIVITY Function Parameters**

**start_time**: Time starting from which the executed automatic indexing operations are considered for the report. If NULL is specified, the last executed automatic indexing operation is considered for the report. If no value is specified for this parameter, then the current time minus one day (24 hours) is considered at the start time.

**end_time**: Time till which the executed automatic indexing operations are considered for the report. If no value is specified, then the current time is considered as the end time.

**type**: Format of the report. It can have one of the following values: TEXT, HTML, XML. The default value is TEXT.

<tr>
<td>section</td>
<td>Sections to include in the report. It can have a combination of the following values:</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY: Include only the summary details section in the report.</td>
</tr>
<tr>
<td></td>
<td>• INDEX_DETAILS: Include only the auto index details section in the report.</td>
</tr>
<tr>
<td></td>
<td>• VERIFICATION_DETAILS: Include only the auto index verification details section in the report.</td>
</tr>
<tr>
<td></td>
<td>• ERRORS: Include only the error details section in the report.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Include all the sections (summary details, auto index details, auto index verification details, and error details) in the report. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>A combination of these values can be specified using the + or – operators as shown in the following examples:</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY +INDEX_DETAILS +ERRORS: Include summary details, auto index details, and error details sections in the report.</td>
</tr>
<tr>
<td></td>
<td>• ALL –ERRORS: Include all the sections in the report, except the error details section.</td>
</tr>
<tr>
<td>level</td>
<td>Level of automatic indexing information to include in the report. It can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Include basic automatic indexing information in the report.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: Include typical automatic indexing information in the report. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• ALL: Include all the automatic indexing information in the report.</td>
</tr>
</tbody>
</table>

Return Value

A report of the automatic indexing operations executed during the specified period in a database.

Examples

The following example generates a typical report of the automatic indexing operations executed in the last 24 hours. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```sql
declare
  report clob := null;
begin
  report := dbms_auto_index.report_activity();
end;
```
30.2.5 REPORT_LAST_ACTIVITY Function

This function returns a report of the last automatic indexing operation executed in a database.

Syntax

```sql
DBMS_AUTO_INDEX.REPORT_LAST_ACTIVITY (
    type            IN  VARCHAR2 DEFAULT 'TEXT',
    section         IN  VARCHAR2 DEFAULT 'ALL',
    level           IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

**Table 30-6  REPORT_LAST_ACTIVITY Function Parameters**

<table>
<thead>
<tr>

</tbody>
</table>

Return Value

A report of the last automatic indexing operation executed in a database.

Examples

The following example generates a typical report of the last automatic indexing operation executed in a database. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```
declare
    report clob := null;
begin
    report := dbms_auto_index.report_last_activity();
end;
```
The `DBMS_AUTO_REPORT` package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

**See Also:**

`Oracle Database SQL Tuning Guide` for more information about reporting database operations.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of `DBMS_AUTO_REPORT` Subprograms

### 31.1 DBMS_AUTO_REPORT Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR. Captured data are stored in AWR and exposed via 2 views: `DBA_HIST_REPORTS` and `DBA_HIST_REPORTS_DETAILS`.

### 31.2 DBMS_AUTO_REPORT Security Model

This package is available to `PUBLIC` and performs its own security checking.

### 31.3 Summary of DBMS_AUTO_REPORT Subprograms

This table describes the parameters of the `DBMS_AUTO_REPORT` package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FINISH_REPORT_CAPTURE</code> Procedure</td>
<td>Ends the complete capture of SQL monitor data that was started with the <code>START_REPORT_CAPTURE</code> Procedure.</td>
</tr>
<tr>
<td><code>REPORT_REPOSITORYDETAIL</code> Function</td>
<td>Obtains the stored report for a given report ID</td>
</tr>
<tr>
<td><code>REPORT_REPOSITORYDETAIL_XML</code> Function</td>
<td>Obtains the stored XML report for a given report ID</td>
</tr>
</tbody>
</table>
### 31.3.1 FINISH_REPORT_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the `START_REPORT_CAPTURE` procedure.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time*DOP in case of PQ) whose monitoring has completed.

**Syntax**

```
DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;
```

**Related Topics**

- `START_REPORT_CAPTURE` Procedure
  This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

### 31.3.2 REPORT_REPOSITORY_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

**Syntax**

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (    
  rid              IN NUMBER    DEFAULT NULL,    
  type             IN VARCHAR2  DEFAULT 'XML',    
  base_path        IN VARCHAR2  DEFAULT NULL)    
RETURNS CLOB
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
<tr>
<td>type</td>
<td>Desired format of the report. Values can be 'XML', 'TEXT', 'HTML', 'EM' or 'ACTIVE'. The last two options generate a report in the same format called active HTML. Default value is 'XML'.</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>
Return Values
The persisted report for the given record ID

31.3.3 REPORT_REPOSITORY_DETAIL_XML Function
This procedure obtains the stored XML report for a given report ID.

Syntax
```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (  
    rid              IN NUMBER    DEFAULT NULL,  
    base_path        IN VARCHAR2  DEFAULT NULL)  
RETURNS XMLTYPE
```

Parameters

Table 31-3  REPORT_REPOSITORY_DETAIL_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>

Return Values
The persisted XML report for the given record ID

31.3.4 REPORT_REPOSITORY_LIST_XML Function
This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR.

The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

Syntax
```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (  
    active_since              IN DATE     DEFAULT NULL,  
    active_upto               IN DATE     DEFAULT NULL,  
    snapshot_id               IN NUMBER   DEFAULT NULL,  
    dbid                      IN NUMBER   DEFAULT NULL,  
    inst_id                   IN NUMBER   DEFAULT NULL,  
    con_dbid                  IN NUMBER   DEFAULT NULL,  
    session_id                IN NUMBER   DEFAULT NULL,  
    session_serial            IN NUMBER   DEFAULT NULL,  
    component_name            IN VARCHAR2 DEFAULT NULL,  
    key1                      IN VARCHAR2 DEFAULT NULL,  
    key2                      IN VARCHAR2 DEFAULT NULL,  
    key3                      IN VARCHAR2 DEFAULT NULL,  
    report_level              IN VARCHAR2 DEFAULT 'TYPICAL',  
    base_path                 IN VARCHAR2 DEFAULT NULL)  
RETURNS XMLTYPE
```
### Parameters

**Table 31-4  REPORT_REPOSITORY_LIST_XML Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active_since</td>
<td>Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.</td>
</tr>
<tr>
<td>active_upto</td>
<td>Same as active_since except that it is the end of the time range</td>
</tr>
<tr>
<td>snapshot_id</td>
<td>If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.</td>
</tr>
<tr>
<td>dbid</td>
<td>If a value is specified, only those data captured for the specified database ID are included in the list report. If no value is specified, no filtering is performed on database ID</td>
</tr>
<tr>
<td>inst_id</td>
<td>If a value is specified, only those data captured on the specified instance number are included in the list report. If no value is specified, no filtering is performed on the instance ID.</td>
</tr>
<tr>
<td>con_dbid</td>
<td>If a value is specified, only those data captured on the specified container DBID are included in the list report. If no value is specified, no filtering is performed on the container DBID.</td>
</tr>
<tr>
<td>session_id</td>
<td>If a value is specified, only those data captured for the specified session ID are included in the list report. If no value is specified, no filtering is performed on session ID.</td>
</tr>
<tr>
<td>session_serial</td>
<td>If a value is specified, only those data captured for the specified session are included in the list report. If no value is specified, no filtering is performed on session serial number. This parameter should be used in conjunction with the session_id parameter.</td>
</tr>
<tr>
<td>component_name</td>
<td>Can be 'sqlmonitor' for SQL Monitor data or 'rtaddm' for Real-time ADDM data. If a value is specified then data pertaining only to the specified component will be included in the list report. If no value is specified, no filtering is performed.</td>
</tr>
<tr>
<td>key1</td>
<td>Key value relevant to a component. For SQL Monitor, key1 is the SQL ID of the captured SQL statement. If a value is specified, only those data having specified value for key1 are included, else no filtering is performed on key1.</td>
</tr>
<tr>
<td>key2</td>
<td>Key value relevant to a component. For SQL Monitor, key2 is the SQL execution ID of the captured SQL statement. If a value is specified, only those data having specified value for key2 are included, else no filtering is performed on key2.</td>
</tr>
<tr>
<td>key3</td>
<td>Key value relevant to a component. For SQL Monitor, key3 is the SQL execution start time of the captured SQL statement. If a value is specified, then only those data having specified value for key3 are included, else no filtering is performed on key3.</td>
</tr>
<tr>
<td>report_level</td>
<td>Currently only 'TYPICAL' is used</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>
31.3.5 START_REPORT_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the FINISH_REPORT_CAPTURE Procedure. In the case of a RAC system, the capture will start on each node of the cluster.

Syntax

DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

See Also:

Oracle Database Administrator's Guide for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

• Deprecated Subprograms
• Security Model
• Constants
• Summary of DBMS_AUTO_TASK_ADMIN Subprograms

32.1 DBMS_AUTO_TASK_ADMIN Deprecated Subprograms

The DBMS_AUTO_TASK_ADMIN OVERRIDE_PRIORITY subprogram has been deprecated.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

• OVERRIDE_PRIORITY Procedures

32.2 DBMS_AUTO_TASK_ADMIN Security Model

DBMS_AUTO_TASK_ADMIN is a definer's rights package, and EXECUTE is automatically granted to DBA, IMP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE.

32.3 DBMS_AUTO_TASK_ADMIN Constants

The DBMS_AUTO_TASK_ADMIN package defines several constants that can be used for specifying parameter values.

These constants shown in the following table:
### Table 32-1 DBMS_AUTO_TASK_ADMIN Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY_MEDIUM</td>
<td>VARCHAR2</td>
<td>'MEDIUM'</td>
<td>Task with this priority should be executed as time permits</td>
</tr>
<tr>
<td>PRIORITY_HIGH</td>
<td>VARCHAR2</td>
<td>'HIGH'</td>
<td>Task with this priority should be executed within the current Maintenance Window</td>
</tr>
<tr>
<td>PRIORITY_URGENT</td>
<td>VARCHAR2</td>
<td>'URGENT'</td>
<td>Task with this priority is to be executed at the earliest opportunity</td>
</tr>
</tbody>
</table>

### 32.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms

This table lists the DBMS_AUTO_TASK_ADMIN subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedures</td>
<td>Prevents AUTOTASK from executing any requests from a specified client or operation.</td>
</tr>
<tr>
<td>ENABLE Procedures</td>
<td>Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control</td>
</tr>
<tr>
<td>GET_CLIENT_ATTRIBUTES Procedure</td>
<td>Returns values of select client attributes</td>
</tr>
<tr>
<td>GET_P1_RESOURCES Procedure</td>
<td>Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups</td>
</tr>
<tr>
<td>OVERRIDE_PRIORITY Procedures</td>
<td>Manually overrides task priority.</td>
</tr>
<tr>
<td>SET_CLIENT_SERVICE Procedure</td>
<td>Associates an AUTOTASK Client with a specified Service</td>
</tr>
<tr>
<td>SET_P1_RESOURCES Procedure</td>
<td>Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients</td>
</tr>
</tbody>
</table>

### 32.4.1 DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

**Syntax**

Disables all AUTOTASK functionality.

```sql
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```sql
DBMS_AUTO_TASK_ADMIN.DISABLE (
    client_name IN VARCHAR2,
```
Parameters

Table 32-3  DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be disabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

32.4.2 ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.

Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (  
    client_name   IN   VARCHAR2,  
    operation     IN   VARCHAR2,  
    window_name   IN   VARCHAR2);  
```

Parameters

Table 32-4  ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
</tbody>
</table>
Table 32-4  (Cont.) ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be enabled</td>
</tr>
</tbody>
</table>

**Usage Notes**

- If `operation` and `window_name` are both NULL, the client is enabled.
- If `operation` is not NULL, `window_name` is ignored and the specified operation is enabled
- If `operation` is NULL and `window_name` is not NULL, the client is enabled in the specified window.

### 32.4.3 GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

**Syntax**

```sql
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
    client_name        IN    VARCHAR2,   service_name       OUT   VARCHAR2,
    window_group       OUT   VARCHAR2);
```

**Parameters**

Table 32-5  GET_CLIENT_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in <code>DBA_AUTOTASK_CLIENT</code> View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
<tr>
<td>window_group</td>
<td>Name of the window group in which the client is active</td>
</tr>
</tbody>
</table>

### 32.4.4 GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each `AUTOTASK High Priority Consumer Group`.

**Syntax**

```sql
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
    stats_group_pct     OUT   NUMBER,
    seg_group_pct       OUT   NUMBER,
    tune_group_pct      OUT   NUMBER,
    health_group_pct    OUT   NUMBER);
```
Parameters

Table 32-6   GET_P1_RESOURCES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seq_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values will add up to 100%.

32.4.5 OVERRIDE_PRIORITY Procedures

This deprecated procedure is used to manually override task priority.

Note:

This subprogram is deprecated and becomes nonoperative with Oracle Database 12c.

This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to URGENT causes a high priority job to be generated at the start of the maintenance window. Setting priority to CLEAR removes the override.

Syntax

Override Priority for a Client.

```sql
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (client_name       IN    VARCHAR2,
                                        priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```sql
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (client_name       IN    VARCHAR2,
                                        operation         IN    VARCHAR2,
                                        priority          IN    VARCHAR2);
```

Override Priority for a Task.

```sql
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (client_name       IN    VARCHAR2,
                                        operation         IN    VARCHAR2,
                                        task_target_type  IN    VARCHAR2,
                                        task_target_name  IN    VARCHAR2,
                                        priority          IN    VARCHAR2);
```
Parameters

Table 32-7  OVERRIDE_PRIORITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>priority</td>
<td>URGENT, HIGH, MEDIUM or LOW</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>task_target_type</td>
<td>Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View</td>
</tr>
<tr>
<td>task_target_name</td>
<td>Name of the specific target to be affected</td>
</tr>
</tbody>
</table>

32.4.6 SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
    client_name        IN    VARCHAR2,
    service_name       IN    VARCHAR2);
```

Parameters

Table 32-8  SET_CLIENT_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
</tbody>
</table>

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

32.4.7 SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
    stats_group_pct     OUT   NUMBER,
    seg_group_pct       OUT   NUMBER,
    tune_group_pct      OUT   NUMBER,
    health_group_pct    OUT   NUMBER);
```
Parameters

Table 32-9   SET_P1_RESOURCES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seq_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.
DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

See Also:
Oracle OLAP User's Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

33.1 Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

33.2 Summary of DBMS_AW_STATS Subprograms

DBMS_AW_STATS uses the ANALYZE and CLEAR procedures.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE Procedure</td>
<td>Generates optimizer statistics on cubes and cube dimensions.</td>
</tr>
<tr>
<td>CLEAR Procedure</td>
<td>Clears optimizer statistics from cubes and cube dimensions.</td>
</tr>
</tbody>
</table>

33.2.1 ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension.

These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS".
For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

**Syntax**

```sql
DBMS_AW_STATS.ANALYZE
  (iname       IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <code>owner.cube_name</code>. For a dimension, the format is <code>owner.dimension_name</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

**Example**

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```sql
BEGIN
  DBMS_AW_STATS.ANALYZE('time');
  DBMS_AW_STATS.ANALYZE('customer');
  DBMS_AW_STATS.ANALYZE('product');
  DBMS_AW_STATS.ANALYZE('channel');
  DBMS_AW_STATS.ANALYZE('units_cube');
END;
/```

The following statements create and display an execution plan for a `SELECT` statement that joins columns from `UNITS_CUBE_VIEW`, `CUSTOMER_PRIMARY_VIEW`, and the `ACCOUNTS` table:
EXPLAIN PLAN FOR SELECT
   cu.long_description customer,
   a.city city,
   a.zip_pc zip,
   cu.level_name "LEVEL",
   round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
    product_primary_view p,
    customer_view cu,
    channel_view ch,
    units_cube_view f,
    account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
   AND p.level_name = 'TOTAL'
   AND cu.customer_account_id like 'COMP%'
   AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
   AND t.dim_key = f.TIME
   AND p.dim_key = f.product
   AND cu.dim_key = f.customer
   AND ch.dim_key = f.channel
   AND a.account_id = cu.customer_account_id
ORDER BY zip;

SQL> SELECT plan_table_output FROM TABLE(dbms_xplan.display());

    SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')

Note
-----
- dynamic statistics used for this statement
### 33.2.2 CLEAR Procedure

This procedure clears the statistics generated by the ANALYZE procedure.

#### Syntax

```sql
DBMS_AW_STATS.CLEAR (
    inname    IN  VARCHAR2;
)
```

#### Parameters

**Table 33-3  CLEAR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <code>owner.cube_name</code>. For a dimension, the format is <code>owner.dimension_name</code>.</td>
</tr>
</tbody>
</table>

#### Examples

The following scripts clears the statistics from UNITS_CUBE and its dimensions.

```sql
BEGIN
    DBMS_AW_STATS.clear('units_cube');
    DBMS_AW_STATS.clear('time');
    DBMS_AW_STATS.clear('customer');
    DBMS_AW_STATS.clear('product');
    DBMS_AW_STATS.clear('channel');
END;
/
A blockchain table is an append-only table designed for centralized blockchain applications. The `DBMS_BLOCKCHAIN_TABLE` package allows you to do the following: delete rows in a blockchain table that are beyond the row retention defined for the blockchain table; get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row; sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table; and have the database verify the hashes on some or all rows in a blockchain table. Blockchain tables support only DER encoding for X.509 certificates, not PEM encoding.

This chapter contains the following topics:

- **DBMS_BLOCKCHAIN_TABLE Overview**
- **DBMS_BLOCKCHAIN_TABLE Security Model**
- **Summary of DBMS_BLOCKCHAIN_TABLE Subprograms**

### 34.1 DBMS_BLOCKCHAIN_TABLE Overview

In Oracle Blockchain Table, peers are database users who trust the database to maintain a tamper-resistant ledger.

The ledger is implemented as a blockchain table, which is defined and managed by the application. Existing applications can protect against fraud without requiring a new infrastructure or programming model. Although transaction throughput is lower than for a standard table, performance for a blockchain table is better than for a decentralized blockchain.

The `DBMS_BLOCKCHAIN_TABLE` package lets you do the following:

- delete rows in a blockchain table that are beyond the row retention defined for the blockchain table
- get the bytes that are input to the signature algorithm so you can sign a row you inserted into the blockchain table
• get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row
• sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table
• have the database verify the hashes and signatures on some or all rows in a blockchain table.

34.2 DBMS_BLOCKCHAIN_TABLE Security Model

The DBMS_BLOCKCHAIN_TABLE package is owned by SYS and is installed as part of database installation. The routines in the package are run with invokers’ rights (run with the privileges of the current user). Thus any user with select privileges on the blockchain table should be able to validate the row contents of that table.

Any user with delete privileges on the blockchain table can delete rows beyond the retention period defined for the blockchain table.

A user that inserted a row into the blockchain table can add a digital signature to the row after the row is added to a chain in the blockchain table.

34.3 Summary of DBMS_BLOCKCHAIN_TABLE Subprograms

The DBMS_BLOCKCHAIN_TABLE package uses DELETE_EXPIRED_ROWS, GET_BYTES_FOR_ROW_HASH, GET_BYTES_FOR_ROW_SIGNATURE, SIGN_ROW, and VERIFY_ROWS subprograms to perform various functions.

Table 34-1  DBMS_BLOCKCHAIN_TABLE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_EXPIRED_ROWS Procedure</td>
<td>Deletes rows outside the retention window created before before_timestamp if the time stamp is specified; otherwise, deletes all rows outside the retention window.</td>
</tr>
<tr>
<td>GET_BYTES_FOR_ROW_HASH Procedure</td>
<td>Returns in row_data the bytes (series of {meta-data-value} {column-data-value} in column position order) for the particular row identified, followed by the hash (in data format) for previous row in the chain, in the data format supported.</td>
</tr>
<tr>
<td>GET_BYTES_FOR_ROW_SIGNATURE Procedure</td>
<td>The bytes returned are the bytes in the row hash. No metadata is included.</td>
</tr>
<tr>
<td>SIGN_ROW Procedure</td>
<td>This procedure can be used by the current user to provide a signature on row content of a previously inserted row. The user who inserted a row into a blockchain table is the only user that can sign the row.</td>
</tr>
<tr>
<td>VERIFY_ROWS Procedure</td>
<td>Verifies all rows on all applicable chains for integrity of HASH column value for rows created in the range of LOW_TIMESTAMP to HIGH_TIMESTAMP. Row signatures can be verified as an option.</td>
</tr>
</tbody>
</table>
34.3.1 DELETE_EXPIRED_ROWS Procedure

This procedure deletes rows outside the retention window created before_timestamp if the time stamp is specified; otherwise, deletes all rows outside the retention window. The number of rows deleted is returned in number_of_rows_deleted parameter.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.DELETE_EXPIRED_ROWS(
    schema_name          IN VARCHAR2,
    table_name              IN VARCHAR2,
    before_timestamp        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_rows_deleted     OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the blockchain table.</td>
</tr>
<tr>
<td>before_timestamp</td>
<td>The end time for the range of rows deleted by the procedure, subject to the row retention time currently associated with the blockchain table. This is an optional parameter. The default value is NULL.</td>
</tr>
<tr>
<td>number_of_rows_deleted</td>
<td>The count of the number of rows deleted.</td>
</tr>
</tbody>
</table>

34.3.2 GET_BYTES_FOR_ROW_HASH Procedure

This procedure returns the bytes in column_data that the database hashed to get the hash value for the row identified by parameters instance_id, chain_id, and sequence_id. These bytes are a concatenation of metadata and data bytes for each column of the table in column position order, followed by the hash value for the previous row in the chain.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_HASH(
    schema_name          IN VARCHAR2,
    table_name              IN VARCHAR2,
    instance_id          IN NUMBER,
    chain_id                  IN NUMBER,
    sequence_id             IN NUMBER,
    data_format             IN NUMBER,
    row_data                IN OUT BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the blockchain table.</td>
</tr>
</tbody>
</table>
Table 34-3  GET_BYTES_FOR_ROW_HASH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_id</td>
<td>The instance that inserted the row. Valid values are 1, 2, and so on.</td>
</tr>
<tr>
<td>chain_id</td>
<td>The chain containing the row. There are 32 chains in each instance, and they are numbered from 0 to 31.</td>
</tr>
<tr>
<td>sequence_id</td>
<td>The position of the row on the specified chain.</td>
</tr>
<tr>
<td>data_format</td>
<td>The version of the data layout for the hash in the specified row. Must be 1 in this release.</td>
</tr>
<tr>
<td>row_data</td>
<td>The bytes for the specified row in the specified data format that can be input to the cryptographic hash function to verify the value of the hash in the row. Any bytes in the BLOB are overwritten.</td>
</tr>
</tbody>
</table>

Usage Notes

All parameters are required input parameters.

The metadata bytes for a column are 20 bytes that encode the blockchain algorithm version used to hash the row, the column position, the column data type, whether the column value is NULL, and the actual length of the column value in bytes.

The column data bytes are the actual bytes representing the column value on disk for non-character columns. For character columns, the values are normalized to specific character sets. For CHAR and NCHAR columns, blank trimming is also done.

Few metadata bytes are reserved for future use.

34.3.3 GET_BYTES_FOR_ROW_SIGNATURE Procedure

The routine returns in row_data the bytes in the hash in the row without any metadata. No other columns are involved either in the row or in the previous row.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_SIGNATURE(
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    instance_id    IN NUMBER,
    chain_id       IN NUMBER,
    sequence_id    IN NUMBER,
    data_format    IN NUMBER,
    row_data       IN OUT BLOB);
```

Parameters

Table 34-4  GET_BYTES_FOR_ROW_SIGNATURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the blockchain table.</td>
</tr>
</tbody>
</table>
### Table 34-4 (Cont.) GETgetBytesForRowSignature Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_id</td>
<td>The instance on which the row was inserted. Valid values are 1, 2, and so on.</td>
</tr>
<tr>
<td>chain_id</td>
<td>The chain on which the row was inserted. There are 32 chains in each instance, and they are numbered from 0 to 31.</td>
</tr>
<tr>
<td>sequence_id</td>
<td>The position of the row on the chain.</td>
</tr>
<tr>
<td>data_format</td>
<td>The format of the data in row_data. The value must be 1 in the DB20e release.</td>
</tr>
<tr>
<td>row_data</td>
<td>A sequence of bytes that must be signed.</td>
</tr>
</tbody>
</table>

### Usage Notes

All parameters are required input parameters.

### 34.3.4 SIGN_ROW Procedure

This procedure can be used by the current user to provide a signature on row content of a previously inserted row. The transaction that inserted the row into the blockchain table must have committed before the SIGN_ROW procedure is called.

#### Syntax

```sql
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW(
    schema_name               IN VARCHAR2,
    table_name                IN VARCHAR2,
    instance_id               IN NUMBER,
    chain_id                  IN NUMBER,
    sequence_id               IN NUMBER,
    hash                      IN RAW DEFAULT NULL,
    signature                 IN RAW,
    certificate_guid          IN RAW,
    signature_algo            IN NUMBER);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the blockchain table.</td>
</tr>
<tr>
<td>instance_id</td>
<td>The instance on which the row was inserted.</td>
</tr>
<tr>
<td>chain_id</td>
<td>The chain containing the row to be signed. There are 32 chains in each instance, and they are numbered from 0 to 31.</td>
</tr>
<tr>
<td>sequence_id</td>
<td>The position of the row on the chain. Valid values are 1, 2, and so on.</td>
</tr>
<tr>
<td>hash</td>
<td>If non-NULL, the expected value of the hash in the row to be signed. If NULL, the hash in the row to be signed is not checked.</td>
</tr>
<tr>
<td>signature</td>
<td>The user’s digital signature on the hash value stored in the row.</td>
</tr>
</tbody>
</table>
Table 34-5  (Cont.) SIGN_ROW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certificate_guid</td>
<td>A unique identifier for the certificate stored in the database that may be used to verify the digital signature.</td>
</tr>
</tbody>
</table>
| signature_algo | The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package:  
|               | · SIGN_ALGO_RSA_SHA2_256  
|               | · SIGN_ALGO_RSA_SHA2_384  
|               | · SIGN_ALGO_RSA_SHA2_512  |

**Note:**
For information on hidden columns in blockchain tables, see Hidden Columns in Blockchain Tables

**Usage Notes**

- All parameters are required input parameters except for hash.
- The database will verify that:
  - the current user’s obj# matches the user# hidden column value (ensures that the user owns the row)
  - the user has insert privileges for the blockchain table ‘schema_name’.’table_name’
  - the hash (if provided) matches the hash column content for the row
  - the signature column value for the specific row identified by ‘instance_id’, ‘chain_id’, and ‘sequence_id’ is NULL
  - if the verification succeeds, the signature value is stored for the row.

### 34.3.5 VERIFY_ROWS Procedure

Verifies all rows on all applicable chains for integrity of HASH column value and optionally the SIGNATURE column value for rows created in the range of low_timestamp to high_timestamp. An appropriate exception is thrown if the integrity of chains is compromised.

**Syntax**

```
DBMS_BLOCKCHAIN_TABLE.VERIFY_ROWS(
    schema_name                  IN VARCHAR2,
    table_name                   IN VARCHAR2,
    low_timestamp                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    high_timestamp               IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    instance_id                  IN NUMBER DEFAULT NULL,
    chain_id                     IN NUMBER DEFAULT NULL,
    number_of_rows_verified      OUT NUMBER,
    verify_signature             IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 34-6  VERIFY_ROWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the blockchain table.</td>
</tr>
<tr>
<td>low_timestamp</td>
<td>If specified, the low end of the time range for verifying rows. The default value is NULL.</td>
</tr>
<tr>
<td>high_timestamp</td>
<td>If specified, the high end of the time range for verifying rows. The default value is NULL.</td>
</tr>
<tr>
<td>instance_id</td>
<td>If specified, restricts row verification to rows inserted on the specified instance.</td>
</tr>
<tr>
<td>chain_id</td>
<td>If specified, restricts row verification to rows on the specified chain. There are 32 chains in each instance, and they are numbered from 0 to 31.</td>
</tr>
<tr>
<td>number_of_rows_verified</td>
<td>The number of rows verified.</td>
</tr>
<tr>
<td>verify_signature</td>
<td>If verify_signature is TRUE, both the hash on each row and any signature on the row are verified. If verify_signature is FALSE, only the hash on each row is verified. The default value is TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

- The hash on the first element in the time range for verifying rows in a chain is verified only if its sequence number is 1.
- schema_name and table_name are required input parameters
- All others input parameters are optional, with the following exceptions:
  - If chain_id is specified, instance_id must be specified
  - Valid values for instance_id are 1, 2, ... etc.
  - If neither instance_id, nor chain_id is specified, then it implies *all* chains. If only instance_id is specified, then it implies *all* chains on that instance. If both are specified, it implies the specific chain provided by the combination.
  - If both low_timestamp and high_timestamp are specified, then high_timestamp must be later than low_timestamp.

  If low_timestamp is not specified, then the range is the oldest row in the blockchain to high_timestamp.

  If high_timestamp is not specified then the range is low_timestamp to the timestamp of the last row inserted in the table.
The **DBMS_CAPTURE_ADM** package, one of a set of Oracle Replication packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Summary of DBMS_CAPTURE_ADM Subprograms**

### 35.1 DBMS_CAPTURE_ADM Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

---

**See Also:**

*Oracle Database Concepts* for more information about CDBs and PDBs

### 35.2 DBMS_CAPTURE_ADM Security Model

The DBMS_CAPTURE_ADM security can be controlled in one of two ways.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the **DBMS_CAPTURE_ADM** package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the **DBMS_CAPTURE_ADM** package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.
35.3 Summary of DBMS_CAPTURE_ADM Subprograms

This table lists the DBMS_CAPTURE_ADM subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>

<td>Stops the capture process from mining redo logs</td>
</tr>
</tbody>
</table>

**Note:**

All subprograms commit unless specified otherwise.

### 35.3.1 ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

**Syntax**

```sql
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
    container IN VARCHAR2 DEFAULT 'CURRENT');
```
35.3.2 ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` procedure. It also reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the `PREPARE_SCHEMA_INSTANTIATION` procedure
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure for tables in the specified schema

Syntax

```sql
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2,
    container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>The name of the schema for which to abort the effects of preparing instantiation</td>
</tr>
</tbody>
</table>
### 35.3.3 ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SYNC_INSTANTIATION` procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

#### Syntax

```sql
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN  VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN  DBMS_UTILITY.UNCL_ARRAY);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_names</code></td>
<td>When the <code>table_names</code> parameter is <code>VARCHAR2</code> datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated. In either version of the procedure, specify the name of each table in the form <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

### 35.3.4 ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure. Specifically, this procedure performs the following actions:
• Removes data dictionary information related to the table instantiation
• Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2;
    container   IN  VARCHAR2  DEFAULT 'CURRENT');

Parameter

Table 35-5  ABORT_TABLE_INSTANTIATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table for which to abort the effects of preparing instantiation, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure removes supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

35.3.5 ALTER_CAPTURE Procedure

This procedure alters a capture process.

Syntax

DBMS_CAPTURE_ADM.ALTER_CAPTURE(
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT NULL,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    remove_negative_rule_set   IN  BOOLEAN    DEFAULT FALSE,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT NULL,
    start_time                 IN  TIMESTAMP  DEFAULT NULL,
    oldest_scn                 IN  NUMBER     DEFAULT NULL);
### Parameters

**Table 35-6  ALTER_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set.</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.</td>
</tr>
<tr>
<td>start_scn</td>
<td>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.</td>
</tr>
</tbody>
</table>
Table 35-6  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use_database_link</td>
<td>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.</td>
</tr>
</tbody>
</table>
| first_scn         | The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:  
• It must be greater than the current first SCN for the capture process.  
• It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.  
• It must be less than or equal to the required checkpoint SCN for the capture process.  
An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" for information about determining an SCN value that meets all of these conditions.  
When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure for more information about a LogMiner data dictionary.  
If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN. |
Table 35-6  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. To change the negative rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first. If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed.</td>
</tr>
<tr>
<td></td>
<td>To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.</td>
</tr>
<tr>
<td></td>
<td>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:</td>
</tr>
<tr>
<td></td>
<td>· EXECUTE privilege on the rule sets used by the capture process</td>
</tr>
<tr>
<td></td>
<td>· EXECUTE privilege on all rule-based transformation functions used in the rule set</td>
</tr>
<tr>
<td></td>
<td>These privileges can be granted directly to the capture user, or they can be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>The capture process is stopped and restarted automatically when you change the value of this parameter.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</td>
</tr>
<tr>
<td>checkpoint_retention_time</td>
<td>Either the number of days that a capture process retains checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed.</td>
</tr>
<tr>
<td></td>
<td>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours.</td>
</tr>
<tr>
<td></td>
<td>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</td>
</tr>
<tr>
<td>start_time</td>
<td>A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if an invalid time is specified or if the capture process is enabled.</td>
</tr>
<tr>
<td></td>
<td>The start_scn and start_time parameters are mutually exclusive.</td>
</tr>
<tr>
<td>oldest_scn</td>
<td>The oldest SCN of the transactions currently being processed.</td>
</tr>
</tbody>
</table>
Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```sql
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

35.3.6 ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

Syntax

```sql
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
  capture_name   IN  VARCHAR2,
  rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 35-7  ALTER_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If NULL, then the rule set is not changed.</td>
</tr>
</tbody>
</table>
Table 35-7  (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| capture_user | The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:  
  - EXECUTE privilege on the rule sets used by the synchronous capture  
  - EXECUTE privilege on all rule-based transformation functions used in the rule set  
    These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles. |

Usage Notes

If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically.

35.3.7 BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the SQL statement ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;

This procedure is overloaded. One version of this procedure contains the OUT parameter first_scn, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
    first_scn OUT NUMBER);
```

```
DBMS_CAPTURE_ADM.BUILD;
```

Parameters

Table 35-8  BUILD Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the CREATE_CAPTURE or ALTER_CAPTURE procedure in the DBMS_CAPTURE_ADM package.
- In a CDB, the BUILD procedure must be executed from the root.

35.3.8 CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

DBMS_RULE_ADM for more information about rules and rule sets

Syntax

DBMS_CAPTURE_ADM.CREATE_CAPTURE(
    queue_name                 IN  VARCHAR2,
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    source_database            IN  VARCHAR2   DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT FALSE,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    logfile_assignment         IN  VARCHAR2   DEFAULT 'implicit',
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT 60,
    start_time                 IN  TIMESTAMP  DEFAULT NULL,
    source_root_name           IN  VARCHAR2   DEFAULT NULL,
    capture_class              IN  VARCHAR2   DEFAULT 'Streams');
### Parameters

**Table 35-9  CREATE_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| queue_name    | The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form `[schema_name.]queue_name`. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.  
  **Note:** The queue_name setting cannot be altered after the capture process is created. |
| capture_name  | The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner.  
  **Note:** The capture_name setting cannot be altered after the capture process is created. |
| rule_set_name | The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.  
  If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form `[schema_name.]rule_set_name`. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default.  
  An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package.  
  If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.  
  If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.  
  **See Also:** "Usage Notes" for more information setting the start_scn parameter |
| start_scn     | A valid SCN for the database from which the capture process starts capturing changes.  
  An error is returned if an invalid SCN is specified.  
  The start_scn and start_time parameters are mutually exclusive. |
### Table 35-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.</td>
</tr>
</tbody>
</table>
| use_database_link | If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:  
  - Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.  
  - Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.  
  - Prepare source database objects for instantiation. |
Table 35-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. See Also: &quot;Usage Notes&quot; for more information setting the first_scn parameter</td>
</tr>
<tr>
<td>logfile_assignment</td>
<td>If implicit, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR logminer_session_name clause. If explicit, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. See Also: &quot;Usage Notes&quot; for information about adding redo log files manually</td>
</tr>
</tbody>
</table>
Table 35-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</td>
</tr>
<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. <strong>Note:</strong> If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>checkpoint_retention_time</td>
<td>Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>If you specify NULL, or if the specified name is the same as the global name of the current root, then local capture is assumed.</td>
</tr>
<tr>
<td></td>
<td>If not NULL, then remote capture is assumed and a condition is added to the generated rules to filter the LCRs based on the root in the source CDB.</td>
</tr>
<tr>
<td></td>
<td>Note: In a downstream capture configuration, if the capture database is CDB and the source database is a non-CDB, then specify the same value for source_root_name and source_database. The source_root_name parameter does not need to be specified for local capture for either a CDB or a non-CDB.</td>
</tr>
<tr>
<td>capture_class</td>
<td>The valid values are 'Streams', 'XStream' or 'GoldenGate'.</td>
</tr>
<tr>
<td></td>
<td>If NULL is specified, then 'Streams' is assumed.</td>
</tr>
<tr>
<td></td>
<td>Note: The capture_class parameter cannot be set to 'Streams' or NULL when the capture database is a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes

Consider the following usage notes when you run this procedure:

- **DBA Role Requirement**
- **Capture User Requirements**
- **First SCN and Start SCN Settings**
- **Explicit Log File Assignment**

**DBA Role Requirement**

If the user who invokes this procedure is different from the user specified in the capture_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the capture_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the capture_user to SYS.

**Capture User Requirements**

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture
changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- **EXECUTE** privilege on the rule sets used by the capture process
- **EXECUTE** privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

**Note:**

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

**First SCN and Start SCN Settings**

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

**Note:**

When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:
<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-NULL</td>
<td>NULL</td>
<td>Local or Downstream</td>
<td>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the <code>first_scn</code> parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
<tr>
<td>Non-NULL</td>
<td>Non-NULL</td>
<td>Local or Downstream</td>
<td>If the specified value for the <code>start_scn</code> parameter is greater than or equal to the specified value for the <code>first_scn</code> parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the <code>start_scn</code> parameter is less than the specified value for the <code>first_scn</code> parameter, then an error is raised. The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
</tbody>
</table>
The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:

- There is no existing capture process for the local source database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.
- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

<table>
<thead>
<tr>
<th><code>first_scn</code> Setting</th>
<th><code>start_scn</code> Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>Non-NULL</td>
<td>Local</td>
<td>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- There is no existing capture process for the local source database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</td>
</tr>
</tbody>
</table>

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation.

The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.
<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| NULL              | Non-NULL         | Downstream           | When the `CREATE_CAPTURE` procedure creates a downstream capture process, the `use_database_link` parameter must be set to `TRUE` when the `first_scn` parameter is set to `NULL`. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database. The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:  
  - There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.  
  - There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.  
In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing.  
However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.  
If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified `start_scn` parameter value is less than the current SCN for the source database, then an error is raised. |
| NULL              | NULL             | Local or Downstream  | The behavior is the same as setting the `first_scn` parameter to `NULL` and setting the `start_scn` parameter to the current SCN of the source database. |

**See Also:**  
`BUILD Procedure` for more information about the `BUILD` procedure and the LogMiner data dictionary

Explicit Log File Assignment
If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```sql
ALTER DATABASE REGISTER LOGICAL LOGFILE
  file_name FOR capture_process;
```

Here, `file_name` is the name of the redo log file being added and `capture_process` is the name of the capture process that will use the redo log file at the downstream database. The `capture_process` is equivalent to the `logminer_session_name` and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the `DBMS_FILE_TRANSFER` package, FTP, or some other transfer method.

**See Also:**

- Oracle Database SQL Language Reference for more information about the `ALTER DATABASE` statement
- Oracle Data Guard Concepts and Administration for more information registering redo log files

### 35.3.9 CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

**Syntax**

```sql
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
  queue_name     IN  VARCHAR2,
  capture_name   IN  VARCHAR2,
  rule_set_name  IN  VARCHAR2,
  capture_user   IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

**Table 35-10**  CREATE_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>The name of the queue into which the synchronous capture enqueues changes.</td>
</tr>
<tr>
<td></td>
<td>You must specify an existing queue in the form <code>[schema_name.]queue_name</code>.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue in the <code>stradmin</code> schema named</td>
</tr>
<tr>
<td></td>
<td><code>streams_queue</code>, enter <code>stradmin.streams_queue</code>. If the schema is not</td>
</tr>
<tr>
<td></td>
<td>specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <code>queue_name</code> setting cannot be altered after the synchronous</td>
</tr>
<tr>
<td></td>
<td>capture is created.</td>
</tr>
<tr>
<td><code>capture_name</code></td>
<td>The name of the synchronous capture being created. A NULL specification is</td>
</tr>
<tr>
<td></td>
<td>not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <code>capture_name</code> setting cannot be altered after the synchronous</td>
</tr>
<tr>
<td></td>
<td>capture is created.</td>
</tr>
</tbody>
</table>
Table 35-10  (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If NULL, then an error is returned.</td>
</tr>
<tr>
<td>capture_user</td>
<td>The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. Note: If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically. See Also: &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- **ENQUEUE** privilege on the queue specified in the queue_name parameter
- **EXECUTE** privilege on the rule set used by the synchronous capture
- **EXECUTE** privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.
Note:

A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

35.3.10 DROP_CAPTURE Procedure

This procedure drops a capture process.

Syntax

DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name          IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);

Parameters

Table 35-11 DROP_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Replication client. Oracle Replication clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

See Also:

STOP_CAPTURE Procedure

The DROP_CAPTURE Procedure and Rules-related Information
When you use this procedure to drop a capture process, rules-related information for the capture process is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Replication rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- DBA_STREAMS_RULES

### 35.3.11 \texttt{INCLUDE EXTRA ATTRIBUTE} Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

**Syntax**

\[
\text{DBMS\_CAPTURE\_ADM.INCLUDE\_EXTRA\_ATTRIBUTE}\left( \\
\text{capture\_name IN VARCHAR2,} \\
\text{attribute\_name IN VARCHAR2,} \\
\text{include IN BOOLEAN DEFAULT TRUE};
\right)
\]

**Parameters**

Table 35-12: INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
Table 35-12  (Cont.) INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings:</td>
</tr>
<tr>
<td></td>
<td>• row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• username</td>
</tr>
<tr>
<td></td>
<td>The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td>include</td>
<td>If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.</td>
</tr>
</tbody>
</table>

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify FALSE for the include parameter.

35.3.12 PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.
Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

**Table 35-13  PREPARE_GLOBAL_INSTANTIATION Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.
35.3.13 PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name           IN  VARCHAR2,
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL.</td>
</tr>
<tr>
<td></td>
<td>If NONE is specified, then this procedure does not enable supplemental</td>
</tr>
<tr>
<td></td>
<td>logging for any columns in the tables in the schema. This procedure</td>
</tr>
<tr>
<td></td>
<td>does not remove existing supplemental logging specifications for these</td>
</tr>
<tr>
<td></td>
<td>tables.</td>
</tr>
<tr>
<td></td>
<td>If KEYS is specified, then this procedure enables supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for primary key, unique key, bitmap index, and foreign key columns in</td>
</tr>
<tr>
<td></td>
<td>the tables in the schema and for any table added to this schema in the</td>
</tr>
<tr>
<td></td>
<td>future. Primary key columns are logged unconditionally. Unique key,</td>
</tr>
<tr>
<td></td>
<td>bitmap index, and foreign key columns are logged conditionally. Specifying</td>
</tr>
<tr>
<td></td>
<td>KEYS does not enable supplemental logging of bitmap join index columns.</td>
</tr>
<tr>
<td></td>
<td>If ALL is specified, then this procedure enables supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for all columns in the tables in the schema and for any table added to</td>
</tr>
<tr>
<td></td>
<td>this schema in the future. The columns are logged unconditionally.</td>
</tr>
<tr>
<td></td>
<td>Supplemental logging is not enabled for columns of the following types:</td>
</tr>
<tr>
<td></td>
<td>LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name.</td>
</tr>
<tr>
<td></td>
<td>If CURRENT is specified, then this procedure adds supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for the current container.</td>
</tr>
<tr>
<td></td>
<td>If ALL is specified, then this procedure adds supplemental logging for</td>
</tr>
<tr>
<td></td>
<td>all of the containers in the current CDB.</td>
</tr>
<tr>
<td></td>
<td>If pdb_name is specified, then this procedure adds supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for the specified PDB</td>
</tr>
<tr>
<td></td>
<td>ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

35.3.14 PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names  IN  VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names  IN  DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 35-15  PREPARE_SYNC_INSTANTIATION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_names</td>
<td>When the <code>table_names</code> parameter is VARCHAR2 datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.</td>
</tr>
<tr>
<td></td>
<td>When the <code>table_names</code> parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td></td>
<td>In either version of the function, specify the name of each table in the form [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
35.3.15 PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table.

This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
  table_name            IN  VARCHAR2,
  supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
  container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

### Table 35-16  PREPARE_TABLE_INSTANTIATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| supplemental_logging | Either NONE, KEYS, or ALL.  
If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.  
If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.  
If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types. |
| container         | Either CURRENT, ALL, or pdb_name.  
If CURRENT is specified, then this procedure adds supplemental logging for the current container.  
If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.  
If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB.  
ALL and pdb_name are valid only when you invoke the procedure from the root. |
Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

35.3.16 SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```sql
DBMS_CAPTURE_ADM.SET_PARAMETER(
    capture_name  IN  VARCHAR2,
    parameter     IN  VARCHAR2,
    value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 35-17  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 35-18  Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>annotatedddlsize</td>
<td>0 or a positive integer up to 4294967296 (4 GB)</td>
<td>0</td>
<td>The maximum length of the DDL text, in bytes, up to which the DDL can be chosen for annotation, if applicable for the DDL. Any DDL text whose size is greater than the specified size is not annotated. The default, 0, indicates that no DDL text processed by this capture process is annotated. Annotating DDL can simplify filtering and transformation of the DDL within Oracle GoldenGate. <strong>Note:</strong> This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.</td>
</tr>
</tbody>
</table>
Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_idkey_objects</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs. Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter and <em>Oracle Database XStream Guide</em> for more information about ID key LCRs.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------</td>
<td>---------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>capture_sequence</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as SYS and SYSTEM. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs. If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter and &quot;SET_PARAMETER Procedure&quot; for information about the apply_sequence_nextval apply process parameter. If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CPnn) remains the same.</td>
</tr>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td></td>
</tr>

### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>downstream_real_time_mine</td>
<td>Y or N</td>
<td>Y for local capture processes, N for downstream capture processes</td>
<td>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement <code>ALTER SYSTEM ARCHIVE LOG CURRENT</code> to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. If N, then the capture process is an archived-log downstream capture process. An error is raised if an attempt is made to set this parameter for a local capture process.</td>
</tr>
<tr>
<td>excludetag</td>
<td>Comma-delimited list of Oracle Replication tags</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Replication tags. Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludetrans</td>
<td>Comma-delimited list of transaction names</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
<tr>
<td>excludeuser</td>
<td>Comma-delimited list of user names</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludeuserid</td>
<td>Comma-delimited list of user ID values</td>
<td>NULL</td>
<td>Controls whether the capture process captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters. To view the user ID for a user, query the <code>USER_ID</code> column in the <code>ALL_USERS</code> data dictionary view. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>getapplops</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process captures DML changes if the original user is not specified in the <code>excludeuserid</code> or <code>excluduserid</code> parameters and the transaction name is not specified in the <code>excludetrans</code> parameter. If N, then the capture process ignores DML changes if the original user is not specified in the <code>excludeuserid</code> or <code>excluduserid</code> parameters and the transaction name is not specified in the <code>excludetrans</code> parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
</tbody>
</table>
### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getreplicates</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process’s rule sets. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” for information about enabling XStream optimizations. <strong>See Also:</strong> “Usage Notes” for more information about this parameter</td>
</tr>
<tr>
<td>ignore_transaction</td>
<td>A valid transaction ID or NULL</td>
<td>NULL</td>
<td>Instructs the capture process to ignore the specified transaction from the source database, effective immediately. The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database. If NULL, then the capture process ignores this parameter. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.</td>
</tr>
</tbody>
</table>
### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore_unsupported_table</td>
<td>A fully qualified table name, *, or -</td>
<td></td>
<td>Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table. A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables. When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form <code>table_owner.table_name</code>. For example, <code>hr.employees</code>. To specify multiple tables, specify each table in a separate call to the <code>SET_PARAMETER</code> procedure. When <code>*</code> is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log. When <code>-</code> is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.</td>
</tr>
<tr>
<td>include_objects</td>
<td>A list of tables or schema names separated by commas</td>
<td>none</td>
<td>Directs capture to include changes from the specified tables or schemas. An LCR that is selected by <code>include_objects</code> is passed to the outbound server regardless of any further filtering that is specified. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------</td>
<td>---------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| inline_lob_optimization | Y or N          | N       | If Y, then LOBs that can be processed inline (such as small LOBs) are included in the LCR directly, rather than sending LOB chunk LCRs.  
If N, then each LOB column is sent as NULL followed by LOB chunk LCRs to update the LOB column.  
Note: This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.  
See Also: "Usage Notes" for more information about this parameter |
| maximum_scn        | A valid SCN or INFINITE | INFINITE | The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified.  
If INFINITE, then the capture process runs regardless of the SCN value. |
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_sga_size</td>
<td>A positive integer</td>
<td>INFINITE</td>
<td>Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log. The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled. <strong>Note:</strong> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the capture component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 35-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>merge_threshold</td>
<td>A negative integer, 0, a positive integer, or INFINITE</td>
<td>60</td>
<td>The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately.</td>
</tr>
<tr>
<td>message_limit</td>
<td>A positive integer or INFINITE</td>
<td>INFINITE</td>
<td>The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.</td>
</tr>
<tr>
<td>message_tracking</td>
<td>0 or a positive integer</td>
<td>2000000</td>
<td>The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is capture_process_name:AUTOTRACK, where capture_process_name is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically.</td>
</tr>
</tbody>
</table>
### Table 35-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| parallelism      | A positive integer | 1       | The number of preparer servers that can concurrently mine the redo log for the capture process.  
A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the `parallelism` capture process parameter. So, if `parallelism` is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the `parallelism` parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the `PROCESSES` initialization parameter is set appropriately when you set the `parallelism` capture process parameter.  
**Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically. |
| skip_autofiltere | Y or N           | Y       | If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets. |
| d_table_ddl      |                 |         |                                                                                                                                           |

### Table 35-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use_rac_service</td>
<td>Y or N</td>
<td>Y if Replication N if XStream</td>
<td>If Y, then the capture process is run in the owning instance of its queue. If N, then the client specifies where the capture process is to run. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>write_alert_log</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.</td>
</tr>
<tr>
<td>xout_client_exits</td>
<td>Y or N</td>
<td>Y if the capture process sends LCRs to XStream outbound servers N if the capture process sends LCRs to Oracle Apply processes</td>
<td>Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. <strong>Note:</strong> Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to the `SET_PARAMETER` procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- Parameters that Require XStream Optimizations
- XStream or Oracle GoldenGate Integrated Capture Configurations
Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is $4,294,967,295$. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

Parameters that Require XStream Optimizations

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Replication components:

- capture_idkey_objects
- capture_sequence_nextval
- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_sga_size
- use_rac_services

The `DBMS_XSTREAM_ADMD.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure enables XStream optimizations for Oracle Replication. When XStream optimizations are not enabled by the `DBMS_XSTREAM_ADMD.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Replication and the `capture_idkey_objects` parameter is set to `Y`, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
FROM DBA_XSTREAM_OUT_SUPPORT_MODE
WHERE SUPPORT_MODE='ID KEY';
```
XStream or Oracle GoldenGate Integrated Capture Configurations

In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- `capture_idkey_objects`
- `capture_sequence_nextval`
- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `include_objects`
- `inline_lob_optimization`
- `max_sga_size`
- `use_rac_services`

You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.

If an integrated configuration performs bi-directional replication, then, to avoid change cycling, the capture process should not capture the changes made by the Oracle GoldenGate Replicat process. To accomplish this goal, use the default settings for the `getapplops` and `getreplicates` parameters and exclude changes made by the user running the Replicat process. To exclude these changes, specify this user in the `excludeuserid` or `excludeuser` parameter. Typically, the user running the Oracle GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by applications or by the Replicat process. For example, an intermediate database in a
replication environment might capture all of the changes made to the database, including both application changes and Replicat process changes, and send these changes to a different destination database.

Table 35-19 describes the capture process behavior when at least one of the exclude parameters is non-NULL.

Table 35-19   Behavior When at Least One exclude Parameter Is Non-NULL

See the documentation for the Oracle GoldenGate product for more information:

http://docs.oracle.com/cd/E15881_01/index.htm
Note:
A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process's rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process's rule sets.

Oracle Database XStream Guide

35.3.17 START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 35-21  START_CAPTURE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>The capture process uses LogMiner to capture changes in the redo information.</td>
</tr>
<tr>
<td></td>
<td>A NULL setting is not allowed.</td>
</tr>
</tbody>
</table>

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (cnnn) is an Oracle background process.
35.3.18 STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```sql
DBMS_CAPTURE_ADM.STOP_CAPTURE(
    capture_name  IN  VARCHAR2,
    force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 35-22  STOP_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CPnn, where nn can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.
DBMS_CLOUD

The DBMS_CLOUD package provides comprehensive support for working with data in Object Storage.

This chapter contains the following topics:

• DBMS_CLOUD Overview
• Installing the DBMS_CLOUD Package
• DBMS_CLOUD Security Model
• DBMS_CLOUD Exceptions
• Summary of DBMS_CLOUD Subprograms
• DBMS_CLOUD Package File URI Formats
• DBMS_CLOUD Package Format Options
• DBMS_CLOUD Avro and Parquet Support

36.1 DBMS_CLOUD Overview

Using DBMS_CLOUD to work with data in Object Storage you can do the following:

• Manage your credentials for accessing Object Store.
• Copy data as-is: External data is loaded into the database in a single one-step operation, without the need to create any objects in the database. The load operation is monitored and tracked inside the database.
• Manage the information about your load operations.
• Validate the content of external data prior to consumption. Prior to consumption of external data you verify its content and identify rows that do not conform to the expected external data format.
• Create an external table. Create the necessary object in the database for flexible and continuous consumption.
• Work with objects in object stores and directories.

36.2 Installing the DBMS_CLOUD Package

The DBMS_CLOUD package provides a comprehensive support for working with data in Object Storage starting with Oracle Database 19c and later releases. However, this package is not pre-installed with Oracle Database. You need to manually install the DBMS_CLOUD package and also configure users or roles to use this package.

For information on installing the DBMS_CLOUD package and configuring users/roles, see the MOS-NOTE with Doc ID 2748362.1.
36.3 DBMS_CLOUD Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles.

36.4 DBMS_CLOUD Exceptions

The following table describes exceptions for DBMS_CLOUD.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reject_limit</td>
<td>20003</td>
<td>The reject limit of an external table was reached.</td>
</tr>
<tr>
<td>credential_not_exist</td>
<td>20004</td>
<td>A credential object does not exist.</td>
</tr>
<tr>
<td>table_not_exist</td>
<td>20005</td>
<td>A table does not exist.</td>
</tr>
<tr>
<td>unsupported_obj_store</td>
<td>20006</td>
<td>An unsupported object store URI was provided.</td>
</tr>
<tr>
<td>iden_too_long</td>
<td>20008</td>
<td>An identifier is too long.</td>
</tr>
<tr>
<td>invalid_format</td>
<td>20009</td>
<td>A format argument is not valid.</td>
</tr>
<tr>
<td>missing_credential</td>
<td>20010</td>
<td>Mandatory credential object information was not specified.</td>
</tr>
<tr>
<td>invalid_object_uri</td>
<td>20011</td>

</tbody>
</table>

36.5 Summary of DBMS_CLOUD Subprograms

This section covers the DBMS_CLOUD subprograms provided with Oracle Database.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPY_DATA Procedure</td>
<td>This procedure loads data into existing Oracle Database tables from files in the Cloud.</td>
</tr>
<tr>
<td>COPY_DATA Procedure for Avro or Parquet Files</td>
<td>This procedure with the format parameter type set to the value avro or parquet loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud. Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table.</td>
</tr>
<tr>
<td>CREATE_CREDENTIAL Procedure</td>
<td>This procedure stores cloud service credentials in Oracle Database.</td>
</tr>
<tr>
<td>CREATE_EXTERNAL_TABLE Procedure</td>
<td>This procedure creates an external table on files in the Cloud. This allows you to run queries on external data from Oracle Database.</td>
</tr>
<tr>
<td>CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files</td>
<td>This procedure with the format parameter type set to the value avro or parquet creates an external table with either Avro or Parquet format files in the Cloud. This allows you to run queries on external data from Oracle Database.</td>
</tr>
<tr>
<td>CREATE_EXTERNAL_PART_TABLE Procedure</td>
<td>This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.</td>
</tr>
<tr>
<td>CREATE_HYBRID_PART_TABLE Procedure</td>
<td>This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.</td>
</tr>
<tr>
<td>DELETE_ALL_OPERATIONS Procedure</td>
<td>This procedure clears either all data load operations logged in the user_load_operations table in your schema or clears all the data load operations of the specified type, as indicated with the type parameter.</td>
</tr>
<tr>
<td>DELETE_FILE Procedure</td>
<td>This procedure removes the specified file from the specified directory on Oracle Database.</td>
</tr>
<tr>
<td>DELETE_OBJECT Procedure</td>
<td>This procedure deletes the specified object on object store.</td>
</tr>
<tr>
<td>DROP_CREDENTIAL Procedure</td>
<td>This procedure removes an existing credential from Oracle Database.</td>
</tr>
<tr>
<td>GET_OBJECT Procedure and Function</td>
<td>This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a BLOB to Oracle Database.</td>
</tr>
<tr>
<td>LIST_FILES Function</td>
<td>This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.</td>
</tr>
<tr>
<td>LIST_OBJECTS Function</td>
<td>This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.</td>
</tr>
<tr>
<td>PUT_OBJECT Procedure</td>
<td>This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a BLOB from Oracle Database to the Cloud Object Storage.</td>
</tr>
</tbody>
</table>
Subprogram | Description
--- | ---
**UPDATE_CREDENTIAL Procedure** | This procedure updates cloud service credential attributes in Oracle Database.

**VALIDATE_EXTERNAL_TABLE Procedure** | This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database.

**VALIDATE_EXTERNAL_PART_TABLE Procedure** | This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database.

**VALIDATE_HYBRID_PART_TABLE Procedure** | This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Oracle Database.

### 36.5.1 COPY_DATA Procedure

This procedure loads data into existing Oracle Database tables from files in the Cloud. The overloaded form enables you to use the *operation_id* parameter.

#### Syntax

```sql
DBMS_CLOUD.COPY_DATA (    table_name        IN VARCHAR2,
  credential_name   IN VARCHAR2,
  file_uri_list     IN CLOB,
  schema_name       IN VARCHAR2,
  field_list        IN CLOB,
  format            IN CLOB);
```

```sql
DBMS_CLOUD.COPY_DATA (    table_name        IN VARCHAR2,
  credential_name   IN VARCHAR2 DEFAULT NULL,
  file_uri_list     IN CLOB DEFAULT NULL,
  schema_name       IN VARCHAR2 DEFAULT NULL,
  field_list        IN CLOB DEFAULT NULL,
  format            IN CLOB DEFAULT NULL,
  operation_id      OUT NOCOPY NUMBER);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the target table on the database. The target table needs to be created before you run COPY_DATA.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
</tbody>
</table>
### Parameter | Description
--- | ---
file_uri_list | Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. The format of the URIs depend on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.
schema_name | The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.
field_list | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the target table definition. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see Oracle® Database Utilities. For an example using field_list, see CREATE_EXTERNAL_TABLE Procedure.
format | The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro or Parquet file format options, see DBMS_CLOUD Package Format Options for Avro or Parquet.
operation_id | Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

### 36.5.2 COPY_DATA Procedure for Avro or Parquet Files

This procedure with the format parameter type set to the value avro or parquet loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud. Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table.

**Syntax**

```sql
DBMS_CLOUD.COPY_DATA (  
    table_name        IN VARCHAR2,  
    credential_name   IN VARCHAR2,  
    file_uri_list     IN CLOB,  
    schema_name       IN VARCHAR2 DEFAULT,  
    field_list        IN CLOB DEFAULT,  
    format            IN CLOB DEFAULT);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the target table on the database. The target table needs to be created before you run COPY_DATA.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>file_uri_list</td>
<td>Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character &quot;*&quot; can be used as the wildcard for multiple characters, the character &quot;?&quot; can be used as the wildcard for a single character.</td>
</tr>
<tr>
<td></td>
<td>The format of the URIs depend on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.</td>
</tr>
<tr>
<td>field_list</td>
<td>Ignored for Avro or Parquet files.</td>
</tr>
<tr>
<td></td>
<td>The fields in the source match the external table columns by name. Source data types are converted to the external table column data type.</td>
</tr>
<tr>
<td></td>
<td>For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details on mapping.</td>
</tr>
<tr>
<td></td>
<td>For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details on mapping.</td>
</tr>
<tr>
<td>format</td>
<td>The options describing the format of the source files. For Avro or Parquet files, only two options are supported: see DBMS_CLOUD Package Format Options for Avro or Parquet.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- As with other data files, Avro and Parquet data loads generate logs that are viewable in the tables dba_load_operations and user_load_operations. Each load operation adds a record to dba[\[user\]]_load_operations that indicates the table containing the logs. The log table provides summary information about the load.

- For Avro or Parquet, when the format parameter type is set to the value avro or parquet, the BADFILE_TABLE table is always empty.
  - For Parquet files, PRIMARY KEY constraint errors throw an ORA error.
  - If data for a column encounters a conversion error, for example, the target column is not large enough to hold the converted value, the value for the column is set to NULL. This does not produce a rejected record.

### 36.5.3 CREATE_CREDENTIAL Procedure

This procedure stores cloud service credentials in Oracle Database.

Use stored cloud service credentials to access the cloud service for data loading, for querying external data residing in the cloud, or for other cases when you use DBMS_CLOUD procedures with a credential_name parameter. This procedure is overloaded. Use the Oracle Cloud Infrastructure-related parameters, including: user_ocid, tenancy_ocid, private_key, and fingerprint only when you are using Oracle Cloud Infrastructure Signing Keys authentication.

**Syntax**

```sql
DBMS_CLOUD.CREATE_CREDENTIAL (credential_name IN VARCHAR2,
```
username          IN VARCHAR2,
password          IN VARCHAR2 DEFAULT NULL);

DBMS_CLOUD.CREATE_CREDENTIAL (  
  credential_name IN VARCHAR2,
  user_ocid       IN VARCHAR2,
  tenancy_ocid    IN VARCHAR2,
  private_key     IN VARCHAR2,
  fingerprint     IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to be stored.</td>
</tr>
<tr>
<td>username</td>
<td>The username and password arguments together specify your cloud service credentials. See below for what to specify for the username and password for different cloud services.</td>
</tr>
<tr>
<td>password</td>
<td>The username and password arguments together specify your cloud service credentials.</td>
</tr>
<tr>
<td>user_ocid</td>
<td>Specifies the user's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the User's OCID.</td>
</tr>
<tr>
<td>tenancy_ocid</td>
<td>Specifies the tenancy's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the Tenancy's OCID.</td>
</tr>
<tr>
<td>private_key</td>
<td>Specifies the generated private key. Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for details on generating a key pair in PEM format.</td>
</tr>
<tr>
<td>fingerprint</td>
<td>Specifies a fingerprint. After a generated public key is uploaded to the user's account the fingerprint is displayed in the console. Use the displayed fingerprint for this argument. See How to Get the Key's Fingerprint and How to Generate an API Signing Key for more details.</td>
</tr>
</tbody>
</table>

Usage Notes

- This operation stores the credentials in the database in an encrypted format.
- You can see the credentials in your schema by querying the user_credentials table.
- The ADMIN user can see all the credentials by querying the dba_credentials table.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for DBMS_CLOUD procedures that require a credential_name parameter.
- This procedure is overloaded. If you provide one of the key based authentication attributes, user_ocid, tenancy_ocid, private_key, or fingerprint, the call is assumed to be an Oracle Cloud Infrastructure Signing Key based credential.
- On Oracle Cloud Infrastructure, private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for more information.
Oracle Cloud Infrastructure Credentials (Auth Tokens)

For Oracle Cloud Infrastructure the **username** is your Oracle Cloud Infrastructure user name. The **password** is your Oracle Cloud Infrastructure auth token. See [Working with Auth Tokens](#).

Oracle Cloud Infrastructure Object Storage Classic Credentials

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, the **username** is your Oracle Cloud Infrastructure Classic user name and the **password** is your Oracle Cloud Infrastructure Classic password.

Amazon Web Services (AWS) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, the **username** is your AWS access key ID and the **password** is your AWS secret access key. See [AWS Identity and Access Management](#).

Microsoft Azure Credentials

If your source files reside in Azure Blob Storage or you are calling an Azure API, the **username** is your Azure storage account name and the **password** is an Azure storage account access key. See [About Azure storage accounts](#).

### 36.5.4 CREATE_EXTERNAL_TABLE Procedure

This procedure creates an external table on files in the Cloud. This allows you to run queries on external data from Oracle Database.

**Syntax**

```sql
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (  
    table_name       IN VARCHAR2,  
    credential_name  IN VARCHAR2,  
    file_uri_list    IN CLOB,  
    column_list      IN CLOB,  
    field_list       IN CLOB DEFAULT,  
    format           IN CLOB DEFAULT);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>file_uri_list</td>
<td>Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character &quot;*&quot; can be used as the wildcard for multiple characters, the character &quot;?&quot; can be used as the wildcard for a single character. The format of the URIs depend on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a>.</td>
</tr>
</tbody>
</table>
Parameter | Description |
---|---|
`column_list` | Comma-delimited list of column names and data types for the external table. |
`field_list` | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the `column_list` parameter. This argument's syntax is the same as the `field_list` clause in regular Oracle external tables. For more information about `field_list` see Oracle® Database Utilities. |
`format` | The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro or Parquet format files, see CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files. |

**Usage Notes**

- The procedure DBMS_CLOUD.CREATE_EXTERNAL_TABLE supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3

The credential is a table level property; therefore, the external files must be on the same object store.

See DBMS_CLOUD Package File URI Formats for more information.

**Example**

```sql
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
    table_name =>'WEATHER_REPORT_DOUBLE_DATE',
    credential_name =>'OBJ_STORE_CRED',
    file_uri_list =>'&base_URL/Charlotte_NC_Weather_History_Double_Dates.csv',
    format => json_object('type' value 'csv', 'skipheaders' value '1'),
    field_list => 'REPORT_DATE DATE''mm/dd/yy'','
    REPORT_DATE_COPY DATE ''yyyy-mm-dd''',
    ACTUAL_MEAN_TEMP,
    ACTUAL_MIN_TEMP,
    ACTUAL_MAX_TEMP,
    AVERAGE_MIN_TEMP,
    AVERAGE_MAX_TEMP,
    AVERAGE_PRECIPITATION',
    column_list => 'REPORT_DATE DATE,'
    REPORT_DATE_COPY DATE,'
    ACTUAL_MEAN_TEMP NUMBER,'
    ACTUAL_MIN_TEMP NUMBER,'
    ACTUAL_MAX_TEMP NUMBER,'
    AVERAGE_MIN_TEMP NUMBER,'
    AVERAGE_MAX_TEMP NUMBER,'
    AVERAGE_PRECIPITATION NUMBER',
  );
END;
```
36.5.5 CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files

This procedure with the format parameter type set to the value avro or parquet creates an external table with either Avro or Parquet format files in the Cloud. This allows you to run queries on external data from Oracle Database.

Syntax

```sql
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (  
table_name IN VARCHAR2,  
credential_name IN VARCHAR2,  
file_uri_list IN CLOB,  
column_list IN CLOB,  
field_list IN CLOB DEFAULT,  
format IN CLOB DEFAULT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>file_uri_list</td>
<td>Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character ‘*’ can be used as the wildcard for multiple characters, the character ‘?’ can be used as the wildcard for a single character. The format of the URIs depend on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.</td>
</tr>
<tr>
<td>column_list</td>
<td>(Optional) This field, when specified, overrides the format-schema parameter which specifies that the schema, columns, and data types, are derived automatically. See the format parameter for details. When the column_list is specified for Avro or Parquet source, the column names must match those columns found in the file. Oracle data types must map appropriately to the Avro or Parquet data types. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details.</td>
</tr>
</tbody>
</table>
**Parameter** | **Description**
--- | ---
field_list | Ignored for Avro or Parquet files. The fields in the source match the external table columns by name. Source data types are converted to the external table column data type. For Parquet files, see `DBMS_CLOUD Parquet to Oracle Data Type Mapping` for details. For Avro files, see `DBMS_CLOUD Avro to Oracle Data Type Mapping` for details.

format | For Avro or Parquet, there are only two supported parameters. See `DBMS_CLOUD Format Options for Avro or Parquet` for details.

**Examples Avro**

```
format => '{"type":"avro", "schema": "all"}'
```

```
format => json_object('type' value 'avro', 'schema' value 'first')
```

**Examples Parquet**

```
format => '{"type":"parquet", "schema": "all"}'
```

```
format => json_object('type' value 'parquet', 'schema' value 'first')
```

**Avro or Parquet Column Name Mapping to Oracle Column Names**

See `DBMS_CLOUD Avro and Parquet to Oracle Column Name Mapping` for information on column name mapping and column name conversion usage in Oracle SQL.

### 36.5.6 CREATE_EXTERNAL_PART_TABLE Procedure

This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.

**Syntax**

```
DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (  
  table_name IN VARCHAR2,  
  credential_name IN VARCHAR2,  
  partitioning_clause IN CLOB,  
  column_list IN CLOB,  
  field_list IN CLOB DEFAULT,  
  format IN CLOB DEFAULT);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>partitioning_clause</td>
<td>Specifies the complete partitioning clause, including the location information for individual partitions.</td>
</tr>
<tr>
<td>column_list</td>
<td>Comma-delimited list of column names and data types for the external table.</td>
</tr>
<tr>
<td>field_list</td>
<td>Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the column_list parameter. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see Oracle® Database Utilities.</td>
</tr>
<tr>
<td>format</td>
<td>The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options.</td>
</tr>
</tbody>
</table>

Usage Notes

- With Avro or Parquet data format using DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE, the schema format option is not available and the column_list parameter must be specified. The schema format option is available with DBMS_CLOUD.CREATE_EXTERNAL_TABLE.
- The procedure DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3

See DBMS_CLOUD Package File URI Formats for more information.

Example

BEGIN
   DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
      table_name =>'PET1',
      credential_name =>'OBJ_STORE_CRED',
      format => json_object('delimiter' value ',', 'recorddelimiter' value 'newline', 'characterset' value 'us7ascii'),
      column_list => 'col1 number, col2 number, col3 number',
      partitioning_clause => 'partition by range (col1)
                               (partition p1 values less than (1000)
                                location ( ''&base_URL//file_11.txt'' ),
                                partition p2 values less than (2000)
                                location ( ''&base_URL//file_21.txt'' ),
                               ...)
   )
END
36.5.7 CREATE_HYBRID_PART_TABLE Procedure

This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.

Syntax

```sql
DBMS_CLOUD.CREATE_HYBRID_PART_TABLE (  
    table_name           IN VARCHAR2,  
    credential_name      IN VARCHAR2,  
    partitioning_clause  IN CLOB,  
    column_list          IN CLOB,  
    field_list           IN CLOB DEFAULT,  
    format               IN CLOB DEFAULT);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>partitioning_clause</td>
<td>Specifies the complete partitioning clause, including the location information for individual partitions.</td>
</tr>
<tr>
<td>column_list</td>
<td>Comma-delimited list of column names and data types for the external table.</td>
</tr>
<tr>
<td>field_list</td>
<td>Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the column_list parameter. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see Oracle® Database Utilities.</td>
</tr>
<tr>
<td>format</td>
<td>The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options.</td>
</tr>
</tbody>
</table>

Usage Note

- The procedure `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3
The credential is a table level property; therefore, the external files must be on the same object store.

See DBMS_CLOUD Package File URI Formats for more information.

Example

```sql
BEGIN
    DBMS_CLOUD.CREATE_HYBRID_PART_TABLE(
        table_name =>'HPT1',
        credential_name =>'OBJ_STORE_CRED',
        format => json_object('delimiter' value ',', 'recorddelimiter' value 'newline', 'characterset' value 'us7ascii'),
        column_list => 'col1 number, col2 number, col3 number',
        partitioning_clause => 'partition by range (col1)
            (partition p1 values less than (1000) external location ''&base_URL/file_11.txt'')
            partition p2 values less than (2000) external location ''&base_URL/file_21.txt'')
            partition p3 values less than (3000) ''
    );
END;
/```

36.5.8 DELETE_ALL_OPERATIONS Procedure

This procedure clears either all data load operations logged in the user_load_operations table in your schema or clears all the data load operations of the specified type, as indicated with the type parameter.

Syntax

```sql
DBMS_CLOUD.DELETE_ALL_OPERATIONS (type IN VARCHAR DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Specifies the type of operation to delete. Type values can be found in the TYPE column in the user_load_operations table. If no type is specified all rows are deleted.</td>
</tr>
</tbody>
</table>

Usage Note

- DBMS_CLOUD.DELETE_ALL_OPERATIONS does not delete currently running operations (operations in a “Running” status).
36.5.9 DELETE_FILE Procedure

This procedure removes the specified file from the specified directory on Oracle Database.

Syntax

```sql
DBMS_CLOUD.DELETE_FILE (  
directory_name IN VARCHAR2,  
file_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_name</td>
<td>The name of the directory on the Oracle Database instance.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file to be removed.</td>
</tr>
</tbody>
</table>

Note:

To run `DBMS_CLOUD.DELETE_FILE` with a user other than ADMIN you need to grant write privileges on the directory that contains the file to that user. For example, run the following command as ADMIN to grant write privileges to `db_user`:

```
GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
```

Example

```sql
BEGIN
    DBMS_CLOUD.DELETE_FILE(  
        directory_name => 'DATA_PUMP_DIR',  
        file_name => 'exp1.dmp');
END;
/
```

36.5.10 DELETE_OBJECT Procedure

This procedure deletes the specified object on object store.

Syntax

```sql
DBMS_CLOUD.DELETE_OBJECT (  
    credential_name IN VARCHAR2,  
    object_uri IN VARCHAR2);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>object_uri</td>
<td>Object or file URI for the object to delete. The format of the URI depends on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a>.</td>
</tr>
</tbody>
</table>

Example

BEGIN
    DBMS_CLOUD.DELETE_OBJECT(
        credential_name => 'DEF_CRED_NAME',
        object_uri => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/namespace-string/b/bucketname/o/exp1.dmp');
END;
/

36.5.11 DROP_CREDENTIAL Procedure

This procedure removes an existing credential from Oracle Database.

Syntax

```
DBMS_CLOUD.DROP_CREDENTIAL (        
    credential_name     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to be removed.</td>
</tr>
</tbody>
</table>

36.5.12 GET_OBJECT Procedure and Function

This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a BLOB to Oracle Database.

Syntax

```
DBMS_CLOUD.GET_OBJECT (        
    credential_name     IN VARCHAR2,        
    object_uri          IN VARCHAR2,        
    directory_name      IN VARCHAR2,        
    file_name           IN VARCHAR2 DEFAULT NULL,        
    startoffset         IN NUMBER DEFAULT 0,        
    endoffset           IN NUMBER DEFAULT 0,        
    compression         IN VARCHAR2 DEFAULT NULL);
```
DBMS_CLOUD.GET_OBJECT(
    credential_name IN VARCHAR2 DEFAULT NULL,
    object_uri IN VARCHAR2,
    startoffset IN NUMBER DEFAULT 0,
    endoffset IN NUMBER DEFAULT 0,
    compression IN VARCHAR2 DEFAULT NULL)
RETURN BLOB;

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>object_uri</td>
<td>Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The name of the directory on the database.</td>
</tr>
<tr>
<td>file_name</td>
<td>Specifies the name of the file to create. If file name is not specified, the file name is taken from after the last slash in the object_uri parameter. For special cases, for example when the file name contains slashes, use the file_name parameter.</td>
</tr>
<tr>
<td>startoffset</td>
<td>The offset, in bytes, from where the procedure starts reading.</td>
</tr>
<tr>
<td>endoffset</td>
<td>The offset, in bytes, until where the procedure stops reading.</td>
</tr>
<tr>
<td>compression</td>
<td>Specifies the compression used to store the object. When compression is set to 'AUTO' the file is uncompressed (the value 'AUTO' implies the object specified with object_uri is compressed with Gzip).</td>
</tr>
</tbody>
</table>

**Note:**

To run `DBMS_CLOUD.GET_OBJECT` with a user other than ADMIN you need to grant WRITE privileges on the directory to that user. For example, run the following command as ADMIN to grant write privileges to `db_user`:

```sql
GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
```

**Return Values**

The function form reads from Object Store and `DBMS_CLOUD.GET_OBJECT` returns a BLOB.

**Examples**

```sql
BEGIN
    DBMS_CLOUD.GET_OBJECT(
        credential_name => 'OBJ_STORE_CRED',
        object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/file.txt',
        directory_name => 'DATA_PUMP_DIR');
END;
```
To read character data from a file in Object Store:

```sql
SELECT to_clob(
    DBMS_CLOUD.GET_OBJECT(
        credential_name => 'OBJ_STORE_CRED',
        object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/file.txt'))
FROM DUAL;
```

To add an image stored on Object Store in a BLOB in the database:

```sql
DECLARE
    l_blob BLOB := NULL;
BEGIN
    l_blob := DBMS_CLOUD.GET_OBJECT(
        credential_name => 'OBJ_STORE_CRED',
        object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/MyImage.gif');
END;
/
```

In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See Understanding Object Storage Namespaces for more information.

### 36.5.13 LIST_FILES Function

This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.

**Syntax**

```sql
DBMS_CLOUD.LIST_FILES (directory_name IN VARCHAR2) RETURN TABLE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_name</td>
<td>The name of the directory on the database.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- `DBMS_CLOUD.LIST_FILES` is only supported for directory objects mapping to Oracle File System (OFS) or Database File System (DBFS) file systems.
To run DBMS_CLOUD.LIST_FILES with a user other than ADMIN you need to grant read privileges on the directory to that user. For example, run the following command as ADMIN to grant read privileges to db_user:

```
GRANT READ ON DIRECTORY data_pump_dir TO db_user;
```

This is a pipelined table function with return type as DBMS_CLOUD_TYPES.list_object_ret_t.

DBMS_CLOUD.LIST_FILES does not obtain the checksum value and returns NULL for this field.

Example

This is a pipelined function that returns a row for each file. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_FILES('DATA_PUMP_DIR');
```

<table>
<thead>
<tr>
<th>OBJECT_NAME</th>
<th>BYTES</th>
<th>CHECKSUM</th>
<th>CREATED</th>
<th>LAST_MODIFIED</th>
</tr>
</thead>
<tbody>
<tr>
<td>cwallet.sso</td>
<td>2965</td>
<td></td>
<td>2018-12-12T18:10:47Z</td>
<td>2019-11-23T06:36:54Z</td>
</tr>
</tbody>
</table>

### 36.5.14 LIST_OBJECTS Function

This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.

**Syntax**

```
DBMS_CLOUD.LIST_OBJECTS (    
    credential_name IN VARCHAR2,    
    location_uri   IN VARCHAR2) 
RETURN TABLE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>location_uri</td>
<td>Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Depending on the capabilities of the object store, DBMS_CLOUD.LIST_OBJECTS does not return values for certain attributes and the return value for the field is NULL in this case.
All supported Object Stores return values for the OBJECT_NAME, BYTES, and CHECKSUM fields.

The following table shows support for the fields CREATED and LAST_MODIFIED by Object Store:

<table>
<thead>
<tr>
<th>Object Store</th>
<th>CREATED</th>
<th>LAST_MODIFIED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Cloud Infrastructure Native</td>
<td>Returns timestamp</td>
<td>Returns NULL</td>
</tr>
<tr>
<td>Oracle Cloud Infrastructure Swift</td>
<td>Returns NULL</td>
<td>Returns timestamp</td>
</tr>
<tr>
<td>Oracle Cloud Infrastructure Classic</td>
<td>Returns NULL</td>
<td>Returns timestamp</td>
</tr>
<tr>
<td>Amazon S3</td>
<td>Returns NULL</td>
<td>Returns timestamp</td>
</tr>
<tr>
<td>Azure</td>
<td>Returns timestamp</td>
<td>Returns timestamp</td>
</tr>
</tbody>
</table>

- The checksum value is the MD5 checksum. This is a 32-character hexadecimal number that is computed on the object contents.
- This is a pipelined table function with return type as `DBMS_CLOUD_TYPES.list_object_ret_t`.

**Example**

This is a pipelined function that returns a row for each object. For example, use the following query to use this function:

```sql
SELECT * FROM DBMS_CLOUD.LIST_OBJECTS('OBJ_STORE_CRED', 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/');
```

<table>
<thead>
<tr>
<th>OBJECT_NAME</th>
<th>BYTES</th>
<th>CHECKSUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>cwallet.sso</td>
<td>2965</td>
<td>2339a2731ba24a837b26d344d643dc07</td>
</tr>
<tr>
<td></td>
<td>2019-11-23T06:36:54Z</td>
<td></td>
</tr>
</tbody>
</table>

In this example, namespace-string is the Oracle Cloud Infrastructure object storage namespace and bucketname is the bucket name. See Understanding Object Storage Namespaces for more information.

**36.5.15 PUT_OBJECT Procedure**

This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a BLOB from Oracle Database to the Cloud Object Storage.

**Syntax**

```sql
DBMS_CLOUD.PUT_OBJECT ( credential_name IN VARCHAR2, object_uri IN VARCHAR2, directory_name IN VARCHAR2, file_name IN VARCHAR2);
```
DBMS_CLOUD.PUT_OBJECT (  
    credential_name      IN VARCHAR2,  
    object_uri           IN VARCHAR2,  
    contents             IN BLOB,  
    file_name            IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to access the Cloud Object Storage.</td>
</tr>
<tr>
<td>object_uri</td>
<td>Object or file URI. The format of the URI depends on the Cloud Object</td>
</tr>
<tr>
<td></td>
<td>Storage service you are using, for details see DBMS_CLOUD Package File URI</td>
</tr>
<tr>
<td>directory_name</td>
<td>The name of the directory on the Oracle Database.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file in the specified directory.</td>
</tr>
</tbody>
</table>

**Note:**

To run DBMS_CLOUD.PUT_OBJECT with a user other than ADMIN you need to grant read privileges on the directory to that user. For example, run the following command as ADMIN to grant read privileges to db_user:

```
GRANT READ ON DIRECTORY data_pump_dir TO db_user;
```

Example

To handle BLOB data after in-database processing and then store the data directly into a file in the object store:

```
DECLARE
    my_blob_data BLOB;
BEGIN
    /* Some processing producing BLOB data and populating my_blob_data */
    DBMS_CLOUD.PUT_OBJECT(  
        credential_name => 'OBJ_STORE_CRED',  
        object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/my_new_file',  
        contents => my_blob_data));
END;
/
```

Usage Notes

Depending on your Cloud Object Storage, the size of the object you transfer is limited as follows:
Cloud Object Storage Service | Object Transfer Size Limit
---|---
Oracle Cloud Infrastructure Object Storage | 50 GB
Amazon S3 | 5 GB
Azure Blob Storage | 256 MB

Oracle Cloud Infrastructure object store does not allow writing files into a public bucket without supplying credentials (Oracle Cloud Infrastructure allows users to download objects from public buckets). Thus, you must supply a credential name with valid credentials to store an object in an Oracle Cloud Infrastructure public bucket using `PUT_OBJECT`.

See [DBMS_CLOUD Package File URI Formats](#) for more information.

### 36.5.16 UPDATE_CREDENTIAL Procedure

This procedure updates cloud service credential attributes in Oracle Database.

Use stored credentials for data loading, for querying external data residing in the Cloud, or wherever you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure lets you update an attribute with a new value for a specified `credential_name`.

#### Syntax

```sql
DBMS_CLOUD.UPDATE_CREDENTIAL (  
    credential_name   IN VARCHAR2,
    attribute         IN VARCHAR2,
    value             IN VARCHAR2);  
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential to be stored.</td>
</tr>
<tr>
<td>attribute</td>
<td>Name of attribute to update: USERNAME or PASSWORD.</td>
</tr>
<tr>
<td>value</td>
<td>New value for the selected attribute.</td>
</tr>
</tbody>
</table>

#### Usage Notes

- The user name is case sensitive. It cannot contain double quotes or spaces.
- The `ADMIN` user can see all the credentials by querying the `dba_credentials` table.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.

#### Example

```sql
BEGIN  
  DBMS_CLOUD.UPDATE_CREDENTIAL(  
    credential_name => 'OBJ_STORE_CRED',  
    attribute => 'USERNAME',  
    value => 'my_username';  
END;
```

36.5.17 VALIDATE_EXTERNAL_TABLE Procedure

This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a badfile table on Oracle Database. The overloaded form enables you to use the operation_id parameter.

Syntax

```sql
DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE (
    table_name      IN VARCHAR2,
    schema_name     IN VARCHAR2 DEFAULT,
    rowcount        IN NUMBER DEFAULT,
    stop_on_error   IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE(
    table_name      IN VARCHAR2,
    operation_id    OUT NOCOPY NUMBER,
    schema_name     IN VARCHAR2 DEFAULT NULL,
    rowcount        IN NUMBER DEFAULT 0,
    stop_on_error   IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>operation_id</td>
<td>Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.</td>
</tr>
<tr>
<td>rowcount</td>
<td>Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.</td>
</tr>
<tr>
<td>stop_on_error</td>
<td>Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter.</td>
</tr>
</tbody>
</table>

If the external table refers to Avro or Parquet files then the validate stops at the first rejected row.

When the external table specifies the format parameter type set to the value avro or parquet, the parameter stop_on_error effectively always has the value TRUE. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.
Usage Notes

- `DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE` works with both partitioned external tables and hybrid partitioned tables. This potentially reads data from all external partitions until `rowcount` is reached or `stop_on_error` applies. You do not have control over which partition, or parts of a partition, is read in which order.

36.5.18 VALIDATE_EXTERNAL_PART_TABLE Procedure

This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a `badfile` table on Oracle Database. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```sql
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (  
    table_name                 IN VARCHAR2,  
    partition_name             IN CLOB DEFAULT,  
    schema_name                IN VARCHAR2 DEFAULT,  
    rowcount                   IN NUMBER DEFAULT,  
    partition_key_validation   IN BOOLEAN DEFAULT,  
    stop_on_error              IN BOOLEAN DEFAULT);  
```

```sql
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (  
    table_name                 IN VARCHAR2,  
    operation_id               OUT NUMBER,  
    partition_name             IN CLOB DEFAULT,  
    schema_name                IN VARCHAR2 DEFAULT,  
    rowcount                   IN NUMBER DEFAULT,  
    partition_key_validation   IN BOOLEAN DEFAULT,  
    stop_on_error              IN BOOLEAN DEFAULT);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_name</code></td>
<td>The name of the external table.</td>
</tr>
<tr>
<td><code>operation_id</code></td>
<td>Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.</td>
</tr>
<tr>
<td><code>partition_name</code></td>
<td>If defined, then only a specific partition is validated. If not specified then read all partitions sequentially until <code>rowcount</code> is reached.</td>
</tr>
<tr>
<td><code>schema_name</code></td>
<td>The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.</td>
</tr>
<tr>
<td><code>rowcount</code></td>
<td>Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.</td>
</tr>
</tbody>
</table>
### 36.5.19 VALIDATE_HYBRID_PART_TABLE Procedure

This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a `badfile` table on Oracle Database. The overloaded form enables you to use the `operation_id` parameter.

#### Syntax

```sql
DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (    table_name IN VARCHAR2,    partition_name IN CLOB DEFAULT,    schema_name IN VARCHAR2 DEFAULT,    rowcount IN NUMBER DEFAULT,    partition_key_validation IN BOOLEAN DEFAULT,    stop_on_error IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (    table_name IN VARCHAR2,    operation_id OUT NUMBER,    partition_name IN CLOB DEFAULT,    schema_name IN VARCHAR2 DEFAULT,    rowcount IN NUMBER DEFAULT,    partition_key_validation IN BOOLEAN DEFAULT,    stop_on_error IN BOOLEAN DEFAULT);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the external table.</td>
</tr>
<tr>
<td>operation_id</td>
<td>Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.</td>
</tr>
<tr>
<td>partition_name</td>
<td>If defined, then only a specific partition is validated. If not specified then read from all external partitions sequentially until <code>rowcount</code> is reached.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.</td>
</tr>
<tr>
<td>rowcount</td>
<td>Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_key_validation</td>
<td>For internal use only. Do not use this parameter.</td>
</tr>
<tr>
<td>stop_on_error</td>
<td>Determines if the validate should stop when a row is rejected. The default value is <code>TRUE</code> meaning the validate stops at the first rejected row. Setting the value to <code>FALSE</code> specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the <code>rowcount</code> parameter.</td>
</tr>
</tbody>
</table>

### 36.6 DBMS_CLOUD Package File URI Formats

Describes the format of the source file URIs in operations with DBMS_CLOUD. The format depends on the object storage service you are using.

DBMS_CLOUD guarantees secure communication and any URI that you specify must use HTTPS, with `https://` as the prefix for the URI.

**Topics**

- Oracle Cloud Infrastructure Object Storage Native URI Format
- Oracle Cloud Infrastructure Object Storage Swift URI Format
- Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL
- URI Format Using Public URL
- Oracle Cloud Infrastructure Object Storage Classic URI Format
- Amazon S3 URI Format
- Azure Blob Storage URI Format

#### 36.6.1 Oracle Cloud Infrastructure Object Storage Native URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure native URIs, with the format:

https://objectstorage.region.oraclecloud.com/n/namespace-string/b/bucket/o/filename

For example, the Native URI for the file `channels.txt` in the `bucketname` bucket in the Phoenix data center is:

https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/channels.txt

In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See Understanding Object Storage Namespaces for more information.

You can find the URI from the Oracle Cloud Infrastructure Object Storage "Object Details" in the right hand side ellipsis menu in the Object Store:
1. From the Oracle Cloud Infrastructure left navigation list click **Object Storage** → **Object Storage**.
2. From the Name column, select a bucket.
3. In the Objects area, click **View Object Details**.

4. On the **Object Details** page, the **URL Path (URI)** field shows the URI to access the object.

NOTE:
The source files need to be stored in an Object Storage tier bucket. Oracle Database does not support buckets in the Archive Storage tier. See **Overview of Object Storage** for more information.

### 36.6.2 Oracle Cloud Infrastructure Object Storage Swift URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure Swift URIs with the format:

```
https://swiftobjectstorage.region.oraclecloud.com/v1/namespace-string/bucket/filename
```

For example, the Swift URI for the file `channels.txt` in the `bucketname` bucket in the Phoenix data center is:

```
https://swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1/namespace-string/bucketname/channels.txt
```
36.6.3 Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure pre-authenticated URIs. When you create a pre-authenticated request, a unique URL is generated. You can then provide the unique URL to users in your organization, partners, or third parties to access the Object Storage resource target identified in the pre-authenticated request.

Note:
Carefully assess the business requirement for and the security ramifications of pre-authenticated access. When you create the pre-authenticated request URL, note the **Expiration** and the **Access Type** to make sure they are appropriate for your use.

A pre-authenticated request URL gives anyone who has the URL access to the targets identified in the request for as long as the request is active. In addition to considering the operational needs of pre-authenticated access, it is equally important to manage its distribution.

The format for pre-authenticated request URLs is:

```
https://objectstorage.region.oraclecloud.com/p/encrypted_string/n/namespace-string/b/bucketname/o/filename
```

For example, a sample pre-authenticated URI for the file `channels.txt` in the `bucketname` bucket in the Phoenix data center is:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/p/2xN-uDtWNsiD910UCyGue/n/namespace-string/b/bucketname/o/channels.txt
```

In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See Understanding Object Storage Namespaces for more information.

You can use a pre-authenticated URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Oracle Cloud Infrastructure object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.
For example:

BEGIN
  DBMS_CLOUD.COPY_DATA(
    table_name =>'CHANNELS',
    file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/p/
unique-pre-authenticated-string/n/namespace-string/b/bucketname/o/
channels.txt',
    format => json_object('delimiter' value ',') );
END;
/

Note:
A list of mixed URLs is valid. If the URL list contains both pre-authenticated URLs and URLs that require authentication, DBMS_CLOUD uses the specified credential_name to access the URLs that require authentication and for the pre-authenticated URLs the specified credential_name is ignored.

See Using Pre-Authenticated Requests for more information.

36.6.4 URI Format Using Public URL

If your source files reside on an Object Store that provides public URLs, you can use public URLs with DBMS_CLOUD procedures. Public means the Object Storage service supports anonymous, unauthenticated access to the Object Store files. See your Cloud Object Storage service for details on how to make an object public in a supported Object Store.

Note:
Carefully assess the business requirement for and the security ramifications of using public URLs. When you use public URLs, due to the file content not being authenticated, make sure this is appropriate for your use.

You can use a public URL in any DBMS_CLOUD procedure that takes a URL to access files in your object store, without the need to create a credential. You need to either specify the credential_name parameter as NULL or not supply a credential_name parameter.

For example the following uses DBMS_CLOUD.COPY_DATA without a credential_name:

BEGIN
  DBMS_CLOUD.COPY_DATA(
    table_name =>'CHANNELS',
    file_uri_list =>'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/chan_v3.dat',
    format => json_object('delimiter' value ',') );
END;
/
In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See Understanding Object Storage Namespaces for more information.

**Note:**

A list of mixed URLs is valid. If the URL list contains both public URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the public URLs the specified `credential_name` is ignored.

See Public Buckets for information on using Oracle Cloud Infrastructure public buckets.

### 36.6.5 Oracle Cloud Infrastructure Object Storage Classic URI Format

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, see the REST page for a description of the URI format for accessing your files: About REST URLs for Oracle Cloud Infrastructure Object Storage Classic Resources.

### 36.6.6 Amazon S3 URI Format

If your source files reside in Amazon S3, see the following for a description of the URI format for accessing your files: Accessing a Bucket.

For example the following refers to the file `channels.txt` in the `adb` bucket in the `us-west-2` region.

https://s3-us-west-2.amazonaws.com/adb/channels.txt

### 36.6.7 Azure Blob Storage URI Format

If your source files reside in Azure Blob Storage, see the following for a description of the URI format for accessing your files: Resource URI Syntax.

For example the following refers to the file `channels.txt` in the `adb` container in the storage account `db_user`:

https://db_user.blob.core.windows.net/adb/channels.txt

**Note:**

You can use Shared Access Signatures (SAS) URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Azure Blob Storage, without the need to create a credential. To use a Shared Access Signature (SAS) URL, either specify the `credential_name` parameter as NULL, or do not supply a `credential_name` parameter.

See Grant Limited Access to Azure Storage Resources Using Shared Access Signatures (SAS) for more information.
36.7 DBMS_CLOUD Package Format Options

The format argument in DBMS_CLOUD specifies the format of source files.

The two ways to specify the format argument are:

format => '{"format_option" : "format_value" }'

And:

format => json_object('format_option' value 'format_value')

Examples:

format => json_object('type' VALUE 'CSV')

To specify multiple format options, separate the values with a ",".

For example:

format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
                     'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull' value 'true')

Note:

For Avro or Parquet format options, see DBMS_CLOUD Package Format Options
for Avro or Parquet.

<table>
<thead>
<tr>
<th>Format Option</th>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>blankasnull</td>
<td>When set to true, loads fields consisting of spaces as null.</td>
<td>blankasnull : true</td>
</tr>
<tr>
<td></td>
<td>Default value: False</td>
<td></td>
</tr>
<tr>
<td>characterset</td>
<td>Specifies the characterset of source files</td>
<td>characterset: string</td>
</tr>
<tr>
<td></td>
<td>Default value: Database characterset</td>
<td></td>
</tr>
<tr>
<td>compression</td>
<td>Specifies the compression type of the source file. ZIP archiving format is not supported. Specifying the value auto checks for the compression types: gzip, zlib, bzip2.</td>
<td>compression: auto</td>
</tr>
<tr>
<td></td>
<td>Default value: Null value meaning no compression.</td>
<td></td>
</tr>
<tr>
<td>conversionerrors</td>
<td>If a row is rejected because of data type conversion errors, the related columns are stored as null or the row is rejected.</td>
<td>conversionerrors : reject_record</td>
</tr>
<tr>
<td></td>
<td>Default value: reject_record</td>
<td></td>
</tr>
<tr>
<td>Format Option</td>
<td>Description</td>
<td>Syntax</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
<td>--------</td>
</tr>
</tbody>
</table>
| dateformat    | Specifies the date format in the source file. The format option AUTO searches for the following formats: | dateformat: `string`  
|               | J  MM-DD-YYYYBC  MM-DD-YYYY  YYYYMMDD HHMISS  YYMMDD HHMISS  YYYY.DDD  YYYY-MM-DD | Default value: Database date format |
| delimiter     | Specifies the field delimiter. To use a special character as the delimiter, specify the HEX value of the ASCII code of the character. For example, the following specifies the TAB character as the delimiter: | delimiter: `character`  
|               | `format => json_object('delimiter' value 'X''9'''')` | Default value: (pipe character) |
| escape        | The character "\" is used as the escape character when specified. | escape: `true`  
|               | Default value: `False` |  
| ignoreblanklines | Blank lines are ignored when set to true. | ignoreblanklines: `true`  
|               | Default value: `False` |  
| ignoremissingcolumns | If there are more columns in the field_list than there are in the source files, the extra columns are stored as null. | ignoremissingcolumns : `true`  
|               | Default value: `False` |  
| language      | Specifies a language name (for example, FRENCH), from which locale-sensitive information can be derived. | language: `string`  
| numericcharacters | Specifies the characters to use as the group separator and decimal character.  
|                  | `decimal_character`: The decimal separates the integer portion of a number from the decimal portion.  
|                  | `group_separator`: The group separator separates integer groups (that is, thousands, millions, billions, and so on). | numericcharacters:  
|                  | "decimal_character"  
|                  | "group_separator"  
| numberformat   | Specifies the number format model. Number format models cause the number to be rounded to the specified number of significant digits. A number format model is composed of one or more number format elements. This is used in combination with numericcharacters. | numberformat:  
|               | `number_format_model`  
|               | Default value: is derived from the setting of the NLS_TERRITORY parameter  
<p>|               | See Number Format Models in SQL Language Reference for more information. |</p>
<table>
<thead>
<tr>
<th>Format Option</th>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
</table>
| **quote**     | Specifies the quote character for the fields, the quote characters are removed during loading when specified. | quote: *character*  
Default value: Null meaning no quote |
| **recorddelimiter** | Specifies the record delimiter.  
By default, DBMS_CLOUD tries to automatically find the correct newline character as the delimeter. It first searches the file for the Windows newline character "\r\n". If it finds the Windows newline character, this is used as the record delimiter for the file. If a Windows newline character is not found, it searches for the UNIX/Linux newline character "\n" and if it finds one it uses it as the record delimiter for the file.  
Specify this argument explicitly if you want to override the default behavior, for example:  

```json
format =>
json_object('recorddelimiter' VALUE '''\r\n''')
```
To indicate that there is no record delimiter you can specify a recorddelimiter that does not occur in the input file. For example, to indicate that there is no delimiter, specify the control character 0x01 (SOH) as a value for the recorddelimiter and set the recorddelimiter value to "0x'01'" (this character does not occur in JSON text). For example:

```json
format => '{"recorddelimiter" : "0x'01'"}'
```
 | recorddelimiter: *character*  
Default value: newline |
| **rejectlimit** | The operation will error out after specified number of rows are rejected. | rejectlimit: *number*  
Default value: 0 |
| **removequotes** | Removes any quotes that are around any field in the source file. | removequotes: *true*  
Default value: False |
| **skipheaders** | Specifies how many rows should be skipped from the start of the file. | skipheaders: *number*  
Default value: 0 if not specified, 1 if specified without a value |
| **territory** | Specifies a territory name to further determine input data characteristics. | territory: *string*  
Default value: Null  
See Locale Data in *Oracle Database Globalization Support Guide* for a listing of Oracle-supported territories. |

### 36.8 DBMS_CLOUD Avro and Parquet Support

This section covers the DBMS_CLOUD Avro and Parquet support provided with Oracle Database.

**Topics**
- DBMS_CLOUD Package Format Options for Avro or Parquet
- DBMS_CLOUD Package Avro to Oracle Data Type Mapping
- DBMS_CLOUD Package Parquet to Oracle Data Type Mapping
- DBMS_CLOUD Package Avro and Parquet Complex Types
36.8.1 DBMS_CLOUD Package Format Options for Avro or Parquet

The format argument in DBMS_CLOUD specifies the format of source files.

The two ways to specify the format argument are:

format => '{"format_option" : "format_value" }'

And:

format => json_object('format_option' value 'format_value')

Examples:

format => json_object('type' VALUE 'CSV')

To specify multiple format options, separate the values with a ",".

For example:

format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true', 'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull' value 'true')

<table>
<thead>
<tr>
<th>Format Option</th>

<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Specifies the file type.</td>
<td>type : avro</td>
</tr>
<tr>
<td>schema</td>
<td>When schema is set to first or all, the external table columns and data types are automatically derived from the Avro or Parquet file metadata.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The column names will match those found in Avro or Parquet. The data types are converted from Avro or Parquet data types to Oracle data types. All columns are added to the table.</td>
<td>schema: first</td>
</tr>
<tr>
<td></td>
<td>The value first specifies to use the metadata from the first Avro or Parquet file in the file_uri_list to auto generate the columns and their data types. Use first if all of the files have the same schema.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The value all specifies to use the metadata from all Avro or Parquet files in the file_uri_list to auto generate the columns and their data types. Use all (slower) if the files may have different schemas.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Default:</strong> If column_list is specified, then the schema value, if specified is ignored. If column_list is not specified then the schema default value is first.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For Avro or Parquet format files the schema format option is not available and the column_list parameter must be specified for partitioned external tables using the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE procedure.</td>
<td></td>
</tr>
</tbody>
</table>
36.8.2 DBMS_CLOUD Package Avro to Oracle Data Type Mapping

Describes the mapping of Avro data types to Oracle data types.

<table>

</table>

See [DBMS_CLOUD Package Avro and Parquet Complex Types](#) for information on using Parquet complex types.

### 36.8.4 DBMS_CLOUD Package Avro and Parquet Complex Types

Describes the mapping of Avro and Parquet complex data types to Oracle data types.

Oracle Database supports complex data types, including the following complex types:

- struct
- list
- map
- union
- array

When you specify a source file type of Avro or Parquet and the source file includes complex columns, Oracle Database queries return JSON for the complex columns. This simplifies processing of query results; you can use Oracle's powerful JSON parsing features consistently across the file types and data types. The following table shows the format for the complex types in Oracle Database:
36.8.5 DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping

Describes rules for how Avro and Parquet column names are converted to Oracle column names.

The following are supported for Avro and Parquet column names, but may require use of double quotes for Oracle SQL references in external tables. Thus, for ease of use and to avoid having to use double quotes when referencing column names, if possible do not use the following in Avro and Parquet column names:

- Embedded blanks
- Leading numbers
- Leading underscores
- Oracle SQL reserved words

The following table shows various types of Avro and Parquet column names, and rules for using the column names in Oracle column names in external tables.

<table>
<thead>
<tr>
<th>Avro or Parquet Name</th>
<th>CREATE TABLE Name</th>
<th>Oracle CATALOG</th>
<th>Valid SQL</th>
<th>Notes</th>
</tr>
</thead>
</table>
| part, Part, or PART  | part, Part, PART  | PART          | select part
select Part
select paRT
select PART          | Oracle implicitly uppercases unquoted column names |
<p>| Ord No               | &quot;Ord No&quot;          | Ord No        | select &quot;Ord No&quot; | Double quotes are required when there are embedded blanks, which also preserves the character case |</p>
<table>
<thead>
<tr>
<th>Avro or Parquet Name</th>
<th>CREATE TABLE Name</th>
<th>Oracle CATALOG</th>
<th>Valid SQL</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>index_key</strong></td>
<td>&quot;<strong>index_key</strong>&quot;</td>
<td><strong>index_key</strong></td>
<td>select <strong>index_key</strong>&quot;</td>
<td>Double quotes are required when there is a leading underscore, which also preserves the character case</td>
</tr>
<tr>
<td>6Way</td>
<td>&quot;6Way&quot;</td>
<td>6Way</td>
<td>select &quot;6Way&quot;</td>
<td>Double quotes are required when there is a leading numeric digit, which also preserves the character case</td>
</tr>
<tr>
<td>create, Create, or CREATE, and so on. (any case variation) partition, Partition, PARTITION, and so on (for an Oracle Reserved word)</td>
<td>&quot;CREATE&quot; &quot;PARTITION&quot;</td>
<td>CREATE PARTITION</td>
<td>select &quot;CREATE&quot; select &quot;PARTITION&quot;</td>
<td>Double quotes are required around Oracle SQL Reserved words. These are forced to uppercase, but must always be double-quoted when used anywhere in SQL</td>
</tr>
<tr>
<td>rowid, Rowid, ROWid, and so on (for ROWID see notes)</td>
<td>rowid</td>
<td>rowid</td>
<td>select &quot;rowid&quot; select &quot;Rowid&quot; select &quot;ROWid&quot; select &quot;rowid&quot;</td>
<td>For ROWID, any mixed or lower-case variation of ROWID preserves the case and must always be double-quoted and use the original case variations. Due to the inherent conflict with Oracle ROWID for the table, if you specify upper-case ROWID, it is automatically stored as lower-case &quot;rowid&quot; and must always be double-quoted when referenced.</td>
</tr>
</tbody>
</table>
Notes:

- In general a column name in an external table can be referenced without double quotes.
- Unless there is an embedded blank, a leading underscore ("_") or leading numeric digit ("0" through "9") in the column name, the original case of the column name is preserved, and it must always be referenced with double quotes and using the original case (upper, lower or mixed-case) of the Avro or Parquet column name.
- After using `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` to create an external table with the format specified as `avro` or `parquet`, use the `DESCRIBE` command in SQL*Plus to view the table's column names.
- When Oracle SQL Reserved Words are used in Avro or Parquet column names, they must always be double-quoted when referenced anywhere in SQL. See Oracle SQL Reserved Words for more information.
The **DBMS_COMPARISON** package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Data Structures
- Summary of DBMS_COMPARISON Subprograms

### 37.1 DBMS_COMPARISON Overview

The **DBMS_COMPARISON** package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you to converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the **DBMS_COMPARISON** package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the **CREATE_COMPARISON Procedure** in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.

2. Run the **COMPARE Function** in this package to compare the database object at the two databases and identify differences. This function returns **TRUE** when no differences are found and **FALSE** when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the **COMPARE** function.

3. If you want to examine the comparison results, query the following data dictionary views:
   - **DBA_COMPARISON_SCAN**
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the `CONVERGE` procedure in this package.

After you create a comparison with the `CREATE_COMPARISON` procedure in the `DBMS_COMPARISON` package, you can run the comparison at any time using the `COMPARE` function. Each time you run the `COMPARE` function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the `RECHECK` function.

The comparison results for a single execution of the `COMPARE` function can include one or more scans. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A bucket is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the parent scan of each scan that analyzes the smaller buckets into which the larger bucket was split. The root scan in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

### 37.2 DBMS_COMPARISON Security Model

Security on this package can be controlled in one of two ways.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

Each subprogram in the `DBMS_COMPARISON` package has a `comparison_name` parameter. The current user must be the owner of the specified comparison to run a subprogram in the `DBMS_COMPARISON` package.
To run the COMPAR E function, RECHECK function, or CONVERGE procedure, the following users must have the SELECT or READ privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.

Note:
The database administrator (DBA) can assume control over some of the DBMS_COMPARISON functions and procedures owned by other users. This control applies to DROP_COMPARISON and PURGE_COMPARISON. This DBA override can be particularly useful in cleanup operations when comparisons created by another user need to be dropped.

37.3 DBMS_COMPARISON Constants

The DBMS_COMPARISON package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 37-1 lists the parameters and enumerated constants.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_mode</td>
<td>CMP_COMPARE_MODE_OBJ</td>
<td>VARCHAR2(30)</td>
<td>CMP_COMPARE_MODE_OBJECT is a database object. This constant can be specified as 'OBJECT'.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Option</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>scan_mode</td>
<td>CMP_SCAN_MODE_FULL</td>
<td>VARCHAR2(30)</td>
<td>CMP_SCAN_MODE_FULL indicates that the entire database object is compared. This constant can be specified as 'FULL'.</td>
</tr>
<tr>
<td></td>
<td>CMP_SCAN_MODE_RANDOM</td>
<td></td>
<td>CMP_SCAN_MODE_RANDOM indicates that a random portion of the database object is compared. This constant can be specified as 'RANDOM'.</td>
</tr>
<tr>
<td></td>
<td>CMP_SCAN_MODE_CYCLIC</td>
<td></td>
<td>CMP_SCAN_MODE_CYCLIC indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as 'CYCLIC'.</td>
</tr>
<tr>
<td></td>
<td>CMP_SCAN_MODE_CUSTOM</td>
<td></td>
<td>CMP_SCAN_MODE_CUSTOM indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as 'CUSTOM'.</td>
</tr>
<tr>
<td>converge_options</td>
<td>CMP_CONVERGE_LOCAL_WINS</td>
<td>VARCHAR2(30)</td>
<td>CMP_CONVERGE_LOCAL_WINS indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as 'LOCAL'.</td>
</tr>
<tr>
<td></td>
<td>CMP_CONVERGE_REMOTE_WINS</td>
<td></td>
<td>CMP_CONVERGE_REMOTE_WINS indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as 'REMOTE'.</td>
</tr>
<tr>
<td>null_value</td>
<td>CMP_NULL_VALUE_DEF</td>
<td>VARCHAR2(100)</td>
<td>CMP_NULL_VALUE_DEF indicates that ORA$STREAMS$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA$STREAMS$NV'.</td>
</tr>
<tr>
<td>max_num_buckets</td>
<td>CMP_MAX_NUM_BUCKETS</td>
<td>INTEGER</td>
<td>CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.</td>
</tr>
</tbody>
</table>
Table 37-1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_rows_in_bucket</td>
<td>· CMP_MIN_ROWS_IN_BUCK</td>
<td>INTEGER</td>
<td>CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.</td>
</tr>
</tbody>
</table>

37.4 DBMS_COMPARISON Views

The DBMS_COMPARISON package uses several views.

These views are listed below:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

See Also:

Oracle Database Reference

37.5 DBMS_COMPARISON Operational Notes

The DBMS_COMPARISON package has certain requirements and operational notes.

These include the following:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Datatype Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated
Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11g Release 1 (11.1) database.
- The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

See Also:
Oracle Database Globalization Support Guide for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.

See Also:
CREATE_COMPARISON Procedure
Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.
- Timestamp columns are of the following datatypes: `TIMESTAMP`, `TIMESTAMP` with `TIME ZONE`, and `TIMESTAMP` with `LOCAL TIME ZONE`.
- Interval columns are of the following datatypes: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the `DBMS_COMPARISON` package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or `DATE` datatype column
- A composite index that only includes number, timestamp, interval, or `DATE` datatype columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

For the scan modes `CMP_SCAN_MODE_FULL` and `CMP_SCAN_MODE_CUSTOM` to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` datatype column
- A composite index that only includes number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the `DBMS_COMPARISON` package does not support the database objects. For example, if the database objects only have a single index on an `NVARCHAR2` column, then the `DBMS_COMPARISON` package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a `NUMBER` column and an `NCHAR` column, then the `DBMS_COMPARISON` package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.
The `DBMS_COMPARISON` package can use an index only if all of the columns in the index are included in the `column_list` parameter when the comparison is created with the `CREATE_COMPARISON` procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```sql
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
INDEX_COLUMN = 'Y';
```

If there are multiple index columns, then the index column with 1 for the `COLUMN_POSITION` is the lead index column in the composite index.

---

**See Also:**

- "Constants" for information about scan modes
- `CREATE_COMPARISON Procedure` for information about specifying an index for a comparison

---

### Datatype Requirements for the `DBMS_COMPARISON` Package

The `DBMS_COMPARISON` package can compare data in columns of the following datatypes:

- `VARCHAR2`
- `NVARCHAR2`
- `NUMBER`
- `FLOAT`
- `DATE`
- `BINARY_FLOAT`
- `BINARY_DOUBLE`
- `TIMESTAMP`
- `TIMESTAMP WITH TIME ZONE`
- `TIMESTAMP WITH LOCAL TIME ZONE`
- `INTERVAL YEAR TO MONTH`
- `INTERVAL DAY TO SECOND`
- `RAW`
- `CHAR`
- `NCHAR`

If a column with datatype `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with datatype `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.
The DBMS_COMPARISON package cannot compare data in columns of the following datatypes:

- LONG
- LONG RAW
- ROWID
- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFs, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

### See Also:

- CREATE_COMPARISON Procedure
- Oracle Database SQL Language Reference for more information about datatypes
- Oracle Database Globalization Support Guide for information about national character sets

### Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

### Note:

If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.
37.6 DBMS_COMPARISON Data Structures

The DBMS_COMPARISON package defines a RECORD type.

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note:
The COMPARE function only returns a value for the scan_id field.

37.6.1 COMPARISON_TYPE Record Type

This record type contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note:
The COMPARE function only returns a value for the scan_id field.

Syntax

TYPE COMPARISON_TYPE IS RECORD(
    scan_id            NUMBER,
    loc_rows_merged    NUMBER,
    rmt_rows_merged    NUMBER,
    loc_rows_deleted   NUMBER,
    rmt_rows_deleted   NUMBER);

Table 37-2 COMPARISON_TYPE Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan</td>
</tr>
<tr>
<td>loc_rows_merged</td>
<td>The number of rows in the local database object updated with information from the database object at the remote site</td>
</tr>
<tr>
<td>rmt_rows_merged</td>
<td>The number of rows in the database object updated at the remote site with information from the database object at the local site</td>
</tr>
<tr>
<td>loc_rows_deleted</td>
<td>The number of rows deleted from the local database object</td>
</tr>
<tr>
<td>rmt_rows_deleted</td>
<td>The number of rows deleted from the remote database object</td>
</tr>
</tbody>
</table>

37.7 Summary of DBMS_COMPARISON Subprograms

This table lists the DBMS_COMPARISON subprograms and briefly describes them.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPARE Function</td>
<td>Performs the specified comparison</td>
</tr>
<tr>
<td>CONVERGE Procedure</td>
<td>Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan</td>
</tr>
<tr>
<td>CREATE_COMPARISON Procedure</td>
<td>Creates a comparison</td>
</tr>
<tr>
<td>DROP_COMPARISON Procedure</td>
<td>Drops a comparison</td>
</tr>
<tr>
<td>PURGE_COMPARISON Procedure</td>
<td>Purges the comparison results, or a subset of the comparison results, for a comparison</td>
</tr>
<tr>
<td>RECHECK Function</td>
<td>Rechecks the differences in a specified scan for a comparison</td>
</tr>
</tbody>
</table>

### 37.7.1 COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

```sql
DBMS_COMPARISON.COMPARE(
    comparison_name IN VARCHAR2,
    scan_info OUT COMPARISON_TYPE,
    min_value IN VARCHAR2 DEFAULT NULL,
    max_value IN VARCHAR2 DEFAULT NULL,
    perform_row_dif IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the compare operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type.</td>
</tr>
</tbody>
</table>

See Also:

- CREATE_COMPARISON Procedure
### Table 37-4  (Cont.) COMPARE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_value</td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See the index column requirements under DBMS_COMPARISON Operational Notes. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See DBMS_COMPARISON Constants for information about scan modes.</td>
</tr>
<tr>
<td>max_value</td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See the index column requirements under DBMS_COMPARISON Operational Notes. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See DBMS_COMPARISON Constants for information about scan modes.</td>
</tr>
<tr>
<td>perform_row_dif</td>
<td>If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See DBMS_COMPARISON Overview for information about buckets.</td>
</tr>
</tbody>
</table>

### Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

### 37.7.2 CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

**Syntax**

```sql
DBMS_COMPARISON.CONVERGE(
    comparison_name  IN  VARCHAR2,
```
Table 37-5  CONVERGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
<tr>
<td></td>
<td>CMP_CONVERGE_REMOTE_WINS constant.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot; for information about these constants.</td>
</tr>
<tr>
<td>perform_commit</td>
<td>If TRUE, then performs a COMMIT periodically while making the DML</td>
</tr>
<tr>
<td></td>
<td>changes. The CONVERGE procedure might perform more than one</td>
</tr>
<tr>
<td></td>
<td>COMMIT when this parameter is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then does not perform a COMMIT after making DML changes.</td>
</tr>
<tr>
<td>local_converge_tag</td>
<td>The Replication tag to set in the session on the local database before</td>
</tr>
<tr>
<td></td>
<td>performing any changes to converge the data in the database objects</td>
</tr>
<tr>
<td></td>
<td>being converged.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL, then this parameter setting takes precedence over the</td>
</tr>
<tr>
<td></td>
<td>local_converge_tag parameter in the CREATE_COMPARISON procedure that created</td>
</tr>
<tr>
<td></td>
<td>the comparison.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then this parameter is ignored, and the local_converge_tag</td>
</tr>
<tr>
<td></td>
<td>parameter in the CREATE_COMPARISON procedure that created the comparison is</td>
</tr>
<tr>
<td></td>
<td>used.</td>
</tr>
<tr>
<td>remote_converge_tag</td>
<td>The Replication tag to set in the session on the remote database before</td>
</tr>
<tr>
<td></td>
<td>performing any changes to converge the data in the database objects</td>
</tr>
<tr>
<td></td>
<td>being converged.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL, then this parameter setting takes precedence over the</td>
</tr>
<tr>
<td></td>
<td>remote_converge_tag parameter in the CREATE_COMPARISON procedure that created</td>
</tr>
<tr>
<td></td>
<td>the comparison.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then this parameter is ignored, and the remote_converge_tag</td>
</tr>
<tr>
<td></td>
<td>parameter in the CREATE_COMPARISON procedure that created the comparison is</td>
</tr>
<tr>
<td></td>
<td>used.</td>
</tr>
</tbody>
</table>

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.
37.7.3 CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```sql
DBMS_COMPARISON.CREATE_COMPARISON(
    comparison_name      IN  VARCHAR2,
    schema_name          IN  VARCHAR2,
    object_name          IN  VARCHAR2,
    dblink_name          IN  VARCHAR2,
    index_schema_name    IN  VARCHAR2  DEFAULT NULL,
    index_name           IN  VARCHAR2  DEFAULT NULL,
    remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
    remote_object_name   IN  VARCHAR2  DEFAULT NULL,
    comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
    column_list          IN  VARCHAR2  DEFAULT '*',
    scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
    scan_percent         IN  NUMBER    DEFAULT NULL,
    null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
    local_converge_tag   IN  RAW       DEFAULT NULL,
    remote_converge_tag  IN  RAW       DEFAULT NULL,
    max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
    min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 37-6  CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that contains the local database object to compare.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the local database object to compare.</td>
</tr>
<tr>
<td>dblink_name</td>
<td>Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database.</td>
</tr>
<tr>
<td>index_schema_name</td>
<td>The name of the schema that contains the index.</td>
</tr>
</tbody>
</table>

- If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the `remote_schema_name` and `remote_object_name` parameters.
- If NULL, then the schema specified in the `schema_name` parameter is used.
Table 37-6 (Cont.) CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index_name</td>
<td>The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. See Also: &quot;Usage Notes&quot; for more information about specifying an index</td>
</tr>
<tr>
<td>remote_schema_name</td>
<td>The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.</td>
</tr>
<tr>
<td>remote_object_name</td>
<td>The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.</td>
</tr>
<tr>
<td>comparison_mode</td>
<td>Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.</td>
</tr>
<tr>
<td>column_list</td>
<td>Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See &quot;Usage Notes&quot; for information about columns that are required in the column_list parameter.</td>
</tr>
<tr>
<td>scan_mode</td>
<td>Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM. If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function. See &quot;Constants&quot; for information about these constants.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| scan_percent      | The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required.  
If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison.  
If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run.  
If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored.  
**Note:** When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See DBMS_COMPARISON Operational Notes for more information about the DBMS_COMPARISON package index requirements for the lead index column. |
| null_value        | The value to substitute for each NULL in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant.  
If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found.  
See "Constants" for information about this constant.                                                                                                                   |
| local_converge_tag | The Oracle Replication tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared.  
If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure for more information. |
| remote_converge_tag | The Oracle Replication tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared.  
If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure for more information. |
Table 37-6  (Cont.) CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_num_buckets</td>
<td>Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See &quot;Constants&quot; for information about this constant. See &quot;Overview&quot; for information about buckets. Note: If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.</td>
</tr>
<tr>
<td>min_rows_in_bucket</td>
<td>Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See &quot;Constants&quot; for information about this constant. See &quot;Overview&quot; for information about buckets.</td>
</tr>
</tbody>
</table>

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in column_list parameter might or might not be used.

The columns in the specified index must meet the requirements described in DBMS_COMPARISON Operational Notes. If the index columns do not meet these requirements, then an error is raised.

Note:

If you do not specify an index when you create a comparison, then the CREATE_COMPARISON procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the CREATE_COMPARISON procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the CONVERGE procedure synchronizes data.

Usage Notes for the column_list Parameter

When the column_list parameter is set to a value other than '*' , the following columns are required in the column_list parameter:
• Any columns that are required to meet the index column requirements for the DBMS_COMPARISON package. If the index_name parameter is non-NULL, then the columns in the specified index must be in the column list. If the index_name parameter is NULL, then see DBMS_COMPARISON Operational Notes for information about the DBMS_COMPARISON index requirements.

• If you plan to use the CONVERGE procedure to make changes to a database object based on the comparison, then any columns in this database object that have a NOT NULL constraint but no default value must be included in the column list. If these columns are not included, then the CONVERGE procedure returns an error. See CONVERGE Procedure.

37.7.4 DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

DBMS_COMPARISON.DROP_COMPARISON(
    comparison_name IN VARCHAR2);

Parameters

Table 37-7  DROP_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
</tbody>
</table>

37.7.5 PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

Note:

At least one of the following parameters must be set to NULL: scan_id or purge_time. If both the scan_id and purge_time parameters are NULL, then this procedure purges all comparison results for the comparison.

Syntax

DBMS_COMPARISON.PURGE_COMPARISON(
    comparison_name IN VARCHAR2,
    scan_id IN NUMBER DEFAULT NULL,
    purge_time IN TIMESTAMP DEFAULT NULL);
Parameters

Table 37-8  PURGE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>

<td>the comparison. See &quot;Overview&quot; for information about scans.</td>
</tr>
<tr>
<td>purge_time</td>
<td>The date before which results are purged. If NULL, then no date is</td>
</tr>
<tr>
<td></td>
<td>considered when purging comparison results for the comparison.</td>
</tr>
</tbody>
</table>

37.7.6 RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

**Note:**

This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the COMPARE function.

**See Also:**

COMPARE Function

Syntax

```sql
DBMS_COMPARISON.RECHECK(
    comparison_name IN VARCHAR2,
    scan_id          IN NUMBER,
    perform_row_dif  IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```
Parameters

Table 37-9 RECHECK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan to recheck.</td>
</tr>
<tr>
<td></td>
<td>See “Overview” for more information about specifying a scan ID in this parameter.</td>
</tr>
<tr>
<td>perform_row_dif</td>
<td>If TRUE, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.</td>
</tr>
<tr>
<td></td>
<td>See “Overview” for information about buckets.</td>
</tr>
</tbody>
</table>

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

DBMS_COMPRESSION

The DBMS_COMPRESSION package provides an interface to facilitate choosing the correct compression level for an application.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of DBMS_COMPRESSION Subprograms

See Also:

- Oracle Database Administrator's Guide
- Oracle Database Concepts
- Oracle Database SQL Language Reference
- Oracle Database Data Warehousing Guide
- Oracle Database VLDB and Partitioning Guide
- Oracle Database Reference

38.1 DBMS_COMPRESSION Overview

The DBMS_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

38.2 DBMS_COMPRESSION Security Model

The DBMS_COMPRESSION package is defined with AUTHID CURRENT USER, so it executes with the privileges of the current user.

38.3 DBMS_COMPRESSION Constants

The DBMS_COMPRESSION package uses constants that can be used for specifying parameter values.

These constants are shown in the following table:
<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP_NOCOMPRESS</td>
<td>NUMBER</td>
<td>1</td>
<td>No compression</td>
</tr>
<tr>
<td>COMP_ADVANCED</td>
<td>NUMBER</td>
<td>2</td>
<td>Advanced row compression</td>
</tr>
<tr>
<td>COMP_QUERY_HIGH</td>
<td>NUMBER</td>
<td>4</td>
<td>High for query warehouse compression (Hybrid Columnar Compression)</td>
</tr>
<tr>

<td>Identifies the object whose compression ratio is estimated as of type index</td>
</tr>
</tbody>
</table>

**Note:**

Hybrid columnar compression is a feature of certain Oracle storage systems. See Oracle Database Concepts for more information.

### 38.4 DBMS_COMPRESSION Data Structures

The DBMS_COMPRESSION package defines a RECORD type and a TABLE type.

#### RECORD TYPES

**COMPREC Record Type**

#### TABLE TYPES

**COMPRECLIST Table Type**

### 38.4.1 COMPREC Record Type

The COMPREC record type is a record for calculating an individual index compression ratio on a table.

#### Syntax

```
TYPE COMPREC IS RECORD(
  ownname   varchar2(255),
  objname   varchar2(255),
  blkcnt_cmp PLS_INTEGER,
  blkcnt_uncmp PLS_INTEGER,
  row_cmp   PLS_INTEGER,
  row_un cmp PLS_INTEGER,
)
```
Fields

Table 38-2  COMPREC Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the object owner</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by the compressed sample of the object</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by the uncompressed sample of the object</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the object</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the object</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object</td>
</tr>
</tbody>
</table>

38.4.2 COMPRECLIST Table Type

COMPRECLIST is a table type of the COMPREC Record Type.

Syntax

```sql
TYPE compreclist IS TABLE OF comprec;
```

Related Topics

- **COMPREC Record Type**
  The COMPREC record type is a record for calculating an individual index compression ratio on a table.

38.5 Summary of DBMS_COMPRESSION Subprograms

The DBMS_COMPRESSION package uses the GET_COMPRESSION_RATIO Procedure and GET_COMPRESSION_TYPE Function subprograms.

Table 38-3  DBMS_COMPRESSION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_COMPRESSION_RATIO Procedure</td>
<td>Analyzes the compression ratio of a table, and gives information about compressibility of a table</td>
</tr>
<tr>
<td>GET_COMPRESSION_TYPE Function</td>
<td>Returns the compression type for a specified row</td>
</tr>
</tbody>
</table>
38.5.1 GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table or an index, and gives information about compressibility of the object. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

Get compression ratio for an object (table or index, default is table):

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
    scratchtbsname        IN     VARCHAR2,  
    ownname               IN     VARCHAR2,  
    objname               IN     VARCHAR2,  
    subobjname            IN     VARCHAR2,  
    compype               IN     NUMBER,  
    blkcnt_cmp            OUT    PLS_INTEGER,  
    blkcnt_uncmp          OUT    PLS_INTEGER,  
    row_cmp               OUT    PLS_INTEGER,  
    row_uncmp             OUT    PLS_INTEGER,  
    cmp_ratio             OUT    NUMBER,  
    compype_str           OUT    VARCHAR2,  
    subset_numrows        IN     NUMBER  DEFAULT COMP_RATIO_MINROWS,  
    objtype               IN     PLS_INTEGER DEFAULT OBJTYPE_TABLE);  
```

Get compression ratio for LOBs:

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
    scratchtbsname        IN     VARCHAR2,  
    tabowner              IN     VARCHAR2,  
    tabname               IN     VARCHAR2,  
    lobname               IN     VARCHAR2,  
    partname              IN     VARCHAR2,  
    compype               IN     NUMBER,  
    blkcnt_cmp            OUT    PLS_INTEGER,  
    blkcnt_uncmp          OUT    PLS_INTEGER,  
    lobcnt                OUT    PLS_INTEGER,  
    cmp_ratio             OUT    NUMBER,  
    compype_str           OUT    VARCHAR2,  
    subset_numrows        IN     number DEFAULT COMP_RATIO_LOB_MAXROWS);  
```

Get compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
    scratchtbsname        IN     VARCHAR2,  
    ownname               IN     VARCHAR2,  
    tabname               IN     VARCHAR2,  
    compype               IN     NUMBER,  
    index_cr              OUT    DBMS_COMPRESSION.COMPRECLIST,  
    compype_str           OUT    VARCHAR2,  
    subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);  
```
Parameters

Table 38-4  GET_COMPRESSION_RATIO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scratchtbsname</td>
<td>Temporary scratch tablespace that can be used for analysis</td>
</tr>
<tr>
<td>ownname/tabowner</td>
<td>Schema of the table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to analyze</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the partition or sub-partition of the object</td>
</tr>
<tr>
<td>compctype</td>
<td>Compression types for which analysis should be performed</td>
</tr>
<tr>
<td></td>
<td>When the object is an index, only the following compression types are valid:</td>
</tr>
<tr>
<td></td>
<td>COMP_INDEX.Advanced_HIGH (value 1024) and COMP_INDEX.Advanced_LOW (value 2048).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The following compression types cannot be specified in this parameter for any type of object: COMP_BLOCK (value 64) and COMP_BASIC (value 4096).</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by compressed sample of the table</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by uncompressed sample of the table</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the table</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the table</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>compctype_str</td>
<td>String describing the compression type</td>
</tr>
<tr>
<td>subset_numrows</td>
<td>Number of rows sampled to estimate compression ratio.</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object, either OBJTYPE_TABLE or OBJTYPE_INDEX</td>
</tr>
<tr>
<td>lobname</td>
<td>Name of the LOB column</td>
</tr>
<tr>
<td>partname</td>
<td>In case of partitioned tables, the related partition name</td>
</tr>
<tr>
<td>lobcnt</td>
<td>Number of lobs actually sampled to estimate compression ratio</td>
</tr>
<tr>
<td>index_cr</td>
<td>List of indexes and their estimated compression ratios</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.

38.5.2 GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (  
    ownname IN VARCHAR2,  
    tabname IN VARCHAR2,  
    compctype IN VARCHAR2,  
    subset_numrows IN NUMBER,  
    objtype IN VARCHAR2,  
    index_cr IN VARCHAR2,  
    lobcnt IN NUMBER,  
    partname IN VARCHAR2,  
    lobname IN VARCHAR2,  
    row_cmp IN NUMBER,  
    row_uncmp IN NUMBER,  
    blkcnt_cmp IN NUMBER,  
    blkcnt_uncmp IN NUMBER,  
    ownname IN VARCHAR2,  
    tabname IN VARCHAR2) RETURN VARCHAR2;
```
Parameters

Table 38-5  GET_COMPRESSION_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>rowid</td>
<td>Rowid of the row</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the table partition or subpartition</td>
</tr>
</tbody>
</table>

Return Values

Flag to indicate the compression type (see Table 38-1).
The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

See Also:
Oracle Database Concepts for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:
- Summary of DBMS_CONNECTION_POOL Subprograms

39.1 Summary of DBMS_CONNECTION_POOL Subprograms

This table lists the DBMS_CONNECTION_POOL subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARAM Procedure</td>
<td>Alters a specific configuration parameter as a standalone unit and does not affect other parameters</td>
</tr>
<tr>
<td>CONFIGURE_POOL Procedure</td>
<td>Configures the pool with advanced options</td>
</tr>
<tr>
<td>START_POOL Procedure</td>
<td>Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions</td>
</tr>
<tr>
<td>STOP_POOL Procedure</td>
<td>Stops the pool and makes it unavailable for the registered connection clients</td>
</tr>
<tr>
<td>RESTORE_DEFAULTS Procedure</td>
<td>Restores the pool to default settings</td>
</tr>
</tbody>
</table>

39.1.1 ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

```sql
DBMS_CONNECTION_POOL.ALTER_PARAM (pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
                               param_name IN VARCHAR2,
                               param_value IN VARCHAR2);
```
Parameters

Table 39-2 ALTER_PARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>param_name</td>
<td>Any parameter name from CONFIGURE_POOL</td>
</tr>
<tr>
<td>param_value</td>
<td>Parameter value for param_name.</td>
</tr>
</tbody>
</table>

See Also:

For the list and description of all the database resident connection pooling parameters that can be configured using this procedure, see the Oracle Database Administrator's Guide.

Exceptions

Table 39-3 ALTER_PARAM Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56504</td>
<td>Invalid connection pool configuration parameter name</td>
</tr>
<tr>
<td>ORA-56505</td>
<td>Invalid connection pool configuration parameter value</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Examples

DBMS_CONNECTION_POOL.ALTER_PARAM(
    'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');

39.1.2 CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (    
    pool_name    IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
    minsize      IN NUMBER DEFAULT 4,
    maxsize      IN NUMBER DEFAULT 40,
    incrsize     IN NUMBER DEFAULT 2,
    session_cached_cursors IN NUMBER DEFAULT 20,
    inactivity_timeout IN NUMBER DEFAULT 300,
    max_think_time IN NUMBER DEFAULT 120,
    max_use_session IN NUMBER DEFAULT 500000,
    max_lifetime_session IN NUMBER DEFAULT 86400,
    max_txn_think_time IN NUMBER);
```
Parameters

Table 39-4  CONFIGURE_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>mminsize</td>
<td>Minimum number of pooled servers in the pool</td>
</tr>
<tr>
<td>maxsize</td>
<td>Maximum allowed pooled servers in the pool</td>
</tr>
<tr>
<td>incrsize</td>
<td>Pool would increment by this number of pooled server when pooled server are unavailable at application request time</td>
</tr>
<tr>
<td>sessionCachedCursors</td>
<td>Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter</td>
</tr>
<tr>
<td>inactivityTimeout</td>
<td>TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.</td>
</tr>
<tr>
<td>maxThinkTime</td>
<td>The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with no open transactions in it. After obtaining a pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_THINK_TIME, the pooled server is freed and the client connection is terminated.</td>
</tr>
<tr>
<td>maxUseSession</td>
<td>Maximum number of times a connection can be taken and released to the pool</td>
</tr>
<tr>
<td>maxLifetimeSession</td>
<td>TTL (Time to live) for a pooled session</td>
</tr>
<tr>
<td>maxTxnThinkTime</td>
<td>The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with an open transaction. After obtaining the pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_TXN_THINK_TIME, then the pooled server is freed, and the client connection is terminated. The default value of this parameter is the value of the MAX_THINK_TIME parameter. Applications can set the value of the MAX_TXN_THINK_TIME parameter to a value higher than the MAX_THINK_TIME value to allow more time for the connections with open transactions.</td>
</tr>
</tbody>
</table>

Exceptions

Table 39-5  CONFIGURE_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
• minsize should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.

• maxsize should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.

• session_cached_cursors is typically set to the number of most frequently used statements. It occupies cursor resource on the server.

• In doubt, do not set the increment and inactivity_timeout. The pool will have reasonable defaults.

• max_use_session and max_lifetime_session allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.

• The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the maxsize parameter, ensure that there are enough pooled servers for both authentication and connections.

39.1.3 START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```sql
DBMS_CONNECTION_POOL.START_POOL (pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 39-6   START_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be started. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

Table 39-7   START_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56501</td>
<td>Connection pool startup failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
39.1.4 STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```sql
DBMS_CONNECTION_POOL.STOP_POOL (  
    pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 39-8 STOP_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be stopped. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

Table 39-9 STOP_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56506</td>
<td>Connection pool shutdown failed</td>
</tr>
</tbody>
</table>

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

39.1.5 RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```sql
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (  
    pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 39-10 RESTORE_DEFAULTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be restored. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>
Exceptions

Table 39-11  RESTORE_DEFAULTS Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
The **DBMS_CQ_NOTIFICATION** package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

*Oracle Database Development Guide* regarding implementing database change notification.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Operational Notes**
- **Examples**
- **Data Structures**
- **Summary of DBMS_CQ_NOTIFICATION Subprograms**

### 40.1 DBMS_CQ_NOTIFICATION Overview

The **DBMS_CQ_NOTIFICATION** package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and commits, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a `BEGIN–END` block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered “interesting queries” and objects referenced by those queries during query execution are registered. The registration is completed by `END`ing the registration block. The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID
to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

40.2 DBMS_CQ_NOTIFICATION Security Model

The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT or READ privileges on all objects to be registered. Note that if the SELECT or READ privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

40.3 DBMS_CQ_NOTIFICATION Constants

DBMS_CQ_NOTIFICATION constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDs describe registration Quality of Service properties that the client requires. These are specified during registration.

The constants are shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL_OPERATIONS</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Interested in being notified on all operations, specified as a parameter during registration</td>
</tr>
<tr>
<td>ALL_ROWS</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>All rows within the table may have been potentially modified</td>
</tr>
<tr>
<td>EVENT_STARTUP</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Instance startup notification</td>

</tbody>
</table>

40.4 DBMS_CQ_NOTIFICATION Operational Notes

The following are DBMS_CQ_NOTIFICATION operational notes.

Object Level Registration

- The notifications are published by the database when a transaction changes the registered objects and commits.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

Query Result Change Registration

- The notifications are published by the database when a transaction changes the result set of the registered query and commits.
Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.

- Are the registrations being created as a non-SYS user?

- If you are attempting DML changes on the registered object, are you COMMITting the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITS.

- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named `<ORACLE_SID>_j*_<PID>.trc`.

For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc'.

Suppose a registration is created with 'chnf_callback' as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
  Error in PLSQL notification of msgid:
  Queue :
  Consumer Name :
  PLSQL function :chnf_callback
  Exception Occured, Error msg:
  ORA-00604: error occurred at recursive SQL level 2
  ORA-06550: line 1, column 7:
  ORA-06550: line 1, column 7:
  ORA-06550: line 1, column 7:
  ORA-06550: line 1, column 7:
  ORA-06550: line 1, column 7:
```

40.5 DBMS_CQ_NOTIFICATION Examples

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application
has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

Object Change Registration Example

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.

2. Create a server side stored procedure to process notifications

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                         table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                         row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
regid           NUMBER;
tbname          VARCHAR2(60);
event_type      NUMBER;
umtables       NUMBER;
operation_type  NUMBER;
umrows         NUMBER;
row_id          VARCHAR2(20);
BEGIN
  regid      := ntfnds.registration_id;
umtables  := ntfnds.numtables;
event_type := ntfnds.event_type;

INSERT INTO nfevents VALUES(regid, event_type);
IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
  FOR i IN 1..numtables LOOP
    tbname          := ntfnds.table_desc_array(i).table_name;
    operation_type  := ntfnds.table_desc_array(i).Opflags;
    INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
    /* Send the table name and operation_type to client side listener using
    UTL_HTTP */
    /* If interested in the rowids, obtain them as follows */
    IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
      numrows := ntfnds.table_desc_array(i).numrows;
    ELSE

numrows := 0; /* ROWID INFO NOT AVAILABLE */
END IF;

/* The body of the loop is not executed when numrows is ZERO */
FOR j IN 1..numrows LOOP
    Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
    INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
    /* optionally Send out row_ids to client side listener using
    UTL_HTTP; */
END LOOP;
END LOOP;

END LOOP;
END IF;
COMMIT;
END;
/

In Step 2 we can send as much information about the invalidation as the mid-tier
application needs based on the information obtained from the notification
descrptor.

Notes

a. In the above example, a registration was created on the EMPLOYEES table with
'chnf_callback' as the PL/SQL handler for notifications. During registration,
the client specified reliable notifications (QOS_RELIABLE) and rowid notifications
(QOS_ROWIDS)

b. The handler accesses the table descriptor array from the notification descriptor
only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g
EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be
accessed.

c. The handler accesses the row descriptor array from the table notification
descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the
ALL_ROWS bit is set in the table operation flag, then it means that all rows within
the table may have been potentially modified. In addition to operations like
TRUNCATE that affect all rows in the tables, this bit may also be set if individual
rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single
transaction (more than 80) or the total shared memory consumption due to
rowids on the RDBMS is determined too large (exceeds 1% of the dynamic
shared pool size). In this case, the recipient must conservatively assume that
the entire table has been invalidated and the callback/application must be able
to handle this condition.

Also note that the implementation of the user defined callback is up to the
developer. In the above example, the callback was used to record event
details into database tables. The application can additionally send the
notification details to a mid-tier HTTP listener of its cache management system
(as in the example) using UTL_HTTP. The listener could then refresh its cache
by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in
the previously defined procedure name (chnf_callback) as the name of the server
side PL/SQL procedure to be executed when a notification is generated.

Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
REGDS SYS.CHNF$REG_INFO;

BEGIN
  qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
              DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
  REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
  regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
  SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
  DBMS_CQ_NOTIFICATION.REG_END;
END;
/

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;COMMIT;

Once the notification is processed, you will find rows which might look like the following in the nfevents, nftablechanges and nfrowchanges tables.

SQL> SELECT * FROM nfevents;
REGID EVENT_TYPE
------------------------
20045          6

SQL> SELECT * FROM nftablechanges;
REGID TABLE_NAME TABLE_OPERATION
-----------------------------
20045 HR.EMPLOYEES 4

SQL> select * from nfrowchanges;
REGID TABLE_NAME ROW_ID
---------------------
20045 HR.EMPLOYEES AAAKB/AABAAAJ8zAAF

Query Result Change Registration Example

1. Creating a Callback

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);
Rem Create a table to record changes to registered tables.

CREATE TABLE nftablechanges(
    qid NUMBER,
    table_name VARCHAR2(100),
    table_operation NUMBER);

Rem Create a table to record rowids of changed rows.

CREATE TABLE nfrowchanges(
    qid NUMBER,
    table_name VARCHAR2(100),
    row_id VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
    (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
    regid           NUMBER;
    tbname          VARCHAR2(60);
    event_type      NUMBER;
    numtables       NUMBER;
    operation_type  NUMBER;
    numrows         NUMBER;
    row_id          VARCHAR2(2000);
    numqueries      NUMBER;
    qid NUMBER;
    qop NUMBER;
BEGIN
    regid := ntfnds.registration_id;
    event_type := ntfnds.event_type;
    INSERT INTO nfevents VALUES(regid, event_type);
    numqueries := 0;
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
        numqueries := ntfnds.query_desc_array.count;
        FOR i in 1..numqueries LOOP
            qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
            qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
            INSERT INTO nfqueries VALUES(qid, qop);
            numtables := 0;
            numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
            FOR j IN 1..numtables LOOP
                tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
                operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).Opflags;
                INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
                IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
                THEN
                    numrows :=
                    ntfnds.query_desc_array(i).table_desc_array(j).numrows;
                ELSE
                    numrows := 0; /* ROWID INFO NOT AVAILABLE */
                END IF;
            END LOOP; /* loop over rows */
        END LOOP; /* loop over queries */
    END IF;
END; /* The body of the loop is not executed when numrows is ZERO */
END; /* loop over rows */
2. Creates a query registration

DECLARE
    reginfo    cq_notification$_reg_info;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    v_cursor   SYS_REFCURSOR;
    regid      NUMBER;
    qosflags   NUMBER;
BEGIN
    /* Register two queries for result-set-change notifications: */
    /* 1. Construct registration information.
       'chnf_callback' is name of notification handler.
       QOS_QUERY specifies result-set-change notifications. */
    qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
                DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
    reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);
    /* 2. Create registration */
    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);
    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
        FROM HR.employees
        WHERE employee_id = 7902;
    CLOSE v_cursor;
    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
    CLOSE v_cursor;
    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

3. After creating the query registrations, the output from USER_CQ_NOTIFICATION_QUERIES would appear as follows.

SQL> SELECT queryid, regid, to_char(querytext)
    FROM user_cq_notification_queries;

    QUERYID  REGID
    --------  ------
    TO_CHAR(QUERYTEXT)
    -------------------
    22          41
    SELECT HR.DEPARTMENTS.DEPARTMENT_ID FROM HR.DEPARTMENTS WHERE HR.DEPARTMENTS.
DEPARTMENT_NAME = 'IT'

SELECT HR.EMPLOYEES.MANAGER_ID FROM HR.EMPLOYEES WHERE HR.EMPLOYEES.EMPLOYEE_ID = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

SQL> update departments set department_name = 'FINANCE' where department_name = 'IT';
1 row updated.
SQL> commit;
Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;
REGID EVENT_TYPE
---------- ----------
61 7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;
QID QOP
---------- ----------
42 7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
SQL> select * from nftablechanges;
REGID
----------
TABLE_NAME
-------------------------------------------------------------------------------
42 HR.DEPARTMENTS
4

TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;
REGID
----------
TABLE_NAME
40.6 DBMS_CQ_NOTIFICATION Data Structures

The **DBMS_CQ_NOTIFICATION** package defines several **OBJECT** types.

**OBJECT Types**

- **CQ_NOTIFICATION$_DESCRIPTOR** Object Type
- **CQ_NOTIFICATION$_QUERY** Object Type
- **CQ_NOTIFICATION$_QUERY_ARRAY** Object (Array) Type
- **CQ_NOTIFICATION$_TABLE** Object Type
- **CQ_NOTIFICATION$_TABLE_ARRAY** Object (Array) Type
- **CQ_NOTIFICATION$_ROW** Object Type
- **CQ_NOTIFICATION$_ROW_ARRAY** Object (Array) Type
- **CQ_NOTIFICATION$_REG_INFO** Object Type

### 40.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the **SYS.CHNF$_DESC** type.

**Syntax**

```sql
TYPE SYS.CHNF$_DESC IS OBJECT(
    registration_id NUMBER,
    transaction_id RAW(8),
    dbname VARCHAR2(30),
    event_type NUMBER,
    numtables NUMBER,
    table_desc_array CQ_NOTIFICATION$_TABLE_ARRAY,
    query_desc_array CQ_NOTIFICATION$_QUERY_ARRAY);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_id</td>
<td>Registration ID returned during registration</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Transaction ID. <code>transaction_id</code> of the transaction that made the change. Will be NULL unless the <code>event_type</code> is <code>EVENT_OBJCHANGE</code> or <code>EVENT_QUERYCHANGE</code>.</td>
</tr>
<tr>
<td>dbname</td>
<td>Name of database</td>
</tr>
</tbody>
</table>
Table 40-2  (Cont.) CQ_NOTIFICATION$ _DESCRIPTOR Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_type</td>
<td>Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)</td>
</tr>
<tr>
<td>numtables</td>
<td>Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>query_desc_array</td>
<td>Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE</td>
</tr>
</tbody>
</table>

40.6.2 CQ_NOTIFICATION$ _QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit.

An array of CQ_NOTIFICATION$ _QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION$ _DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$ _QDESC.

Syntax

```sql
TYPE SYS.CHNF$ _QDESC IS OBJECT (
    queryid            NUMBER,
    queryop            NUMBER,
    table_desc_array   CQ_NOTIFICATION$ _TABLE_ARRAY);
```

Attributes

Table 40-3  TYPE SYS.CQ_NOTIFICATION$ _QUERY Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryid</td>
<td>QueryId of the changed query</td>
</tr>
<tr>
<td>queryop</td>
<td>Operation describing change to the query</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table changes which contributed to the query Result Set change</td>
</tr>
</tbody>
</table>
40.6.3 CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_QUERY objects. It is a synonym for the SYS.CHNF$_QUERY_ARRAY type.

Syntax

TYPE CQ_NOTIFICATION$_QUERY_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_QUERY;

40.6.4 CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for EVENT_OBJCHANGE event types. For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

TYPE SYS.CHNF$_TDESC IS OBJECT (  
  opflags            NUMBER,  
  table_name         VARCHAR2(2*M_IDEN+1),  
  numrows            NUMBER,  
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)

Attributes

Table 40-4 TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE &quot; FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of modified table</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.</td>
</tr>
<tr>
<td>row_desc_array</td>
<td>Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.</td>
</tr>
</tbody>
</table>
40.6.5 CQ_NOTIFICATION$ TABLE ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$ TABLE objects. It is a synonym for the SYS.CHNF$ TDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$ TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$ TABLE;
```

40.6.6 CQ_NOTIFICATION$ ROW Object Type

An array of CQ_NOTIFICATION$ ROW is embedded inside a CQ_NOTIFICATION$ TABLE (table change descriptor), if the QOS_ROWIDS option was chosen at registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$ RDESC.

Syntax

```
TYPE SYS.CHNF$ RDESC IS OBJECT (
    opflags NUMBER,  
    row_id VARCAHR2 (2000));
```

Attributes

Table 40-5  TYPE SYS.CQ_NOTIFICATION$ ROW Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).</td>
</tr>
<tr>
<td>row_id</td>
<td>The rowid of the modified row</td>
</tr>
</tbody>
</table>

40.6.7 CQ_NOTIFICATION$ ROW ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION$ ROW objects. It is embedded inside the CQ_NOTIFICATION$ TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF$ RDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$ ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$ ROW;
```
40.6.8 CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named SYS.CHNF$_REG_INFO.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    qosflags                        NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    transaction_lag                 NUMBER,
    ntfn_grouping_class             NUMBER,
    ntfn_grouping_value             NUMBER,
    ntfn_grouping_type              NUMBER,
    ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count      NUMBER);
```

Attributes

Table 40-6  TYPE CQ_NOTIFICATION$_REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>Name of the server side PL/SQL procedure to be executed on a notification. Prototype is &lt;call_backname&gt;(ntfnds IN SYS.chnf$_desc)</td>
</tr>
<tr>
<td>qosflags</td>
<td>Quality of service flags. Can be set to an OR of the following values:</td>
</tr>
<tr>
<td></td>
<td>• QOS_RELIABLE (0x1): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown.</td>
</tr>
<tr>
<td></td>
<td>• QOS_DEREG_NFY (0x2): The registration will be expunged on the first notification</td>
</tr>
<tr>
<td></td>
<td>• QOS_ROWIDS (0x4): The notification needs to include information about the rowids that were modified</td>
</tr>
<tr>
<td></td>
<td>• QOS_QUERY (0x8): specifies query result change notification as opposed to object change notification</td>
</tr>
<tr>
<td></td>
<td>• QOS_BEST_EFFORT (0x10) or QOS_BEST_EFFORT (0x16): can register simplified versions of queries and minimizes evaluation with some false positives.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>timeout</td>
<td>If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.</td>
</tr>
<tr>
<td>operations_filter</td>
<td>if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</td>
</tr>
<tr>
<td></td>
<td>• 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS)</td>
</tr>
<tr>
<td></td>
<td>• 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP)</td>
</tr>
<tr>
<td></td>
<td>• 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP)</td>
</tr>
<tr>
<td></td>
<td>• 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP)</td>
</tr>
<tr>
<td></td>
<td>A combination of operations can be specified by using a bitwise OR.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the &quot;GROUPING notification&quot; option.</td>
</tr>
<tr>
<td>transaction_lag</td>
<td>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change notification registrations.</td>
</tr>
<tr>
<td>ntfn_grouping_class</td>
<td>When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.</td>
</tr>
<tr>
<td>ntfn_grouping_value</td>
<td>The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.</td>
</tr>
<tr>
<td>ntfn_grouping_type</td>
<td>The type of grouping desired. It can be one of two allowed values</td>
</tr>
<tr>
<td></td>
<td>• DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification</td>
</tr>
<tr>
<td></td>
<td>• DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded</td>
</tr>
<tr>
<td>ntfn_grouping_start_time</td>
<td>When to start generating notifications. If specified as NULL, it defaults to the current system generated time.</td>
</tr>
</tbody>
</table>
Table 40-6  (Cont.) TYPE CQ_NOTIFICATION$$_REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntnf_grouping_repeat_count</td>
<td>How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.</td>
</tr>
</tbody>
</table>

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```sql
TYPE CQ_NOTIFICATION$$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),  
qosflags                        NUMBER,  
timeout                         NUMBER);  
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```sql
TYPE CQ_NOTIFICATION$$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),  
qosflags                        NUMBER,  
timeout                         NUMBER,  
operations_filter               NUMBER,  
tnfn_grouping_class             NUMBER,  
tnfn_grouping_value             NUMBER,  
tnfn_grouping_type              NUMBER,  
tnfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,  
tnfn_grouping_repeat_count      NUMBER);  
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```sql
TYPE CQ_NOTIFICATION$$_REG_INFO IS OBJECT (  
callback                        VARCHAR2(20),  
qosflags                        NUMBER,  
timeout                         NUMBER,  
operations_filter               NUMBER,  
tnfn_grouping_class             NUMBER,  
tnfn_grouping_value             NUMBER,  
tnfn_grouping_type              NUMBER,  
tnfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,  
tnfn_grouping_repeat_count      NUMBER);  
```

- In response to a database change, the server side PL/SQL procedure specified by “callback” is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```sql
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$$_desc)  
CHNF$$_DESC describes the change notification descriptor.  
```

- The init.ora parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

### 40.7 Summary of DBMS_CQ_NOTIFICATION Subprograms

This table lists the DBMS_CQ_NOTIFICATION subprograms and briefly describes them.
Table 40-7  DBMS_CQ_NOTIFICATION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CQ_NOTIFICATION_QUERYID Function</td>
<td>Returns the queryid of the most recent query that was attempted to be registered in a registration block</td>
</tr>
<tr>
<td>DEREGISTER Procedure</td>
<td>De-subscribes the client with the supplied registration identifier (ID)</td>
</tr>
<tr>
<td>ENABLE_REG Procedure</td>
<td>Begins a registration block using an existing registration identifier (ID)</td>
</tr>
<tr>
<td>NEW_REG_START Function</td>
<td>Begins a new registration block</td>
</tr>
<tr>
<td>REG_END Procedure</td>
<td>Ends the registration boundary</td>
</tr>
<tr>
<td>SET_ROWID_THRESHOLD Procedure</td>
<td>Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction</td>
</tr>
</tbody>
</table>

40.7.1 CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```sql
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

40.7.2 DEREGISTER Procedure

This procedure describes the client with the specified registration identifier (ID).

Syntax

```sql
DBMS_CQ_NOTIFICATION.DEREGISTER (regid IN NUMBER);
```

Parameters

Table 40-8  DEREGISTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.
40.7.3 ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID).

It is similar to the interface for creating a new registration, except that it takes an existing regid to which to add objects. Subsequent execution of queries causes the objects referenced in the queries to be added to the specified regid, and the registration is completed on invoking the REG_END Procedure.

Syntax

DBMS_CQ_NOTIFICATION.ENABLE_REG (regid IN NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

40.7.4 NEW_REG_START Function

This procedure begins a new registration block.

Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

DBMS_CQ_NOTIFICATION.NEW_REG_START (regds IN sys.chnf$ _reg_info) RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys.chnf$ _reg_info</td>
<td>Registration descriptor describing the notification handler and other properties of the registration</td>
</tr>
</tbody>
</table>

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.
Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE NOTIFICATION system privilege and SELECT or READ privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

40.7.5 REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```sql
DBMS_CQ_NOTIFICATION.REG_END;
```

40.7.6 SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```sql
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (  
    tilename     IN  VARCHAR2,
    threshold    IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Table 40-11</th>
<th>SET_ROWID_THRESHOLD Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>tilename</td>
<td>Table name qualified by the schema name in the form schemaname.tablename</td>
</tr>
<tr>
<td>threshold</td>
<td>Maximum number of modified rows of the table to be published in the change notification</td>
</tr>
</tbody>
</table>

Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.
The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

See Also:

- Oracle Database Administrator’s Guide regarding Specifying Job Credentials

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_CREDENTIAL Subprograms

41.1 DBMS_CREDENTIAL Overview

Credentials are database objects that hold a username/password pair for authenticating and impersonating EXTPROC callout functions, as well as remote jobs, external jobs and file watchers from the SCHEDULER.

They are created using the CREATE_CREDENTIAL Procedure. The procedure also allows you to specify the Windows domain for remote external jobs executed against a Windows server.

41.2 DBMS_CREDENTIAL Security Model

Every Oracle credential has a unique credential name and you can associate a credential through its unique credential name with EXTPROC by means of a PL/SQL alias library.

In order to associate a credential with a PL/SQL alias library and external procedure, you must have the CREATE AND/OR REPLACE LIBRARY privilege or CREATE AND/OR REPLACE FUNCTION / PROCEDURE privilege and read permission of the DLL or shared object that the alias library to be associated with so that you can create and/or replace function or procedure to make use of the alias library.

Once authenticated, EXTPROC must act on behalf of the client based on client's identity defined in the supplied user credential. If not authenticated, EXTPROC must return an error message.
In order to create or alter a credential, you must have the **CREATE CREDENTIAL** privilege. If you are attempting to create or alter a credential in a schema other than your own, you must have the **CREATE ANY CREDENTIAL** privilege.

### 41.3 DBMS_CREDENTIAL Operational Notes

As the existing `CREATE OR REPLACE LIBRARY` statement and `CREATE OR REPLACE FUNCTION/PROCEDURE` do not support a `CREDENTIAL` clause, this model requires syntax and semantic changes in `CREATE OR REPLACE LIBRARY` and `CREATE OR REPLACE FUNCTION/PROCEDURE` statement.

For example:

```sql
CREATE OR REPLACE LIBRARY test
  AS '$ORACLE_HOME/bin/test.so' CREDENTIAL ricky_cred;
CREATE OR REPLACE FUNCTION ftest1
  (x VARCHAR2, y BINARY_INTEGER)
RETURN BINARY_INTEGER
AS LANGUAGE C
LIBRARY test
NAME "negative"
PARAMETERS(x STRING, y INT);
```

The credential name defined in the `CREDENTIAL` clause is a name of a database object. Therefore, do not enclose the credential name with single or double quotes.

An example of a credential being used on an external job:

```sql
BEGIN
  DBMS_SCHEDULER.CREATE_JOB(
    job_name => 'example_job',
    job_type => 'EXECUTABLE',
    job_action => '/bin/ls',
    credential_name => 'ricky_cred');
END;
/
```

### 41.4 Summary of DBMS_CREDENTIAL Subprograms

This table lists the DBMS_CREDENTIAL subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_CREDENTIAL Procedure</td>
<td>Creates a stored username/password pair in a database object called an Oracle credential</td>
</tr>
<tr>
<td>DISABLE_CREDENTIAL Procedure</td>
<td>Disables an Oracle credential</td>
</tr>
<tr>
<td>DROP_CREDENTIAL Procedure</td>
<td>Drops an Oracle credential</td>
</tr>
<tr>
<td>ENABLE_CREDENTIAL Procedure</td>
<td>Enables an Oracle credential</td>
</tr>
<tr>
<td>UPDATE_CREDENTIAL Procedure</td>
<td>Updates an existing Oracle credential</td>
</tr>
</tbody>
</table>
41.4.1 CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called an Oracle credential. You can also use this procedure to manage the credentials used for accessing files stored in cloud object storage.

Syntax

```
DBMS_CREDENTIAL.CREATE_CREDENTIAL (    
    credential_name   IN  VARCHAR2,    
    username          IN  VARCHAR2,    
    password          IN  VARCHAR2,    
    database_role     IN  VARCHAR2 DEFAULT NULL,    
    windows_domain    IN  VARCHAR2 DEFAULT NULL,    
    comments          IN  VARCHAR2 DEFAULT NULL,    
    enabled           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>username</td>
<td>User name to login to the operating system or remote database to run a job if this credential is chosen. This cannot be set to NULL.</td>
</tr>
<tr>
<td>password</td>
<td>Password to login to the remote operating system to run a job if this credential is chosen. It is case sensitive.</td>
</tr>
<tr>
<td>database_role</td>
<td>Whether a database job using this credential should attempt to log in with administrative privileges. Values: SYSDBA, SYSDG, SYSADMIN or SYSBACKUP.</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that can be used to describe the credential to the user. The Scheduler does not use this field.</td>
</tr>
<tr>
<td>enabled</td>
<td>Determines whether the credential is enabled or not</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE CREDENTIAL or CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- Attempting to create a credential with an existing credential name returns an error. To alter an existing credential, users must drop the existing credential first using the DROP_CREDENTIAL Procedure.
• Attempting to drop an existing credential, which is already referenced by alias libraries, returns an error. To drop an existing credential without any checking, users must set the `force` parameter of `DROP_CREDENTIAL Procedure` to `TRUE`.

• You may also alter a credential, by means of the `UPDATE_CREDENTIAL Procedure`.

Examples

Create a Basic Credential

CONN scott
Enter password: password

BEGIN
  -- Basic credential.
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
    credential_name => 'TIM_HALL_CREDENTIAL',
    username => 'tim_hall',
    password => 'password');
END

Create a Windows Credential

CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
    credential_name => 'TIM_HALL_WIN_CREDENTIAL',
    username => 'tim_hall',
    password => 'password',
    windows_domain => 'localdomain');
END

Display Information about Credentials

Information about credentials is displayed using the `DBA|ALL|USER|_CREDENTIALS` views.

COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   user_credentials
ORDER BY credential_name;

<table>
<thead>
<tr>
<th>CREDENTIAL_NAME</th>
<th>USERNAME</th>
<th>WINDOWS_DOMAIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIM_HALL_CREDENTIAL</td>
<td>tim_hall</td>
<td></td>
</tr>
<tr>
<td>TIM_HALL_WIN_CREDENTIAL</td>
<td>tim_hall</td>
<td>LOCALDOMAIN</td>
</tr>
</tbody>
</table>

2 rows selected.

SQL>
41.4.2 DISABLE_CREDENTIAL Procedure

This procedure disables an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DISABLE_CREDENTIAL (  
    credential_name   IN  VARCHAR2,  
    force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 41-3  DISABLE_CREDENTIAL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>force</td>
<td>If FALSE, the credential is not disabled provided it has no dependency on any existing scheduler job or PL/SQL library. An error is returned if the dependency is observed. If TRUE, the credential is disabled whether or not there is any scheduler job or PL/SQL library referencing it.</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled lets an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user of external jobs, database jobs, file transfers, external procedures, and file watching. To enable an existing disabled credential, you need to use the ENABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

41.4.3 DROP_CREDENTIAL Procedure

This procedure drops an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DROP_CREDENTIAL (  
    credential_name   IN  VARCHAR2,  
    force             IN  BOOLEAN DEFAULT FALSE);
```
### Parameters

**Table 41-4  DROP_CREDENTIAL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the credential must not be referenced by any EXTPROC alias library or an error is raised. If set to TRUE, the credential is dropped whether or not there are extproc alias libraries referencing it. EXTPROC alias libraries that reference the dropped credential become invalid.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Only the owner of a credential or a user with the CREATE ANY CREDENTIAL system privilege may drop the credential.

**Examples**

EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_CREDENTIAL', FALSE);
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_WIN_CREDENTIAL', FALSE);

### 41.4.4 ENABLE_CREDENTIAL Procedure

This procedure enables an Oracle credential.

**Syntax**

```sql
DBMS_CREDENTIAL.ENABLE_CREDENTIAL (  
    credential_name   IN  VARCHAR2);
```  

**Parameters**

**Table 41-5  ENABLE_CREDENTIAL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled would allow an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user (external jobs, file
transfers, external procedures, file watching). To disable an existing credential, you need to use the DISABLE_CREDENTIAL Procedure.

- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

### 41.4.5 UPDATE_CREDENTIAL Procedure

This procedure updates an existing Oracle credential.

**Syntax**

```sql
DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
    credential_name   IN   VARCHAR2,
    attribute         IN   VARCHAR2,
    value             IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>attribute</td>
<td>Name of attribute to update: USERNAME, PASSWORD, WINDOWS_DOMAIN, DATABASE_ROLE or COMMENTS</td>
</tr>
<tr>
<td>value</td>
<td>New value for the selected attribute</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- EXTPROC alias libraries that reference the updated credential will become invalid. A library becomes invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

**Examples**

#### Update a Basic Credential

```sql
CONN scott
Enter password: password
BEGIN
    -- Basic credential.
    DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
        credential_name   =>  'TIM_HALL_CREDENTIAL',
        attribute         =>  'password',
        value             =>  'password2');

    DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
        credential_name   =>  'TIM_HALL_CREDENTIAL',
```
attribute        =>  'username',
value            =>  'tim_hall'};

END;

Update a Windows Credential

CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.UPDATE_CREDENTIAL(
    credential_name =>  'TIM_HALL_WIN_CREDENTIAL',
    username        =>  'tim_hall',
    password        =>  'password',
    windows_domain  =>  'localdomain');
END

Display Information about Credentials

Information about credentials is displayed using the [DBA|ALL|USER] _CREDENTIALS views.

COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   all_credentials
ORDER BY credential_name;

<table>
<thead>
<tr>
<th>CREDENTIAL_NAME</th>
<th>USERNAME</th>
<th>WINDOWS_DOMAIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIM_HALL_CREDENTIAL</td>
<td>tim_hall</td>
<td></td>
</tr>
<tr>
<td>TIM_HALL_WIN_CREDENTIAL</td>
<td>tim_hall</td>
<td>LOCALDOMAIN</td>
</tr>
</tbody>
</table>

2 rows selected.

SQL>
DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also:

Oracle Database Security Guide for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

- Overview
- Security Model
- Datatypes
- Algorithms
- Restrictions
- Exceptions
- Operational Notes
- Summary of DBMS_CRYPTO Subprograms

42.1 DBMS_CRYPTO Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, SHA-1, and SHA-2 cryptographic hashes
- MD5, SHA-1, and SHA-2 Message Authentication Code (MAC)
Block cipher modifiers are also provided with `DBMS_CRYPTO`. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 42-1 summarizes the `DBMS_CRYPTO` package features.

<table>
<thead>
<tr>
<th>Package Feature</th>
<th><code>DBMS_CRYPTO</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptographic algorithms</td>
<td>DES, 3DES, AES, RC4, 3DES_2KEY</td>
</tr>
<tr>
<td>Padding forms</td>
<td>PKCS5, zeroes</td>
</tr>
<tr>
<td>Block cipher chaining modes</td>
<td>CBC, CFB, ECB, OFB</td>
</tr>
<tr>
<td>Cryptographic hash algorithms</td>
<td>MD5, SHA-1, SHA-2 (SHA-256, SHA-384, SHA-512), MD4</td>
</tr>
<tr>
<td>Keyed hash (MAC) algorithms</td>
<td>HMAC_MD5, HMAC_SH1, HMAC_SH256, HMAC_SH384, HMAC_SH512</td>
</tr>
<tr>
<td>Cryptographic pseudo-random number generator</td>
<td>RAW, NUMBER, BINARY_INTEGER</td>
</tr>
<tr>
<td>Database types</td>
<td>RAW, CLOB, BLOB</td>
</tr>
</tbody>
</table>

The `DBMS_CRYPTO` package replaces `DBMS_OBFUSCATION_TOOLKIT`, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, SHA-1, or SHA-2.

### 42.2 DBMS_CRYPTO Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

### 42.3 DBMS_CRYPTO Datatypes

Parameters for the `DBMS_CRYPTO` subprograms use these datatypes.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOB</td>
<td>A source or destination binary LOB</td>
</tr>
<tr>
<td>CLOB</td>
<td>A source or destination character LOB (excluding NCLOB)</td>
</tr>
<tr>
<td>PLS_INTEGER</td>
<td>Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)</td>
</tr>
<tr>
<td>RAW</td>
<td>A source or destination RAW buffer</td>
</tr>
</tbody>
</table>
42.4 DBMS_CRYPTO Algorithms

The DBMS_CRYPTO package contains predefined cryptographic algorithms, modifiers, and cipher suites.

These are shown in the following tables.

### Table 42-3  DBMS_CRYPTO Cryptographic Hash Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HASH_MD4</td>
<td>Produces a 128-bit hash, or message digest of the input message</td>
</tr>
<tr>
<td>HASH_MD5</td>
<td>Also produces a 128-bit hash, but is more complex than MD4</td>
</tr>
<tr>
<td>HASH_SH1</td>
<td>Secure Hash Algorithm (SHA-1). Produces a 160-bit hash.</td>
</tr>
<tr>
<td>HASH_SH256</td>
<td>SHA-2, produces a 256-bit hash.</td>
</tr>
<tr>
<td>HASH_SH384</td>
<td>SHA-2, produces a 384-bit hash.</td>
</tr>
<tr>
<td>HASH_SH512</td>
<td>SHA-2, produces a 512-bit hash.</td>
</tr>
</tbody>
</table>

### Table 42-4  DBMS_CRYPTO MAC (Message Authentication Code) Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HMAC_MD5¹</td>
<td>Same as MD5 hash function, except it requires a secret key to verify the hash value.</td>
</tr>
<tr>
<td>HMAC_SH1¹</td>
<td>Same as SHA hash function, except it requires a secret key to verify the hash value.</td>
</tr>
<tr>
<td>HMAC_SH256</td>
<td>Same as SHA-2 256-bit hash function, except it requires a secret key to verify the hash value.</td>
</tr>
<tr>
<td>HMAC_SH384</td>
<td>Same as SHA-2 384-bit hash function, except it requires a secret key to verify the hash value.</td>
</tr>
<tr>
<td>HMAC_SH512</td>
<td>Same as SHA-2 512-bit hash function, except it requires a secret key to verify the hash value.</td>
</tr>
</tbody>
</table>

¹ Complies with IETF RFC 2104 standard

### Table 42-5  DBMS_CRYPTO Encryption Algorithms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPT_DES</td>
<td>Data Encryption Standard. Block cipher. Uses key length of 56 bits.</td>
</tr>
<tr>
<td>ENCRYPT_3DES_2KEY</td>
<td>Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.</td>
</tr>
<tr>
<td>ENCRYPT_3DES</td>
<td>Data Encryption Standard. Block cipher. Operates on a block 3 times.</td>
</tr>
<tr>
<td>ENCRYPT_RC4</td>
<td>Stream cipher. Uses a secret, randomly generated key unique to each session.</td>
</tr>
</tbody>
</table>
### Table 42-6  DBMS_CRYPTO Block Cipher Suites

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DES_CBC_PKCS5</td>
<td>ENCRYPT_DES(^1) + CHAIN_CBC(^2) + PAD_PKCS5(^3)</td>
</tr>
<tr>
<td>DES3_CBC_PKCS5</td>
<td>ENCRYPT_3DES(^1) + CHAIN_CBC(^2) + PAD_PKCS5(^3)</td>
</tr>
</tbody>
</table>

1. See Table 42-5  
2. See Table 42-7  
3. See Table 42-8

### Table 42-7  DBMS_CRYPTO Block Cipher Chaining Modifiers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHAIN_ECB</td>
<td>Electronic Codebook. Encrypts each plaintext block independently.</td>
</tr>
<tr>
<td>CHAIN_CBC</td>
<td>Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.</td>
</tr>
<tr>
<td>CHAIN_CFB</td>
<td>Cipher-Feedback. Enables encrypting units of data smaller than the block size.</td>
</tr>
<tr>
<td>CHAIN_OFB</td>
<td>Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that ( n ) bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.</td>
</tr>
</tbody>
</table>

### Table 42-8  DBMS_CRYPTO Block Cipher Padding Modifiers

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAD_PKCS5</td>
<td>Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard</td>
</tr>
<tr>
<td>PAD_NONE</td>
<td>Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.</td>
</tr>
<tr>
<td>PAD_ZERO</td>
<td>Provides padding consisting of zeroes</td>
</tr>
</tbody>
</table>

### 42.5 DBMS_CRYPTO Restrictions

The `VARCHAR2` datatype is not directly supported by `DBMS_CRYPTO`. Before you can perform cryptographic operations on data of the type `VARCHAR2`, you must convert it to the uniform database character set `AL32UTF8`, and then convert it to the `RAW` datatype. After performing these conversions, you can then encrypt it with the `DBMS_CRYPTO` package.

**See Also:**

[DBMS_CRYPTO Operational Notes](#) for information about the conversion rules for converting datatypes.
42.6 DBMS_CRYPTO Exceptions

The following table lists exceptions that have been defined for DBMS_CRYPTO.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CipherSuiteInvalid</td>
<td>28827</td>
<td>The specified cipher suite is not defined.</td>
</tr>
<tr>
<td>CipherSuiteNull</td>
<td>28829</td>
<td>No value has been specified for the cipher suite to be used.</td>
</tr>
<tr>
<td>KeyNull</td>
<td>28239</td>
<td>The encryption key has not been specified or contains a NULL value.</td>
</tr>
<tr>
<td>KeyBadSize</td>
<td>28234</td>
<td>DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.</td>
</tr>
<tr>
<td>DoubleEncryption</td>
<td>28233</td>
<td>Source data was previously encrypted.</td>
</tr>
</tbody>
</table>

42.7 DBMS_CRYPTO Operational Notes

This section describes several DBMS_CRYPTO operational notes.

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both ENCRYPT and DECRYPT procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the ENCRYPT and DECRYPT functions are used to encrypt and decrypt RAW datatypes. Data of type VARCHAR2 must be converted to RAW before you can use DBMS_CRYPTO functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the HASH function and the MAC function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, the user runs DBMS_CRYPTO.HASH against the stored data to create a hash value. On returning the stored data, the user can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.
The **HASH** function included with **DBMS_CRYPTO**, is a one-way hash function that you can use to generate a hash value from either **RAW** or **LOB** data. The **MAC** function is also a one-way hash function, but with the addition of a secret key. It works the same way as the **DBMS_CRYPTO.HASH** function, except only someone with the key can verify the hash value.

**MACs** can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

**About Generating and Storing Encryption Keys**

The **DBMS_CRYPTO** package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by **DBMS_CRYPTO** occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although **DBMS_CRYPTO** cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the **RANDOMBYTES** function to generate random material for keys.

When generating encryption keys for **DES**, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak **DES** keys. Lists of the known weak and semiweak **DES** keys are available on several public Internet sites.

### See Also:

- **Oracle Database Security Guide** for information about configuring network encryption and SSL
- **RANDOMBYTES Function**

### Conversion Rules

- To convert **VARCHAR2** to **RAW**, use the **UTL_I18N.STRING_TO_RAW** function to perform the following steps:
  1. Convert **VARCHAR2** in the current database character set to **VARCHAR2** in the **AL32UTF8** database character.
  2. Convert **VARCHAR2** in the **AL32UTF8** database character set to **RAW**.

Syntax example:

```sql
UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
```
• To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:

1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

Syntax example:

UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');

See Also:

UTL_I18N for information about using the UTL_I18N PL/SQL package.

• If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

42.8 DBMS_CRYPTO Examples

This listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

DECLARE
  input_string       VARCHAR2 (200) := 'Secret Message';
  output_string      VARCHAR2 (200);
  encrypted_raw      RAW (2000);             -- stores encrypted binary text
  decrypted_raw      RAW (2000);             -- stores decrypted binary text
  num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
  key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
  encryption_type    PLS_INTEGER :=
                     DBMS_CRYPTO.ENCRYPT_AES256
                     + DBMS_CRYPTO.CHAIN_CBC
                     + DBMS_CRYPTO.PAD_PKCS5;
  iv_raw             RAW (16);
BEGIN
  DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
  key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
  iv_raw        := DBMS_CRYPTO.RANDOMBYTES (16);
  encrypted_raw := DBMS_CRYPTO.ENCRYPT
                    ( src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
                      typ => encryption_type,
                      key => key_bytes_raw,
                      iv  => iv_raw
                    );
  -- The encrypted value "encrypted_raw" can be used here
  decrypted_raw := DBMS_CRYPTO.DECRYPT
                    ( src => encrypted_raw,
                      typ => encryption_type,
                    );
```sql
key => key_bytes_raw,
iv  => iv_raw

));

output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

## 42.9 Summary of DBMS_CRYPTO Subprograms

This table lists the DBMS_CRYPTO subprograms in alphabetical order and briefly describes them.

### Table 42-10  DBMS_CRYPTO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECRYPT Function</td>
<td>Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)</td>
</tr>
<tr>
<td>DECRYPT Procedures</td>
<td>Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Function</td>
<td>Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Procedures</td>
<td>Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>HASH Function</td>
<td>Applies one of the supported cryptographic hash algorithms (MD4, MD5, SHA-1, or SHA-2) to data</td>
</tr>
<tr>
<td>MAC Function</td>
<td>Applies Message Authentication Code algorithms (MD5, SHA-1, or SHA-2) to data to provide keyed message protection</td>
</tr>
<tr>
<td>RANDOMBYTES Function</td>
<td>Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys</td>
</tr>
<tr>
<td>PKDECRYPT Function</td>
<td>Decrypts RAW data using a private key assisted with key algorithm and encryption algorithm and returns decrypted data.</td>
</tr>
<tr>
<td>PKENCRIPT Function</td>
<td>Encrypts RAW data using a public key assisted with key algorithm and encryption algorithm and returns encrypted data</td>
</tr>
<tr>
<td>RANDOMINTEGER Function</td>
<td>Returns a random BINARY_INTEGER</td>
</tr>
<tr>
<td>RANDOMNUMBER Function</td>
<td>Returns a random 128-bit integer of the NUMBER datatype</td>
</tr>
<tr>
<td>SIGN Function</td>
<td>Signs RAW data using a private key assisted with key algorithm and sign algorithm, and returns a signature</td>
</tr>
<tr>
<td>VERIFY Function</td>
<td>Verifies RAW data using the signature, public key assisted with key algorithm, and sign algorithm. It returns TRUE if the signature was verified</td>
</tr>
</tbody>
</table>
42.9.1 DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv IN RAW DEFAULT NULL
) RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

**Table 42-11  DECRYPT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- To retrieve original plaintext data, **DECRYPT** must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

**See Also:**

"Usage Notes" for the **ENCRYPT** function for additional information about the ciphers and modifiers available with this package.

- If **VARCHAR2** data is converted to **RAW** before encryption, then it must be converted back to the appropriate database character set by using the **UTL_I18N** package.

**See Also:**

DBMS_CRYPTO Operational Notes for a discussion of the **VARCHAR2 to RAW** conversion rules.
42.9.2 DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 42-12  DECRYPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is all zeroes.</td>
</tr>
</tbody>
</table>

42.9.3 ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv  IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```
Parameters

Table 42-13  ENCRYPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 42-7 and Table 42-8 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

```sql
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
  + DBMS_CRYPTO.CHAIN_CBC
  + DBMS_CRYPTO.PAD_NONE;
```

See Table 42-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

See Also:
The discussion of conversion rules under DBMS_CRYPTO Operational Notes

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

42.9.4 ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
  dst IN OUT NOCOPY BLOB,
  src IN            BLOB,
  typ IN            PLS_INTEGER,
  key IN            RAW,
  iv  IN            RAW          DEFAULT NULL);
```

```sql
DBMS_CRYPTO.ENCRYPT(
  dst IN OUT NOCOPY BLOB,
  src IN            CLOB         CHARACTER SET ANY_CS,
  typ IN            PLS_INTEGER,
  key IN            RAW,
  iv  IN            RAW          DEFAULT NULL);
```

```sql
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```sql
DBMS_CRYPTO.Hash (  
    src IN BLOB,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```sql
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER,  
    key IN RAW,  
    iv IN RAW          DEFAULT NULL);
```

**Pragmas**

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 42-14  ENCRYPT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

See DBMS_DEBUG Operational Notes for more information about the conversion rules for the ENCRYPT procedure.

### 42.9.5 HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a hash value. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notes for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 42-3.

**Syntax**

```sql
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```sql
DBMS_CRYPTO.Hash (  
    src IN BLOB,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```sql
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER,  
    key IN RAW,  
    iv IN RAW          DEFAULT NULL);
```
Parameters

Table 42-15  HASH Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The source data to be hashed.</td>
</tr>
<tr>
<td>typ</td>
<td>The hash algorithm to be used.</td>
</tr>
</tbody>
</table>

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm) or SHA-2 because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

42.9.6 MAC Function

This function applies Message Authentication Code (MAC) algorithms to data to provide keyed message protection.

A MAC is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in HASH Function, but they also include a key. Only someone with the identical key can verify the hash. Also refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notes for more information about using MACs.

See Table 42-4 for a list of MAC algorithms that have been defined for this package.

Syntax

```sql
DBMS_CRYPTO.MAC (  
  src IN RAW,  
  typ IN PLS_INTEGER,  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN BLOB,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN CLOB CHARACTER SET ANY_CS,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;
```
Pragmas

```
pragma restrict_references(mac, WNDs, RNDs, WNPS, RNPS);
```

Parameters

### Table 42-16 MAC Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Source data to which MAC algorithms are to be applied.</td>
</tr>
<tr>
<td>typ</td>
<td>MAC algorithm to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for MAC algorithm.</td>
</tr>
</tbody>
</table>

#### 42.9.7 PKDECRYPT Function

This function decrypts RAW data using a private key assisted with key algorithm and encryption algorithm and returns decrypted data.

**Syntax**

```
DBMS_CRYPTO.PKDECRYPT(
    src IN RAW,
    prv_key IN RAW,
    pubkey_alg IN BINARY_INTEGER,
    enc_alg IN BINARY_INTEGER)
RETURN RAW;
```

**Parameters**

### Table 42-17 PKDECRYPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>prv_key</td>
<td>Private key.</td>
</tr>
<tr>
<td>pubkey_alg</td>
<td>Specify the KEY_TYPE_RSA RSA key type.</td>
</tr>
<tr>
<td>enc_alg</td>
<td>Specify the algorithm PKENCRYPT_RSA_PKCS1_OAEP, for RSA Public Key Cryptosystem with PKCS1 and OAEP padding.</td>
</tr>
</tbody>
</table>

#### 42.9.8 PKENCRYPT Function

This function encrypts RAW data using a public key assisted with key algorithm and encryption algorithm and returns encrypted data.

**Syntax**

```
DBMS_CRYPTO.PKENCRYPT(
    src IN RAW,
    pub_key IN RAW,
    pubkey_alg IN BINARY_INTEGER,
    enc_alg IN BINARY_INTEGER)
RETURN RAW;
```
Parameters

Table 42-18  PKENCRYPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>pub_key</td>
<td>Public key.</td>
</tr>
<tr>
<td>pubkey_alg</td>
<td>Specify the KEY_TYPE_RSA RSA key type.</td>
</tr>
<tr>
<td>enc_alg</td>
<td>Specify the algorithm PKENCRYPT_RSA_PKCS1_OAEP, for RSA Public Key Cryptosystem with PKCS1 and OAEP padding.</td>
</tr>
</tbody>
</table>

42.9.9 RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys.

The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

```sql
DBMS_CRYPTO.RANDOMBYTES (number_bytes IN POSITIVE) RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 42-19  RANDOMBYTES Function Parameter

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_bytes</td>
<td>The number of pseudo-random bytes to be generated.</td>
</tr>
</tbody>
</table>

Usage Note

The number_bytes value should not exceed the maximum length of a RAW variable.

42.9.10 RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle BINARY_INTEGER datatype.

Syntax

```sql
DBMS_CRYPTO.RANDOMINTEGER RETURN BINARY_INTEGER;
```
42.9.11 RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

```sql
DBMS_CRYPTO.RANDOMNUMBER
RETURN NUMBER;
```

42.9.12 SIGN Function

This function signs RAW data using a private key assisted with key algorithm and sign algorithm, and returns a signature.

Syntax

```sql
DBMS_CRYPTO.SIGN(
    src IN RAW,
    prv_key IN RAW,
    pubkey_alg IN BINARY_INTEGER,
    sign_alg IN BINARY_INTEGER)
RETURN RAW;
```

Parameters

**Table 42-20  SIGN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be signed.</td>
</tr>

</tr>
</tbody>
</table>

42.9.13 VERIFY Function

This function verifies RAW data using the signature, public key assisted with key algorithm, and sign algorithm. It returns TRUE if the signature was verified.

Syntax

```sql
DBMS_CRYPTO.VERIFY(
  src IN RAW,
  sign IN RAW,
  pub_key IN RAW,
  pubkey_alg IN BINARY_INTEGER,
  sign_alg IN BINARY_INTEGER)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be verified.</td>
</tr>
<tr>
<td>sign</td>
<td>Message signature.</td>
</tr>
<tr>
<td>pub_key</td>
<td>Public key.</td>
</tr>
<tr>
<td>pubkey_alg</td>

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_CSX_ADMIN

### 43.1 DBMS_CSX_ADMIN Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

### 43.2 DBMS_CSX_ADMIN Security Model

Owned by XDB, the DBMS_CSX_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

### 43.3 DBMS_CSX_ADMIN Constants

The DBMS_CSX_ADMIN package uses several constants.

These are described in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Default token table</td>
</tr>
<tr>
<td>TAB_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Token table set associated with tables, not tablespaces</td>
</tr>
<tr>
<td>TBS_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Token table set associated with a tablespace</td>
</tr>
<tr>
<td>NO_CREATE</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Token tables already exist, associate them with the given table/tablespace</td>
</tr>
</tbody>
</table>
Table 43-1  (Cont.) DBMS_CSX_ADMIN Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_INDEXES</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Do not create indexes on the new set of token tables</td>
</tr>
<tr>
<td>WITH_INDEXES</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Create indexes on the token tables</td>
</tr>
<tr>
<td>DEFAULT_TOKS</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Prepopulate the token tables with default token mappings</td>
</tr>
<tr>
<td>NO_DEFAULT_TOKS</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Do not prepopulate the token tables with default token mappings</td>
</tr>
</tbody>
</table>

43.4 Summary of DBMS_CSX_ADMIN Subprograms

This table lists and describes the DBMS_CSX_ADMIN Package subprograms.

Table 43-2  DBMS_CSX_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETTOKENTABLEINFO Procedure &amp; Function</td>
<td>Returns the GUID of the token table set where token mappings for this table</td>
</tr>
<tr>
<td>GETTOKENTABLEINFOBYTABLES PACE Procedure</td>
<td>Returns the GUID and the token table names for this tablespace</td>
</tr>
<tr>
<td>NAMESPACEIDTABLE Function</td>
<td>Returns default namespace-ID token table</td>
</tr>
<tr>
<td>PATHIDTABLE Function</td>
<td>Returns the default path-ID token table</td>
</tr>
<tr>
<td>QNAMEIDTABLE Function</td>
<td>Returns the default qname-ID token table.</td>
</tr>
</tbody>
</table>

43.4.1 GETTOKENTABLEINFO Procedure & Function

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```sql
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
  ownername  IN  VARCHAR2,
  tablename  IN  VARCHAR2,
  guid       OUT  RAW,
  qnametable OUT  VARCHAR2,
  nmspctable OUT  VARCHAR2,
  level      OUT  NUMBER,
  tabno      OUT  NUMBER);
```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO (  
  tabno   IN   NUMBER,  
  guid    OUT  RAW);  
RETURN BOOLEAN;

Parameters

Table 43-3  GETTOKENTABLEINFO Procedure & Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set used by the given table</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table in the new set</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table in the new set</td>
</tr>
<tr>
<td>level</td>
<td>DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise</td>
</tr>
<tr>
<td>tabno</td>
<td>Table object number</td>
</tr>
</tbody>
</table>

43.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE (  
  tname     IN   VARCHAR2,  
  tablespaceno IN   NUMBER,  
  guid       OUT  RAW,  
  qnametable OUT  VARCHAR2,  
  nmspctable OUT  VARCHAR2,  
  isdefault  OUT  BOOLEAN,  
  containTokTab OUT  BOOLEAN);  

Parameters

Table 43-4  GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tname</td>
<td>Tablespace name</td>
</tr>
<tr>
<td>tablespaceno</td>
<td>Tablespace number</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set associated with this tablespace (if any)</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table</td>
</tr>
<tr>
<td>isdefault</td>
<td>TRUE if the token table is the default one</td>
</tr>
<tr>
<td>containTokTab</td>
<td>TRUE if the tablespace contains its own token table set</td>
</tr>
</tbody>
</table>
43.4.3 NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

DBMS_CSX_ADMIN.NAMESPACEIDTABLE
RETURN VARCHAR2;

43.4.4 PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing EXPLAIN PLAN for a query on an XML table with an XML index.

Syntax

DBMS_CSX_ADMIN.PATHIDTABLE
RETURN VARCHAR2;

43.4.5 QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

DBMS_CSX_ADMIN.QNAMEIDTABLE
RETURN VARCHAR2;
DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

See Also:
OLAP Technology in the Oracle Database in Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

• Using DBMS_CUBE
• Using SQL Aggregation Management
• Upgrading 10g Analytic Workspaces
• Summary of DBMS_CUBE Subprograms

44.1 Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management".

The metadata for cubes and dimensions is defined in XML documents, called templates, which you can derive from relational materialized views using the CREATE_CUBE or DERIVE_FROM_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.
44.1.1 DBMS_CUBE Security Model

Certain roles and system privileges are required to use the DBMS_CUBE package.

To create dimensional objects in the user’s own schema:

- **OLAP_USER** role
- **CREATE SESSION** privilege

To create dimensional objects in different schemas:

- **OLAP_DBA** role
- **CREATE SESSION** privilege

To create cube materialized views in the user’s own schema:

- **CREATE MATERIALIZED VIEW** privilege
- **CREATE DIMENSION** privilege
- **ADVISOR** privilege

To create cube materialized views in different schemas:

- **CREATE ANY MATERIALIZED VIEW** privilege
- **CREATE ANY DIMENSION** privilege
- **ADVISOR** privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs **SELECT** object privileges on those tables.

44.2 Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in **DBMS_CUBE** that supports the rapid deployment of cube materialized views from existing relational materialized views.

Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, **DBMS_CUBE** also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.
Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

See Also:
Adding Materialized View Capability to a Cube in Oracle OLAP User’s Guide for more information about cube materialized views and enhanced OLAP analytics.

44.2.1 Subprograms in SQL Aggregation Management

SQL Aggregation Management includes four subprograms.

• CREATE_MVIEW Function
• DERIVE_FROM_MVIEW Function
• DROP_MVIEW Procedure
• REFRESH_MVIEW Procedure

44.2.2 Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

• Explicit GROUP BY clause for one or more columns.
• No expressions in the select list or GROUP BY clause.
• At least one of these numeric aggregation methods: SUM, MIN, MAX, or AVG.
• No outer joins.
• Summary keys with at least one simple column associated with a relational dimension. or Summary keys with at least one simple column and no hierarchies or levels.
• Numeric datatype of any type for the fact columns. All facts are converted to NUMBER.
• Eligible for rewrite. REWRITE_CAPABILITY should be GENERAL; it cannot be NONE. Refer to the ALL_MVIEWS entry in the Oracle Database Reference.
• Cannot use the DISTINCT or UNIQUE keywords with an aggregate function in the defining query. For example, AVG(DISTINCT units) causes an error in STRICT mode and is ignored in LOOSE mode.

You can choose between two modes when rendering the cube materialized view, LOOSE and STRICT. In STRICT mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In LOOSE mode (the default), some
deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The `AVG` function is changed to `SUM` and `COUNT`.
- The `COUNT` function without a `SUM`, `MIN`, `MAX`, or `AVG` function is ignored.
- The `STDDEV` and `VARIANCE` functions are ignored.

You can also choose how conditions in the `WHERE` clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

### 44.2.3 Permissions for Managing and Querying Cube Materialized Views

Certain permissions are required to manage and query cube materialized views. To create cube materialized views, you must have these privileges:

- `CREATE [ANY] MATERIALIZED VIEW` privilege
- `CREATE [ANY] DIMENSION` privilege
- `ADVISOR` privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- `GLOBAL QUERY REWRITE` privilege
- `SELECT` or `READ` privilege on the relational source tables
- `SELECT` or `READ` privilege on the analytic workspace (\$name) that supports the cube materialized view
- `SELECT` or `READ` privilege on the cube
- `SELECT` or `READ` privilege on the dimensions of the cube

Note that you need `SELECT` or `READ` privileges on the database objects that support the cube materialized views, but not on the cube materialized views.

### 44.2.4 Example of SQL Aggregation Management

Six examples of SQL Aggregate Management are given. All these examples use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: `CAL_MONTH_SALES_MV` and `FWEK_PSCAT_SALES_MV`.

- About Relational Materialized View `CAL_MONTH_SALES_MV`
- Creating the Cube Materialized View
- Disabling the Relational Materialized Views
- Creating Execution Plans for Cube Materialized Views
- Maintaining Cube Materialized Views
New Database Objects

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

SELECT query FROM user_mviews
   WHERE mview_name='CAL_MONTH_SALES_MV';

QUERY
--------------------------------------------
SELECT   t.calendar_month_desc
 ,        sum(s.amount_sold) AS dollars
FROM     sales s
 ,        times t
WHERE    s.time_id = t.time_id
GROUP BY t.calendar_month_desc

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

SELECT dimension_name FROM user_dimensions;

DIMENSION_NAME
-------------------------------------
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

SET serverout ON format wrapped

DECLARE
   salesaw  varchar2(30);
BEGIN
   salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                                    'build=immediate');
END;
/

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212 08:42:58.003.
Created cube organized materialized view "CB$CAL_MONTH_SALES" for rewrite at 200130212 08:42:58.004.

The following query lists the materialized views in the SH schema:
SELECT mview_name FROM user_mviews;

MVIEW_NAME
-------------------------------
| CB$CAL_MONTH_SALES        |
| CB$TIMES_DIM_D1_CAL_ROLLUP |
| CAL_MONTH_SALES_MV         |
| FWEEK_PSCAT_SALES_MV       |

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;

Materialized view altered.

You can also use the DISABLEQRW parameter in the CREATE_MVIEW function, which disables query rewrite on the source materialized view as described in Table 44-7.

Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the SALES table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

EXPLAIN PLAN FOR SELECT
t.calendar_quarter_desc,
sum(s.amount_sold) AS dollars
FROM     sales s,
times t
WHERE     s.time_id = t.time_id
AND       t.calendar_quarter_desc LIKE '2001%'
GROUP BY t.calendar_quarter_desc
ORDER BY t.calendar_quarter_desc;

The query returns these results:

<table>
<thead>
<tr>
<th>CALENDAR_QUARTER_DESC</th>
<th>DOLLARS</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01</td>
<td>6547097.44</td>
</tr>
<tr>
<td>2001-02</td>
<td>6922468.39</td>
</tr>
<tr>
<td>2001-03</td>
<td>7195998.63</td>
</tr>
<tr>
<td>2001-04</td>
<td>7470897.52</td>
</tr>
</tbody>
</table>
The execution plan shows that query rewrite returned the summary data from the cube materialized view, \texttt{CB$CAL\_MONTH\_SALES}, instead of recalculating it from the \texttt{SALES} table.

SELECT plan_table_output FROM TABLE(dbms_xplan.display());

```
PLAN_TABLE_OUTPUT
---------------------------------------------------------------------------------------------------------------
Plan hash value: 2999729407
-----------------------------------------------------------------------------------------------------
| Id  | Operation                      | Name               | Rows  | Bytes | Cost (%CPU) | Time     |
-----------------------------------------------------------------------------------------------------
| 0   | SELECT STATEMENT               |                    | 1     | 30    | 3 (34)      | 00:00:01 |
| 1   | SORT GROUP BY                  |                    | 1     | 30    | 3 (34)      | 00:00:01 |
* 2   | MAT\_VIEW\_REWRITE\_CUBE\_ACCESS | CB$CAL\_MONTH\_SALES | 1     | 30    | 2 (0)       | 00:00:01 |
-----------------------------------------------------------------------------------------------------

Predicate Information (identified by operation id):

\[
2 - \text{filter}('\text{CB$CAL\_MONTH\_SALES}.\text{D1\_CALENDAR\_QUARTER\_DESC}' \text{LIKE} '2001%' \text{AND} '\text{CB$CAL\_MONTH\_SALES}.\text{SYS\_GID}' = 63)
\]

15 rows selected.

**Maintaining Cube Materialized Views**

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the \texttt{REFRESH\_MVIEW} Procedure:

```
BEGIN
  dbms_cube.refresh_mview('SH', 'CB$CAL\_MONTH\_SALES');
END;
/
```

Completed refresh of cube mview "SH"."CB$CAL\_MONTH\_SALES" at 20130212 14:30:59.534.

If you want to drop a cube materialized view, use the \texttt{DROP\_MVIEW} Procedure so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
  dbms_cube.drop_mview('SH', 'CB$CAL\_MONTH\_SALES');
END;
/
```

Dropped cube organized materialized view "SH"."CAL\_MONTH\_SALES" including container analytic workspace "SH"."CAL\_MONTH\_SALES\_AW" at 20130212 13:38:47.878.

**New Database Objects**

The \texttt{CREATE\_MVIEW} function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as \texttt{ALL\_CUBES} and \texttt{ALL\_CUBE\_DIMENSIONS}.

This example created the following supporting objects:

- **Analytic workspace** \texttt{CAL\_MONTH\_SALES\_AW} (\texttt{AW$CAL\_MONTH\_SALES\_AW} table)
- **Cube** \texttt{CAL\_MONTH\_SALES}
- **Cube dimension** \texttt{TIMES\_DIM\_D1}
• Dimension hierarchy CAL_ROLLUP
• Dimension levels ALL TIMES_DIM, YEAR, QUARTER, and MONTH
• Numerous attributes for levels in the CAL_ROLLUP hierarchy

44.3 Upgrading 10g Analytic Workspaces

You can upgrade an OLAP 10g analytic workspace to OLAP 12c by saving the OLAP 10g objects as an XML template and importing the XML into a different schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

Oracle OLAP metadata is the same in OLAP 11g and OLAP 12c so you do not need to upgrade an OLAP 11g analytic workspace to OLAP 12c. This topic describes upgrading an Oracle OLAP 10g analytic workspace to OLAP 12c.

**Tip:**
Oracle recommends using Analytic Workspace Manager for performing upgrades. See Upgrading Metadata From Oracle OLAP 10g in Oracle OLAP User’s Guide.

These subprograms in DBMS_CUBE support the upgrade process:

- CREATE_EXPORT_OPTIONS Procedure
- CREATE_IMPORT_OPTIONS Procedure
- EXPORT_XML Procedure
- EXPORT_XML_TO_FILE Procedure
- IMPORT_XML Procedure
- INITIALIZE_CUBE_UPGRADE Procedure
- UPGRADE_AW Procedure

Prerequisites:

- The OLAP 10g analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12c.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12c analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - SELECT or READ privileges on the OLAP 10g analytic workspace (GRANT SELECT ON schema.AW$analytic_workspace).
- SELECT or READ privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.
- Appropriate privileges for an OLAP administrator.
- Same default tablespace as the Oracle 10g user.

See the Oracle OLAP User's Guide.

Correcting Naming Conflicts

The namespaces are different in OLAP 10g than those in OLAP 12c. For a successful upgrade, you must identify any 10g object names that are used multiple times under the 12c naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 12c:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 12c object names do not need to be distinct from 10g object names, because they are in different namespaces.
- **Cube**: The names of measures must be unique within a cube.
- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 12c analytic workspace.

Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 12c naming rules. For example, a 10g dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 12c namespace, the name is not unique in 12c; to a 12c client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, a 12c client can browse the OLAP 12c metadata. You cannot attach an OLAP 12c client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10g metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 12c client, you see the new object names. When using an 10g client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10g, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 12c objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 12c namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.
OLAP 12c clients automatically use **CUBE_UPGRADE_INFO** when it exists in the same schema as the OLAP 10g analytic workspace.

**See Also:**

"INITIALIZE_CUBE_UPGRADE Procedure"

---

**Rename Table**

You can create a rename table that contains new object names for an OLAP 12c analytic workspace. You can then use the rename table in the **CREATE_IMPORT_OPTIONS** and **UPGRADE_AW** procedures.

When upgrading within the same schema, you must provide a unique name for the 12c analytic workspace. The **UPGRADE_AW** procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 12c cubes are created in a different namespace than the 10g cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the **CUBE_UPGRADE_INFO** table.

**To create a rename table:**

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10g analytic workspace.
2. Issue a command like the following:

   ```sql
   CREATE TABLE table_name (
       source_id    VARCHAR2(300),
       new_name     VARCHAR2(30),
       object_type  VARCHAR2(30));
   ```

3. Populate the rename table with the appropriate values, as follows.

   * **table_name** is the name of the rename table.
   * **source_id** is the identifier for an object described in the XML document supplied to **IMPORT_XML**. The identifier must have this format:
     
     `schema_name.object_name[.subobject_name]`
   
   * **new_name** is the object name given during the import to the object specified by **source_id**.
   
   * **object_type** is the object type as described in the XML, such as **StandardDimension** or **DerivedMeasure**.

   For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

   ```sql
   INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL12', 'AW');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE', 'Cube');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS', 'StandardDimension');
   ```
Simple Upgrade

A simple upgrade creates an OLAP 12c analytic workspace from an OLAP 10g analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner for the OLAP 12c analytic workspace.
2. To rename any objects in the 12c analytic workspace, create a rename table as described in the Rename Table section. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure".
4. Use the DBMS_CUBE.BUILD procedure to load data into the cube.

Example 44-1  Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 12c analytic workspace named GLOBAL12 from an OLAP 10g analytic workspace named GLOBAL10. GLOBAL10 contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

BEGIN

    -- Upgrade the analytic workspace
    dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12');

    -- Load and aggregate the data
    dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

Custom Upgrade

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner of the OLAP 12c analytic workspace.
2. Generate an initialization table, as described in the Initialization Table section. Review the new, default object names and modify them as desired.
3. Create a rename table, as described in the Rename Table section. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 12c analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or
between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.

4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure". The SUPPRESS_NAMESPACE option must be set to TRUE for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure".
   c. Create an XML template in OLAP 12c format, as described in "EXPORT_XML Procedure".
   d. Create an OLAP 12c analytic workspace from the XML template, as described in "IMPORT_XML Procedure".

5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure".

Example 44-2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the GLOBAL10 analytic workspace from OLAP 10g metadata to OLAP 12c metadata in the GLOBAL_AW schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```sql
CREATE TABLE my_object_map(
    source_id    VARCHAR2(300),
    new_name     VARCHAR2(30),
    object_type  VARCHAR2(30));
INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL12', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```sql
set serverout on
DECLARE
    importClob    clob;
    exportClob    clob;
    exportOptClob clob;
    importOptClob clob;
BEGIN
    -- Create table of reconciled names
dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob,
                                     suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table
                                     => 'MY_OBJECT_MAP');

    -- More code...
END;
```
-- Create CLOBs for the metadata
DBMS_LOB.CREATETEMPORARY(IMPORTCLOB, TRUE);
DBMS_LOB.CREATETEMPORARY(EXPORTCLOB, TRUE);

-- Export metadata from a 10g analytic workspace to a CLOB
DBMS_CUBE.EXPORT_XML(OBJECT_IDS=>'GLOBAL_AW', OPTIONS_XML=>EXPORTOPTCLOB,
OUT_XML=>EXPORTCLOB);

-- Import metadata from the CLOB
DBMS_CUBE.IMPORT_XML(IN_XML=>'exportClob', OPTIONS_XML=>'importOptClob,
OUT_XML=>'importClob');

-- Load and aggregate the data
DBMS_CUBE.BUILD('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

44.4 Summary of DBMS_CUBE Subprograms

This table lists and describes the DBMS_CUBE procedure subprograms.

Table 44-1  DBMS_CUBE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD Procedure</td>
<td>Loads data into one or more cubes and dimensions, and prepares the data for querying.</td>
</tr>
<tr>
<td>CREATE_EXPORT_OPTIONS</td>
<td>Creates an input XML document of processing options for the EXPORT_XML procedure.</td>
</tr>
<tr>
<td>Procedure</td>
<td>Creates an input XML document of processing options for the IMPORT_XML procedure.</td>
</tr>
<tr>
<td>CREATE_IMPORT_OPTIONS</td>
<td>Creates a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>Procedure</td>
<td>Creates an XML template for a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>CREATE_MVIEW Function</td>
<td>Drops a cube materialized view.</td>
</tr>
<tr>
<td>DROP_MVIEW Procedure</td>
<td>Exports the XML of an analytic workspace to a CLOB.</td>
</tr>
<tr>
<td>EXPORT_XML Procedure</td>
<td>Exports the XML of an analytic workspace to a file.</td>
</tr>
<tr>
<td>EXPORT_XML_TO_FILE Procedure</td>
<td>Creates, modifies, or drops an analytic workspace by using an XML template</td>
</tr>
<tr>
<td>INITIALIZE_CUBE_UPGRADE Procedure</td>
<td>Processes Oracle OLAP 10g objects with naming conflicts to enable Oracle 12c clients to access them.</td>
</tr>
<tr>
<td>REFRESH_MVIEW Procedure</td>
<td>Refreshes a cube materialized view.</td>
</tr>
<tr>
<td>UPGRADE_AW Procedure</td>
<td>Upgrades an analytic workspace from Oracle OLAP 10g to 12c.</td>
</tr>
<tr>
<td>VALIDATE_XML Procedure</td>
<td>Checks the XML to assure that it is valid, without committing the results to the database.</td>
</tr>
</tbody>
</table>
44.4.1 BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (script IN VARCHAR2, method IN VARCHAR2 DEFAULT NULL, refresh_after_errors IN BOOLEAN DEFAULT FALSE, parallelism IN BINARY_INTEGER DEFAULT 0, atomic_refresh IN BOOLEAN DEFAULT FALSE, automatic_order IN BOOLEAN DEFAULT TRUE, add_dimensions IN BOOLEAN DEFAULT TRUE, scheduler_job IN VARCHAR2 DEFAULT NULL, master_build_id IN BINARY_INTEGER DEFAULT 0, nested IN BOOLEAN DEFAULT FALSE, job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS');
```

Parameters

Table 44-2  BUILD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>A list of cubes and dimensions and their build options (see &quot;SCRIPT Parameter&quot;).</td>
</tr>
<tr>
<td>method</td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects.</td>
</tr>
<tr>
<td></td>
<td>• C: Complete refresh clears all dimension values before loading. (Default)</td>
</tr>
<tr>
<td></td>
<td>• F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</td>
</tr>
<tr>
<td></td>
<td>• ?: Fast refresh if possible, and otherwise a complete refresh.</td>
</tr>
<tr>
<td></td>
<td>• P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td></td>
<td>• S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</td>
</tr>
<tr>
<td></td>
<td>FALSE to roll back all objects in the build.</td>
</tr>
<tr>
<td>parallelism</td>
<td>Number of parallel processes to allocate to this job (see Usage Notes).</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>atomic_refresh</td>
<td><strong>TRUE</strong> prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. <strong>FALSE</strong> enables users to access intermediate results during an build.</td>
</tr>
<tr>
<td>automatic_order</td>
<td><strong>TRUE</strong> enables optimization of the build order. Dimensions are loaded before cubes. <strong>FALSE</strong> builds objects in the order you list them in the script.</td>
</tr>
<tr>
<td>add_dimensions</td>
<td><strong>TRUE</strong> automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. <strong>FALSE</strong> includes only dimensions specifically listed in the script.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>master_build_id</td>
<td>A unique name for the build.</td>
</tr>
<tr>
<td>nested</td>
<td><strong>TRUE</strong> performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace. <strong>FALSE</strong> does not perform nested refresh operations.</td>
</tr>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
</tbody>
</table>

**SCRIPT Parameter**

The **SCRIPT** parameter identifies the objects to include in the build, and specifies the type of processing to perform on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,....]
```

**Where:**

- **VALIDATE** checks all steps of the build and sends the planned steps to CUBE_BUILD_LOG without executing the steps. You can view all generated SQL in the OUTPUT column of the log table.
- **NO COMMIT** builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "**SCRIPT Parameter: USING Clause: SET command**".
- **objects** is the qualified name of one or more cubes or dimensions, separated by commas, in the form `[aw_name.]object`, such as UNITS_CUBE or GLOBAL.UNITS_CUBE.
SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

Note:
A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

• AGGREGATE USING [MEASURE]
  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

• ANALYZE
  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

• CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]
  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The 'C' (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

  – VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)

  – LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the F method)

  – AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  These optional arguments control the load method, and can be combined with any of the refresh options:

  – PARALLEL: Each partition is cleared separately. (Default)

  – SERIAL: All partitions are cleared together.

  If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

• COMPIL $E$ [SORT | NO SORT | SORT ONLY]
  Creates the supporting structures for the dimension. (Dimensions only)
These options control the use of a sort order attribute:

- **SORT**: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
- **NO SORT**: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.
- **SORT ONLY**: The compile step only runs the sort.

• **EXECUTE PLSQL string**

Executes a PL/SQL command or script in the database.

• **EXECUTE OLAP DML string [PARALLEL | SERIAL]**

Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:

- **PARALLEL**: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.
- **SERIAL**: Execute the command or program once for the entire cube. (Default)

• **[INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] VALUES (dim_key, parent, level_name)**

Adds a dimension member to one or more hierarchies. **INSERT** throws an error if the member already exists, while **MERGE** does not. See "Dimension Maintenance Example".

*dimension.hierarchy*: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, "PRODUCT"."PRIMARY".

*dim_key*: The DIM_KEY value of the dimension member.

*parent*: The parent of the dimension key.

*level_name*: The level of the dimension key.

• **UPDATE [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] SET PARENT = parent, LEVEL=level_name WHERE MEMBER = dim_key**

Alters the level or parent of an existing dimension member. See **INSERT** for a description of the options. Also see "Dimension Maintenance Example".

• **DELETE FROM DIMENSION WHERE MEMBER=dim_key**

Deletes a dimension member. See "Dimension Maintenance Example".

*dim_key*: The DIM_KEY value of the dimension member to be deleted.

• **SET dimension.attribute[qdr] = CAST('attribute_value' AS VARCHAR2))**

Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example".

*dimension.attribute*: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT"."LONG_DESCRIPTION".

*qdr*: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.

*attribute_value*: The value of the attribute, such as 'Optical Mouse'.

• **FOR dimension_clause measure_clause BUILD (commands)**
Restricts the build to particular measures and dimension values, using the following arguments. See "FOR Clause Example".

- **dimension_clause**:
  
  \[ \text{dimension} \ \text{ALL} \ | \ \text{NONE} \ | \ \text{WHERE condition} \ | \ \text{LEVELS} \ (\text{level} \ [, \ \text{level} \ldots]) \]

  \text{dimension} is the name of a dimension of the cube.

  \text{ALL} sets the dimension status to all members before executing the list of commands.

  \text{NONE} loads values for no dimension members.

  \text{WHERE} loads values for those dimension members that match the condition.

  \text{LEVELS} loads values for dimension members in the named levels.

  \text{level} is a level of the named dimension.

- **measure_clause**:

  \[ \text{MEASURES} \ (\text{measure} \ [, \ \text{measure} \ldots]) \]

  \text{measure} is the name of a measure in the cube.

- **commands**:

  Any of the other USING commands.

- **LOAD**

  \[ \text{[SYNCH} \ | \ \text{NO SYNCH} \ | \ \text{RETAIN}] \ [\text{PRUNE} \ | \ \text{PARALLEL} \ | \ \text{SERIAL}] \ [\text{WHERE condition}] \]

  Loads data into the dimension or cube.

  - **WHERE** limits the load to those values in the mapped relational table that match \text{condition}.

  - **condition** is a valid predicate based on the columns of the mapped table. See the "Examples".

These optional arguments apply only to dimensions:

- **SYNCH** matches the dimension keys to the relational data source. (Default)

- **NO SYNCH** loads new dimension keys but does not delete old keys.

  If the parent of a dimension key has changed in the relational data source, this option allows the load to change the parent/child relation in the analytic workspace.

- **RETAIN** loads new dimension keys but does not delete old keys.

  This option does not allow the parent of a dimension key to change. If the parent has changed, the load rejects the record. The rejection generates an error in the rejected records log, if the log is enabled.

These optional arguments apply only to cubes:

- **PRUNE**: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.

- **PARALLEL**: Each partition is loaded separately. (Default)

- **SERIAL**: All partitions are loaded in one SELECT statement.

- **MODEL**

  \[ \text{model} \text{name} \ [\text{PARALLEL} \ | \ \text{SERIAL}] \]
Executes a model previously created for the cube. It accepts these arguments:

- **PARALLEL**: The model runs separately on each partition.
- **SERIAL**: The model runs on all cubes at the same time. (Default)

**SET**

Supports write-back to the cube using the syntax described in "SCRIPT Parameter: USING Clause: SET command". (Cubes only)

**SOLVE [PARALLEL | SERIAL]**

Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

It accepts these arguments:

- **PARALLEL**: Each partition is solved separately. (Default)
- **SERIAL**: All partitions are solved at the same time.

**SCRIPT Parameter: USING Clause: AGGREGATE command**

The **AGGREGATE** command in a script specifies the aggregation rules for one or more measures.

---

**Note:**

The **AGGREGATE** command is available only for uncompressed cubes.

---

**AGGREGATE** has the following syntax:

```
{ AGGREGATE USING MEASURE
   WHEN measure1 THEN operator1
   WHEN measure2 THEN operator2...
   ELSE default_operator

   | [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES {hierarchy}}
```

**USING MEASURE Clause**

This clause enables you to specify different aggregation operators for different measures in the cube.

**Operator Clause**

The **operator_clause** has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

**WEIGHTBY** multiplies each data value by an expression before aggregation.

**SCALEBY** adds the value of an expression to each data value before aggregation.
### Table 44-3  Aggregation Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of data values that were added together.</td>
</tr>
<tr>
<td>FIRST</td>
<td>WEIGHTBY</td>
<td>The first real data value.</td>
</tr>
<tr>
<td>HIER_AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.</td>
</tr>
<tr>
<td>HIER_FIRST</td>
<td>WEIGHTBY</td>
<td>The first data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>HIER_LAST</td>
<td>WEIGHTBY</td>
<td>The last data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>LAST</td>
<td>WEIGHTBY</td>
<td>The last real data value.</td>
</tr>
<tr>
<td>MAX</td>
<td>WEIGHTBY</td>
<td>The largest data value among the children of each parent.</td>
</tr>
<tr>
<td>MIN</td>
<td>WEIGHTBY</td>
<td>The smallest data value among the children of each parent.</td>
</tr>
<tr>
<td>NO AGGREGATION</td>
<td>No option</td>
<td>Do not aggregate the values of the dimension or dimensions. Leave all aggregated values as NA.</td>
</tr>
<tr>
<td>SUM</td>
<td>SCALEBY</td>
<td>Adds data values. (Default)</td>
</tr>
</tbody>
</table>

### Processing Options

You can specify these processing options for aggregation:

- **(ALLOW | DISALLOW) OVERFLOW**
  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.
  - ALLOW: A calculation that generates overflow executes without error and produces null results. (Default)
  - DISALLOW: A calculation involving overflow stops executing and generates an error message.

- **(ALLOW | DISALLOW) DIVISION BY ZERO**
  Specifies whether to allow division by zero.
  - ALLOW: A calculation involving division by zero executes without error but returns a null value. (Default)
  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.

- **(CONSIDER | IGNORE) NULLS**
  Specifies whether nulls are included in the calculations.
CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.

IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

• MAINTAIN COUNT

Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

SCRIPT Parameter: USING Clause: SET command

The SET command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

target is a a measure or a qualified data reference.

expression returns values of the appropriate datatype for target.

Qualified Data References

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

```
expression [ { dimension = member }[ , { dimension = member } ...] ]
```

Where:

expression is a dimensional expression, typically the name of a measure.

dimension is a primary dimension of expression.

member is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

```
global.sales[global.time = 'CY2007'
```

The next example returns Sales values only for the United States in calendar year 2007:

```
sales[customer = 'US', time = 'CY2007'
```

See the Examples for qualified data references in SET commands.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.
The \( \text{F} \) and \( \text{P} \) methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

**Parallelism**

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the `PARALLELISM` argument of the `BUILD` procedure.
- Setting of the `JOB_QUEUE_PROCESSES` database initialization parameter.

Suppose `UNITS_CUBE` has 12 partitions, `PARALLELISM` is set to 10, and `JOB_QUEUE_PROCESSES` is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the `PARALLEL_DEGREE_POLICY` database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

**Build Logs**

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected records log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the `DBMS_CUBE_LOG` package.

You can also create the cube log file by running `$ORACLE_HOME/olap/admin/utlolaplog.sql`. This script creates three additional views:

- `CUBE_BUILD_LATEST`: Returns rows only from the last build.
- `CUBE_BUILD_REPORT`: Returns one row for each command with elapsed times.
- `CUBE_BUILD_REPORT_LATEST`: Returns a report like `CUBE_BUILD_REPORT` only from the last build.

This report shows a successfully completed build of the objects in the `GLOBAL` analytic workspace, which has four dimensions and two cubes.

```sql
SELECT command, status, build_object, build_object_type type
FROM cube_build_report_latest;
```

<table>
<thead>
<tr>
<th>COMMAND</th>
<th>STATUS</th>
<th>BUILD_OBJECT</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD</td>
<td>COMPLETED</td>
<td></td>
<td>BUILD</td>
</tr>
<tr>
<td>FREEZE</td>
<td>COMPLETED</td>
<td></td>
<td>BUILD</td>
</tr>
<tr>
<td>LOAD NO SYNCH</td>
<td>COMPLETED</td>
<td>CHANNEL</td>
<td>DIMENSION</td>
</tr>
<tr>
<td>COMPILE</td>
<td>COMPLETED</td>
<td>CHANNEL</td>
<td>DIMENSION</td>
</tr>
</tbody>
</table>
Examples

This example uses the default parameters to build **UNITS_CUBE**.

EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');

The next example builds **UNITS_CUBE** and explicitly builds two of its dimensions, **TIME** and **CHANNEL**. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
    method=>'CCS',
    parallelism=>2);
END;
/

The following example loads only the selection of data identified by the **WHERE** clause:

BEGIN
  DBMS_CUBE.BUILD(q'!
    GLOBAL."TIME",
    GLOBAL.CHANNEL,
    GLOBAL.CUSTOMER,
    GLOBAL.PRODUCT,
    GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
      WHERE UNITS_FACT.MONTH_ID LIKE '2006%
        AND UNITS_FACT.SALES > 5000)');
END;
/
FOR Clause Example

In this example, the Time dimension is partitioned by calendar year, and DBMS_CUBE builds only the partition identified by CY2006. The HIER_ANCESTOR is an analytic function in the OLAP expression syntax.

BEGIN
    dbms_cube.build(q'!
        UNITS_CUBE USING
        {
            FOR "TIME"
                WHERE HIER_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) = 'CY2006'
                    BUILD (LOAD, SOLVE)
            !',
            parallelism=>1)
    END;
/

The next example uses a FOR clause to limit the build to the SALES measure in 2006. All objects are built using the complete (C) method.

BEGIN
    DBMS_CUBE.BUILD(
        script => '
            GLOBAL."TIME",
            GLOBAL.CHANNEL,
            GLOBAL.CUSTOMER,
            GLOBAL.PRODUCT,
            GLOBAL.UNITS_CUBE USING
            {
                FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
                    BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE ''2006%'')
            },
        method => 'C',
        parallelism => 2)
    END;
/

Write-Back Examples

The following examples show various use of the SET command in a USING clause.

This example sets Sales Target to Sales increased by 5%:

DBMS_CUBE.BUILD('UNITS_CUBE USING(
    SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
        = 29.99, SOLVE)');

The next example contains two SET commands, but does not reaggregate the cube:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2006.12'', "PRODUCT"=''DLX MOUSE'']
        = 29.49,
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
        = 29.99)');
Dimension Maintenance Example

This script shows dimension maintenance. It adds a new dimension member named OPT MOUSE to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

BEGIN
  dbms_output.put_line('Add optical mouse');
  dbms_cube.build(q'!
    "PRODUCT" using (MERGE INTO ALL HIERARCHIES
    VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY"))
  !');

  dbms_output.put_line('Alter optical mouse');
  dbms_cube.build(q'!
    "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."PRIMARY")
    SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM"
    WHERE MEMBER = 'ITEM_OPT MOUSE')
  !');

  dbms_output.put_line('Provide attributes to optical mouse');
  dbms_cube.build(q'!
    "PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"["PRODUCT" = 'ITEM_OPT MOUSE']
    = CAST('Optical Mouse' AS VARCHAR2))
  !');

  dbms_output.put_line('Delete optical mouse');
  dbms_cube.build(q'!
    "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
  !');

END;
/

OLAP DML Example

This example uses the OLAP DML to add comments to the cube build log:

BEGIN
  DBMS_CUBE.BUILD(q'!
    global.units_cube USING {
      EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
      EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
      EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
      EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel ''CALENDAR_YEAR'')' parallel!
    },
    parallelism=>2,
    add_dimensions=>false);
END;
/

This query shows the comments in the cube build log:

SELECT partition, slave_number, TO_CHAR(output) output
FROM cube_build_log
WHERE command = 'OLAP DML'
AND status = 'COMPLETED'
ORDER BY slave_number, time;

PARTITION SLAVE_NUMBER OUTPUT
44.4.2 CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure and the EXPORT_XML_TO_FILE Procedure.

Syntax

```
DBMS_CUBE.CREATE_EXPORT_OPTIONS (  
  out_options_xml        IN/OUT  CLOB,  
  target_version         IN      VARCHAR2  DEFAULT NULL,  
  suppress_owner         IN      BOOLEAN   DEFAULT FALSE,  
  suppress_namespace     IN      BOOLEAN   DEFAULT FALSE,  
  preserve_table_owners  IN      BOOLEAN   DEFAULT FALSE,  
  metadata_changes       IN      CLOB      DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed into the options_xml parameter of the EXPORT_XML Procedure.</td>
</tr>
</tbody>
</table>
Table 44-4  (Cont.) CREATE_EXPORT_OPTIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_version</td>
<td>Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 12.1 or 12.1.0.1.0. This parameter defaults to the current database version, and so can typically be omitted.</td>
</tr>
<tr>
<td>suppress_owner</td>
<td>Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter True to drop the owner from the XML, or enter False to retain it. Enter True if you plan to import the exported metadata into a different schema.</td>
</tr>
<tr>
<td>suppress_namespace</td>
<td>Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter True to drop the namespace from the XML, or enter False to retain it (default). Enter True when upgrading to Oracle OLAP 12c metadata. Namespaces allow objects created in Oracle 10g to coexist with objects created in Oracle 12c. You cannot set or change namespaces.</td>
</tr>
<tr>
<td>preserve_table_owners</td>
<td>Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter True to retain the table owner, or enter False to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to True to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.</td>
</tr>
<tr>
<td>metadata_changes</td>
<td>Contains an 12c XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.</td>
</tr>
</tbody>
</table>

Examples

The following example generates an XML document of export options:

```sql
DECLARE
    optionsClob  CLOB;
BEGIN
    dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
    dbms_cube.create_export_options(out_options_xml=>optionsClob,
        suppress_namespace=>TRUE);
    dbms_output.put_line(optionsClob);
END;
/
```

The `DBMS_OUTPUT.PUT_LINE` procedure displays this XML document (formatted for readability):

```xml
<?xml version="1.0"?>
<Export TargetVersion="12.1.0.1">
    <ExportOptions>
        <Option Name="SuppressOwner" Value="FALSE"/>
        <Option Name="SuppressNamespace" Value="TRUE"/>
        <Option Name="PreserveTableOwners" Value="FALSE"/>
    </ExportOptions>
</Export>
```
The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the CHANNEL dimension.

```sql
DECLARE
    importClob clob;
    exportClob clob;
    overClob clob;
    exportOptClob clob;
    importOptClob clob;
BEGIN
    dbms_lob.createtemporary(overClob, TRUE);
    dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
    dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3"
MinimumDatabaseVersion="12.1.0.1">');
    dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
    dbms_lob.writeappend(overClob,75, '<Description Type="Description"
Language="AMERICAN" Value="Sales Channel"/>');
    dbms_lob.writeappend(overClob,20, '</StandardDimension>');
    dbms_lob.writeappend(overClob,11, '</Metadata>');
    dbms_lob.close(overClob);

    -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob,
    suppress_namespace=>TRUE, metadata_changes=>overClob);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table
    => 'MY_OBJECT_MAP');

    -- Create CLOBs for the metadata
    dbms_lob.createtemporary(importClob, TRUE);
    dbms_lob.createtemporary(exportClob, TRUE);

    -- Export metadata from a 10g analytic workspace to a CLOB
    dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
    out_xml=>exportClob);

    -- Import metadata from the CLOB
    dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob,
    out_xml=>importClob);

    -- Load and aggregate the data
    dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');
END;
/
```

The following is the content of exportClob (formatting added for readability). The XML document changes the description of Channel to Sales Channel.
44.4.3 CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure.

Syntax

DBMS_CUBE.CREATE_IMPORT_OPTIONS {
    out_options_xml  IN/OUT  CLOB,
    validate_only    IN      BOOLEAN   DEFAULT FALSE,
    rename_table     IN      VARCHAR2  DEFAULT NULL);

Parameters

Table 44-5  CREATE_IMPORT_OPTIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed to the options_xml parameter of the IMPORT_XML Procedure.</td>
</tr>
<tr>
<td>validate_only</td>
<td>TRUE causes the IMPORT_XML procedure to validate the metadata described in the input file or the in_xml parameter, without committing the changes to the metadata.</td>
</tr>
<tr>
<td>rename_table</td>
<td>The name of a table identifying new names for the imported objects, in the form [schema_name.]table_name. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.</td>
</tr>
</tbody>
</table>

Usage Notes

See the information about using a rename table in DBMS_CUBE - Upgrading 10g Analytic Workspaces.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure".

DECLARE
    importClob  clob;
BEGIN
    dbms_lob.createtemporary(importClob, TRUE);

    dbms_cube.create_import_options(out_options_xml => importClob, rename_table => 'MY_OBJECT_MAP', validate_only => TRUE);

    dbms_output.put_line(importClob);
END;
/

It generates the following XML document:

```xml
<?xml version="1.0"?>
<Import>

### 44.4.4 CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

**Syntax**

```sql
DBMS_CUBE.CREATE_MVIEW (  
    mvowner        IN  VARCHAR2,  
    mvname         IN  VARCHAR2,  
    sam_parameters IN  CLOB  DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot;. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>
SQL Aggregation Management Parameters

The `CREATE_MVIEW` and `DERIVE_FROM_MVIEW` functions use the SQL aggregation management (SAM) parameters described in Table 44-7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

### Table 44-7  SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ADDTOPS           | Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created.  
| TRUE: Creates levels named `ALL_dimension` with level members `ALL_dimension`. (Default)  
| FALSE: Creates only the hierarchies and levels identified by the relational dimensions. |
| ADDUNIQUEKEYPREFIX| Controls the creation of dimension keys.  
| TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as `CITY_NEW_YORK` and `STATE_NEW_YORK`. (Default)  
| FALSE: Uses the relational dimension keys as cube dimension keys. |
| ATRMAPTYPE        | Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both.  
| HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default)  
| DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy.  
| BOTH: Maps attributes to both dimension and hierarchy levels.  
| AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema. |
| AWNAME            | Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is `fact_tablename_AWn`. |
| BUILD             | Specifies whether a data refresh will immediately follow creation of the cube materialized view.  
| IMMEDIATE: Refreshes immediately.  
| DEFERRED: Does not perform a data refresh. (Default)  

**Note:** Only the `CREATE_MVIEW` function uses this parameter.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUBEMVOPTION</td>
<td>Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions. <strong>COMPLETE_REFRESH</strong>: Creates a complete refresh cube materialized view (full update). <strong>FAST_REFRESH</strong>: Creates a fast refresh materialized view (incremental update). <strong>REWRITE_READY</strong>: Runs validation checks for a rewrite cube materialized view, but does not create it. <strong>REWRITE</strong>: Creates a rewrite cube materialized view. <strong>REWRITE_WITH_ATTRIBUTES</strong>: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default) <strong>Note</strong>: The following settings do not create a cube materialized view. Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view. <strong>NONE</strong>: Does not create a cube materialized view. <strong>COMPLETE_REFRESH_READY</strong>: Runs validation checks for a complete refresh cube materialized view, but does not create it. <strong>FAST_REFRESH_READY</strong>: Runs validation checks for fast refresh, but does not create the cube materialized view.</td>
</tr>
<tr>
<td>CUBENAME</td>
<td>Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_Cn</code>.</td>
</tr>
<tr>
<td>DIMJAVABINDVARS</td>
<td>Supports access by Java programs to the XML document. <strong>TRUE</strong>: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template. <strong>FALSE</strong>: Generates an XML template that does not support Java bind variables. (Default)</td>
</tr>
<tr>
<td>DISABLEQRW</td>
<td>Controls disabling of query rewrite on the source relational materialized view. <strong>TRUE</strong>: Issues an ALTER MATERIALIZED VIEW mview_name DISABLE QUERY REWRITE command. <strong>FALSE</strong>: No action. <strong>Note</strong>: Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.</td>
</tr>
<tr>
<td>EXPORTXML</td>
<td>Exports the XML that defines the dimensional objects to a file, which you specify as <code>dir/filename</code>. Both the directory and the file name are case sensitive. <strong>dir</strong>: Name of a database directory. <strong>filename</strong>: The name of the file, typically given an XML filename extension.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>FILTERPARTITIONANCESTORLEVELS</td>
<td>Controls the generation of aggregate values above the partitioning level of a partitioned cube. TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL. FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)</td>
</tr>
<tr>
<td>LOGDEST</td>
<td>Directs and stores log messages. By default, the messages are not available. SERVEROUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer. TRACEFILE: Sends messages to the session trace file.</td>
</tr>
<tr>
<td>PARTITIONOPTION</td>
<td>Controls partitioning of the cube. NONE: Prevents partitioning. DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default) FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning. dimension.hierarchy.level: Partitions the cube using the specified dimension, hierarchy, and level.</td>
</tr>
<tr>
<td>POPULATELINEAGE</td>
<td>Controls the appearance of attributes in a cube materialized view. TRUE: Includes all dimension attributes in the cube materialized view. (Default) FALSE: Omits all dimension attributes from the cube materialized view.</td>
</tr>
<tr>
<td>PRECOMPUTE</td>
<td>Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session. precompute_percentage:[precompute_top_percentage] Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.</td>
</tr>
<tr>
<td>REMAPCOMPOSITEKEYS</td>
<td>Controls how multicolumn keys are rendered in the cube. TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default) FALSE: Creates a unique key attribute for each column.</td>
</tr>
</tbody>
</table>
### Table 44-7  (Cont.) SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENDERINGMODE</td>
<td>Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See &quot;Requirements for the Relational Materialized View&quot;.</td>
</tr>
<tr>
<td></td>
<td>LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default)</td>
</tr>
<tr>
<td></td>
<td>STRICT: Any loss in fidelity raises an exception so that no XML template is created.</td>
</tr>
<tr>
<td>SEEFILTERS</td>
<td>Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Renders valid conditions in the XML template. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: Ignores all conditions.</td>
</tr>
<tr>
<td>UNIQUENAMES</td>
<td>Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Modifies all relational names when they are rendered in the cube. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.</td>
</tr>
<tr>
<td>UNKNOWNKEYASDIM</td>
<td>Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies.</td>
</tr>
<tr>
<td></td>
<td>FALSE: Raises an exception when no relational dimension is found for the column. (Default)</td>
</tr>
<tr>
<td>VALIDATEXML</td>
<td>Controls whether the generated XML document is validated.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Validates the template using the VALIDATE_XML procedure. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: No validation is done.</td>
</tr>
</tbody>
</table>

**Returns**

The name of the cube materialized view created by the function.

**Usage Notes**

See "Using SQL Aggregation Management"

**Examples**

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.
SET serverout ON format wrapped

DECLARE
  salesaw  varchar2(30);
BEGIN
  salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/

The next example sets several parameters for creating a cube materialized view from FWEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- **ADDTOPS**: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- **PRECOMPUTE**: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- **EXPORTXML**: Creates a text file for the XML document.
- **BUILD**: Performs a data refresh.

DECLARE
  salescubemv   varchar2(30);
  sam_param     clob := 'ADDTOPS=FALSE,
                      PRECOMPUTE=40:10,
                      EXPORTXML=WORK_DIR/sales.xml,
                      BUILD=IMMEDIATE';
BEGIN
  salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                                          sam_param);
END;
/

### 44.4.5 DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

**Syntax**

```sql
DBMS_CUBE.DERIVE_FROM_MVIEW (  
    mvowner    IN  VARCHAR2,
    mvname     IN  VARCHAR2,
    sam_parameters IN  CLOB  DEFAULT NULL)
RETURN CLOB;
```

**Parameters**

**Table 44-8  DERIVE_FROM_MVIEW Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
</tbody>
</table>
Table 44-8  (Cont.) DERIVE_FROM_MVIEW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot;. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Optional list of parameters in the form 'parameter1=value1, parameter2=value2,...': See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the IMPORT_XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management".

Examples

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALES_MV relational materialized view in the SH schema.

```sql
DECLARE
    salescubexml  clob := null;
    sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';
BEGIN
    salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV', sam_param);
END;
/
```

44.4.6 DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```sql
DBMS_CUBE.DROP_MVIEW (
    mvowner     IN  VARCHAR2,
    mvname      IN  VARCHAR2,
    sam_parameters IN  CLOB  DEFAULT NULL);
```
Parameters

Table 44-9  DROP_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view</td>
</tr>
<tr>
<td>sam_parameters</td>
<td><strong>EXPORTXML</strong>: Exports the XML that drops the dimensional objects to a file, which you specify as dir/filename. Both the directory and the file name are case sensitive. dir: Name of a database directory. filename: The name of the file, typically given an XML filename extension.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management".

Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```
SELECT mview_name FROM user_mviews;
```

```
MVIEW_NAME
-------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEK_PSCAT_SALES_MV
```

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

```
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
```

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130213 16:31:40.056.
This query against the data dictionary confirms that the materialized views have been dropped.

```
SELECT mview_name FROM user_mviews;
```

```
MVIEW_NAME
-------------------------------
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

### 44.4.7 EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

#### Syntax

```
DBMS_CUBE.EXPORT_XML
    (object_ids            IN      VARCHAR2,
     out_xml               IN/OUT  CLOB);
```

```
DBMS_CUBE.EXPORT_XML
    (object_ids            IN      VARCHAR2,
     options_xml           IN      CLOB,
     out_xml               IN/OUT  CLOB);
```

```
DBMS_CUBE.EXPORT_XML
    (object_ids            IN      VARCHAR2,
     options_dirname       IN      VARCHAR2,
     options_filename      IN      VARCHAR2,
     out_xml               IN/OUT  CLOB);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as <code>GLOBAL</code>.</td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form <code>owner.aw_name.AW</code>, such as <code>GLOBAL.GLOBAL.AW</code>.</td>
</tr>
<tr>
<td></td>
<td>- Cube</td>
</tr>
<tr>
<td></td>
<td>- Dimension</td>
</tr>
<tr>
<td></td>
<td>- Named build process</td>
</tr>
<tr>
<td></td>
<td>- Measure folder</td>
</tr>
<tr>
<td></td>
<td>You can specify multiple objects by separating the names with commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>options_dirname</th>
<th>The case-sensitive name of a database directory that contains <code>options_filename</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_filename</td>
<td>A file containing an XML document of export options.</td>
</tr>
<tr>
<td>options_xml</td>
<td>A CLOB variable that contains an XML document of export options. Use the <code>CREATE_EXPORT_OPTIONS</code> Procedure to generate this document.</td>
</tr>
</tbody>
</table>
Table 44-10  (Cont.) EXPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_xml</td>
<td>A CLOB variable that will store the XML document of OLAP metadata for the objects listed in object_ids.</td>
</tr>
</tbody>
</table>

Export Options

The default settings for the export options are appropriate in many cases, so you can omit the options_xml parameter or the options_dirname and options_filename parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```xml
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure.

Usage Notes

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

For an example of using EXPORT_XML in an upgrade to the same schema, see "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

The following PL/SQL script copies an OLAP 12c analytic workspace named GLOBAL12 from the GLOBAL_AW schema to the GLOBAL schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the INITIALIZE_CUBE_UPGRADE procedure.
- Call the CREATE_EXPORT_OPTIONS procedure with the additional parameter setting SUPPRESS_NAMESPACE=>TRUE.

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL_AW.AW$GLOBAL and on all relational data sources.

```sql
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_owner=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
```

Chapter 44
Summary of DBMS_CUBE Subprograms

44-39
dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL12.AW',
options_xml=>optionsClob, out_xml=>exportClob);

-- Import metadata from the CLOB
ds dbs_cube.import_xml(in_xml=>exportClob);

-- Load and aggregate the data
ds dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');

END;
/

44.4.8 EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new
or existing analytic workspace using the IMPORT_XML procedure. In this way, you can
create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading OLAP standard
form metadata contained in an Oracle OLAP 10g analytic workspace to OLAP 12c
format.

Syntax

DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids           IN      VARCHAR2,
   output_dirname       IN      VARCHAR2,
   output_filename      IN      VARCHAR2;
  DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids           IN      VARCHAR2,
   options_dirname      IN      VARCHAR2,
   options_filename     IN      VARCHAR2,
   output_dirname       IN      VARCHAR2,
   output_filename      IN      VARCHAR2;

Parameters

Table 44-11 EXPORT_XML_TO_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as GLOBAL.</td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form owner.aw_name.AW, such as GLOBAL.GLOBAL.AW.</td>
</tr>
<tr>
<td></td>
<td>- Cube</td>
</tr>
<tr>
<td></td>
<td>- Dimension</td>
</tr>
<tr>
<td></td>
<td>- Named build process</td>
</tr>
<tr>
<td></td>
<td>- Measure folder</td>
</tr>
<tr>
<td></td>
<td>You can specify multiple objects by separating the names with commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: When exporting an individual object, be sure to export any</td>
</tr>
<tr>
<td></td>
<td>objects required to reconstruct it. For example, when you export a cube,</td>
</tr>
<tr>
<td></td>
<td>you must also export the dimensions of the cube.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory that contains</td>
</tr>
<tr>
<td></td>
<td>options_filename. See &quot;Export Options&quot;.</td>
</tr>
</tbody>
</table>
Table 44-11  (Cont.) EXPORT_XML_TO_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_filename</td>
<td>The name of a file containing an XML document of export options. See &quot;Export Options&quot;.</td>
</tr>
<tr>
<td>output_dirname</td>
<td>The case-sensitive name of a database directory where output_filename is created.</td>
</tr>
<tr>
<td>output_filename</td>
<td>The name of the template file created by the procedure.</td>
</tr>
</tbody>
</table>

Export Options

The default settings for the export options are appropriate in most cases, and you can omit the options_dirname and options_filename parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings, like the following:

```xml
<?xml version="2.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure.

Usage Notes

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Examples

The following example generates an XML file named global.xml in OLAP 12c format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the GLOBAL_AW schema. The output file is generated in the WORK_DIR database directory.

```sql
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 12c format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the GLOBAL_AW schema. Both the options file and the output file are in the WORK_DIR database directory.

```sql
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR', 'options.xml', 'WORK_DIR', 'global.xml');
```
44.4.9 IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2 );

DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (input_dirname         IN      VARCHAR2,
   input_filename        IN      VARCHAR2,
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   options_xml           IN      CLOB,
   out_xml               IN/OUT  CLOB );
```

Parameters

```
Table 44-12  IMPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>in_xml</td>
<td>A CLOB containing an XML document describing an analytic workspace.</td>
</tr>
<tr>

<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory containing a file of import options.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file of import options.</td>
</tr>
</tbody>
</table>
```
Table 44-12  (Cont.) IMPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_xml</td>
<td>An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure to generate this document.</td>
</tr>
<tr>
<td>out_xml</td>
<td>An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.</td>
</tr>
</tbody>
</table>

Usage Notes

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure with the EXPORTXML parameter.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');

The next example exports an OLAP 10g template and uses IMPORT_XML to validate it before an upgrade to 12c.

DECLARE
    exportOptClob clob;
    importOptClob clob;
    importClob    clob;
    exportClob    clob;
BEGIN
    -- Create a CLOB for the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB for the XML template
    dbms_lob.createtemporary(importOptClob, TRUE);

    -- Create a CLOB for import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_only=>TRUE);

    -- Create a CLOB for the change log
    dbms_lob.createtemporary(importClob, TRUE);

    -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    EXAMPLE

    DECLARE
        exportOptClob clob;
        importOptClob clob;
        importClob    clob;
        exportClob    clob;
    BEGIN
        -- Create a CLOB for the export options
        dbms_lob.createtemporary(exportOptClob, TRUE);
        dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

        -- Create a CLOB for the XML template
        dbms_lob.createtemporary(importOptClob, TRUE);

        -- Create a CLOB for import options
        dbms_lob.createtemporary(importOptClob, TRUE);
        dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_only=>TRUE);

        -- Create a CLOB for the change log
        dbms_lob.createtemporary(importClob, TRUE);

        -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
        dbms_cube.initialize_cube_upgrade;
-- Export metadata from an analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

/* Import metadata from the CLOB. No objects are committed to the database
because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to
TRUE. */

dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob,
out_xml=>importClob);

-- Output the metadata changes
dbms_output.put_line('This is the validation log:');
dbms_output.put_line(importClob);

END;
/

The contents of importClob show that the XML is valid. Otherwise, error messages
appear in the <RootCommitResult> element.

This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>
</RootCommitResult>

For an example of IMPORT_XML within the context of an upgrade from 10g to 12c
metadata, see the Custom Upgrade section of "DBMS_CUBE - Upgrading 10g
Analytic Workspaces".

44.4.10 INITIALIZE_CUBE_UPGRADE Procedure

This procedure processes analytic workspaces created in Oracle OLAP 10g so they
can be used by Oracle OLAP 12c clients. It processes all analytic workspaces in the
current schema. Run this procedure once for each schema in which there are 10g
analytic workspaces.

Without this processing step, 12c clients cannot connect to a database containing a
10g analytic workspace with subobjects of a dimension or cube having the same
name. Additionally, some DBMS_CUBE procedures and functions, such as EXPORT_XML
and EXPORT_XML_TO_FILE, do not work on the 10g metadata.

After processing, OLAP 12c clients can connect and use the alternate names provided
by INITIALIZE_CUBE_UPGRADE for the conflicting subobjects. OLAP 10g clients
continue to use the original names.

INITIALIZE_CUBE_UPGRADE does not upgrade any OLAP 10g objects to OLAP 12c
format.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
Usage Notes

This procedure creates and populates a table named CUBE_UPGRADE_INFO. If it already exists, the table is truncated and repopulated.

While the 10g namespace allowed subobjects with the same name in the same dimension or cube, the 12c namespace does not. When INITIALIZE_CUBE_UPGRADE detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in CUBE_UPGRADE_INFO providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the CONFLICT column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL INSERT and UPDATE if you want to customize the names of OLAP 10g objects on OLAP 12c clients.

The UPGRADE_AW, EXPORT_XML and EXPORT_XML_TO_FILE procedures use the names specified in the NEW_NAME column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of CUBE_UPGRADE_INFO.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Owner of the analytic workspace.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Name of the analytic workspace.</td>
</tr>
<tr>
<td>AWXML_ID</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Full logical name of the object requiring modification, in the form simple_name.[subtype_name].object_type. For example, TIME.DIMENSION and PRODUCT.COLOR.ATTRIBUTE.</td>
</tr>
<tr>
<td>NEW_NAME</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>The name the object will have in Oracle 12c after the upgrade.</td>
</tr>
<tr>
<td>OBJECT_CLASS</td>
<td>VARCHAR2</td>
<td>--</td>
<td>DerivedMeasure for calculated measures, or empty for all other object types.</td>
</tr>
<tr>
<td>CONFLICT</td>
<td>NUMBER</td>
<td>--</td>
<td>Indicates the reason that the row was added to CUBE_UPGRADE_INFO:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 0: The object does not have a naming conflict but appears in the table for other reasons.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 1: Two objects have the same name and would create a conflict in the OLAP 12c namespace. The object type (such as level or hierarchy) will be added to the names.</td>
</tr>
</tbody>
</table>

Examples

The following command creates and populates the CUBE_UPGRADE_INFO table:

EXECUTE dbms_cube.initialize_cube_upgrade;

The table shows that the OLAP 10g analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of CONFLICT is 0.

SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;

<table>
<thead>
<tr>
<th>AWXML_ID</th>
<th>NEW_NAME</th>
<th>CONFLICT</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSTOMER.MARKET_SEGMENT.HIERARCHY</td>
<td>MARKET_SEGMENT_HIERARCHY</td>
<td>1</td>
</tr>
</tbody>
</table>
44.4.11 REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```
DBMS_CUBE.REFRESH_MVIEW (
  mvowner    IN  VARCHAR2,
  mvname     IN  VARCHAR2,
  method     IN  VARCHAR2       DEFAULT NULL,
  refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,
  parallelism IN  BINARY_INTEGER DEFAULT 0,
  atomic_refresh IN  BOOLEAN        DEFAULT FALSE,
  scheduler_job IN  VARCHAR2       DEFAULT NULL,
  sam_parameters IN  CLOB           DEFAULT NULL,
  nested      IN  BOOLEAN        DEFAULT FALSE );
```

Parameters

Table 44-13  REFRESH_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view.</td>
</tr>
</tbody>
</table>
### Table 44-13  (Cont.) REFRESH_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.</td>
</tr>
</tbody>
</table>
|                | - C: Complete refresh clears all dimension values before loading. (Default)  
|                | - F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.  
|                | - ?: Fast refresh if possible, and otherwise a complete refresh.  
|                | - P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.  
|                | - S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" for the BUILD procedure for additional details. |
| refresh_after_errors | TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.  
|                  | FALSE to roll back all objects in the build. |
| parallelism     | Number of parallel processes to allocate to this job. See the "Usage Notes" for the BUILD procedure for additional details. |
| atomic_refresh  | TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state.  
|                  | FALSE enables users to access intermediate results during an build. |
| scheduler_job   | Any text identifier for the job, which will appear in the log table. The string does not need to be unique. |
| sam_parameters  | None. |
| nested          | TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.  
|                  | All objects must reside in a single analytic workspace. |

### Usage Notes

REFRESH_MVIEW changes mvname to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube.
materialized view. See the "BUILD Procedure" for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named \texttt{CB_FWEEK_PSCAT_SALES}.

\begin{verbatim}
SET serverout ON format wrapped
EXECUTE dbms_cube.refresh_mview('SH', 'CB_FWEEK_PSCAT_SALES');
\end{verbatim}

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

\begin{verbatim}
EXECUTE dbms_cube.refresh_mview('SH', 'CB_FWEEK_PSCAT_SALES', '?', TRUE, 2);
\end{verbatim}

After successfully refreshing the cube materialized view, \texttt{REFRESH_MVIEW} returns a message like the following:

\begin{verbatim}
Completed refresh of cube mview "SH"."CB_FWEEK_PSCAT_SALES" at 20130212 15:04:46.370.
\end{verbatim}

44.4.12 UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 12c analytic workspace from a copy of the metadata contained in an OLAP 10g analytic workspace. The original OLAP 10g analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 12c analytic workspace.

\texttt{UPGRADE_AW} automatically runs \texttt{INITIALIZE_CUBE_UPGRADE} if the \texttt{CUBE_UPGRADE_INFO} table does not exist. If it does exist, then \texttt{UPGRADE_AW} does not overwrite it, thus preserving any changes you made to the table.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

\begin{verbatim}
DBMS_CUBE.UPGRADE_AW
    (sourceaw  IN  VARCHAR2,
     destaw    IN  VARCHAR2,
     upgoptions  IN  CLOB DEFAULT NULL);
\end{verbatim}

Parameters

\textbf{Table 44-14}  \texttt{UPGRADE_AW} Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceaw</td>
<td>The name of a 10g analytic workspace.</td>
</tr>
<tr>
<td>destaw</td>
<td>A new name for the generated 12c analytic workspace. It cannot be the same as sourceaw.</td>
</tr>
</tbody>
</table>
Table 44-14  (Cont.) UPGRADE_AW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgoptions</td>
<td>One or more of these upgrade options, as a string in the form 'OPTION=VALUE'. Separate multiple options with commas.</td>
</tr>
<tr>
<td></td>
<td>· PRESERVE_TABLE_OWNERS: YES preserves the original source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the original schema. (Default) NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the destination schema.</td>
</tr>
<tr>
<td></td>
<td>· RENAME_TABLE: The name of a table that specifies new names for objects as they are created in OLAP 12c format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See &quot;CREATE_IMPORT_OPTIONS Procedure&quot; for information about creating a rename table.</td>
</tr>
<tr>
<td></td>
<td>· TARGET_VERSION: The version of the upgrade, specified by a 2- to 5-part number, such as 11.2 or 11.2.0.2.0. If you enter an unsupported version number, then the closest version below it is used.</td>
</tr>
</tbody>
</table>

Examples

This example upgrades an OLAP 10g analytic workspace named GLOBAL10 to an OLAP 12c analytic workspace named GLOBAL12, using a rename table named MY_OBJECT_MAP:

```
BEGIN
  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12', upgoptions => 'RENAME_TABLE=MY_OBJECT_MAP');

  -- Load and aggregate the data
  dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/```

44.4.13 VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
  (dirname               IN  VARCHAR2,
   filename              IN  VARCHAR2 );
```
DBMS_CUBE.VALIDATE_XML
   (in_xml        IN  CLOB );

Parameters

Table 44-15  VALIDATE_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of a file containing an XML template.</td>
</tr>
<tr>
<td>IN_XML</td>
<td>The name of a CLOB containing an XML template.</td>
</tr>
</tbody>
</table>

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;

* 
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1

After the problems are corrected, the procedure reports no errors:

EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');

PL/SQL procedure successfully completed.

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

DEFINE xml_file = 'GLOBAL.XML';
SET ECHO ON;
SET SERVEROUT ON;

DECLARE
   xml_file       BFILE := bfilename('XML_DIR', '&xml_file');
in_xml       CLOB;
out_xml      CLOB := NULL;
dest_offset  INTEGER := 1;
src_offset   INTEGER := 1;
lang_context INTEGER := 0;
warning      INTEGER;
BEGIN
  -- Setup the clob from a file
  DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
  DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
  DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
  DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
   dest_offset, src_offset, 0, lang_context, warning);

  -- Validate the xml
  DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
45

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

• DBMS_CUBE_ADVISE Security Model
• Summary of DBMS_CUBE_ADVISE Subprograms

See Also:
Oracle OLAP User’s Guide for information about cube materialized views

45.1 DBMS_CUBE_ADVISE Security Model

The MV_CUBE_ADVICE function requires the ADVISOR privilege.

45.2 Summary of DBMS_CUBE_ADVISE Subprograms

This table lists and describes the DBMS_CUBE_ADVISE subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MV_CUBE_ADVICE Function</td>
<td>Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.</td>
</tr>
<tr>
<td>SET_CNS_EXCEPTION_LOG Procedure</td>
<td>Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.</td>
</tr>
<tr>
<td>TRACE Procedure</td>
<td>Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.</td>
</tr>
</tbody>
</table>

45.2.1 MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that
allow the broadest range of query rewrite transformations and log-based fast refresh of
the cube materialized view.

**Syntax**

DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
    owner        IN  VARCHAR2  DEFAULT USER,
    mvname       IN  VARCHAR2,
    reqtype      IN  VARCHAR2  DEFAULT '0',
    validate     IN  NUMBER    DEFAULT 0)
RETURN COAD_ADVICE_T  PIPELINED;

**Parameters**

**Table 45-2**  **MV_CUBE_ADVICE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE</td>
</tr>
<tr>
<td>reqtype</td>
<td>Type of advice to generate:</td>
</tr>
<tr>
<td></td>
<td>· 0: All applicable advice types</td>
</tr>
<tr>
<td></td>
<td>· 1: Column NOT NULL constraints</td>
</tr>
<tr>
<td></td>
<td>· 2: Primary key constraints</td>
</tr>
<tr>
<td></td>
<td>· 3: Foreign key constraints</td>
</tr>
<tr>
<td></td>
<td>· 4: Relational dimension objects</td>
</tr>
<tr>
<td></td>
<td>· 5: Cube materialized view logs with primary key</td>
</tr>
<tr>
<td>validate</td>
<td>Validation option:</td>
</tr>
<tr>
<td></td>
<td>· 0: Validate the constraints</td>
</tr>
<tr>
<td></td>
<td>· 1: Do not validate the constraints</td>
</tr>
</tbody>
</table>

**Returns**

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC.  
Table 45-3 describes the columns.

**Table 45-3**  **MV_CUBE_ADVICE Return Values**

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the dimensional object identified in APIOBJECT.</td>
</tr>
<tr>
<td>APIOBJECT</td>
<td>VARCHAR2 (30)</td>
<td>Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.</td>
</tr>
<tr>
<td>SQLOBJOWN</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the relational object identified in SQLOBJECT.</td>
</tr>
<tr>
<td>SQLOBJECT</td>
<td>VARCHAR2 (65)</td>
<td>Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.</td>
</tr>
</tbody>
</table>
Table 45-3  (Cont.) MV_CUBE_ADVICE Return Values

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVICETYPE</td>
<td>NUMBER(38,0)</td>
<td>Type of recommendation:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: Create NOT NULL constraints on the foreign key columns</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2: Create primary key constraints on the master table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 3: Create primary key constraints on the master view</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 4: Create foreign key constraints on the master table</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 5: Create foreign key constraints on the master view</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 6: Create relational dimensions on the master dimension tables</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 7: Create a materialized view log</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 8: Compile the materialized view</td>
</tr>
<tr>
<td>DISPOSITION</td>
<td>CLOB</td>
<td>Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.</td>
</tr>
<tr>
<td>SQLTEXT</td>
<td>CLOB</td>
<td>SQL statement that implements the recommendation.</td>
</tr>
<tr>
<td>DROPTEXT</td>
<td>CLOB</td>
<td>SQL statement that reverses SQLTEXT.</td>
</tr>
</tbody>
</table>

Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

`MV_CUBE_ADVICE` generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL `DROP MATERIALIZED VIEW LOG` statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by `MV_CUBE_ADVICE`. `UNITS_FACT` is the master table for `UNITS_CUBE`, and `MV_CUBE_ADVICE` generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the `CB$UNITS_CUBE` cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
    FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));
```

```
### 45.2.2 SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

**Syntax**

```sql
DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
    exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);
```

**Parameters**

**Table 45-4**  SET_CNS_EXCEPTION_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exceptlogtab</td>
<td>The name of an existing exception log.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To create an exception log, use the `utlexcpt.sql` or the `utlexpt1.sql` script before executing SET_CNS_EXCEPTION_LOG.

The `validate` parameter of MV_CUBE_ADVICE must be set to 1.

**Examples**

The `utlexcpt.sql` script creates a table named `EXCEPTIONS`, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The `ALTER TABLE` statement now includes the clause `VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS"`.

```sql
SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advertise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
FROM TABLE(    dbms_cube_advertise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));
```

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>

</tr>
</tbody>
</table>
45.2.3 TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the `MV_CUBE_ADVICE` function.

**Syntax**

```sql
DBMS_CUBE_ADVISE.TRACE ( diaglevel IN BINARY_INTEGER DEFAULT 0 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diaglevel</td>
<td>0 to turn tracing off, or 1 to turn tracing on.</td>
</tr>
</tbody>
</table>

**Examples**

The following example directs the diagnostic messages to server output. The SQL*Plus `SERVEROUTPUT` setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE DBMS_CUBE_ADVISE.trace(1);
PL/SQL procedure successfully completed.
```

```
SQL> SELECT sqlobject, sqltext, droptext
    FROM TABLE ( DBMS_CUBE_ADVISE.mv_cube_advice( 'GLOBAL', 'CB$UNITS_CUBE' ) )
WHERE apiobject='UNITS_CUBE';
```

```
<table>
<thead>
<tr>
<th>SQLOBJECT</th>
<th>SQLTEXT</th>
<th>DROPTEXT</th>
</tr>

DBMS_COAD_DIAG: Changing diagLevel from [1] to [0]

PL/SQL procedure successfully completed.
DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

**See Also:**

OLAP Technology in the Oracle Database in Oracle OLAP User's Guide regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

- Using DBMS_CUBE_LOG
- Summary of DBMS_CUBE_LOG Subprograms

### 46.1 Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs that enable you to track the progress of long running processes, then use the results to profile performance characteristics.

They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube, such as hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

- Logging Types
- Logging Targets
- Verbosity Levels
- Security Model
- Creating Cube Logs
- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log
46.1.1 DBMS_CUBE_LOG — Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable.

The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

DBMS_CUBE_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function

46.1.2 DBMS_CUBE_LOG — Logging Targets

The TABLE_CREATE procedure creates database tables for storing the logs. Using the ENABLE procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file.

These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See ENABLE Procedure for more information about creating multiple targets.

DBMS_CUBE_LOG provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TARGET_FILE Function
- TARGET_LOB Function
- TARGET_TABLE Function
- TARGET_TRACE Function
46.1.3 DBMS_CUBE_LOG — Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- **LOWEST**: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- **LOW**: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- **MEDIUM**: Logs messages at the level used by Analytic Workspace Manager.
- **HIGH**: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- **HIGHEST**: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

`DBMS_CUBE_LOG` provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- **LEVEL_LOWEST Function**
- **LEVEL_LOW Function**
- **LEVEL_MEDIUM Function**
- **LEVEL_HIGH Function**
- **LEVEL_HIGHEST Function**

46.1.4 DBMS_CUBE_LOG Security Model

The `TABLE_CREATE` procedure requires the `CREATE TABLE` privilege.

46.1.5 DBMS_CUBE_LOG — Creating Cube Logs

To store logging information in a database table, you must create that table using the `TABLE_CREATE` procedure. Cube Build logs are always stored in tables. The `ENABLE` procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the `TABLE_CREATE` procedure.

The following command creates a Cube Build log with the default name of `CUBE_BUILD_LOG`:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the `TABLE_CREATE` procedure to create the table.
2. Execute the `ENABLE` procedure to begin logging.
These commands create and enable a Cube Operations table with the default name of `CUBE_OPERATIONS_LOG` and the default verbosity level:

```sql
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the `ENABLE` procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named `rejects.log` in the `WORK_DIR` database directory:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
   dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
   'WORK_DIR/rejects.log');
```

### 46.1.6 DBMS_CUBE_LOG — Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log are refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is `CUBE_BUILD_LOG`. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_ID</td>
<td>NUMBER</td>
<td>--</td>
<td>A unique sequence number for the build. The same number is used for slave processes in a parallel build.</td>
</tr>
<tr>
<td>SLAVE_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.</td>
</tr>
<tr>
<td>COMMAND</td>
<td>VARCHAR2(25)</td>
<td>--</td>
<td>The name of the command being executed, such as BUILD, LOAD, and SOLVE.</td>
</tr>
<tr>
<td>BUILD_OBJECT</td>
<td>VARCHAR2(500)</td>
<td>--</td>
<td>The name of the cube or cube dimension being processed.</td>
</tr>
<tr>
<td>BUILD_OBJECT_TYPE</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The type of object: CUBE, DIMENSION, or BUILD.</td>
</tr>
</tbody>
</table>

**Note:**

To manage a Cube Build log, use only the `TABLE_CREATE` and `VERSION` procedures.
<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT</td>
<td>CLOB</td>
<td>--</td>
<td>Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2(30)</td>
<td>--</td>
<td>The name of the analytic workspace that contains the objects of the build.</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>The owner of the analytic workspace and all the objects of the build.</td>
</tr>
<tr>
<td>PARTITION</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The name of the partition being processed, or NULL when the current operation does not correspond to a partition.</td>
</tr>
<tr>
<td>SCHEDULER_JOB</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>A user-specified string to identify the build.</td>
</tr>
<tr>
<td>TIME</td>
<td>TIMESTAMP(6)</td>
<td></td>
<td>The time the row is added to the table.</td>
</tr>
<tr>
<td>BUILD_SCRIPT</td>
<td>CLOB</td>
<td>--</td>
<td>The cube build script. Populated only in rows where COMMAND is BUILD.</td>
</tr>
<tr>
<td>BUILD_TYPE</td>
<td>VARCHAR2(22)</td>
<td>--</td>
<td>The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.</td>
</tr>
<tr>
<td>COMMAND_DEPTH</td>
<td>NUMBER(2)</td>
<td>--</td>
<td>The nesting depth of the command. For example, COMPILE HIERARCHIES is a component step of COMPARE, so if COMPARE has a depth of 1, then COMPILE HIERARCHIES has a depth of 2.</td>
</tr>
<tr>
<td>BUILD_SUB_OBJECT</td>
<td>VARCHAR2(30)</td>
<td>--</td>
<td>The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.</td>
</tr>
<tr>
<td>REFRESH_METHOD</td>
<td>VARCHAR2(1)</td>
<td>--</td>
<td>The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>COMMAND_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.</td>
</tr>
<tr>
<td>IN_BRANCH</td>
<td>NUMBER(1)</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>COMMAND_STATUS_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.</td>
</tr>
</tbody>
</table>

### 46.1.7 DBMS_CUBE_LOG — Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log.

The checks include:
- Circularity: Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.

- Hierarchy type: Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.

- Level options: Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is CUBE_DIMENSION_COMPILE. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT NULL</td>
<td>Number of the error being reported</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2(2000)</td>
<td>--</td>
<td>Error message associated with the error</td>
</tr>
<tr>
<td>DIMENSION</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Name of the dimension being compiled</td>
</tr>
<tr>
<td>DIMENSION_MEMBER</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Faulty dimension member</td>
</tr>
<tr>
<td>MEMBER_ANCESTOR</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Parent of DIMENSION_MEMBER</td>
</tr>
<tr>
<td>HIERARCHY1</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>First hierarchy involved in the error</td>
</tr>
<tr>
<td>HIERARCHY2</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Second hierarchy involved in the error</td>
</tr>
<tr>
<td>ERROR_CONTEXT</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about the error</td>
</tr>
</tbody>
</table>

46.1.8 DBMS_CUBE_LOG — Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the SQL_ID column, you can join the Cube Operations log to dynamic performance views such as V$SQL, V$SESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is CUBE_OPERATIONS_LOG. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INST_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Instance identifier</td>
</tr>
<tr>
<td>SID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session identifier</td>
</tr>
<tr>
<td>SERIAL#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session serial number</td>
</tr>
<tr>
<td>USER#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>User identifier</td>
</tr>
<tr>
<td>SQL_ID</td>
<td>VARCHAR2(13)</td>
<td>--</td>
<td>Executing SQL statement identifier</td>
</tr>
<tr>
<td>JOB</td>
<td>NUMBER</td>
<td>--</td>
<td>Job identifier</td>
</tr>
</tbody>
</table>
### 46.1.9 DBMS_CUBE_LOG — Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field generates an error in the log, resulting in multiple rows with the same rowid in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT</td>
<td>Number of the error triggered by the record</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2</td>
<td>--</td>
<td>Error message associated with the error</td>
</tr>
<tr>
<td>RECORD#</td>
<td>NUMBER(38)</td>
<td>--</td>
<td>Input record number</td>
</tr>
<tr>
<td>SOURCE_ROW</td>
<td>ROWID</td>
<td>--</td>
<td>Rowid of the row in the source table; null when the source is a view or a query</td>
</tr>
</tbody>
</table>
## 46.2 Summary of DBMS_CUBE_LOG Subprograms

This table lists and describes the DBMS_CUBE_LOG subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_NAME Function</td>
<td>Returns the default table names of the various log types.</td>
</tr>
<tr>
<td>DISABLE Procedure</td>
<td>Turns logging off for the duration of a session.</td>
</tr>
<tr>
<td>ENABLE Procedure</td>
<td>Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.</td>
</tr>
<tr>
<td>FLUSH Procedure</td>
<td>Forces all buffered messages to be written to the logs.</td>
</tr>
<tr>
<td>GET_LOG Procedure</td>
<td>Returns all buffered messages to be written to the logs.</td>
</tr>
<tr>
<td>GET_LOG_SPEC Function</td>
<td>Retrieves a description of all active logs.</td>
</tr>
<tr>
<td>GET_PARAMETER Function</td>
<td>Returns the current values of the options that control various aspects of logging.</td>
</tr>
<tr>
<td>LEVEL_HIGH Function</td>
<td>Returns the integer value of the high verbosity level.</td>
</tr>
<tr>
<td>LEVEL_HIGHEST Function</td>
<td>Returns the integer value of the highest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOW Function</td>
<td>Returns the integer value of the low verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOWEST Function</td>
<td>Returns the integer value of the lowest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_MEDIUM Function</td>
<td>Returns the integer value of the medium verbosity level.</td>
</tr>
<tr>
<td>SET_LOG_SPEC Procedure</td>
<td>Sets all logging to the values specified in the input string.</td>
</tr>
<tr>
<td>SET_PARAMETER Procedure</td>
<td>Sets options that control various aspects of logging.</td>
</tr>
<tr>
<td>TABLE_CREATE Procedure</td>
<td>Creates the table targets for the OLAP logs.</td>
</tr>
<tr>
<td>TARGET_FILE Function</td>
<td>Returns the integer value of a disk file target.</td>
</tr>
<tr>
<td>TARGET_LOB Function</td>
<td>Returns the integer value of a LOB target.</td>
</tr>
<tr>
<td>TARGET_TABLE Function</td>
<td>Returns the integer value of a database table target.</td>
</tr>
<tr>
<td>TARGET_TRACE Function</td>
<td>Returns the integer value of a trace file target.</td>
</tr>
<tr>
<td>TYPE_BUILD Function</td>
<td>Returns the integer value of the Cube Build log.</td>
</tr>
<tr>
<td>TYPE_DIMENSION_COMPILE Function</td>
<td>Returns the integer value of the Cube Dimension Compile log.</td>
</tr>
<tr>
<td>TYPE_OPERATIONS Function</td>
<td>Returns the integer value of the Cube Operations log.</td>
</tr>
<tr>
<td>TYPE_REJECTED_RECORDS Function</td>
<td>Returns the integer value of the Cube Rejected Records log.</td>
</tr>
<tr>
<td>VERSION Function</td>
<td>Returns the version number of a specific log table or the current version number of a specific log type.</td>
</tr>
</tbody>
</table>
46.2.1 DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (  
  LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS)  
RETURN VARCHAR2;
```

Parameters

Table 46-2 DEFAULT_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
</tbody>
</table>

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;
```

```
DEFAULT_NAME
-------------------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -  
"Default Name" from dual;
```

```
Default Name
-------------------
CUBE_REJECTED_RECORDS
```

46.2.2 DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (  
  LOG_TYPE       IN   BINARY_INTEGER DEFAULT,  
  LOG_TARGET     IN   BINARY_INTEGER DEFAULT);  
```
Parameters

Table 46-3  DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>· 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>· 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>· 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot disable the Cube Build log with this procedure.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are</td>
</tr>
<tr>
<td></td>
<td>sent to a table unless you previously specified a different target using</td>
</tr>
<tr>
<td></td>
<td>the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>· 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>· 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>· 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>· 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot;</td>
</tr>
</tbody>
</table>

Example

This command disables the dimension compilation error log table:

EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);

46.2.3 ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```
DBMS_CUBE_LOG.ENABLE (                      
    LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
    LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
    LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);
```

```
DBMS_CUBE_LOG.ENABLE (                      
    LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
    LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
    LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
    LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);
```

```
DBMS_CUBE_LOG.ENABLE (                      
    LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,                   
    LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);
```
LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
LOG_LOCATION   IN/OUT CLOB );

Parameters

Table 46-4 ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>· 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>· 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>· 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot disable the Cube Build log with this procedure. See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>· 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>· 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>· 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>· 4: TARGET_LOB</td>

<tr>
<td>See &quot;Verbosity Levels&quot;.</td>
<td></td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as owner.table_name when log_target is a table.</td>
</tr>
</tbody>
</table>

Examples

The following command enables all cube logs:

EXECUTE dbms_cube_log.enable;

The following PL/SQL procedure sets the log level to LEVEL_LOWEST:

BEGIN
    dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
    dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
                         dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
46.2.4 FLUSH Procedure

This procedure forces all buffered messages to be written to the logs.

The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```sql
DBMS_CUBE_LOG.FLUSH ( );
```

Example

The following example flushes the buffers for all of the logs:

```sql
EXECUTE dbms_cube_log.flush;
```

46.2.5 GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```sql
DBMS_CUBE_LOG.GET_LOG ( 
  LOG_TYPE IN BINARY_INTEGER DEFAULT TYPE_OPERATIONS,
  LOG_TARGET IN BINARY_INTEGER DEFAULT TARGET_TABLE,
  LOG_LEVEL OUT BINARY_INTEGER,
  LOG_LOCATION OUT VARCHAR2 );
```

Parameters

**Table 46-5  GET_LOG Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>• 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>• 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>• 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot;.</td>
</tr>
</tbody>
</table>
Table 46-5  (Cont.) GET_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>· 1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>· 2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>· 3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>· 4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>· 5: LEVEL_HIGHEST</td>
</tr>
<tr>
<td></td>
<td>See &quot;Verbosity Levels&quot;.</td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as owner.table_name when log_target is a table.</td>
</tr>
</tbody>
</table>

Usage Notes

If log_type is not active, then log_level and log_location are null. Use DBMS_CUBE_LOG.ENABLE to activate a log.

Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```
SET serverout ON format wrapped

DECLARE
  myloglevel  binary_integer;
  mylogtarget varchar2(128);
BEGIN
  dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
                        dbms_cube_log.target_table, myloglevel, mylogtarget);
  dbms_output.put_line('Log Level: ' || myloglevel);
  dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

```
Log Level: 5
Log Target: GLOBAL.CUBE_REJECTED_RECORDS
```

46.2.6 GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
    RETURN VARCHAR2;
```
Returns
The type and target of all active logs.

Usage Notes
You can use the output from this function as the input to SET_LOG_SPEC.

Examples
The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```
SELECT dbms_cube_log.get_log_spec FROM dual;
```

```
GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

46.2.7 GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the SET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (  
   LOG_TYPE IN   BINARY_INTEGER,  
   LOG_PARAMETER IN   BINARY_INTEGER )  
RETURN BINARY_INTEGER;
```

Parameters

Table 46-6  GET_PARAMETER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_parameter</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>5: ALLOW_ERRORS</td>
</tr>
<tr>
<td></td>
<td>See &quot;SET_PARAMETER Procedure&quot;.</td>
</tr>
</tbody>
</table>

Returns
The value of the specified log_parameter.
Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) - "Maximum Records" FROM dual;
```

<table>
<thead>
<tr>
<th>Maximum Records</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
</tr>
</tbody>
</table>

46.2.8 LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGH ()
RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to high:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_high);
```

46.2.9 LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
RETURN BINARY_INTEGER;
```

Returns

5

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".
Example
This command sets the verbosity level of the cube operations table to highest:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
dbms_cube_log.target_table, dbms_cube_log.level_highest);

46.2.10 LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

DBMS_CUBE_LOG.LEVEL_LOW ()
RETURN BINARY_INTEGER;

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example
This command sets the verbosity level of the cube operations table to low:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
dbms_cube_log.target_table, dbms_cube_log.level_low);

46.2.11 LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

DBMS_CUBE_LOG.LEVEL_LOWEST ()
RETURN BINARY_INTEGER;

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example
This command sets the verbosity level of the cube operations table to lowest:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
dbms_cube_log.target_table, dbms_cube_log.level_lowest);
46.2.12 LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

**Syntax**

```sql
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
RETURN BINARY_INTEGER;
```

**Returns**

3

**Usage Notes**

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

**Example**

This command sets the verbosity level of the cube operations table to medium:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_medium);
```

46.2.13 SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

**Syntax**

```sql
DBMS_CUBE_LOG.SET_LOG_SPEC (
    LOG_SPEC       IN   VARCHAR2);
```

**Parameters**

**Table 46-7  SET_LOG_SPEC Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_spec</td>
<td>A string consisting of type(target) pairs.</td>
</tr>
<tr>
<td></td>
<td>* Type can be:*</td>
</tr>
<tr>
<td></td>
<td>• OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>* Target can be:*</td>
</tr>
<tr>
<td></td>
<td>• TABLE</td>
</tr>
<tr>
<td></td>
<td>• TRACE</td>
</tr>
<tr>
<td></td>
<td>• FILE</td>
</tr>
<tr>
<td></td>
<td>• LOB</td>
</tr>
</tbody>
</table>

**Usage Notes**

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.
Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

BEGIN
  dbms_cube_log.disable;
  dbms_output.put_line('
  Cube Logs: ' || dbms_cube_log.get_log_spec);

  dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
  dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOGSPEC function activated two logs:

Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)

46.2.14 SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging.

To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

DBMS_CUBE_LOG.SET_PARAMETER (  
  LOG_TYPE IN BINARY_INTEGER,  
  LOG_PARAMETER IN BINARY_INTEGER,  
  VALUE IN BINARY_INTEGER );

Parameters

Table 46-8  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1:TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2:TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3:TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4:TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
</tbody>
</table>
Table 46-8 (Cont.) SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_parameter</td>
<td>One of the following parameters:</td>
</tr>
</tbody>
</table>
|                      | · 1: MAX_ERRORS  
Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log. |
|                      | · 2: FLUSH_INTERVAL  
The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering. |
|                      | · 3: LOG_FULL_RECORD  
Controls logging of rejected records. Set this parameter to one of the following constants:                                                   |
|                      |   0: FULL_RECORD_AUTO: Log the full record when no row ID is available.                                                                     |
|                      |   1: FULL_RECORD_ALWAYS: Always log the full record.                                                                                         |
|                      |   2: FULL_RECORD_NEVER: Never log the full record.                                                                                           |
|                      | · 4: LOG_EVERY_N  
Enters a progress message every \( n \) rows during data maintenance.                                                                 |
|                      | · 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.                                      |
| value                | The new value of log_parameter.                                                                                                            |

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:

BEGIN
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

    dbms_output.put_line('Max rejected records: ' ||
                           dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

    dbms_output.put_line('Buffer time: ' ||
                           dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
                           ' seconds');
END;
/

The procedure displays this information:

Max rejected records: 150
Buffer time: 5 seconds
46.2.15 TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE_CREATE also upgrades existing log tables to the current version while preserving the data.

Syntax

```sql
DBMS_CUBE_LOG.TABLE_CREATE (
    LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
    TBLNAME        IN   VARCHAR2        DEFAULT );
```

Parameters

Table 46-9  TABLE_CREATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>tblname</td>
<td>A table name for the log. These are the default names:</td>
</tr>
<tr>
<td></td>
<td>• CUBE_OPERATIONS_LOG</td>
</tr>
<tr>
<td></td>
<td>• CUBE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• CUBE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

Examples

This example creates a Cube Operations log table named CUBE_OPERATIONS_LOG:

```sql
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE_REJECTED_RECORDS:

```sql
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY_BUILD_LOG:

```sql
EXECUTE dbms_cube_log.table_create -
    (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```
46.2.16 TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

DBMS_CUBE_LOG.TARGET_FILE ()
RETURN BINARY_INTEGER;

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log file:

EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_file);

46.2.17 TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

DBMS_CUBE_LOG.TARGET_LOB ()
RETURN BINARY_INTEGER;

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log LOB:

EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
46.2.18 TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```sql
DBMS_CUBE_LOG.TARGET_TABLE ()
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log table:

```sql
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```

46.2.19 TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```sql
DBMS_CUBE_LOG.TARGET_TRACE ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log trace file:

```sql
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```
46.2.20 TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

```sql
DBMS_CUBE_LOG.TYPE_BUILD ()
RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Build log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

46.2.21 TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```sql
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Dimension Compile log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
"Log Name" FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>CUBE_DIMENSION_COMPILE</td>
</tr>
</tbody>
</table>
46.2.22 TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

    DBMS_CUBE_LOG.TYPE_OPERATIONS ()
    RETURN BINARY_INTEGER;

Returns

    1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See “Logging Types”.

Example

This query returns the default name of a Cube Dimension Compile log:

    SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
               FROM dual;

    Log Name
    -------------------------
    CUBE_OPERATIONS_LOG

46.2.23 TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

Syntax

    DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
    RETURN BINARY_INTEGER;

Returns

    2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See “Logging Types”.

Example

This query returns the default name of a Cube Rejected Records log:

    SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
               "Log Name" FROM dual;

    Log Name
    -------------------------
    CUBE_REJECTED_RECORDS
46.2.24 VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

Syntax

DBMS_CUBE_LOG.VERSION (  
    LOG_TYPE IN BINARY_INTEGER  DEFAULT 1,  
    TBLNAME IN VARCHAR2         DEFAULT NULL) 
RETURN BINARY_INTEGER;

Parameters

Table 46-10  VERSION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>tblname</td>
<td>The name of the log table whose version is returned.</td>
</tr>
</tbody>
</table>

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

SELECT dbms_cube_log.version FROM dual;

    VERSION  
----------  
    2  

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -  
    'CUBE_REJECTED_RECORDS') version FROM dual;

    VERSION  
----------  
    2  

The DBMS_DATA_MINING package is the application programming interface for creating, evaluating, and querying data mining models.

This chapter contains the following topics:

- Overview
- Security Model
- Mining Functions
- Model Settings
- Solver Settings
- Datatypes
- Summary of DBMS_DATA_MINING Subprograms

See Also:

- Oracle Data Mining Concepts

- DBMS_PREDICTIVE_ANALYTICS

47.1 DBMS_DATA_MINING Overview

Oracle Data Mining supports both supervised and unsupervised data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target. You can use Oracle Data Mining to mine structured data and unstructured text.

Supervised data mining functions include:

- Classification
- Regression
- Feature Selection (Attribute Importance)

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection
The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 47-1.

Table 47-1 Oracle Data Mining Algorithms

Oracle Data Mining supports more than one algorithm for the classification, regression, clustering, and feature extraction mining functions. Each of these mining functions has a default algorithm, as shown in Table 47-2.

47.2 DBMS_DATA_MINING Security Model

The DBMS_DATA_MINING package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The
routines in the package are run with invokers’ rights (run with the privileges of the current user).

The `DBMS_DATA_MINING` package exposes APIs that are leveraged by the Oracle Data Mining component of the Advanced Analytics Option. Users who wish to create mining models in their own schema require the `CREATE_MINING_MODEL` system privilege. Users who wish to create mining models in other schemas require the `CREATE_ANY_MINING_MODEL` system privilege.

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include `ALTER_ANY_MINING_MODEL`, `DROP_ANY_MINING_MODEL`, `SELECT_ANY_MINING_MODEL`, `COMMENT_ANY_MINING_MODEL`, and `AUDIT_ANY`.

Individual object privileges on mining models, `ALTER_MINING_MODEL` and `SELECT_MINING_MODEL`, can be used to selectively grant privileges on a model to a different user.

See Also:

*Oracle Data Mining User’s Guide* for more information about the security features of Oracle Data Mining

### 47.3 DBMS_DATA_MINING — Mining Functions

A data mining function refers to the methods for solving a given class of data mining problems.

The mining function must be specified when a model is created. (See `CREATE_MODEL Procedure`.)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ASSOCIATION</strong></td>
<td>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.</td>
</tr>
<tr>
<td><strong>ATTRIBUTE_IMPORTANCE</strong></td>
<td>Attribute importance is a predictive mining function, also known as feature selection. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute importance models can use Minimum Description Length, or CUR Matrix Decomposition. Minimum Description Length is the default.</td>
</tr>
<tr>
<td><strong>CLASSIFICATION</strong></td>
<td>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Decision Tree, Logistic Regression, or Support Vector Machine. The default is Naive Bayes. The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</td>
</tr>
</tbody>

47.4 DBMS_DATA_MINING — Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and datatypes shown in the following table.

Table 47-4  Required Columns in the Model Settings Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETTING_NAME</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_VALUE</td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining
models to which you have access. All the setting values are included in the view, whether default or user-specified.

See Also:

- ALL_MINING_MODEL_SETTINGS in Oracle Database Reference
- Oracle Data Mining User's Guide for information about specifying model settings

47.4.1 DBMS_DATA_MINING — Algorithm Names

The ALGO_NAME setting specifies the model algorithm.

The values for the ALGO_NAME setting are listed in the following table.

Table 47-5  Algorithm Names

<table>

</tr>
</tbody>
</table>
Oracle Data Mining supports fully Automatic Data Preparation (ADP), user-directed general data preparation, and user-specified embedded data preparation. The **PREP_*** settings enable the user to request fully automated or user-directed general data preparation. By default, fully Automatic Data Preparation (**PREP_AUTO_ON**) is enabled.

When you enable Automatic Data Preparation, the model uses heuristics to transform the build data according to the requirements of the algorithm. Instead of fully Automatic Data Preparation, the user can request that the data be shifted and/or scaled with the **PREP_SCALE* and PREP_SHIFT*** settings. The transformation instructions are stored with the model and reused whenever the model is applied. Refer to Model Detail Views, *Oracle Data Mining User’s Guide*.

You can choose to supplement Automatic Data Preparations by specifying additional transformations in the **xform_list** parameter when you build the model. (See “CREATE_MODEL Procedure”.)

If you do not use Automatic Data Preparation and do not specify transformations in the **xform_list** parameter to **CREATE_MODEL**, you must implement your own transformations separately in the build, test, and scoring data. You must take special care to implement the exact same transformations in each data set.

If you do not use Automatic Data Preparation, but you do specify transformations in the **xform_list** parameter to **CREATE_MODEL**, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data.

The values for the **PREP_*** setting are described in the following table.

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREP_AUTO</td>
<td>PREP_AUTO_ON</td>
<td>This setting enables fully automated data preparation. The default is PREP_AUTO_ON.</td>
</tr>
<tr>
<td></td>
<td>PREP_AUTO_OFF</td>
<td></td>
</tr>
</tbody>
</table>
### Table 47-6 (Cont.) PREP_* Setting

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREP_SCALE_2DNU</td>
<td>PREP_SCALE_STDDEV</td>
<td>This setting enables scaling data preparation for two-dimensional numeric columns. PREP AUTO must be OFF for this setting to take effect. The following are the possible values:</td>
</tr>
<tr>
<td></td>
<td>PREP_SCALE_RANGE</td>
<td>• PREP_SCALE_STDDEV: A request to divide the column values by the standard deviation of the column and is often provided together with PREP_SHIFT_MEAN to yield z-score normalization.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PREP_SCALE_RANGE: A request to divide the column values by the range of values and is often provided together with PREP_SHIFT_MIN to yield a range of [0,1].</td>
</tr>
<tr>
<td>PREP_SCALE_NNUM</td>
<td>PREP_SCALE_MAXABS</td>
<td>This setting enables scaling data preparation for nested numeric columns. PREP AUTO must be OFF for this setting to take effect. If specified, then the valid value for this setting is PREP_SCALE_MAXABS, which yields data in the range of [-1,1].</td>
</tr>
<tr>
<td>PREP_SHIFT_2DNU</td>
<td>PREP_SHIFT_MEAN</td>
<td>This setting enables centering data preparation for two-dimensional numeric columns. PREP AUTO must be OFF for this setting to take effect. The following are the possible values:</td>
</tr>
<tr>
<td></td>
<td>PREP_SHIFT_MIN</td>
<td>• PREP_SHIFT_MEAN: Results in subtracting the average of the column from each value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PREP_SHIFT_MIN: Results in subtracting the minimum of the column from each value.</td>
</tr>
</tbody>
</table>

### 47.4.3 DBMS_DATA_MINING — Mining Function Settings

The settings described in this table apply to a mining function.
### Table 47-7  Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASSO_MAX_RULE_LENGTH</td>
<td>TO_CHAR( 2&lt; = numeric_exp r &lt;=20)</td>
<td>Maximum rule length for Association Rules. Default is 4.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_CONFIDENCE</td>
<td>TO_CHAR( 0&lt; = numeric_exp r &lt;=1)</td>
<td>Minimum confidence for Association Rules. Default is 0.1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_SUPPORT</td>
<td>TO_CHAR( 0&lt; = numeric_exp r &lt;=1)</td>
<td>Minimum support for Association Rules. Default is 0.1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_SUPPORT_INT</td>
<td>a positive integer</td>
<td>Minimum absolute support that each rule must satisfy. The value must be an integer. Default is 1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_REV_CONFIDENCE</td>
<td>TO_CHAR( 0&lt; = numeric_exp r &lt;=1)</td>
<td>Sets the Minimum Reverse Confidence that each rule should satisfy. The Reverse Confidence of a rule is defined as the number of transactions in which the rule occurs divided by the number of transactions in which the consequent occurs. The value is real number between 0 and 1. The default is 0.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules applied for each association rule: it specifies the list of items that at least one of them must appear in each reported association rule, either as antecedent or as consequent. It is a comma separated string containing the list of including items. If not set, the default behavior is, the filtering is not applied.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules applied for each association rule: it specifies the list of items that none of them can appear in each reported Association Rules. It is a comma separated string containing the list of excluding items. No rule can contain any item in the list. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_ANT_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules for the antecedent: it specifies the list of items that at least one of them must appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of including items. The antecedent part of each rule must contain at least one item in the list. The default is NULL.</td>
</tr>
</tbody>
</table>
### Table 47-7 (Cont.) Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASSO_ANT_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules for the antecedent: it specifies the list of items that none of them can appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of excluding items. No rule can contain any item in the list in its antecedent part. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_CONS_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules for the consequent: it specifies the list of items that at least one of them must appear in the consequent part of each reported association rule. It is a comma separated string containing the list of including items. The consequent of each rule must be an item in the list. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_CONS_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules for the consequent: it specifies the list of items that none of them can appear in the consequent part of each reported association rule. It is a comma separated string containing the list of excluding items. No rule can have any item in the list as its consequent. The excluding rule can be used to reduce the data that must be stored, but the user may be required to build extra model for executing different including or Excluding Rules. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_AGGREGATES</td>
<td>NULL</td>
<td>Specifies the columns to be aggregated. It is a comma separated string containing the names of the columns for aggregation. Number of columns in the list must be &lt;= 10. You can set ASSO_AGGREGATES if ODMs_ITEM_ID_COLUMN_NAME is set indicating transactional input data. See DBMS_DATA_MINING - Global Settings. The data table must have valid column names such as ITEM_ID and CASE_ID which are derived from ODMs_ITEM_ID_COLUMN_NAME and case_id_column_name respectively. ITEM_VALUE is not a mandatory value. The default is NULL. For each item, the user may supply several columns to aggregate. It requires more memory to buffer the extra data. Also, the performance impact can be seen because of the larger input data set and more operation.</td>
</tr>
</tbody>
</table>

---

Oracle
<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASSO_ABS_ERROR</td>
<td>0&lt;ASSO_ABS_ERROR = MAX(ASSO_MIN_SUPPORT, ASSO_MIN_CONFIDENCE).</td>
<td>Specifies the absolute error for the Association Rules sampling. A smaller value of ASSO_ABS_ERROR obtains a larger sample size which gives accurate results but takes longer computational time. &quot;Set a reasonable value for ASSO_ABS_ERROR, such as its default value, to avoid large sample size. The default value is 0.5 * MAX(ASSO_MIN_SUPPORT, ASSO_MIN_CONFIDENCE).&quot;</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_CONF_LEVEL</td>
<td>0</td>
<td>Specifies the confidence level for an Association Rules sample. A larger value of ASSO_CONF_LEVEL obtains a larger sample size. Any value between 0.9 and 1 is suitable. The default value is 0.95.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_COST_TABLE_NAME</td>
<td>table_name</td>
<td>(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See &quot;ADD_COST_MATRIX Procedure&quot; for the column requirements. See Oracle Data Mining Concepts for information about costs.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_PRIORS_TABLE_NAME</td>
<td>table_name</td>
<td>(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See Oracle Data Mining User's Guide for the column requirements. See Oracle Data Mining Concepts for additional information about priors.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_TABLE_NAME</td>
<td>table_name</td>
<td>(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See Oracle Data Mining User's Guide for the column requirements. See Oracle Data Mining Concepts for additional information about class weights.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_BALANCED</td>
<td>ON-OFF</td>
<td>This setting indicates that the algorithm must create a model that balances the target distribution. This setting is most relevant in the presence of rare targets, as balancing the distribution may enable better average accuracy (average of per-class accuracy) instead of overall accuracy (which favors the dominant class). The default value is OFF.</td>
</tr>
</tbody>
</table>

Oracle Data Mining Concepts for information about mining functions
47.4.4 DBMS_DATA_MINING — Global Settings

The configuration settings in this table are applicable to any type of model, but are currently only implemented for specific algorithms.

Table 47-8  Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| ODMS_ITEM_ID_COLUMN_NAME | column_name | (Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns:
  • Case ID, either categorical or numeric
  • Item ID, either categorical or numeric
  A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data.
  Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms).
  For more information about single-record and multi-record case data, see Oracle Data Mining User's Guide. |
| ODMS_ITEM_VALUE_COLUMN_NAME | column_name | (Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format.
  If ASSO_AGGREGATES is used, then the build data must include the following three columns and the columns specified in the AGGREGATES setting.
  • Case ID, either categorical or numeric
  • Item ID, either categorical or numeric, specified by ODMS_ITEM_ID_COLUMN_NAME
  • Item value, either categorical or numeric, specified by ODMS_ITEM_VALUE_COLUMN_NAME
  If ASSO_AGGREGATES, Case ID, and Item ID column are present, then the Item Value column may or may not appear.
  The Item Value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples).
  For details on ASSO_AGGREGATES, see DBMS_DATA_MINING - Mining Function Settings. |
### Table 47-8  (Cont.) Global Settings

<table>
<thead>
<tr>

<tr>
<td>ODMS_MAX_PARTITIONS</td>
<td>1 &lt; value &lt;= 1000000</td>
<td>This setting indicates the maximum number of partitions allowed for the model. The default is 1000.</td>
</tr>
<tr>
<td>ODMS_SAMPLING</td>
<td>ODMS_SAMPLING_ENABLE</td>
<td>This setting allows the user to request sampling of the build data. The default is ODMS_SAMPLING_DISABLE.</td>
</tr>
<tr>
<td></td>
<td>ODMS_SAMPLING_DISABLE</td>
<td></td>
</tr>
<tr>
<td>ODMS_SAMPLE_SIZE</td>
<td>0 &lt; Value</td>
<td>This setting determines how many rows will be sampled (approximately). It can be set only if ODMS_SAMPLING is enabled. The default value is system determined.</td>
</tr>
<tr>
<td>ODMS_PARTITION_BUILD_TYPE</td>
<td>ODMS_PARTITION_BUILD_INTRA</td>
<td>This setting controls the parallel build of partitioned models.</td>
</tr>
<tr>
<td></td>
<td>ODMS_PARTITION_BUILD_INTER</td>
<td>ODMS_PARTITION_BUILD_INTRA — Each partition is built in parallel using all slaves.</td>
</tr>
<tr>
<td></td>
<td>ODMS_PARTITION_BUILD_HYBRID</td>
<td>ODMS_PARTITION_BUILD_INTRA — Each partition is built entirely in a single slave, but multiple partitions may be built at the same time since multiple slaves are active. ODMS_PARTITION_BUILD_HYBRID — It is a combination of the other two types and is recommended for most situations to adapt to dynamic environments. The default mode is ODMS_PARTITION_BUILD_HYBRID</td>
</tr>
<tr>
<td>ODMS_TABLESPACE_NAME</td>
<td>tablespace_name</td>
<td>This setting controls the storage specifications.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you explicitly set this to the name of a tablespace (for which you have sufficient quota), then the specified tablespace storage creates the resulting model content. If you do not provide this setting, then the default tablespace of the user creates the resulting model content.</td>
</tr>
<tr>
<td>ODMS_RANDOM_SEED</td>
<td>The value must be a non-negative integer</td>
<td>The hash function with a random number seed generates a random number with uniform distribution. Users can control the random number seed by this setting. The default is 0. This setting is used by Random Forest, Neural Networks and CUR.</td>
</tr>
<tr>
<td>ODMS_DETAILS</td>
<td>• ODMS_ENABLE</td>
<td>This setting reduces the space that is used while creating a model, especially a partitioned model. The default value is ODMS_ENABLE. When the setting is ODMS_ENABLE, it creates model tables and views when the model is created. You can query the model with SQL. When the setting is ODMS_DISABLE, model views are not created and tables relevant to model details are not created either. The reduction in the space depends on the model. Reduction on the order of 10x can be achieved.</td>
</tr>
<tr>
<td></td>
<td>• ODMS_DISABLE</td>
<td></td>
</tr>
</tbody>
</table>
47.4.5 DBMS_DATA_MINING — Algorithm Settings: 
ALGO_EXTENSIBLE_LANG

The settings listed in the following table configure the behavior of the mining model with an Extensible algorithm. The mining model is built in R language.

The RALG_*_FUNCTION specifies the R script that is used to build, score, and view an R model and must be registered in the Oracle R Enterprise script repository. The R scripts are registered through Oracle R Enterprise with special privileges. When ALGO_EXTENSIBLE_LANG is set to R in the MINING_MODEL_SETTING table, the mining model is built in the R language. After the R model is built, the names of the R scripts are recorded in the MINING_MODEL_SETTING table in the SYS schema. The scripts must exist in the script repository for the R model to function. The amount of R memory used to build, score, and view the R model through these R scripts can be controlled by Oracle R Enterprise.

All algorithm-independent DBMS_DATA_MINING subprograms can operate on an R model for mining functions such as Association, Attribute Importance, Classification, Clustering, Feature Extraction, and Regression.

The supported DBMS_DATA_MINING subprograms include, but are not limited, to the following:

- ADD_COST_MATRIX Procedure
- COMPUTE_CONFUSION_MATRIX Procedure
- COMPUTE_LIFT Procedure
- COMPUTE_ROC Procedure
- CREATE_MODEL Procedure
- DROP_MODEL Procedure
- EXPORT_MODEL Procedure
- GET_MODEL_COST_MATRIX Function
- IMPORT_MODEL Procedure
- REMOVE_COST_MATRIX Procedure
- RENAME_MODEL Procedure
### Table 47-9  ALGO_EXTENSIBLE_LANG Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RALG_BUILD_FUNCTION</td>
<td>R_BUILD_FUNCTION_SCRIPT_NAME</td>
<td>Specifies the name of an existing registered R script for R algorithm mining model build function. The R script defines an R function for the first input argument for training data and returns an R model object. For Clustering and Feature Extraction mining function model build, the R attributes <code>dm$nclus</code> and <code>dm$nfeat</code> must be set on the R model to indicate the number of clusters and features respectively. The <code>RALG_BUILD_FUNCTION</code> must be set along with <code>ALGO_EXTENSIBLE_LANG</code> in the <code>model_setting_table</code>.</td>
</tr>
<tr>
<td>RALG_BUILD_PARAMETER</td>
<td>SELECT value</td>
<td>Specifies a list of numeric and string scalar for optional input parameters of the model build function.</td>
</tr>
<tr>
<td>RALG_SCORE_FUNCTION</td>
<td>R_SCORE_FUNCTION_SCRIPT_NAME</td>
<td>Specifies the name of an existing registered R script to score data. The script returns a <code>data.frame</code> containing the corresponding prediction results. The setting is used to score data for mining functions such as Regression, Classification, Clustering, and Feature Extraction. This setting does not apply to Association and Attribute Importance functions.</td>
</tr>
<tr>
<td>RALG_WEIGHT_FUNCTION</td>
<td>R_WEIGHT_FUNCTION_SCRIPT_NAME</td>
<td>Specifies the name of an existing registered R script for R algorithm that computes the weight (contribution) for each attribute in scoring. The script returns a <code>data.frame</code> containing the contributing weight for each attribute in a row. This function setting is needed for <code>PREDICTION_DETAILS</code> SQL function.</td>
</tr>
<tr>
<td>RALG_DETAILS_FUNCTION</td>
<td>R_DETAILS_FUNCTION_SCRIPT_NAME</td>
<td>Specifies the name of an existing registered R script for R algorithm that produces the model information. This setting is required to generate a model view.</td>
</tr>
<tr>
<td>RALG_DETAILS_FORMAT</td>
<td>SELECT type_value</td>
<td>Specifies the <code>SELECT</code> query for the list of numeric and string scalars for the output column type and the column name of the generated model view. This setting is required to generate a model view.</td>
</tr>
</tbody>
</table>

47.4.6 DBMS_DATA_MINING — Algorithm Settings: CUR Matrix Decomposition

The following settings affect the behavior of the CUR Matrix Decomposition algorithm.
The following settings configure the behavior of the CUR Matrix Decomposition algorithm.

Table 47-10   CUR Matrix Decomposition Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURS_APPROX_ATTR_NUM</td>
<td>The value must be a positive integer</td>
<td>Defines the approximate number of attributes to be selected. The default value is the number of attributes.</td>
</tr>
<tr>
<td>CURS_ROW_IMPORTANCE</td>
<td>CURS_ROW_IMP_ENABLE</td>
<td>Defines the flag indicating whether or not to perform row selection. The default value is CURS_ROW_IMP_DISABLE.</td>
</tr>
<tr>
<td></td>
<td>CURS_ROW_IMP_DISABLE</td>
<td></td>
</tr>
<tr>
<td>CURS_APPROX_ROW_NUM</td>
<td>The value must be a positive integer</td>
<td>Defines the approximate number of rows to be selected. This parameter is only used when users decide to perform row selection (CURS_ROW_IMP_ENABLE). The default value is the total number of rows.</td>
</tr>
<tr>
<td>CURS_SVD_RANK</td>
<td>The value must be a positive integer</td>
<td>Defines the rank parameter used in the column/row leverage score calculation. If users do not provide an input value, the value is determined by the system.</td>
</tr>
</tbody>

47.4.7 DBMS_DATA_MINING — Algorithm Settings: Decision Tree

These settings configure the behavior of the Decision Tree algorithm. Note that the Decision Tree settings are also used to configure the behavior of Random Forest as it constructs each individual Decision Tree.
### Table 47-11 Decision Tree Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TREE_IMPURITY_METRIC</td>
<td>TREE_IMPURITY_ENTROPY</td>
<td>Tree impurity metric for Decision Tree.</td>
</tr>
<tr>
<td></td>
<td>TREE_IMPURITY_GINI</td>
<td>Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses TREE_IMPURITY_GINI.</td>
</tr>
<tr>
<td>TREE_TERM_MAX_DEPTH</td>
<td>For Decision Tree:</td>
<td>Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node).</td>
</tr>
<tr>
<td></td>
<td>2&lt;= a number &lt;=20</td>
<td>For Decision Tree the default is 7.</td>
</tr>
<tr>
<td></td>
<td>For Random Forest:</td>
<td>For Random Forest the default is 16.</td>
</tr>
<tr>
<td></td>
<td>2&lt;= a number &lt;=100</td>
<td></td>
</tr>
<tr>
<td>TREE_TERM_MINPCT_NODE</td>
<td>0&lt;= a number&lt;=10</td>
<td>The minimum number of training rows in a node expressed as a percentage of the rows in the training data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default is 0.05, indicating 0.05%.</td>
</tr>
<tr>
<td>TREE_TERM_MINPCT_SPLIT</td>
<td>0 &lt; a number &lt;=20</td>
<td>Minimum number of rows required to consider splitting a node expressed as a percentage of the training rows.</td>
</tr>
<tr>
<td></td>
<td>T</td>
<td>Default is 0.1, indicating 0.1%.</td>
</tr>
<tr>
<td>TREE_TERM_MINREC_NODE</td>
<td>a number&gt;=0</td>
<td>Minimum number of rows in a node.</td>
</tr>
<tr>
<td></td>
<td>T</td>
<td>Default is 10.</td>
</tr>
<tr>
<td>TREE_TERM_MINREC_SPLIT</td>
<td>a number &gt; 1</td>
<td>Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value.</td>
</tr>
<tr>
<td></td>
<td>T</td>
<td>Default is 20.</td>
</tr>
</tbody>

### 47.4.8 DBMS_DATA_MINING — Algorithm Settings: Expectation Maximization

These algorithm settings configure the behavior of the Expectation Maximization algorithm.

- Table 47-12
- Table 47-13
- Table 47-14
- Table 47-15
### Table 47-12  Expectation Maximization Settings for Data Preparation and Analysis

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_ATTRIBUTE_FILTER</td>
<td>EMCS_ATTR_FILTER_ENABLE, EMCS_ATTR_FILTER_DISABLE</td>
<td>Whether or not to include uncorrelated attributes in the model. When EMCS_ATTRIBUTE_FILTER is enabled, uncorrelated attributes are not included.</td>
</tr>
<tr>
<td>EMCS_MAX_NUM_ATTR_2D</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Maximum number of correlated attributes to include in the model. Note: This setting applies only to attributes that are not nested (2D). Default is 50.</td>
</tr>
<tr>
<td>EMCS_NUM_DISTRIBUTION</td>
<td>EMCS_NUM_DISTR_BERNOULLI, EMCS_NUM_DISTR_GAUSSIAN, EMCS_NUM_DISTR_SYSTEM</td>
<td>The distribution for modeling numeric attributes. Applies to the input table or view as a whole and does not allow per-attribute specifications. The options include Bernoulli, Gaussian, or system-determined distribution. When Bernoulli or Gaussian distribution is chosen, all numeric attributes are modeled using the same type of distribution. When the distribution is system-determined, individual attributes may use different distributions (either Bernoulli or Gaussian), depending on the data. Default is EMCS_NUM_DISTR_SYSTEM.</td>
</tr>
<tr>
<td>EMCS_NUM_EQUIWIDTH_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Number of equi-width bins that will be used for gathering cluster statistics for numeric columns. Default is 11.</td>
</tr>
<tr>
<td>EMCS_NUM_PROJECTIONS</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Specifies the number of projections that will be used for each nested column. If a column has fewer distinct attributes than the specified number of projections, the data will not be projected. The setting applies to all nested columns. Default is 50.</td>
</tr>
<tr>
<td>EMCS_NUM_QUANTILE_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Specifies the number of quantile bins that will be used for modeling numeric columns with multivalued Bernoulli distributions. Default is system-determined.</td>
</tr>
</tbody>
</table>
Table 47-12  (Cont.) Expectation Maximization Settings for Data Preparation and Analysis

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_NUM_TOPN_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Specifies the number of top-N bins that will be used for modeling categorical columns with multivalued Bernoulli distributions. Default is system-determined.</td>
</tr>
</tbody>
</table>

Table 47-13  Expectation Maximization Settings for Learning

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CONVERGENCE_CRITERION</td>
<td></td>
<td>The convergence criterion for EM. The convergence criterion may be based on a held-aside data set, or it may be Bayesian Information Criterion. Default is system determined.</td>
</tr>
<tr>
<td>EMCS_CONV_CRIT_HELDASIDE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EMCS_CONV_CRIT_BIC</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EMCS_LOGLIKE_IMPROVEMENT</td>
<td>TO_CHAR( 0 &lt; numeric_expr &lt; 1)</td>
<td>When the convergence criterion is based on a held-aside data set (EMCS_CONVERGENCE_CRITERION = EMCS_CONV_CRIT_HELDASIDE), this setting specifies the percentage improvement in the value of the log likelihood function that is required for adding a new component to the model. Default value is 0.001.</td>
</tr>
<tr>
<td>EMCS_NUM_COMPONENTS</td>
<td>TO_CHAR(numeric_expr &gt;= 1)</td>
<td>Maximum number of components in the model. If model search is enabled, the algorithm automatically determines the number of components based on improvements in the likelihood function or based on regularization, up to the specified maximum. The number of components must be greater than or equal to the number of clusters. Default is 20.</td>
</tr>
<tr>
<td>EMCS_NUM_ITERATIONS</td>
<td>TO_CHAR(numeric_expr &gt;= 1)</td>
<td>Specifies the maximum number of iterations in the EM algorithm. Default is 100.</td>
</tr>
<tr>
<td>EMCS_MODEL_SEARCH</td>
<td>EMCS_MODEL_SEARCH_ENABLE EMCS_MODEL_SEARCHDISABLE (default).</td>
<td>This setting enables model search in EM where different model sizes are explored and a best size is selected. The default is EMCS_MODEL_SEARCH_DISABLE.</td>
</tr>
<tr>
<td>EMCS_REMOVE_COMPONENTS</td>
<td>EMCS_REMOVE_COMPS_ENABLE (default) EMCS_REMOVE_COMPSDISABLE (default).</td>
<td>This setting allows the EM algorithm to remove a small component from the solution. The default is EMCS_REMOVE_COMPS_ENABLE.</td>
</tr>
<tr>
<td>EMCS_RANDOM_SEED</td>
<td>Non-negative integer</td>
<td>This setting controls the seed of the random generator used in EM. The default is 0.</td>
</tr>
</tbody>
</table>
### Table 47-14  Expectation Maximization Settings for Component Clustering

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CLUSTER_COMPONENTS</td>
<td>EMCS_CLUSTER_COMP_ENABLE</td>
<td>Enables or disables the grouping of EM components into high-level clusters. When disabled, the components themselves are treated as clusters.</td>
</tr>
<tr>
<td></td>
<td>EMCS_CLUSTER_COMP_DISABLE</td>
<td>When component clustering is enabled, model scoring through the SQL CLUSTER function will produce assignments to the higher level clusters. When clustering is disabled, the CLUSTER function will produce assignments to the original components.</td>
</tr>
<tr>
<td>EMCS_CLUSTER_THRESH</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Dissimilarity threshold that controls the clustering of EM components. When the dissimilarity measure is less than the threshold, the components are combined into a single cluster. A lower threshold may produce more clusters that are more compact. A higher threshold may produce fewer clusters that are more spread out.</td>
</tr>
<tr>
<td>EMCS_LINKAGE_FUNCTION</td>
<td>EMCS_LINKAGE_SINGLE</td>
<td>Allows the specification of a linkage function for the agglomerative clustering step. EMCS_LINKAGE_SINGLE uses the nearest distance within the branch. The clusters tend to be larger and have arbitrary shapes.</td>
</tr>
<tr>
<td></td>
<td>EMCS_LINKAGE_AVERAGE</td>
<td>EMCS_LINKAGE_AVERAGE uses the average distance within the branch. There is less chaining effect and the clusters are more compact.</td>
</tr>
<tr>
<td></td>
<td>EMCS_LINKAGE_COMPLETE</td>
<td>EMCS_LINKAGE_COMPLETE uses the maximum distance within the branch. The clusters are smaller and require strong component overlap.</td>
</tr>
</tbody>
</table>

### Table 47-15  Expectation Maximization Settings for Cluster Statistics

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CLUSTER_STATISTICS</td>
<td>EMCS_CLUS_STATS_ENABLE</td>
<td>Enables or disables the gathering of descriptive statistics for clusters (centroids, histograms, and rules). When statistics are disabled, model size is reduced, and GET_MODEL_DETAILS_EM only returns taxonomy (hierarchy) and cluster counts. Default is EMCS_CLUS_STATS_ENABLE.</td>
</tr>
<tr>
<td></td>
<td>EMCS_CLUS_STATS_DISABLE</td>
<td></td>
</tr>
<tr>
<td>EMCS_MIN_PCT_ATTR_SUPPORT</td>
<td>TO_CHAR(0 &lt; numeric_expr &lt; 1)</td>
<td>Minimum support required for including an attribute in the cluster rule. The support is the percentage of the data rows assigned to a cluster that must have non-null values for the attribute. Default is 0.1.</td>
</tr>
</tbody>
</table>
### 47.4.9 DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis

Explicit Semantic Analysis (ESA) is a useful technique for extracting meaningful and interpretable features.

The settings listed in the following table configure the ESA values.

#### Table 47-16  Explicit Semantic Analysis Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESAS_VALUE_THRESHOLD</td>
<td>Non-negative number</td>
<td>This setting thresholds a small value for attribute weights in the transformed build data. The default is $1e^{-8}$.</td>
</tr>
<tr>
<td>ESAS_MIN_ITEMS</td>
<td>Text input 100</td>
<td>This setting determines the minimum number of non-zero entries that need to be present in an input row. The default is 100 for text input and 0 for non-text input.</td>
</tr>
<tr>
<td></td>
<td>Non-text input is 0</td>
<td></td>
</tr>
<tr>
<td>ESAS_TOPN_FEATURES</td>
<td>A positive integer</td>
<td>This setting controls the maximum number of features per attribute. The default is 1000.</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Data Mining Concepts* for information about Explicit Semantic Analysis.

### 47.4.10 DBMS_DATA_MINING — Algorithm Settings: Exponential Smoothing

Exponential Smoothing (ESM) is a useful technique for extracting meaningful and interpretable features.

The settings listed in the following table configure Exponential Smoothing values.
<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXSM_MODEL</td>
<td>It can take value in set (EXSM_SIMPLE, EXSM_SIMPLE_MULT, EXSM_HOLT, EXSM_HOLT_DMP, EXSM_MUL_TRND, EXSM_MULTRD_DMP, EXSM_SEAS_ADD, EXSM_SEAS_MUL, EXSM_HW, EXSM_HW_DMP, EXSM_HW_ADDSEA, EXSM_HWMT, EXSM_HWMT_DMP)</td>
<td>This setting specifies the model.</td>
</tr>
</tbody>
</table>
### Table 47-17  (Cont.) Exponential Smoothing Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXSM_SEASONALITY</td>
<td>positive integer &gt; 1</td>
<td>This setting specifies a positive integer value as the length of seasonal cycle. The value it takes must be larger than 1. For example, setting value 4 means that every group of four observations forms a seasonal cycle.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This setting is only applicable and must be provided for models with seasonality, otherwise the model throws an error. When EXSM_INTERVAL is not set, this setting applies to the original input time series. When EXSM_INTERVAL is set, this setting applies to the accumulated time series.</td>
</tr>
<tr>
<td>EXSM_INTERVAL</td>
<td>It can take value in set</td>
<td>This setting only applies and must be provided when the time column (case id column) has datetime type. It specifies the spacing interval of the accumulated equally spaced time series.</td>
</tr>
<tr>
<td></td>
<td>{EXSM_INTERVAL_YEAR,</td>
<td>The model throws an error if the time column of input table is of datetime type and setting EXSM_INTERVAL is not provided.</td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_QTR,</td>
<td>The model throws an error if the time column of input table is of oracle number type and setting EXSM_INTERVAL is provided.</td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_MONTH,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_WEEK,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_DAY,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_HOUR,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_MIN,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_MAX,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_MIN,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_AVG,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_MEDIAN,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_INTERVAL_COUNT</td>
<td></td>
</tr>
<tr>
<td>EXSM_ACCUMULATE</td>
<td>It can take value in set</td>
<td>This setting only applies and must be provided when the time column has datetime type. It specifies how to generate the value of the accumulated time series from the input time series.</td>
</tr>
<tr>
<td></td>
<td>{EXSM_ACCU_TOTAL,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_STD,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_MAX,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_MIN,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_AVG,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_MEDIAN,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>EXSM_ACCU_COUNT</td>
<td></td>
</tr>
</tbody>
</table>
### Table 47-17 (Cont.) Exponential Smoothing Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXSM_SETMISSING</td>
<td>It can also specify an option taking value in set {EXSM_MISS_MIN, EXSM_MISS_MAX, EXSM_MISS_AVG, EXSM_MISS_MEDIAN, EXSM_MISS_LAST, EXSM_MISS_FIRST, EXSM_MISS_PREV, EXSM_MISS_NEXT, EXSM_MISS_AUTO}</td>
<td>This setting specifies how to handle missing values, which may come from input data and/or the accumulation process of time series. You can specify either a number or an option. If a number is specified, all the missing values are set to that number. EXSM_MISS_MIN: Replaces missing value with minimum of the accumulated time series. EXSM_MISS_MAX: Replaces missing value with maximum of the accumulated time series. EXSM_MISS_AVG: Replaces missing value with average of the accumulated time series. EXSM_MISS_MEDIAN: Replaces missing value with median of the accumulated time series. EXSM_MISS_LAST: Replaces missing value with last non-missing value of the accumulated time series. EXSM_MISS_FIRST: Replaces missing value with first non-missing value of the accumulated time series. EXSM_MISS_PREV: Replaces missing value with the previous non-missing value of the accumulated time series. EXSM_MISS_NEXT: Replaces missing value with the next non-missing value of the accumulated time series. EXSM_MISS_AUTO: EXSM model treats the input data as an irregular (non-uniformly spaced) time series. If this setting is not provided, EXSM_MISS_AUTO is the default value. In such a case, the model treats the input time series as irregular time series, viewing missing values as gaps.</td>
</tr>
<tr>
<td>EXSM_PREDICTION_STEP</td>
<td>It must be set to a number between 1-30.</td>
<td>This setting specifies how many steps ahead the predictions are to be made. If it is not set, the default value is 1: the model gives one-step-ahead prediction. A value greater than 30 results in an error.</td>
</tr>
<tr>
<td>EXSM_CONFIDENCE_LEVEL</td>
<td>It must be a number between 0 and 1, exclusive.</td>
<td>This setting specifies the desired confidence level for prediction. The lower and upper bounds of the specified confidence interval is reported. If this setting is not specified, the default confidence level is 95%.</td>
</tr>
</tbody>
</table>
Table 47-17 (Cont.) Exponential Smoothing Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXSM_OPT_CRITERION   | It takes value in set (EXSM_OPT_CRIT_LIK, EXSM_OPT_CRIT_MSE, EXSM_OPT_CRIT_AMSE, EXSM_OPT_CRIT_SIG, EXSM_OPT_CRIT_MAE) | This setting specifies the desired optimization criterion. The optimization criterion is useful as a diagnostic for comparing models’ fit to the same data.  
                                |                                                                                | EXSM_OPT_CRIT_LIK: Minus twice the log-likelihood of a model.  
                                |                                                                                | EXSM_OPT_CRIT_MSE: Mean square error of a model.  
                                |                                                                                | EXSM_OPT_CRIT_AMSE: Average mean square error over user-specified time window.  
                                |                                                                                | EXSM_OPT_CRIT_SIG: Model’s standard deviation of residuals.  
                                |                                                                                | EXSM_OPT_CRIT_MAE: Mean absolute error of a model.  
                                |                                                                                | The default value is EXSM_OPT_CRIT_LIK. |
| EXSM_NMSE            | positive integer                                                              | This setting specifies the length of the window used in computing the error metric average mean square error (AMSE).                        |

The settings listed in the following table configure the behavior of Neural Network.
<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NNET_HIDDEN_LAYERS</td>
<td>Non-negative integer</td>
<td>Defines the topology by number of hidden layers. The default value is 1.</td>
</tr>
<tr>
<td>NNET_NODES_PER_LAYER</td>
<td>A list of positive integers</td>
<td>Defines the topology by number of nodes per layer. Different layers can have different number of nodes. The value should be non-negative integers and comma separated. For example, ‘10, 20, 5’. The setting values must be consistent with NNET_HIDDEN_LAYERS. The default number of nodes per layer is the number of attributes or 50 (if the number of attributes &gt; 50).</td>
</tr>
<tr>
<td>NNET_ACTIVATIONS</td>
<td>A list of the following strings:</td>
<td>Defines the activation function for the hidden layers. For example, &quot;NNET_ACTIVATIONS_BIPOLAR_SIG&quot;, &quot;NNET_ACTIVATIONS_TANH&quot;. Different layers can have different activation functions. The default value is &quot;NNET_ACTIVATIONS_LOG_SIG&quot;. The number of activation functions must be consistent with NNET_HIDDEN_LAYERS and NNET_NODES_PER_LAYER.</td>
</tr>
</tbody>
</table>
| NNET_WEIGHT_LOWER_BOUNDED    | A real number                  | The setting specifies the lower bound of the region where weights are randomly initialized. NNET_WEIGHT_LOWER_BOUND and NNET_WEIGHT_UPPER_BOUND must be set together. Setting one and not setting the other raises an error. NNET_WEIGHT_LOWER_BOUND must not be greater than NNET_WEIGHT_UPPER_BOUND. The default value is \(-\sqrt{6/(1_n+n_o)}\). The value of 1_n nodes for:  
  - input layer dense attributes is \((1+\text{number of dense attributes})\)  
  - input layer sparse attributes is \(\text{number of sparse attributes}\)  
  - each hidden layer is \((1+\text{number of nodes in that hidden layer})\)  
  The value of r_n nodes is the number of nodes in the layer that the weight is connecting to. |

Note: All quotes are single and two single quotes are used to escape a single quote in SQL statements.

47.5 DBMS_DATA_MINING — Solver Settings

Oracle Data Mining algorithms can use different solvers. Solver settings can be provided at build time in the setting table.

Related Topics
- DBMS_DATA_MINING — Solver Settings: ADMM
  The settings listed in the following table configure the behavior of Alternating Direction Method of Multipliers (ADMM). Generalized Linear Models (GLM) use these settings.
- DBMS_DATA_MINING — Solver Settings: LBFGS
  The settings listed in the following table configure the behavior of L-BFGS. Neural Network and Generalized Linear Models (GLM) use these settings.

47.5.1 DBMS_DATA_MINING — Solver Settings: ADMM

The settings listed in the following table configure the behavior of Alternating Direction Method of Multipliers (ADMM). Generalized Linear Models (GLM) use these settings.

Table 47-28  DBMS_DATA_MINING ADMM Settings

<table>
<thead>
<tr>
<th>Settings Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMM_CONSENSUS</td>
<td>A positive integer</td>
<td>It is a ADMM’s consensus parameter. The value must be a positive number. The default value is 0.1.</td>
</tr>
<tr>
<td>ADMM_ITERATIONS</td>
<td>A positive integer</td>
<td>The number of ADMM iterations. The value must be a positive integer. The default value is 50.</td>
</tr>
</tbody>
</table>

47.6 DBMS_DATA_MINING Datatypes

The `DBMS_DATA_MINING` package defines object datatypes for mining transactional data. The package also defines a type for user-specified transformations. These types are called `DM_NESTED_n`, where `n` identifies the Oracle datatype of the nested attributes.

The Data Mining object datatypes are described in the following table:
Table 47-30  DBMS_DATA_MINING Summary of Datatypes

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_NESTED_BINARY_DOUBLE</td>
<td>The name and value of a numerical attribute of type BINARY_DOUBLE.</td>
</tr>
<tr>
<td>DM_NESTED_BINARY_DOUBLES</td>
<td>A collection of DM_NESTED_BINARY_DOUBLE.</td>
</tr>
<tr>
<td>DM_NESTED_BINARY_FLOAT</td>
<td>The name and value of a numerical attribute of type BINARY_FLOAT.</td>
</tr>
<tr>
<td>DM_NESTED_BINARY_FLOATS</td>
<td>A collection of DM_NESTED_BINARY_FLOAT.</td>
</tr>
<tr>
<td>DM_NESTED_CATEGORICAL</td>
<td>The name and value of a categorical attribute of type CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>DM_NESTED_CATEGORICALS</td>
<td>A collection of DM_NESTED_CATEGORICAL.</td>
</tr>
<tr>
<td>DM_NESTED_NUMERICAL</td>
<td>The name and value of a numerical attribute of type NUMBER or FLOAT.</td>
</tr>
<tr>
<td>DM_NESTED_NUMERICALS</td>
<td>A collection of DM_NESTED_NUMERICAL.</td>
</tr>
<tr>
<td>ORA_MINING_VARCHAR2_NT</td>
<td>A table of VARCHAR2 (4000).</td>
</tr>
<tr>
<td>TRANSFORM_LIST</td>
<td>A list of user-specified transformations for a model.</td>
</tr>
<tr>
<td></td>
<td>Accepted as a parameter by the CREATE_MODEL Procedure.</td>
</tr>
<tr>
<td></td>
<td>This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.</td>
</tr>
</tbody>
</table>

For more information about mining nested data, see Oracle Data Mining User's Guide.

**Note:**

Starting from Oracle Database 12c Release 2, *GET_MODEL_DETAILS are deprecated and are replaced with Model Detail Views. See Oracle Data Mining User's Guide.

### 47.6.1 Deprecated Types

This topic contains tables listing deprecated types.

The DBMS_DATA_MINING package defines object datatypes for storing information about model attributes. Most of these types are returned by the table functions GET_n, where n identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms".

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the Oracle Database PL/SQL Language Reference.
<table>
<thead>
<tr>
<th>Datatype</th>

47.7.1 ADD_COST_MATRIX Procedure

The ADD_COST_MATRIX procedure associates a cost matrix table with a Classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. To view the scoring matrix for a model, query the DM$VC prefixed model view. Refer to Model Detail View for Classification Algorithm.
To obtain the default scoring matrix for a model, query the DM$VC prefixed model view. To remove the default scoring matrix from a model, use the REMOVE_COST_MATRIX procedure. See "GET_MODEL_COST_MATRIX Function" and "REMOVE_COST_MATRIX Procedure".

See Also:

- "Biasing a Classification Model" in Oracle Data Mining Concepts for more information about costs
- Oracle Database SQL Language Reference for syntax of inline cost matrix
- Oracle Data Mining User’s Guide

Syntax

DBMS_DATA_MINING.ADD_COST_MATRIX (  
model_name                IN VARCHAR2,  
cost_matrix_table_name    IN VARCHAR2,  
cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);  
partition_name            IN VARCHAR2 DEFAULT NULL);

Parameters

Table 47-36  ADD_COST_MATRIX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table (described in Table 47-37).</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table. If no schema is specified, then the current schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition in a partitioned model</td>
</tr>
</tbody>
</table>

Usage Notes

1. If the model is not in your schema, then ADD_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 47-37.

Table 47-37  Required Columns in a Cost Matrix Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTUAL_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
<tr>
<td>PREDICTED_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
<tr>
<td>COST</td>
<td>NUMBER, FLOAT, BINARY_DOUBLE, or BINARY_FLOAT</td>
</tr>
</tbody>
</table>
3. The types of the actual and predicted target values must be the same as the type of the model target. For example, if the target of the model is `BINARY_DOUBLE`, then the actual and predicted values must be `BINARY_DOUBLE`. If the actual and predicted values are `CHAR` or `VARCHAR`, then `ADD_COST_MATRIX` treats them as `VARCHAR2` internally.

If the types do not match, or if the actual or predicted value is not a valid target value, then the `ADD_COST_MATRIX` procedure raises an error.

4. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the `costs` column of the cost matrix table.

5. All Classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the `CLAS_COST_TABLE_NAME` setting in the settings table for the model. See Table 47-7.

   The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the `REMOVE_COST_MATRIX` procedure to remove the cost matrix and the `ADD_COST_MATRIX` procedure to add a new one.

6. Scoring on a partitioned model is partition-specific. Scoring cost matrices can be added to or removed from an individual partition in a partitioned model. If `PARTITION_NAME` is `NOT NULL`, then the model must be a partitioned model. The `COST_MATRIX` is added to that partition of the partitioned model.

   If the `PARTITION_NAME` is `NULL`, but the model is a partitioned model, then the `COST_MATRIX` table is added to every partition in the model.

Example

This example creates a cost matrix table called `COSTS_NB` and adds it to a Naive Bayes model called `NB_SH_CLAS_SAMPLE`. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```sql
CREATE TABLE costs_nb (
    actual_target_value NUMBER,
    predicted_target_value NUMBER,
)
```
```sql
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;
EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(nb_sh_clas_sample COST MODEL
    USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;

<table>

<td>555</td>
<td>44</td>
</tr>
</tbody>
</table>
```

### 47.7.2 ADD_PARTITION Procedure

The `ADD_PARTITION` procedure supports a single or multiple partition addition to an existing partitioned model.

The `ADD_PARTITION` procedure derives build settings and user-defined expressions from the existing model. The target column must exist in the input data query when adding partitions to a supervised model.

**Syntax**

```sql
DBMS_DATA_MINING.ADD_PARTITION (model_name IN VARCHAR2,
data_query IN CLOB,
add_options IN VARCHAR2 DEFAULT ERROR);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>data_query</td>
<td>An arbitrary SQL statement that provides data to the model build. The user must have privilege to evaluate this query.</td>
</tr>
</tbody>
</table>
### Table 47-38 (Cont.) ADD_PARTITION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add_options</td>
<td>Allows users to control the conditional behavior of ADD for cases where rows in the input dataset conflict with existing partitions in the model. The following are the possible values:</td>
</tr>
<tr>
<td></td>
<td>• REPLACE: Replaces the existing partition for which the conflicting keys are found.</td>
</tr>
<tr>
<td></td>
<td>• ERROR: Terminates the ADD operation without adding any partitions.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE: Eliminates the rows having the conflicting keys.</td>
</tr>
</tbody>
</table>

**Note:**
For better performance, Oracle recommends using DROP_PARTITION followed by the ADD_PARTITION instead of using the REPLACE option.

### 47.7.3 ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

**Syntax**

```sql
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION ( 
  model_name             VARCHAR2, 
  expression             CLOB, 
  attribute_name         VARCHAR2 DEFAULT NULL, 
  attribute_subname      VARCHAR2 DEFAULT NULL);
```

**Parameters**

### Table 47-39 ALTER_REVERSE_EXPRESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>expression</td>
<td>An expression to replace the reverse transformation associated with the attribute.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute. Specify NULL if you wish to apply expression to a cluster, feature, or One-Class SVM prediction.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
</tbody>
</table>
Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are applied to the attributes returned in model details (GET_MODEL_DETAILS_* functions) and to the scored target of predictive models.

   See Also:
   “About Transformation Lists” under
   DBMS_DATA_MINING_TRANSFORM Operational Notes

2. If you alter the reverse transformation for the target of a model that has a cost matrix, you must specify a transformation expression that has the same type as the actual and predicted values in the cost matrix. Also, the reverse transformation that you specify must result in values that are present in the cost matrix.

   See Also:
   “ADD_COST_MATRIX Procedure” and Oracle Data Mining Concepts for information about cost matrices.

3. To prevent reverse transformation of an attribute, you can specify NULL for expression.

4. The reverse transformation expression can contain a reference to a PL/SQL function that returns a valid Oracle datatype. For example, you could define a function like the following for a categorical attribute named blood_pressure that has values 'Low', 'Medium' and 'High'.

   ```
   CREATE OR REPLACE FUNCTION numx(c char) RETURN NUMBER IS
   BEGIN
     CASE c WHEN ''Low'' THEN RETURN 1;
       WHEN ''Medium'' THEN RETURN 2;
       WHEN ''High'' THEN RETURN 3;
       ELSE RETURN null;
     END CASE;
   END numx;
   ```

   Then you could invoke ALTER_REVERSE_EXPRESSION for blood_pressure as follows.

   ```
   EXEC dbms_data_minng.alter_reverse_expression(
     '<model_name>', 'NUMX(blood_pressure)', 'blood_pressure');
   ```

5. You can use ALTER_REVERSE_EXPRESSION to label clusters produced by clustering models and features produced by feature extraction.

   You can use ALTER_REVERSE_EXPRESSION to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.
Examples

1. In this example, the target (affinity_card) of the model CLASS_MODEL is manipulated internally as yes or no instead of 1 or 0 but returned as 1s and 0s when scored. The ALTER_REVERSE_EXPRESSION procedure causes the target values to be returned as TRUE or FALSE.

The data sets MINING_DATA_BUILD and MINING_DATA_TEST are included with the Oracle Data Mining sample programs. See Oracle Data Mining User's Guide for information about the sample programs.

DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;

</table>

47.7.4 APPLY Procedure

The APPLY procedure applies a mining model to the data of interest, and generates the results in a table. The APPLY procedure is also referred to as **scoring**.

For predictive mining functions, the APPLY procedure generates predictions in a target column. For descriptive mining functions such as Clustering, the APPLY process assigns each case to a cluster with a probability.

In Oracle Data Mining, the APPLY procedure is not applicable to Association models and Attribute Importance models.
Note:

Scoring can also be performed directly in SQL using the Data Mining functions. See

- "Data Mining Functions" in Oracle Database SQL Language Reference
- "Scoring and Deployment" in Oracle Data Mining User’s Guide

Syntax

```sql
DBMS_DATA_MINING.APPLY (  
    model_name           IN VARCHAR2,  
    data_table_name      IN VARCHAR2,  
    case_id_column_name  IN VARCHAR2,  
    result_table_name    IN VARCHAR2,  
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47-40  APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of table or view containing the data to be scored</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table in which to store apply results</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema containing the data to be scored</td>
</tr>
</tbody>
</table>

Usage Notes

1. The data provided for APPLY must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model: both at build time and apply time. (See "Automatic Data Preparation".)

2. APPLY creates a table in the user's schema to hold the results. The columns are algorithm-specific.

The columns in the results table are listed in Table 47-41 through Table 47-45. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in APPLY output.

Note:

Make sure that the case ID column does not have the same name as one of the columns that will be created by APPLY. For example, when applying a Classification model, the case ID in the scoring data must not be PREDICTION or PROBABILITY (See Table 47-41).
3. The datatype for the PREDICTION, CLUSTER_ID, and FEATURE_ID output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure".

4. If the model is partitioned, the result_table_name can contain results from different partitions depending on the data from the input data table. An additional column called PARTITION_NAME is added to the result table indicating the partition name that is associated with each row.
   For a non-partitioned model, the behavior does not change.

Classification

The results table for Classification has the columns described in Table 47-41. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 datatype. If the target has a binary type, the PREDICTION column will have the binary type of the target.

Table 47-41   APPLY Results Table for Classification

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Anomaly Detection

The results table for Anomaly Detection has the columns described in Table 47-42.

Table 47-42   APPLY Results Table for Anomaly Detection

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Regression

The results table for Regression has the columns described in APPLY Procedure.

Table 47-43   APPLY Results Table for Regression

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
</tbody>
</table>

Clustering

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY procedure will contain simply the cluster identifier corresponding to
a case, and the associated probability. The results table has the columns described in Table 47-44.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>CLUSTER_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

### Feature Extraction

Feature Extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY procedure will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 47-45.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>FEATURE_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>MATCH_QUALITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

### Examples

This example applies the GLM Regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The APPLY results are output of the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
        DBMS_DATA_MINING.APPLY (
              model_name     => 'glmr_sh_regr_sample',
              data_table_name => 'mining_data_apply_v',
              case_id_column_name => 'cust_id',
              result_table_name   => 'regression_apply_result');
    END;
/
```

```
SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;
```

<table>
<thead>
<tr>
<th>CUST_ID</th>
<th>PREDICTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>101486</td>
<td>22.8048824</td>
</tr>
<tr>
<td>101487</td>
<td>25.0261101</td>
</tr>
<tr>
<td>101488</td>
<td>48.6146619</td>
</tr>
<tr>
<td>101489</td>
<td>51.82595</td>
</tr>
<tr>
<td>101490</td>
<td>22.6220714</td>
</tr>
<tr>

<td>61.3856816</td>
</tr>
<tr>
<td>101492</td>
<td>24.1400748</td>
</tr>
<tr>
<td>101493</td>
<td>58.034631</td>
</tr>
<tr>
<td>101494</td>
<td>45.7253149</td>
</tr>
<tr>
<td>101495</td>
<td>26.9763318</td>
</tr>
<tr>
<td>101496</td>
<td>48.1433425</td>
</tr>
</tbody>
</table>
47.7.5 COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See Also:

Oracle Data Mining Concepts for more details about confusion matrixes and other test metrics for classification

<td>Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
Table 47-46  (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

```sql
CREATE TABLE apply_result_table_name AS (      
  case_id_column_name    VARCHAR2,
  score_column_name      VARCHAR2,
  score_criterion_column_name  VARCHAR2);
```

- A cost matrix must have the columns described in Table 47-47.

Table 47-47  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>
The confusion matrix created by `COMPUTE_CONFUSION_MATRIX` has the columns described in Table 47-48.

Table 47-48 Columns in a Confusion Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target is the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>value</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id,
           PREDICTION(nb_sh_clas_sample USING *) prediction,
           PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
    FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
    v_accuracy NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (accuracy => v_accuracy,
                                               apply_result_table_name => 'nb_apply_results',
                                               target_table_name => 'mining_data_test_v',
                                               case_id_column_name => 'cust_id',
                                               target_column_name => 'affinity_card',
                                               confusion_matrix_table_name => 'nb_confusion_matrix',
                                               score_column_name => 'PREDICTION',
                                               score_criterion_column_name => 'PROBABILITY',
                                               cost_matrix_table_name => null,

```

*Oracle Data Mining User’s Guide* for valid target datatypes

*Oracle Data Mining Concepts* for more information about confusion matrixes
The confusion matrix and model accuracy are shown as follows.

**** MODEL ACCURACY ****: .7847

SQL> SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE  PREDICTED_TARGET_VALUE  VALUE
-------------------  ----------------------  ----------
1                   0                  60
0                   0                  891
1                   1                  286
0                   1                  263

**Compute a Confusion Matrix Based on a Cost Matrix Table**

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table nb_cost_matrix specifies that a false positive is 3 times more costly than a false negative.

SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE  PREDICTED_TARGET_VALUE  COST
-------------------  ----------------------  ----------
0                   0                  0
0                   1                  .75
1                   0                  .25
1                   1                  0

This statement shows how to generate the predictions using APPLY.

BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name          => 'nb_sh_clas_sample',
    data_table_name     => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name   => 'nb_apply_results');
END;
/

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by APPLY.

DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX {
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_criterion_type => 'PROBABILITY'};
END;
The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

\[
\begin{array}{ccc}
\text{ACTUAL_TARGET_VALUE} & \text{PREDICTED_TARGET_VALUE} & \text{VALUE} \\
1 & 0 & 91 \\
0 & 0 & 942 \\
1 & 1 & 255 \\
0 & 1 & 212 \\
\end{array}
\]

**Compute a Confusion Matrix Based on Embedded Costs**

You can use the `ADD_COST_MATRIX` procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```sql
BEGIN    DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```sql
CREATE TABLE nb_apply_results AS
SELECT cust_id,
    PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
    PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```sql
DECLARE
    v_accuracy NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (    accuracy => v_accuracy,
        apply_result_table_name => 'nb_apply_results',
        target_table_name => 'mining_data_test_v',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        confusion_matrix_table_name => 'nb_confusion_matrix',
        score_column_name => 'PREDICTION',
        score_criterion_column_name => 'COST',
        cost_matrix_table_name => null,
        apply_result_schema_name => null,
        target_schema_name => null,
        cost_matrix_schema_name => null,
        score_criterion_type => 'COST');
END; /
```
The results are:

**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE     VALUE
------------------- ---------------------- ----------
1                      0         91
0                      0        942
1                      1        255
0                      1        212

47.7.6 COMPUTE_CONFUSION_MATRIX_PART Procedure

The COMPUTE_CONFUSION_MATRIX_PART procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

COMPUTE_CONFUSION_MATRIX_PART provides support to computation of evaluation metrics per-partition for partitioned models. For non-partitioned models, refer to COMPUTE_CONFUSION_MATRIX Procedure.

A confusion matrix is a test metric for Classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX_PART accepts three input streams:

• The predictions generated on the test data. The information is passed in three columns:
  – Case ID column
  – Prediction column
  – Scoring criterion column containing either probabilities or costs

• The known target values in the test data. The information is passed in two columns:
  – Case ID column
  – Target column containing the known target values

• (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

"COMPUTE_ROC_PART Procedure"
Syntax

```sql
DBMS_DATA_MINING.compute_confusion_matrix_part(
    accuracy OUT DM_NESTED_NUMERICALS,
    apply_result_table_name IN VARCHAR2,
    target_table_name IN VARCHAR2,
    case_id_column_name IN VARCHAR2,
    target_column_name IN VARCHAR2,
    confusion_matrix_table_name IN VARCHAR2,
    score_column_name IN VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
    score_partition_column_name IN VARCHAR2 DEFAULT 'PARTITION_NAME',
    cost_matrix_table_name IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name IN VARCHAR2 DEFAULT NULL,
    target_schema_name IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL,
    score_criterion_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accuracy</td>
<td>Output parameter containing the overall percentage accuracy of the predictions. The output argument is changed from NUMBER to DM_NESTED_NUMERICALS.</td>
</tr>
<tr>
<td>apply_result_table_name</td>
<td>Table containing the predictions.</td>
</tr>
<tr>
<td>target_table_name</td>
<td>Table containing the known target values from the test data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case ID column in the apply results table. Must match the case identifier in the targets table.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Target column in the targets table. Contains the known target values from the test data.</td>
</tr>
<tr>
<td>confusion_matrix_table_name</td>
<td>Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot;).</td>
</tr>
</tbody>
</table>
Table 47-49  (Cont.) COMPUTE_CONFUSION_MATRIX_PART Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>score_criterion_column_name</td>
<td>Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, then the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is PROBABILITY, which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot;). See the Usage Notes for additional information.</td>
</tr>
<tr>
<td>score_partition_column_name</td>
<td>(Optional) Parameter indicating the column which contains the name of the partition. This column slices the input test results such that each partition has independent evaluation matrices computed.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to COSTS, the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Schema of the apply results table. If null, then the user’s schema is assumed.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Schema of the table containing the known targets. If null, then the user’s schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table, if one is provided. If null, then the user’s schema is assumed.</td>
</tr>
<tr>
<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is PROBABILITY. To use costs as the scoring criterion, specify COST. If score_criterion_type is set to COST but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

• The predictive information you pass to COMPUTE_CONFUSION_MATRIX_PART may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
• Instead of passing a cost matrix to `COMPUTE_CONFUSION_MATRIX_PART`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.

• The predictions that you pass to `COMPUTE_CONFUSION_MATRIX_PART` are in a table or view specified in `apply_result_table_name`.

```
CREATE TABLE apply_result_table_name AS (  
  case_id_column_name VARCHAR2,  
  score_column_name VARCHAR2,  
  score_criterion_column_name VARCHAR2);
```

• A cost matrix must have the columns described in Table 47-47.

### Table 47-50  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>

Examples

These examples use the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id,
      PREDICTION(nb_sh_clas_sample USING *) prediction,
      PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
    FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    score_partition_column_name => null,
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' ||
    ROUND(v_accuracy, 4));
END;
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847
```

```
SELECT * FROM NB_CONFUSION_MATRIX;
```

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>60</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>891</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>286</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>263</td>
</tr>
</tbody>
</table>

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.
The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SELECT * from NB_COST_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
0                      0          0
0                      1        .75
1                      0        .25
1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name          => 'nb_sh_clas_sample',
    data_table_name     => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name   => 'nb_apply_results');
END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy    NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
    accuracy                     => v_accuracy,
    apply_result_table_name      => 'nb_apply_results',
    target_table_name            => 'mining_data_test_v',
    case_id_column_name          => 'cust_id',
    target_column_name           => 'affinity_card',
    confusion_matrix_table_name  => 'nb_confusion_matrix',
    score_column_name            => 'PREDICTION',
    score_criterion_column_name  => 'PROBABILITY',
    score_partition_column_name  => 'PARTITION_NAME'
    cost_matrix_table_name       => 'nb_cost_matrix',
    apply_result_schema_name     => null,
    target_schema_name           => null,
    cost_matrix_schema_name      => null,
    score_criterion_type         => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798
```

```
SELECT * FROM NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
1                      0         91
0                      0        942
1                      1        255
0                      1        212
```

**Compute a Confusion Matrix Based on Embedded Costs**
You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
  v_accuracy         NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (accuracy => v_accuracy,
                                                  apply_result_table_name => 'nb_apply_results',
                                                  target_table_name => 'mining_data_test_v',
                                                  case_id_column_name => 'cust_id',
                                                  target_column_name => 'affinity_card',
                                                  confusion_matrix_table_name => 'nb_confusion_matrix',
                                                  score_column_name => 'PREDICTION',
                                                  score_criterion_column_name => 'COST',
                                                  score_partition_column_name => 'PARTITION_NAME',
                                                  cost_matrix_table_name => null,
                                                  apply_result_schema_name => null,
                                                  target_schema_name => null,
                                                  cost_matrix_schema_name => null,
                                                  score_criterion_type => 'COST');
END;
/```

The results are:

```
**** MODEL ACCURACY ****: .798
```

```
SELECT * FROM NB_CONFUSION_MATRIX;
```

```
ACTUAL_TARGET_VALUE  PREDICTED_TARGET_VALUE   VALUE
-------------------  ----------------------  ----------
   1                        0                91
   0                        0               942
   1                        1               255
   0                        1               212
```

### 47.7.7 COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. COMPUTE_LIFT compares the predictions generated by the model with the actual target values in a set of test data.
Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

**COMPUTE_LIFT** calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, **COMPUTE_LIFT** accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

**See Also:**

*Oracle Data Mining Concepts* for more details about lift and test metrics for classification

<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```sql
CREATE TABLE apply_result_table_name AS (
    case_id_column_name VARCHAR2,
    score_column_name VARCHAR2,
    score_criterion_column_name VARCHAR2);
```

- A cost matrix must have the columns described in Table 47-53.

Table 47-53  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_val</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
The table created by `COMPUTE_LIFT` has the columns described in Table 47-54.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>quantile_number</td>
<td>NUMBER</td>
</tr>
<tr>
<td>probability_threshold</td>
<td>NUMBER</td>
</tr>
<tr>
<td>gain_cumulative</td>
<td>NUMBER</td>
</tr>
<tr>
<td>quantile_total_count</td>
<td>NUMBER</td>
</tr>
<tr>
<td>quantile_target_count</td>
<td>NUMBER</td>
</tr>
<tr>
<td>percent_records_cumulative</td>
<td>NUMBER</td>
</tr>
<tr>
<td>lift_cumulative</td>
<td>NUMBER</td>
</tr>
<tr>
<td>target_density_cumulative</td>
<td>NUMBER</td>
</tr>
<tr>
<td>targets_cumulative</td>

<td>NUMBER</td>
</tr>
<tr>
<td>target_density</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

**Examples**

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
SELECT cust_id, t.prediction, t.probability
FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.
BEGIN
DBMS_DATA_MINING.COMPUTE_LIFT (
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    lift_table_name => 'nb_lift',
    positive_target_value => to_char(1),
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    num_quantiles => 10,
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'PROBABILITY');
END;
/

This query displays some of the statistics from the resulting lift table.

SQL> SELECT quantile_number, probability_threshold, gain_cumulative,
       quantile_total_count
FROM nb_lift;

47.7.8 COMPUTE_LIFT_PART Procedure

The COMPUTE_LIFT_PART procedure computes Lift and stores the results in a table in the user's schema. This procedure provides support to the computation of evaluation metrics per-partition for partitioned models.

Lift is a test metric for binary Classification models. To compute Lift, one of the target values must be designated as the positive class. COMPUTE_LIFT_PART compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

COMPUTE_LIFT_PART calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, COMPUTE_LIFT_PART accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
– Scoring criterion column containing either probabilities or costs associated with the predictions

• The known target values in the test data. The information is passed in two columns:
  – Case ID column
  – Target column containing the known target values

• (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

</tbody>
</table>

When a cost matrix is passed to COMPUTE_LIFT_PART, the cost threshold is returned in the probability_threshold column of the Lift table.

Examples

This example uses the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

The example illustrates Lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

For a partitioned model example, see "COMPUTE_CONFUSION_MATRIX_PART Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS 
    SELECT cust_id, t.prediction, t.probability 
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```
Using probabilities as the scoring criterion, you can compute Lift as follows.

BEGIN
DBMS_DATA_MINING.COMPUTE_LIFT_PART ( 
apply_result_table_name     => 'nb_apply_results',
target_table_name           => 'mining_data_test_v',
case_id_column_name         => 'cust_id',
target_column_name          => 'affinity_card',
lift_table_name             => 'nb_lift',
positive_target_value       => to_char(1),
score_column_name           => 'PREDICTION',
score_criterion_column_name => 'PROBABILITY',
score_partition_column_name => 'PARTITION_NAME',
um_quantiles               => 10,
cost_matrix_table_name      => null,
apply_result_schema_name    => null,
target_schema_name          => null,
cost_matrix_schema_name     => null,
score_criterion_type        => 'PROBABILITY');
END;
/

This query displays some of the statistics from the resulting Lift table.

SELECT quantile_number, probability_threshold, gain_cumulative, quantile_total_count
FROM nb_lift;

47.7.9 COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive
prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

**COMPUTE_ROC** accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

**See Also:**

*Oracle Data Mining Concepts* for more details about ROC and test metrics for classification

“**COMPUTE_CONFUSION_MATRIX Procedure**”

“**COMPUTE_LIFT Procedure**”

**Syntax**

```sql
DBMS_DATA_MINING.COMPUTE_ROC (  
  roc_area_under_curve         OUT NUMBER,  
  apply_result_table_name      IN  VARCHAR2,  
  target_table_name            IN  VARCHAR2,  
  case_id_column_name          IN  VARCHAR2,  
  target_column_name           IN  VARCHAR2,  
  roc_table_name               IN  VARCHAR2,  
  positive_target_value        IN  VARCHAR2,  
  score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',  
  score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',  
  apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,  
  target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

</tbody>
</table>

#### Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.

- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.

```sql
CREATE TABLE apply_result_table_name AS (  
    case_id_column_name VARCHAR2,  
    score_column_name VARCHAR2,  
    score_criterion_column_name VARCHAR2);
```

- The table created by COMPUTE_ROC has the columns shown in Table 47-59.
Table 47-59  COMPUTE_ROC Output

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
</tr>
</thead>

</tr>
<tr>
<td>false_positive_fraction</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also:

Oracle Data Mining Concepts for details about the output of COMPUTE_ROC

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (  
    SELECT probability_threshold, 20 * false_negatives + false_positives cost  
    FROM ROC_table  
    GROUP BY probability_threshold),
  minCost AS (  
    SELECT min(cost) minCost  
    FROM cost  
    SELECT max(probability_threshold) probability_threshold  
    FROM cost, minCost  
    WHERE cost = minCost;

SELECT probability_threshold  
FROM cost, minCost
WHERE cost = minCost;
```

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.
SELECT * FROM ROC_table
ORDER BY probability_threshold;

Examples

This example uses the Naive Bayes model \texttt{nb\_sh\_clas\_sample}, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb\_sh\_clas\_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
    v_area_under_curve NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_ROC (        roc_area_under_curve        => v_area_under_curve,
                                        apply_result_table_name     => 'nb_apply_results',
                                        target_table_name           => 'mining_data_test_v',
                                        case_id_column_name         => 'cust_id',
                                        target_column_name          => 'mining_data_test_v',
                                        roc_table_name              => 'nb_roc',
                                        positive_target_value       => '1',
                                        score_column_name           => 'PREDICTION',
                                        score_criterion_column_name => 'PROBABILITY');
    DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
                          ROUND(v_area_under_curve,4));
END;
/
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212

SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
FROM NB_ROC;
```

47.7.10 COMPUTE_ROC_PART Procedure

The COMPUTE_ROC_PART procedure computes Receiver Operating Characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy. This procedure provides support to computation of evaluation metrics per-partition for partitioned models.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC_PART compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an x-y axis. The false positive rate is placed on the x-axis. The true positive rate is placed on the y-axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE_ROC_PART accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

<td>Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.</td>
</tr>
<tr>
<td>positive_target_value</td>
<td>The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, then you can use the TO_CHAR() operator to provide the value as a string.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot;).</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is PROBABILITY, which is the default name created by the APPLY procedure (See &quot;APPLY Procedure&quot;).</td>
</tr>
</tbody>
</table>
Table 47-60  (Cont.) COMPUTE_ROC_PART Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>score_partition_column_name</td>
<td>Optional parameter indicating the column which contains the name of the partition. This column slices the input test results such that each partition has independent evaluation matrices computed.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Schema of the apply results table. If null, then the user's schema is assumed.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Schema of the table containing the known targets. If null, then the user's schema is assumed.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_ROC_PART may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC_PART are in a table or view specified in apply_results_table_name.

```sql
CREATE TABLE apply_result_table_name AS (  
    case_id_column_name VARCHAR2,  
    score_column_name VARCHAR2,  
    score_criterion_column_name VARCHAR2);  
```

- The COMPUTE_ROC_PART table has the following columns:

Table 47-61  COMPUTE_ROC_PART Output

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>probability</td>
<td>BINARY_DOUBLE</td>
</tr>
<tr>
<td>true_positives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_negatives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_positives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>true_negatives</td>
<td>NUMBER</td>
</tr>
<tr>
<td>true_positive_fraction</td>
<td>NUMBER</td>
</tr>
<tr>
<td>false_positive_fraction</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also:

*Oracle Data Mining Concepts* for details about the output of COMPUTE_ROC_PART

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly
predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```sql
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

- There are two approaches to identify the most desirable probability threshold. The approach you use depends on whether you know the relative cost of positive versus negative class prediction errors.

If the costs are known, then you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query as follows:

```sql
WITH cost AS (
    SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
    GROUP BY probability_threshold),
    minCost AS (
    SELECT min(cost) minCost
    FROM cost)
    SELECT max(probability_threshold) probability_threshold
    FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, then you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```sql
SELECT * FROM ROC_table
ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
SELECT cust_id, t.prediction, t.probability
FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```sql
DECLARE
    v_area_under_curve NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_ROC_PART (}
roc_area_under_curve => v_area_under_curve,
apply_result_table_name => 'nb_apply_results',
target_table_name => 'mining_data_test_v',
case_id_column_name => 'cust_id',
target_column_name => 'affinity_card',
roc_table_name => 'nb_roc',
positive_target_value => '1',
score_column_name => 'PREDICTION',
score_criterion_column_name => 'PROBABILITY';
score_partition_column_name => 'PARTITION_NAME'
DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
ROUND(v_area_under_curve,4));
END;
/

The resulting AUC and a selection of columns from the ROC table are shown as follows.

**** AREA UNDER ROC CURVE ****: .8212

SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
FROM NB_ROC;

<table>
<thead>
<tr>
<th>PROBABILITY</th>
<th>TRUE_POSITIVE_FRACTION</th>
<th>FALSE_POSITIVE_FRACTION</th>
</tr>
</thead>
<tbody>

47.7.11 CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

Syntax

DBMS_DATA_MINING.CREATE_MODEL {
  model_name IN VARCHAR2,
  mining_function IN VARCHAR2,
  data_table_name IN VARCHAR2,
  case_id_column_name IN VARCHAR2,
  target_column_name IN VARCHAR2 DEFAULT NULL,
  settings_table_name IN VARCHAR2 DEFAULT NULL,
  data_schema_name IN VARCHAR2 DEFAULT NULL,
  settings_schema_name IN VARCHAR2 DEFAULT NULL,
  xform_list IN TRANSFORM_LIST DEFAULT NULL);
Parameters

Table 47-62  CREATE_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used. See the Usage Notes for model naming restrictions.</td>
</tr>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in Table 47-3.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Table or view containing the build data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>settings_table_name</td>
<td>Table containing build settings for the model. NULL if there is no settings table (only default settings are used).</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema hosting the build data. If NULL, then the user's schema is assumed.</td>
</tr>
<tr>
<td>settings_schema_name</td>
<td>Schema hosting the settings table. If NULL then the user's schema is assumed.</td>
</tr>
</tbody>
</table>
| xform_list           | A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation"). The datatype of xform_list is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC. Each TRANSFORM_REC specifies the transformation information for a single attribute. TYPE

    TRANSFORM_REC IS RECORD (
      attribute_name VARCHAR2(4000),
      attribute_subname VARCHAR2(4000),
      expression EXPRESSION_REC,
      reverse_expression EXPRESSION_REC,
      attribute_spec VARCHAR2(4000));

The expression field stores a SQL expression for transforming the attribute. The reverse_expression field stores a SQL expression for reversing the transformation in model details and, if the attribute is a target, in the results of scoring. The SQL expressions are manipulated by routines in the DBMS_DATA_MINING_TRANSFORM package:

- SET_EXPRESSION Procedure
- GET_EXPRESSION Function
- SET_TRANSFORM Procedure

The attribute_spec field identifies individualized treatment for the attribute. See the Usage Notes for details. See Table 48-1 for details about the TRANSFORM_REC type.

Usage Notes

1. You can use the attribute_spec field of the xform_list argument to identify an attribute as unstructured text or to disable Automatic Data Preparation for the attribute. The attribute_spec can have the following values:
• TEXT: Indicates that the attribute contains unstructured text. The TEXT value may optionally be followed by POLICY_NAME, TOKEN_TYPE, MAX_FEATURES, and MIN_DOCUMENTS parameters.

TOKEN_TYPE has the following possible values: NORMAL, STEM, THEME, SYNONYM, BIGRAM, STEM_BIGRAM. SYNONYM may be optionally followed by a thesaurus name in square brackets.

MAX_FEATURES specifies the maximum number of tokens extracted from the text.

MIN_DOCUMENTS specifies the minimal number of documents in which every selected token shall occur. (For information about creating a text policy, see CTX_DDL.CREATE_POLICY in Oracle Text Reference).

Oracle Data Mining can process columns of VARCHAR2/CHAR, CLOB, BLOB, and BFILE as text. If the column is VARCHAR2 or CHAR and you do not specify TEXT, Oracle Data Mining will process the column as categorical data. If the column is CLOB, then Oracle Data Mining will process it as text by default (You do not need to specify it as TEXT. However, you do need to provide an Oracle Text Policy in the settings). If the column is BLOB or BFILE, you must specify it as TEXT, otherwise CREATE_MODEL will return an error.

If you specify TEXT for a nested column or for an attribute in a nested column, CREATE_MODEL will return an error.

• NOPREP: Disables ADP for the attribute. When ADP is OFF, the NOPREP value is ignored.

You can specify NOPREP for a nested column, but not for an attribute in a nested column. If you specify NOPREP for an attribute in a nested column when ADP is on, CREATE_MODEL will return an error.

2. You can obtain information about a model by querying the Data Dictionary views.

ALL/USER/DBA_MINING_MODELS
ALL/USER/DBA_MINING_MODEL_ATTRIBUTES
ALL/USER/DBA_MINING_MODEL_SETTINGS
ALL/USER/DBA_MINING_MODEL_VIEWS
ALL/USER/DBA_MINING_MODEL_PARTITION
ALL/USER/DBA_MINING_MODEL_XFORMS

You can obtain information about model attributes by querying the model details through model views. Refer to Oracle Data Mining User’s Guide.

3. The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

• It must be 123 or fewer characters long.

• It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in Oracle Database SQL Language Reference.

4. To build a partitioned model, you must provide additional settings.
The setting for partitioning columns are as follows:

```
INSERT INTO settings_table VALUES ('ODMS_PARTITION_COLUMNS', 'GENDER, AGE');
```

To set user-defined partition number for a model, the setting is as follows:

```
INSERT INTO settings_table VALUES ('ODMS_MAX_PARTITIONS', '10');
```

The default value for maximum number of partitions is 1000.

5. By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is `ON`, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is `OFF`, the specified transformations are the only ones implemented by the model. In both cases, transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation". Other transforms that can be specified with `xform_list` include `FORCE_IN`. Refer to Oracle Data Mining User's Guide.

Examples

The first example builds a Classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (   
  setting_name  VARCHAR2(30),   
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN   
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES   
    (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);   
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES   
    (dbms_data_mining.prep_auto,dbms_data_mining.prep_auto_on);   
  COMMIT; 
END; /
-- Create the model using the specified settings
BEGIN   
  DBMS_DATA_MINING.CREATE_MODEL(   
    model_name => 'svm_model',   
    mining_function => dbms_data_mining.classification,   
    data_table_name => 'mining_data_build_v',   
    case_id_column_name => 'cust_id',   
    target_column_name => 'affinity_card',   
    settings_table_name => 'svm_model_settings'); 
END; /
```

You can display the model settings with the following query:

```
SELECT * FROM user_mining_model_settings   
WHERE model_name IN 'SVM_MODEL';
```
The following is an example of querying a model view instead of the older GEL_MODELDETAILS_SVM routine.

```sql
SELECT target_value, attribute_name, attribute_value, coefficient FROM DM$VLSVM_MODEL;
```

The second example creates an Anomaly Detection model. Anomaly Detection uses SVM Classification without a target. This example uses the same settings table created for the SVM Classification model in the first example.

```
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'anomaly_detect_model',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_data_build_v',
        case_id_column_name => 'cust_id',
        target_column_name  => null,
        settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;
```

This query shows that only the SVM Classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
    FROM user_mining_model_attributes
    WHERE target = 'YES';
```

### 47.7.12 CREATE_MODEL2 Procedure

The CREATE_MODEL2 procedure is an alternate procedure to the CREATE_MODEL procedure, which enables creating a model without extra persistence stages. In the CREATE_MODEL procedure, the input is a table or a view and if such an object is not already present, the user
must create it. By using the CREATE_MODEL2 procedure, the user does not need to create such transient database objects.

Syntax

```sql
DBMS_DATA_MINING.CREATE_MODEL2 (  
  model_name            IN VARCHAR2,  
  mining_function       IN VARCHAR2,  
  data_query            IN CLOB,  
  set_list              IN SETTING_LIST,  
  case_id_column_name   IN VARCHAR2 DEFAULT NULL,  
  target_column_name    IN VARCHAR2 DEFAULT NULL,  
  xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then the current schema is used. See the Usage Notes, CREATE_MODEL Procedure for model naming restrictions.</td>
</tr>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in DBMS_DATA_MINING — Mining Function Settings.</td>
</tr>
<tr>
<td>data_query</td>
<td>A query which provides training data for building the model.</td>
</tr>
<tr>
<td>set_list</td>
<td>Specifies the SETTING_LIST SETTING_LIST is a table of CLOB index by VARCHAR2(30); Where the index is the setting name and the CLOB is the setting value for that name.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>xform_list</td>
<td>Refer to CREATE_MODEL Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

Refer to CREATE_MODEL Procedure for Usage Notes.

Examples

The following example uses the Support Vector Machine algorithm.

declare
  v_setlst DBMS_DATA_MINING.SETTING_LIST;
BEGIN
  v_setlst(dbms_data_mining.algo_name) :=
    dbms_data_mining.algo_support_vector_machines;
  v_setlst(dbms_data_mining.prep_auto) := dbms_data_mining.prep_auto_on;
  DBMS_DATA_MINING.CREATE_MODEL2(  
    model_name => 'svm_model',  
    mining_function => dbms_data_mining.classification,
47.7.13 Create Model Using Registration Information

Create model function fetches the setting information from JSON object.

Usage Notes

If an algorithm is registered, user can create model using the registered algorithm name. Since all R scripts and default setting values are already registered, providing the value through the setting table is not necessary. This makes the use of this algorithm easier.

Examples

The first example builds a Classification model using the GLM algorithm.

```
CREATE TABLE GLM_RDEMO_SETTINGS_CL (
    setting_name    VARCHAR2(30),
    setting_value   VARCHAR2(4000));
BEGIN
    INSERT INTO GLM_RDEMO_SETTINGS_CL
    VALUES ('ALGO_EXTENSIBLE_LANG', 'R');
    INSERT INTO GLM_RDEMO_SETTINGS_CL
    VALUES (dbms_data_mining.ralg_registration_algo_name, 't1');
    INSERT INTO GLM_RDEMO_SETTINGS_CL
    VALUES (dbms_data_mining.odms_formula,
             'AGE + EDUCATION + HOUSEHOLD_SIZE + OCCUPATION');
    INSERT INTO GLM_RDEMO_SETTINGS_CL
    VALUES ('RALG_PARAMETER_FAMILY', 'binomial(logit)');
END;
/
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name => 'GLM_RDEMO_CLASSIFICATION',
        mining_function => dbms_data_mining.classification,
        data_table_name => 'mining_data_build_v',
        case_id_column_name => 'CUST_ID',
        target_column_name => 'AFFINITY_CARD',
        settings_table_name => 'GLM_RDEMO_SETTINGS_CL');
END;
/
```
47.7.14 DROP_ALGORITHM Procedure

This function is used to drop the registered algorithm information.

Syntax

DBMS_DATA_MINING.DROP_ALGORITHM (algorithm_name  IN  VARCHAR2(30),
cascade         IN  BOOLEAN default FALSE)

Parameters

Table 47-64  DROP_ALGORITHM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm_name</td>
<td>Name of the algorithm.</td>
</tr>
<tr>
<td>cascade</td>
<td>If the cascade option is TRUE, all the models with this algorithms are forced to drop. There after, the algorithm is dropped. The default value is FALSE.</td>
</tr>
</tbody>
</table>

Usage Note

• To drop a mining model, you must be the owner or you must have the RQADMIN privilege. See Oracle Data Mining User's Guide for information about privileges for data mining.
• Make sure a model is not built on the algorithm, then drop the algorithm from the system table.
• If you try to drop an algorithm with a model built on it, then an error is displayed.

47.7.15 DROP_PARTITION Procedure

The DROP_PARTITION procedure drops a single partition that is specified in the parameter partition_name.

Syntax

DBMS_DATA_MINING.DROP_PARTITION (  
    model_name                IN VARCHAR2,
    partition_name            IN VARCHAR2);

Parameters

Table 47-65  DROP_PARTITION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition that must be dropped.</td>
</tr>
</tbody>
</table>
47.7.16 DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
                               force      IN BOOLEAN DEFAULT FALSE);

Parameters

Table 47-66   DROP_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>force</td>
<td>Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.</td>
</tr>
</tbody>
</table>

Usage Note

To drop a mining model, you must be the owner or you must have the DROP ANY MINING MODEL privilege. See Oracle Data Mining User's Guide for information about privileges for data mining.

Example

You can use the following command to delete a valid mining model named nb_sh_clas_sample that exists in your schema.

```
BEGIN
    DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
```

47.7.17 EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set.

To import the models from the dump file set, use the IMPORT_MODEL Procedure. EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, EXPORT_MODEL and IMPORT_MODEL are the only utilities that support the export/import of individual models.

See Also:

Oracle Database Utilities for information about Oracle Data Pump
Oracle Data Mining User's Guide for more information about exporting and importing mining models
Syntax

```sql
DBMS_DATA_MINING.EXPORT_MODEL (
    filename          IN VARCHAR2,
    directory         IN VARCHAR2,
    model_filter      IN VARCHAR2 DEFAULT NULL,
    filesize          IN VARCHAR2 DEFAULT NULL,
    operation         IN VARCHAR2 DEFAULT NULL,
    remote_link       IN VARCHAR2 DEFAULT NULL,
    jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 47-67  EXPORT.MODEL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the <code>filesize</code> parameter, or you can use the <code>operation</code> parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies. See Oracle Database SQL Language Reference for information about directory objects.</td>
</tr>
<tr>
<td>model_filter</td>
<td>Optional parameter that specifies which model or models to export. If you do not specify a value for <code>model_filter</code>, all models in the schema are exported. You can also specify <code>NULL</code> (the default) or 'ALL' to export all models. You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 47-68.</td>
</tr>
<tr>
<td>filesize</td>
<td>Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than <code>filesize</code>, one or more additional files are created within the dump set. See the description of the <code>filename</code> parameter for more information.</td>
</tr>
</tbody>
</table>
Table 47-67  (Cont.) EXPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **operation**   | Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the `filesize` parameter determines the size of the files. You can specify either of the following values for **operation**:  
  - `'EXPORT'` — Export all or the specified models. (Default)  
  - `'ESTIMATE'` — Estimate the size of the exporting models.                                                                                   |
| **remote_link** | Optional parameter that specifies the name of a database link to a remote system. The default value is `NULL`. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for **remote_link**, you can export the models in the remote database. The `EXP_FULL_DATABASE` role is required for exporting the remote models. The `EXP_FULL_DATABASE` privilege, the `CREATE DATABASE LINK` privilege, and other privileges may also be required. |
| **jobname**     | Optional parameter that specifies the name of the export job. By default, the name has the form `username_exp_nnnn`, where `nnnn` is a number. For example, a job name in the `SCOTT` schema might be `SCOTT_exp_134`.  
  If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters.  
  A log file for the export job, named `jobname.log`, is created in the same directory as the dump file set.                                                                                     |

Usage Notes

The **model_filter** parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the **USER_MINING_MODELS** view to list the models in your schema.

SQL> describe user_mining_models
Table: user_mining_models

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODEL_NAME</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>MINING_FUNCTION</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ALGORITHM</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>CREATION_DATE</td>
<td>NOT NULL</td>

</tr>
<tr>
<td>MODEL_SIZE</td>
<td>NOT NULL</td>
<td>NUMBER</td>
</tr>
<tr>
<td>COMMENTS</td>
<td>NOT NULL</td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

Examples of model filters are provided in Table 47-68.

Table 47-68  Sample Values for the Model Filter Parameter

<table>
<thead>
<tr>
<th>Sample Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'mymodel'</code></td>
<td>Export the model named <code>mymodel</code></td>
</tr>
<tr>
<td><code>'name= ''mymodel'''</code></td>
<td>Export the model named <code>mymodel</code></td>
</tr>
<tr>
<td><code>'name IN (''mymodel2'',''mymodel3'')'</code></td>
<td>Export the models named <code>mymodel2</code> and <code>mymodel3</code></td>
</tr>
<tr>
<td><code>'ALGORITHM_NAME = ''NAIVE_BAYES''</code></td>
<td>Export all Naive Bayes models. See Table 47-5 for a list of algorithm names.</td>
</tr>
</tbody>
</table>
Table 47-68  (Cont.) Sample Values for the Model Filter Parameter

<table>
<thead>
<tr>
<th>Sample Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'FUNCTION_NAME =''CLASSIFICATION'''</td>
<td>Export all classification models. See Table 47-3 for a list of mining functions.</td>
</tr>
</tbody>
</table>

Examples

1. The following statement exports all the models in the DMUSER3 schema to a dump file set called models_out in the directory $ORACLE_HOME/rdbms/log. This directory is mapped to a directory object called DATA_PUMP_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

   SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');

   You can exit SQL*Plus and list the resulting dump file and log file.

   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp

2. The following example uses the same directory object and is executed by the same user. This example exports the models called NMF_SH_SAMPLE and SVMR_SH_REGR_SAMPLE to a different dump file set in the same directory.

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ( 'models2_out', 'DATA_PUMP_DIR',
         'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');

   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp
   >DMUSER3_exp_924.log  models2_out01.dmp

3. The following examples show how to export models with specific algorithm and mining function names.

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('algo.dmp','DM_DUMP',
         'ALGORITHM_NAME IN (''O_CLUSTER'',''GENERALIZED_LINEAR_MODEL'',
         'SUPPORT_VECTOR_MACHINES'',''NAIVE_BAYES'');

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('func.dmp', 'DM_DUMP',
         'FUNCTION_NAME IN {CLASSIFICATION,CLUSTERING,FEATURE_EXTRACTION}');

47.7.18 EXPORT_SERMODEL Procedure

This procedure exports the model in a serialized format so that they can be moved to another platform for scoring.

When exporting a model in serialized format, the user must pass in an empty BLOB locator and specify the model name to be exported. If the model is partitioned, the user can optionally select an individual partition to export, otherwise all partitions are exported. The returned BLOB contains the content that can be deployed.

Syntax

DBMS_DATA_MINING.EXPORT_SERMODEL ( model_data IN OUT NOCOPY BLOB,
model_name IN VARCHAR2,
partition_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 47-69  EXPORT_SERMODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_data</td>
<td>Provides serialized model data.</td>
</tr>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do not</td>
</tr>
<tr>
<td></td>
<td>specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition that must be exported.</td>
</tr>
</tbody>
</table>

Examples

The following statement exports all the models in a serialized format.

DECLARE
  v_blob blob;
BEGIN
  dbms_lob.createtemporary(v_blob, FALSE);
  dbms_data_mining.export_sermodel(v_blob, 'MY_MODEL');
  -- save v_blob somewhere (e.g., bfile, etc.)
  dbms_lob.freetemporary(v_blob);
END;
/

See Also:

Oracle Data Mining User’s Guide for more information about exporting and importing mining models

47.7.19 FETCH_JSON_SCHEMA Procedure

User can fetch and read JSON schema from the ALL_MINING_ALGORITHMS view. This function returns the pre-registered JSON schema for R extensible algorithms.

Syntax

DBMS_DATA_MINING.FETCH_JSON_SCHEMA RETURN CLOB;

Parameters

Table 47-70  FETCH_JSON_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RETURN</td>
<td>This function returns the pre-registered JSON schema for R extensibility.</td>
</tr>
<tr>
<td></td>
<td>The default value is CLOB.</td>
</tr>
</tbody>
</table>
Usage Note

If a user wants to register a new algorithm using the algorithm registration function, they must fetch and follow the pre-registered JSON schema using this function, when they create the required JSON object metadata, and then pass it to the registration function.

47.7.20 GET_ASSOCIATION_RULES Function

The GET_ASSOCIATION_RULES function returns the rules produced by an Association model. Starting from Oracle Database 12c Release 2, this function is deprecated. See “Model Detail Views” in Oracle Data Mining User’s Guide.

You can specify filtering criteria to GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, then the greatest performance improvement will result from specifying the topn parameter.

Syntax

```sql
DBMS_DATA_MINING.get_association_rules(
    model_name       IN VARCHAR2,
    topn             IN NUMBER DEFAULT NULL,
    rule_id          IN INTEGER DEFAULT NULL,
    min_confidence   IN NUMBER DEFAULT NULL,
    min_support      IN NUMBER DEFAULT NULL,
    max_rule_length  IN INTEGER DEFAULT NULL,
    min_rule_length  IN INTEGER DEFAULT NULL,
    sort_order       IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
    antecedent_items IN DM_ITEMS DEFAULT NULL,
    consequent_items IN DM_ITEMS DEFAULT NULL,
    min_lift         IN NUMBER DEFAULT NULL,
    partition_name   IN VARCHAR2 DEFAULT NULL)
RETURN DM_Rules PIPELINED;
```

Parameters

Table 47-71  GET_ASSOCIATION_RULES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.</td>
</tr>
<tr>
<td>topn</td>
<td>Returns the n top rules ordered by confidence and then support, both descending. If you specify a sort order, then the top n rules are derived after the sort is performed.</td>
</tr>
<tr>
<td>rule_id</td>
<td>Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.</td>
</tr>
</tbody>
</table>
### Table 47-71  (Cont.) GET_ASSOCIATION_RULES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_confidence</td>
<td>Returns the rules with confidence greater than or equal to this number.</td>
</tr>
<tr>
<td>min_support</td>
<td>Returns the rules with support greater than or equal to this number.</td>
</tr>
<tr>
<td>max_rule_length</td>
<td>Returns the rules with a length less than or equal to this number.</td>
</tr>
<tr>
<td></td>
<td>Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 47-72). For example, in the rule A=&gt;B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.</td>
</tr>
<tr>
<td>min_rule_length</td>
<td>Returns the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.</td>
</tr>
<tr>
<td>sort_order</td>
<td>Sorts the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. (See Table 47-72 for the column names.) For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you must specify: ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by Confidence in descending order, then by Support in descending order.</td>
</tr>
<tr>
<td>antecedent_items</td>
<td>Returns the rules with these items in the antecedent.</td>
</tr>
<tr>
<td>consequent_items</td>
<td>Returns the rules with this item in the consequent.</td>
</tr>
<tr>
<td>min_lift</td>
<td>Returns the rules with lift greater than or equal to this number.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

### Return Values

The object type returned by GET_ASSOCIATION_RULES is described in Table 47-72. For descriptions of each field, see the Usage Notes.
### Table 47-72  GET_ASSOCIATION RULES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>

<td>consequent_support  OP NUMBER,</td>
</tr>
<tr>
<td></td>
<td>number_of_items     OP INTEGER )</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DM_PREDICATE</th>
<th>The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(attribute_name OP VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_subname OP VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>conditional_operator OP CHAR(2)/<em>=,&lt;&gt;,&lt;,&gt;,&lt;=,&gt;=</em>/,</td>
</tr>
<tr>
<td></td>
<td>attribute_num_value OP NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_str_value OP VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_support OP NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_confidence OP NUMBER)</td>
</tr>
</tbody>
</table>

### Usage Notes

1. This table function pipes out rows of type DM_RULES. For information on Data Mining data types and piped output from table functions, see "Datatypes".
2. The columns returned by GET_ASSOCIATION_RULES are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_RULES</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_id</td>
<td>Unique identifier of the rule</td>
</tr>
<tr>
<td>Column in DM_RULES</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>antecedent</td>
<td>The independent condition in the rule. When this condition exists, the dependent condition in the consequent also exists. The condition is a combination of attribute values called a predicate (DM_PREDICATE). The predicate specifies a condition for each attribute. The condition may specify equality (=), inequality (&lt;&gt;), greater than (&gt;), less than (&lt;), greater than or equal to (&gt;=), or less than or equal to (&lt;=) a given value. Support and confidence for each attribute condition in the antecedent is returned in the predicate. Support is the number of transactions that satisfy the antecedent. Confidence is the likelihood that a transaction will satisfy the antecedent. <strong>Note:</strong> The occurrence of the attribute as a DM_PREDICATE indicates the presence of the item in the transaction. The actual value for attribute_num_value or attribute_str_value is meaningless. For example, the following predicate indicates that 'Mouse Pad' is present in the transaction even though the attribute value is NULL. DM_PREDICATE('PROD_NAME', 'Mouse Pad', '=', NULL, NULL, NULL, NULL))</td>
</tr>
<tr>
<td>consequent</td>
<td>The dependent condition in the rule. This condition exists when the antecedent exists. The consequent, like the antecedent, is a predicate (DM_PREDICATE). Support and confidence for each attribute condition in the consequent is returned in the predicate. Support is the number of transactions that satisfy the consequent. Confidence is the likelihood that a transaction will satisfy the consequent.</td>
</tr>
<tr>
<td>rule_support</td>
<td>The number of transactions that satisfy the rule.</td>
</tr>
<tr>
<td>rule_confidence</td>
<td>The likelihood of a transaction satisfying the rule.</td>
</tr>
<tr>
<td>rule_lift</td>
<td>The degree of improvement in the prediction over random chance when the rule is satisfied.</td>
</tr>
<tr>
<td>antecedent_support</td>
<td>The ratio of the number of transactions that satisfy the antecedent to the total number of transactions.</td>
</tr>
<tr>
<td>consequent_support</td>
<td>The ratio of the number of transactions that satisfy the consequent to the total number of transactions.</td>
</tr>
<tr>
<td>number_of_items</td>
<td>The total number of attributes referenced in the antecedent and consequent of the rule.</td>
</tr>
</tbody>
</table>

**Examples**

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function:

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
```
UPDATE market_settings
    SET setting_value = TO_CHAR(0.081)
WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
    target_column_name => NULL,
    settings_table_name => 'market_settings');
END;
/

-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));

The following query uses the Association model AR_SH_SAMPLE, which is created from one of the Oracle Data Mining sample programs:

SELECT * FROM TABLE (
    DBMS_DATA_MINING.GET_ASSOCIATION_RULES ("AR_SH_SAMPLE", 10, NULL, 0.5, 0.01, 2, 1,
        ORA_MINING_VARCHAR2_NT ("NUMBER_OF_ITEMS DESC", "RULE_CONFIDENCE DESC", "RULE_SUPPORT DESC"),
        DM_ITEMS(DM_ITEM("CUSTPRODS", "Mouse Pad", 1, NULL),
            DM_ITEM("CUSTPRODS", "Standard Mouse", 1, NULL),
        DM_ITEMS(DM_ITEM("CUSTPRODS", "Extension Cable", 1, NULL)));

The query returns three rules, shown as follows:

13  DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Mouse Pad", '=' , 1, NULL, NULL, NULL),
    DM_PREDICATE("CUSTPRODS", "Standard Mouse", '=' , 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Extension Cable", '=' , 1, NULL, NULL, NULL))
    .15532   .84393   2.7075     .18404     .3117   2

11  DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Standard Mouse", '=' , 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Extension Cable", '=' , 1, NULL, NULL, NULL))
    .18085   .56291   1.8059     .32128     .3117   1

9   DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Mouse Pad", '=' , 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE("CUSTPRODS", "Extension Cable", '=' , 1, NULL, NULL, NULL))
    .17766   .55116   1.7682     .32234     .3117   1
47.7.21 GET_FREQUENT_ITEMSETS Function

The GET_FREQUENT_ITEMSETS function returns a set of rows that represent the frequent itemsets from an Association model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User’s Guide.

For a detailed description of frequent itemsets, consult Oracle Data Mining Concepts.

Syntax

```sql
DBMS_DATA_MINING.get_frequent_itemsets(
    model_name IN VARCHAR2,
    topn IN NUMBER DEFAULT NULL,
    max_itemset_length IN NUMBER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_ItemSets PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>topn</td>
<td>When not NULL, return the top n rows ordered by support in descending order</td>
</tr>
<tr>
<td>max_itemset_length</td>
<td>Maximum length of an item set.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Note:
The `partition_name` column applies only when the model is partitioned.
Return Values

Table 47-74  GET_FREQUENT_ITEMSETS Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ITEMSETS</td>
<td>A set of rows of type DM_ITEMSET. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(partition_name VARCHAR2(128), itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER)</td>
</tr>
</tbody>
</table>

Note:
The partition_name columns applies only when the model is partitioned.

The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM:

<table>
<thead>
<tr>
<th>attribute_name</th>
<th>VARCHAR2(4000),</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_subname</td>
<td>VARCHAR2(4000),</td>
</tr>
<tr>
<td>attribute_num_value</td>
<td>NUMBER,</td>
</tr>
<tr>
<td>attribute_str_value</td>
<td>VARCHAR2(4000))</td>
</tr>
</tbody>
</table>

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS

   SELECT *
       FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
   WHERE setting_name LIKE 'ASSO_%';
BEGIN
   -- update the value of the minimum confidence
   UPDATE market_settings
       SET setting_value = TO_CHAR(0.081)
   WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function   => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
```
target_column_name  => NULL,
settings_table_name  => 'market_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));

Oracle Data Mining User's Guide

47.7.22 GET_MODEL_COST_MATRIX Function

The GET_* interfaces are replaced by model views, and Oracle recommends that users leverage the views instead. The GET_MODEL_COST_MATRIX function is replaced by the DMSVC prefixed view, Scoring Cost Matrix. The cost matrix used when building a Decision Tree is made available by the DM$VM prefixed view, Decision Tree Build Cost Matrix.

Refer to Model Detail View for Classification Algorithm.

The GET_MODEL_COST_MATRIX function returns the rows of a cost matrix associated with the specified model.

By default, this function returns the scoring cost matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 47-75.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
  model_name                IN VARCHAR2,
  matrix_type               IN VARCHAR2 DEFAULT cost_matrix_type_score
) RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 47-75  GET_MODEL_COST_MATRIX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].[model_name]. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>
Table 47-75  (Cont.) GET_MODEL_COST_MATRIX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matrix_type</td>
<td>The type of cost matrix.</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_SCORE — cost matrix used for scoring. (Default.)</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

Table 47-76  GET_MODEL_COST_MATRIX Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_COST_MATRIX</td>
<td>A set of rows of type DM_COST_ELEMENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>actual VARCHAR2(4000), NUMBER, predicted VARCHAR2(4000), cost NUMBER</td>
</tr>
</tbody>
</table>

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 47-7.

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

The GET_MODEL_COST_MATRIX may return either the build or scoring cost matrix defined for a model or model partition.

If you do not specify a partitioned model name, then an error is displayed.

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```sql
SELECT *
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
ORDER BY predicted, actual;
```

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>.00</td>
</tr>
<tr>

<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>.00</td>
</tr>
</tbody>
</table>
47.7.23 GET_MODELDETAILS_AI Function

The GET_MODELDETAILS_AI function returns a set of rows that provide the details of an Attribute Importance model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User’s Guide.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_ai(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL
) RETURN dm_ranked_attributes pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_RANKED_ATTRIBUTES</td>
<td>A set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), importance_value NUMBER, rank NUMBER(38))</td>
</tr>
</tbody>
</table>

Examples

The following example returns model details for the Attribute Importance model AI_SH_sample, which was created by the sample program dmaidemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

```sql
SELECT attribute_name, importance_value, rank
FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_AI('AI_SH_sample'))
ORDER BY RANK;
```

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>IMPORTANCE_VALUE</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOUSEHOLD_SIZE</td>
<td>.151685183</td>
<td>1</td>
</tr>
<tr>
<td>CUST_MARITAL_STATUS</td>
<td>.145294546</td>
<td>2</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td>.07838928</td>

<tr>
<td>HOME_THEATER_PACKAGE</td>
<td>.056458722</td>
<td>7</td>
</tr>
</tbody>
</table>
47.7.24 GET_MODEL_DETAILS_EM Function

The GET_MODEL_DETAILS_EM function returns a set of rows that provide statistics about the clusters produced by an Expectation Maximization model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User's Guide.

By default, the EM algorithm groups components into high-level clusters, and GET_MODEL_DETAILS_EM returns only the high-level clusters with their hierarchies. Alternatively, you can configure EM model to disable the grouping of components into high-level clusters. In this case, GET_MODEL_DETAILS_EM returns the components themselves as clusters with their hierarchies. See Table 47-12.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_em(
    model_name VARCHAR2,
    cluster_id NUMBER DEFAULT NULL,
    attribute VARCHAR2 DEFAULT NULL,
    centroid NUMBER DEFAULT 1,
    histogram NUMBER DEFAULT 1,
    rules NUMBER DEFAULT 2,
    attribute_subname VARCHAR2 DEFAULT NULL,
    topn_attributes NUMBER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN dm_clusters PIPELINED;
```

Parameters

Table 47-79  GET_MODEL_DETAILS_EM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise, the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned.</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>- 1: Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>- 0: Details about centroids are not returned</td>
</tr>
</tbody>
</table>
### Table 47-79  (Cont.) GET_MODEL_DETAILS_EM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>· 1: Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>· 0: Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>· 2: Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>· 1: Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>· 0: No information about rules is returned</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of a nested attribute. The full name of a nested attribute has the form:</td>
</tr>
<tr>
<td></td>
<td>attribute_name.attribute_subname</td>
</tr>
<tr>
<td></td>
<td>where attribute_name is the name of the column and attribute_subname is the name of the nested attribute in that column. If the attribute is not nested, then attribute_subname is null.</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the ( n ) attributes with the highest confidence values in the rules are returned.</td>
</tr>
<tr>
<td></td>
<td>If the number of attributes included in the rules is less than ( topn ), then, up to ( n ) additional attributes in alphabetical order are returned.</td>
</tr>
<tr>
<td></td>
<td>If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

#### Usage Notes

1. For information on Data Mining datatypes and Return Values for Clustering Algorithms piped output from table functions, see “Datatypes”.

2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCS_CLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.

4. When the partition_name is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

### 47.7.25 GET_MODELDETAILS_EM_COMP Function

The GET_MODELDETAILS_EM_COMP table function returns a set of rows that provide details about the parameters of an Expectation Maximization model. Starting from Oracle Database 12c...
Release 2, this function is deprecated. See "Model Detail Views" in *Oracle Data Mining User’s Guide*.

**Syntax**

```sql
DBMS_DATA_MINING.get_model_details_em_comp(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_EM_COMPONENT_SET PIPELINED;
```

**Parameters**

**Table 47-80 GET_MODEL_DETAILS_EM_COMP Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model to retrieve details for.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 47-81 GET_MODEL_DETAILS_EM_COMP Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_EM_COMPONENT_SET</td>
<td>A set of rows of type DM_EM_COMPONENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(info_type VARCHAR2(30), component_id NUMBER, cluster_id NUMBER, attribute_name VARCHAR2(4000), covariate_name VARCHAR2(4000), attribute_value VARCHAR2(4000), value NUMBER )</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. This table function pipes out rows of type DM_EM_COMPONENT. For information on Data Mining datatypes and piped output from table functions, see "Datatypes". The columns in each row returned by GET_MODEL_DETAILS_EM_COMP are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_EM_COMPONENT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_type</td>
<td>The type of information in the row. The following information types are supported:</td>
</tr>
<tr>
<td></td>
<td>• cluster</td>
</tr>
<tr>
<td></td>
<td>• prior</td>
</tr>
<tr>
<td></td>
<td>• mean</td>
</tr>
<tr>
<td></td>
<td>• covariance</td>
</tr>
<tr>
<td></td>
<td>• frequency</td>
</tr>
<tr>
<td>Column in DM_EM_COMPONENT</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>component_id</td>
<td>Unique identifier of a component</td>
</tr>
<tr>
<td>cluster_id</td>
<td>Unique identifier of the high-level leaf cluster for each component</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of an original attribute or a derived feature ID. The derived feature ID is used in models built on data with nested columns. The derived feature definitions can be obtained from the GET_MODEL_DETAILS_EM_PROJ Function.</td>
</tr>
<tr>
<td>covariate_name</td>
<td>Name of an original attribute or a derived feature ID used in variance/covariance definition</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Categorical value or bin interval for binned numerical attributes</td>
</tr>
<tr>
<td>value</td>
<td>Encodes different information depending on the value of info_type, as follows:</td>
</tr>
<tr>
<td></td>
<td>• cluster — The value field is NULL</td>
</tr>
<tr>
<td></td>
<td>• prior — The value field returns the component prior</td>
</tr>
<tr>
<td></td>
<td>• mean — The value field returns the mean of the attribute specified in attribute_name</td>
</tr>
<tr>
<td></td>
<td>• covariance — The value field returns the covariance of the attributes specified in attribute_name and covariate_name. Using the same attribute in attribute_name and covariate_name, returns the variance.</td>
</tr>
<tr>
<td></td>
<td>• frequency — The value field returns the multivalued Bernoulli frequency parameter for the attribute/value combination specified by attribute_name and attribute_value</td>
</tr>
<tr>
<td></td>
<td>See Usage Note 2 for details.</td>
</tr>
</tbody>
</table>

2. The following table shows which fields are used for each info_type. The blank cells represent NULLs.

<table>
<thead>
<tr>
<th>info_type</th>
<th>component_id</th>
<th>cluster_id</th>
<th>attribute_name</th>
<th>covariate_name</th>
<th>attribute_value</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>prior</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>mean</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>covariance</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>frequency</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

4. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.
47.7.26 GET_MODELDETAILS_EM_PROJ Function

The GET_MODELDETAILS_EM_PROJ function returns a set of rows that provide statistics about the projections produced by an Expectation Maximization model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User's Guide.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_em_proj(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_EM_PROJECTION_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_EM_PROJECTION_SET</td>
<td>A set of rows of type DM_EM_PROJECTION. The rows have the following columns: (feature_name VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_EM_PROJECTION. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

The columns in each row returned by GET_MODELDETAILS_EM_PROJ are described as follows:
<table>
<thead>
<tr>
<th>Column in DM_EM_PROJECTION</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature_name</td>
<td>Name of a derived feature. The feature maps to the attribute_name returned by the GET_MODELDETAILS_EM Function.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of a column in the build data</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Subname in a nested column</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Categorical value</td>
</tr>
<tr>
<td>coefficient</td>
<td>Projection coefficient. The representation is sparse; only the non-zero coefficients are returned.</td>
</tr>
</tbody>
</table>

2. **GET_MODEL_DETAILS** functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information.

3. When the value is `NULL` for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

### 47.7.27 GET_MODEL_DETAILS_GLM Function

The **GET_MODEL_DETAILS_GLM** function returns the coefficient statistics for a Generalized Linear Model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in *Oracle Data Mining User’s Guide*.

The same set of statistics is returned for both linear and Logistic Regression, but statistics that do not apply to the mining function are returned as `NULL`. For more details, see the Usage Notes.

**Syntax**

```sql
DBMS_DATA_MINING.get_model_details_glm(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_GLM_Coeff_Set PIPELINED;
```

**Parameters**

**Table 47-84  GET_MODEL_DETAILS_GLM Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>

|                       | exp_upper_coeff_limit   BINARY_DOUBLE)                                   |

GET_MODELDETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF datatype. The statistics are described in Table 47-86.

Table 47-86  DM_GLM_COEFF Datatype Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td>The non-reference target class for Logistic Regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 47-18. For Linear Regression, class is null.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of an attribute in a nested table. The full name of a nested attribute has the form: attribute_name.attribute_subname where attribute_name is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, then attribute_subname is null. If the attribute is an intercept, then both the attribute_name and the attribute_subname are null.</td>
</tr>
</tbody>
</table>
Table 47-86  (Cont.) DM_GLM_COEFF Datatype Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_value</td>
<td>The value of the attribute (categorical attribute only). For numeric attributes, attribute_value is null.</td>
</tr>
<tr>
<td>feature_expression</td>
<td>The feature name constructed by the algorithm when feature generation is enabled and higher-order features are found. If feature selection is not enabled, then the feature name is simply the fully-qualified attribute name (attribute_name.attribute_subname if the attribute is in a nested column). For categorical attributes, the algorithm constructs a feature name that has the following form: fully-qualified_attribute_name.attribute_value. For numeric attributes, the algorithm constructs a name for the higher-order feature by taking the product of the resulting values: (attrib1)<em>(attrib2)</em>..... where attrib1 and attrib2 are fully-qualified attribute names.</td>
</tr>
<tr>

</tr>
<tr>
<td>exp_upper_coeff_limit</td>
<td>Exponentiated coefficient for upper confidence bound of the coefficient for Logistic Regression. For Linear Regression, exp_upper_coeff_limit is null.</td>
</tr>
</tbody>
</table>

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, exp_coefficient does not apply to Linear Regression.
- They cannot be computed from a theoretical standpoint. For information on ridge regression, see Table 47-18.
• They cannot be computed because of limitations in system resources.
• Their values would be infinity.
• When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns some of the model details for the GLM Regression model GLMR_SH_Regr_sample, which was created by the sample program dmglrdem.sql. For information about the sample programs, see Oracle Data Mining User's Guide.

```sql
SET line 120
SET pages 99
column attribute_name format a30
column attribute_subname format a20
column attribute_value format a20
col coefficient format 990.9999
col std_error format 990.9999
SQL> SELECT * FROM
  (SELECT attribute_name, attribute_value, coefficient, std_error
   FROM DM$VDGLMR_SH_REGR_SAMPLE order by 1,2)
WHERE rownum < 11;

47.7.28 GET_MODEL_DETAILS_GLOBAL Function

The GET_MODEL_DETAILS_GLOBAL function returns statistics about the model as a whole. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User's Guide.

Global details are available for Generalized Linear Models, Association Rules, Singular Value Decomposition, and Expectation Maximization. There are new Global model views which show global information for all algorithms. Oracle recommends that users leverage the views instead. Refer to Model Details View Global.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_global(
  model_name IN VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_model_global_details PIPELINED;
```
Parameters

Table 47-87  GET_MODEL_DETAILS_GLOBAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

```
47.7.29 GET_MODEL_DETAILS_KM Function

The GET_MODEL_DETAILS_KM function returns a set of rows that provide the details of a \(k\)-Means clustering model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User's Guide.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_km(
    model_name VARCHAR2,
    cluster_id NUMBER DEFAULT NULL,
    attribute VARCHAR2 DEFAULT NULL,
    centroid NUMBER DEFAULT 1,
    histogram NUMBER DEFAULT 1,
    rules NUMBER DEFAULT 2,
    attribute_subname VARCHAR2 DEFAULT NULL,
    topn_attributes NUMBER DEFAULT NULL,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN dm_clusters PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned.</td>
</tr>
</tbody>
</table>
| centroid        | This parameter accepts the following values:
|                 | • 1: Details about centroids are returned (default) |
|                 | • 0: Details about centroids are not returned |
| histogram       | This parameter accepts the following values:
|                 | • 1: Details about histograms are returned (default) |
|                 | • 0: Details about histograms are not returned |
| rules           | This parameter accepts the following values:
|                 | • 2: Details about rules are returned (default) |
|                 | • 1: Rule summaries are returned |
|                 | • 0: No information about rules is returned |
Table 47-89  (Cont.) GET_MODELDETAILS_KM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_subname</td>
<td>The name of a nested attribute. The full name of a nested attribute has the form: ( \text{attribute_name}.	ext{attribute_subname} ) where ( \text{attribute_name} ) is the name of the column and ( \text{attribute_subname} ) is the name of the nested attribute in that column. If the attribute is not nested, attribute_subname is null.</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the ( n ) attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than ( n ), then up to ( n ) additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and Return Value for Clustering Algorithms piped output from table functions, see "Datatypes".
2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the \( k \)-Means clustering model KM_SH_Clus_sample, which was created by the sample program dmkmdemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

```sql
SELECT T.id clu_id, T.record_count rec_cnt, T.parent parent, T.tree_level tree_level, T.dispersion dispersion
FROM (SELECT *
      FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_KM( 'KM_SH_Clus_sample'))
      ORDER BY id) T
WHERE ROWNUM < 6;
```

<table>
<thead>
<tr>
<th>CLU_ID</th>

<td>486</td>
<td>3</td>
<td>3</td>
<td>5.42901522</td>
</tr>
</tbody>
</table>
### 47.7.30 GET_MODELDETAILS_NB Function

The `GET_MODELDETAILS_NB` function returns a set of rows that provide the details of a Naive Bayes model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in *Oracle Data Mining User's Guide*.

#### Syntax

```sql
DBMS_DATA_MINING.get_model_details_nb(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_NB_Details PIPELINED;
```

#### Parameters

**Table 47-90**  
**GET_MODELDETAILS_NB Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name].model_name</code>. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

#### Return Values

**Table 47-91**  
**GET_MODELDETAILS_NB Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_NB_DETAILS| A set of rows of type DM_NB_DETAIL. The rows have the following columns:  
  (target_attribute_name VARCHAR2(30),
   target_attribute_str_value VARCHAR2(4000),
   target_attribute_num_value NUMBER,
   prior_probability NUMBER,
   conditionals DM_CONDITIONALS)  
  The `conditionals` column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:  
  (attribute_name VARCHAR2(4000),
   attribute_subname VARCHAR2(4000),
   attribute_str_value VARCHAR2(4000),
   attribute_num_value NUMBER,
   conditional_probability NUMBER) |

#### Usage Notes

- The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".
• When the value is `NULL` for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

**Examples**

The following query is from the sample program `dmnbdemo.sql`. It returns model details about the model `NB_SH_Clas_sample`. For information about the sample programs, see Oracle Data Mining User's Guide.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are `{lower_boundary, upper_boundary}`; for categorical bins, the label matches the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

```sql
WITH
  bin_label_view AS ( 
    SELECT col, bin, (DECODE(bin,'1','[','(' || lv || ',' || val || ')]') label 
    FROM (SELECT col, 
            bin, 
            LAST_VALUE(val) OVER ( 
               PARTITION BY col ORDER BY val 
               ROWS BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv, 
            val 
    FROM nb_sh_sample_num) 
    UNION ALL 
    SELECT col, bin, val label 
    FROM nb_sh_sample_cat 
  ),
  model_details AS ( 
    SELECT T.target_attribute_name tname, 
           NVL(TO_CHAR(T.target_attribute_num_value,T.target_attribute_str_value)) tval, 
           C.attribute_name pname, 
           NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval, 
           T.prior_probability priorp, 
           C.conditional_probability condp 
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('NB_SH_Clas_sample')) T, 
         TABLE(T.conditionals) C, 
         bin_label_view L 
    WHERE C.attribute_name = L.col (+) AND 
          (NVL(C.attribute_str_value,C.attribute_num_value) = L.bin(+)) 
    ORDER BY 1,2,3,4,5,6 
  )
  SELECT tname, tval, pname, pval, priorp, condp 
  FROM model_details 
  WHERE ROWNUM < 11;
```

47.7.31 GET_MODEL_DETAILS_NMF Function

The GET_MODEL_DETAILS_NMF function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User’s Guide.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_nmf(
    model_name IN VARCHAR2,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN DM_NMF_Feature_Set PIPELINED;
```

Parameters

Table 47-92  GET_MODEL_DETAILS_NMF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

Table 47-93  GET_MODEL_DETAILS_NMF Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_NMF_FEATURE_SET    | A set of rows of DM_NMF_FEATURE. The rows have the following columns:  
                        | (feature_id NUMBER,  
                        | mapped_feature_id VARCHAR2(4000),  
                        | attribute_set DM_NMF_ATTRIBUTE_SET)  
                        | The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:  
                        | (attribute_name VARCHAR2(4000),  
                        | attribute_subname VARCHAR2(4000),  
                        | attribute_value VARCHAR2(4000),  
                        | coefficient NUMBER)                                                                                                                                 |

Usage Notes

• The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining datatypes and piped output from table functions, see “Datatypes”.

• When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.
Examples

The following example returns model details for the feature extraction model NMF_SH_Sample, which was created by the sample program dmnmdemo.sql. For information about the sample programs, see Oracle Data Mining User's Guide.

```sql
SELECT * FROM (
    SELECT F.feature_id,
           A.attribute_name,
           A.attribute_value,
           A.coefficient
     FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
         TABLE(F.attribute_set) A
    ORDER BY feature_id,attribute_name,attribute_value
) WHERE ROWNUM < 11;
```

47.7.32 GET_MODELDETAILS_OC Function

The GET_MODELDETAILS_OC function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the Clustering patterns generated during the creation of the model. Starting from Oracle Database 12c Release 2, this function is deprecated. See “Model Detail Views” in Oracle Data Mining User’s Guide.

You can provide input to GET_MODELDETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then GET_MODELDETAILS_OC returns all the information about the model.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_oc(
    model_name VARCHAR2,
    cluster_id NUMBER DEFAULT NULL,
    attribute VARCHAR2 DEFAULT NULL,
    centroid NUMBER DEFAULT 1,
    histogram NUMBER DEFAULT 1,
    rules NUMBER DEFAULT 2,
    topn_attributes NUMBER DEFAULT NULL,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN dm_clusters PIPELINED;
```
Parameters

Table 47-94  GET_MODEL_DETAILS_OC Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned.</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>1: Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>0: Details about centroids are not returned</td>
</tr>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>1: Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>0: Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>2: Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>1: Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>0: No information about rules is returned</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the ( n ) attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than ( topn ), then up to ( n ) additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Usage Notes

1. For information about Data Mining datatypes and Return Values for Clustering Algorithms piped output from table functions, see "Datatypes".

2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the clustering model OC_SH_Clus_sample, which was created by the sample program dmocdemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.
SELECT clu_id, attribute_name, op, s_value
FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
         sp.attribute_str_value s_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC('OC_SH_Clus_sample')) a,
         TABLE(a.split_predicate) sp
ORDER BY a.id, op, s_value)
WHERE ROWNUM < 11;

47.7.33 GET_MODEL_SETTINGS Function

The GET_MODEL_SETTINGS function returns the settings used to build the given model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Static Data Dictionary Views: ALL_ALL_TABLES to ALL_OUTLINES" in Oracle Database Reference.

Syntax

FUNCTION get_model_settings(model_name IN VARCHAR2)
    RETURN DM_Model_Settings PIPELINED;

Parameters

Table 47-95  GET_MODEL_SETTINGS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>
Return Values

Table 47-96  GET_MODEL_SETTINGS Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SETTINGS</td>
<td>A set of rows of type DM_MODEL_SETTINGS. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>DM_MODEL_SETTINGS TABLE OF SYS.DM_MODEL_SETTING</td>
</tr>
<tr>
<td></td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>SETTING_NAME</td>
</tr>
<tr>
<td></td>
<td>SETTING_VALUE</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_MODEL_SETTINGS. For information on Data Mining datatypes and piped output from table functions, see "DBMS_DATA_MINING Datatypes".

2. The setting names/values include both those specified by the user and any defaults assigned by the build process.

Examples

The following example returns model model settings for an example Naive Bayes model.

<table>
<thead>
<tr>
<th>SETTING_NAME</th>
<th>SETTING_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALGO_NAME</td>
<td>ALGO_NAIVE_BAYES</td>
</tr>
<tr>
<td>PREP_AUTO</td>

47.7.34 GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function returns the list of columns from the build input table that were used by the build process to train the model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Static Data Dictionary Views: ALL_ALL_TABLES to ALL_OUTLINES" in Oracle Database Reference.
Syntax

FUNCTION get_model_signature (model_name IN VARCHAR2)
RETURN DM_Model_Signature PIPELINED;

Parameters

Table 47-97  GET_MODEL_SIGNATURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

Table 47-98  GET_MODEL_SIGNATURE Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SIGNATURE</td>
<td>A set of rows of type DM_MODEL_SIGNATURE. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>DM_MODEL_SIGNATURE TABLE OF SYSDM_MODEL_SIGNATURE_ATTRIBUTE</td>
</tr>
<tr>
<td></td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>ATTRIBUTE_NAME</td>
</tr>
<tr>
<td></td>
<td>ATTRIBUTE_TYPE</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining datatypes and piped output from table functions, see "DBMS_DATA_MINING Datatypes".

2. The signature names or types include only those attributes used by the build process.

Examples

The following example returns model settings for an example Naive Bayes model.

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>ATTRIBUTE_TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGE</td>
<td>NUMBER</td>
</tr>
<tr>
<td>ANNUAL_INCOME</td>

</tr>
<tr>
<td>MARITAL_STATUS</td>
<td>VARCHAR2</td>
</tr>
</tbody>
</table>
47.7.35 GET_MODELDETAILS_SVD Function

The GET_MODELDETAILS_SVD function returns a set of rows that provide the details of a Singular Value Decomposition model. Oracle recommends to use model details view settings. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User's Guide.

Refer to Model Details View for Singular Value Decomposition.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_svd(
  model_name IN VARCHAR2,
  matrix_type IN VARCHAR2 DEFAULT NULL,
  partition_name VARCHAR2 DEFAULT NULL
) RETURN DM_SVD_MATRIX_Set PIPELINED;
```

Parameters

**Table 47-99  GET_MODELDETAILS_SVD Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>Specifies which of the three SVD matrix types to return. Values are: U, S, V, and NULL. When matrix_type is null (default), all matrices are returned. The U matrix is only computed when the SVDS_U_MATRIX_OUTPUT setting is enabled. It is not computed by default. If the model does not contain U matrices and you set matrix_type to U, an empty set of rows is returned. See Table 47-26.</td>
</tr>
<tr>
<td>partition_name</td>
<td>A partition in a partitioned model.</td>
</tr>
</tbody>
</table>
Return Values

Table 47-100  GET_MODELDETAILS_SVD Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVD_MATRIX_SET</td>
<td>A set of rows of type DM_SVD_MATRIX. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(matrix_type CHAR(1),</td>
</tr>
<tr>
<td></td>
<td>feature_id NUMBER,</td>
</tr>
<tr>
<td></td>
<td>mapped_feature_id VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_subname VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>case_id VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>value NUMBER,</td>
</tr>
<tr>
<td></td>
<td>variance NUMBER,</td>
</tr>
<tr>
<td></td>
<td>pct_cum_variance NUMBER)</td>
</tr>
</tbody>
</table>

See Usage Notes for details.

Usage Notes

1. This table function pipes out rows of type DM_SVD_MATRIX. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

The columns in each row returned by GET_MODELDETAILS_SVD are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_SVD_MATRIX_SET</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matrix_type</td>
<td>The type of matrix. Possible values are S, V, and U. This field is never null.</td>
</tr>
<tr>
<td>feature_id</td>
<td>The feature that the matrix entry refers to.</td>
</tr>
<tr>
<td>mapped_feature_id</td>
<td>A descriptive name for the feature.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Column name in the V matrix component bases. This field is null for the S and U matrices.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Subname in the V matrix component bases. This is relevant only in the case of a nested column. This field is null for the S and U matrices.</td>
</tr>
<tr>
<td>case_id</td>
<td>Unique identifier of the row in the build data described by the U matrix projection. This field is null for the S and V matrices.</td>
</tr>
<tr>
<td>value</td>
<td>The matrix entry value.</td>
</tr>
<tr>
<td>variance</td>
<td>The variance explained by a component. It is non-null only for S matrix entries. This column is non-null only for S matrix entries and for SVD models with setting dbms_data_mining.svds_scoring_mode set to dbms_data_mining.svds_scoring_pca and the build data is centered, either manually or because the setting dbms_data_mining.prep_auto is set to dbms_data_mining.prep_auto_on.</td>
</tr>
</tbody>
</table>

See Usage Notes for details.
The percent cumulative variance explained by the components thus far. The components are ranked by the explained variance in descending order. This column is non-null only for $S$ matrix entries and for SVD models with setting

```
dbms_data_mining.svds_scoring_mode set to dbms_data_mining.svds_scoring_pca and the build data is centered, either manually or because the setting dbms_data_mining.prep_auto is set to dbms_data_mining.prep_auto_on.
```

2. The output of `GET_MODELDETAILS` is in sparse format. Zero values are not returned. Only the diagonal elements of the $S$ matrix, the non-zero coefficients in the $V$ matrix bases, and the non-zero $U$ matrix projections are returned.

   There is one exception: If the data row does not produce non-zero $U$ Matrix projections, the case ID for that row is returned with NULL for the `feature_id` and `value`. This is done to avoid losing any records from the original data.

3. `GET_MODELDETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

4. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the preferred partition name.

### 47.7.36 GET_MODELDETAILS_SVM Function

The `GET_MODELDETAILS_SVM` function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Model Detail Views" in Oracle Data Mining User’s Guide.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by `GET_MODELDETAILS_SVM`, then the coefficient of this attribute should be interpreted as zero.

#### Syntax

```
DBMS_DATA_MINING.get_model_details_svm(
    model_name VARCHAR2,
    reverse_coef NUMBER DEFAULT 0,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN DM_SVM_Linear_Coeff_Set PIPELINED;
```
Parameters

Table 47-101 GET_MODELDETAILS_SVM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.model_name]. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>reverse_coef</td>
<td>Whether or not GET_MODELDETAILS_SVM should transform the attribute coefficients using the original attribute transformations. When reverse_coef is set to 0 (default), GET_MODELDETAILS_SVM returns the coefficients directly from the model without applying transformations. When reverse_coef is set to 1, GET_MODELDETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation. See Usage Note 4.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

Table 47-102 GET_MODELDETAILS_SVM Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVM_LINEAR_COEFF_SET</td>
<td>A set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(class VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_set DM_SVM_ATTRIBUTE_SET)</td>
</tr>
<tr>
<td></td>
<td>The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_subname VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".
2. The class column of DM_SVM_LINEAR_COEFF contains Classification target values. For SVM Regression models, class is null. For each Classification target value, a set of coefficients is returned. For Binary Classification, one-class Classification, and Regression models, only a single set of coefficients is returned.
3. The attribute_value column in DM_SVM_ATTRIBUTE_SET is used for categorical attributes.
4. GET_MODELDETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the
model details are the original attributes (or a close approximation of the original attributes) used to build the model.

The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want `GET_MODEL_DETAILS_SVM` to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

5. When the value is `NULL` for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the SVM Classification model `SVMC_SH_Clas_sample`, which was created by the sample program `dmsvcdem.sql`. For information about the sample programs, see Oracle Data Mining User’s Guide.

WITH
mod_dtls AS (
  SELECT * FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVMC_SH_Clas_sample'))
),
model_details AS (
  SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient
  FROM mod_dtls D,
  TABLE(D.attribute_set) A
  ORDER BY D.class, ABS(A.coefficient) DESC
)
SELECT class, attribute_name aname, attribute_value aval, coefficient coeff
FROM model_details
WHERE ROWNUM < 11;

47.7.37 GET_MODEL_DETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_xml(
  model_name IN VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL)
RETURN XMLType;
```
Parameters

Table 47-103 GET_MODEL_DETAILS_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

Table 47-104 GET_MODEL_DETAILS_XML Function Return Value

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLTYPE</td>
<td>The XML definition for the Decision Tree model. See &quot;XMLTYPE&quot; for details.</td>
</tr>
<tr>
<td></td>
<td>The XML definition conforms to the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at <a href="http://www.dmg.org">http://www.dmg.org</a>.</td>
</tr>
<tr>
<td></td>
<td>If a nested attribute is used as a splitter, the attribute will appear in the XML document as field=&quot;&lt;column_name&gt;.&lt;subname&gt;&quot;, as opposed to the non-nested attributes which appear in the document as field=&quot;&lt;column_name&gt;&quot;.</td>
</tr>
</tbody>
</table>

Note:
The column names are surrounded by single quotes and a period separates the column_name from the subname.

The rest of the document style remains unchanged.

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '\#'.

Examples

The following statements in SQL*Plus return the details of the Decision Tree model dt_sh_clas_sample. This model is created by the program dmdtdemo.sql, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

column dt_details format a320

47.7.38 GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model. Starting from Oracle Database 12c Release 2, this function is deprecated. See "Static Data Dictionary Views: ALL_ALL_TABLES to ALL_OUTLINES" in Oracle Database Reference.

All GET_* interfaces are replaced by model views, and Oracle recommends that users reference the model views to retrieve the relevant information. The GET_MODEL_TRANSFORMATIONS function is replaced by the following:

- USER(/DBA/ALL)_MINING_MODEL_XFORMS: provides the user-embedded transformations
- DM$VX prefixed model view: provides text feature extraction information
- D$VN prefixed model view: provides normalization and missing value information
- DM$VB: provides binning information

See Also:

Data Preparation for Text Features

Syntax

DBMS_DATA_MINING.get_model_transformations(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_Transforms PIPELINED;

Parameters

Table 47-105  GET_MODEL_TRANSFORMATIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Indicates the name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>
Return Values

Table 47-106  GET_MODEL_TRANSFORMATIONS Function Return Value

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_TRANSFORMS</td>
<td>The transformation expressions embedded in model_name. The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields: attribute_name VARCHAR2(4000) attribute_subname VARCHAR2(4000) expression CLOB reverse_expression CLOB</td>
</tr>
</tbody>
</table>

Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

When invoked for a partitioned model, the partition_name parameter must be specified.

Examples

In this example, several columns in the SH.CUSTOMERS table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

CREATE OR REPLACE VIEW mining_data AS

47.7.39 GET_TRANSFORM_LIST Procedure

This procedure converts transformation expressions specified as DM_TRANSFORMS to a transformation list (TRANSFORM_LIST) that can be used in creating a model. DM_TRANSFORMS is returned by the GET_MODEL_TRANSFORMATIONS function.

You can also use routines in the DBMS_DATA_MINING_TRANSFORM package to construct a transformation list.

See Also:

- "About Transformation Lists" in DBMS_DATA_MINING_TRANSFORM
- "GET_MODEL_TRANSFORMATIONS Function"
- "CREATE_MODEL Procedure"

Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST ( 
    xform_list OUT NOCOPY TRANSFORM_LIST,
    model_xforms IN DM_TRANSFORMS);
```

```
Parameters

Table 47-107  GET_TRANSFORM_LIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Examples

In this example, a model mod1 is trained using several columns in the SH.CUSTOMERS table. The model uses ADP, which automatically bins one of the columns.

A second model mod2 is trained on the same data without ADP, but it uses a transformation list that was obtained from mod1. As a result, both mod1 and mod2 have the same embedded transformation expression.

CREATE OR REPLACE VIEW mining_data AS

Chapter 47
Summary of DBMS_DATA_MINING Subprograms

47-143
47.7.40 IMPORT_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

Import from a dump file set

You can import mining models from a dump file set that was created by the IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. IMPORT_MODEL and IMPORT_MODEL export/import mining models only.

Import from PMML

You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type RegressionModel, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group (http://www.dmg.org). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.
See Also:

Oracle Data Mining User’s Guide for more information about exporting and importing mining models

Oracle Database Utilities for information about Oracle Data Pump

http://www.dmg.org/faq.html for more information about PMML

Syntax

Imports a mining model from a dump file set:

```sql
DBMS_DATA_MINING.IMPORT_MODEL (
    filename          IN  VARCHAR2,
    directory         IN  VARCHAR2,
    model_filter      IN  VARCHAR2 DEFAULT NULL,
    operation         IN  VARCHAR2 DEFAULT NULL,
    remote_link       IN  VARCHAR2 DEFAULT NULL,
    jobname           IN  VARCHAR2 DEFAULT NULL,
    schema_remap      IN  VARCHAR2 DEFAULT NULL,
    tablespace_remap  IN  VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```sql
DBMS_DATA_MINING.IMPORT_MODEL (
    model_name        IN  VARCHAR2,
    pmmldoc           IN  XMLTYPE
    strict_check      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 47-108 IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to &quot;EXPORT_MODEL Procedure&quot; for details.) If the dump file set contains multiple files, you can specify 'filename%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies. Note: The target database must have also have read/write access to the file system directory.</td>
</tr>
</tbody>
</table>
### Table 47-108 (Cont.) IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| model_filter| Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. 

The value of model_filter can be one or more model names. The following are valid filters. 

- 'mymodel1'
- 'name IN ('mymodel2','mymodel3')'

The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3. |
| operation    | Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. 

You can specify either of the following values for operation: 

- 'IMPORT' — Import the models (Default) 
- 'SQL_FILE' — Write the SQL DDL for creating the models to a text file. The text file is named job_name.sql and is located in the dump set directory. |
| remote_link  | Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can import models into the local database from the remote database. The import is fileless; no dump file is involved. The IMP_FULL_DATABASE role is required for importing the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required. (See Example 2.) |
| jobname      | Optional parameter that specifies the name of the import job. By default, the name has the form username_imp_nnnn, where nnnn is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. 

If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. 

A log file for the import job, named jobname.log, is created in the same directory as the dump file set. |
| schema_remap | Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. 

If the dump file set belongs to a different schema, you must specify a schema mapping in the form export_user:import_user. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. 

Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different schema. |
| tablespace_remap | Optional parameter for importing into a different tablespace. By default, models are exported and imported within the same tablespace. 

If the dump file set belongs to a different tablespace, you must specify a tablespace mapping in the form export_tablespace:import_tablespace. For example, you would specify 'TBLSPC01:TBLSPC02' to import a model that was exported from tablespace TBLSPC01 into tablespace TBLSPC02. 

Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different tablespace. |
Table 47-108  (Cont.) IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name for the new model that will be created in the database as a result of an import from PMML. The name must be unique within the user’s schema.</td>
</tr>
<tr>
<td>pmmldoc</td>
<td>The PMML document representing the model to be imported. The PMML document has an XMLTYPE object type. See “XMLTYPE” for details.</td>
</tr>
<tr>
<td>strict_check</td>
<td>Whether or not an error occurs when the PMML document contains sections that are not part of core PMML (for example, Output or Targets). Oracle Data Mining supports only core PMML; any non-core features may affect the scoring representation. If the PMML does not strictly conform to core PMML and strict_check is set to TRUE, then IMPORT_MODEL returns an error. If strict_check is FALSE (the default), then the error is suppressed. The model may be imported and scored.</td>
</tr>
</tbody>
</table>

Examples

1. This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMP_FULL_DATABASE privilege. The dmuser2 user has been assigned the USER2 tablespace; dmuser3 has been assigned the USER3 tablespace.

   SQL> connect dmuser2
   Enter password: dmuser2_password
   Connected.
   SQL> select model_name from user_mining_models;
   MODEL_NAME
   ---------------------
   NMF_SH_SAMPLE
   SVMO_SH_CLAS_SAMPLE
   SVMR_SH_REGR_SAMPLE

   -- export the model called NMF_SH_SAMPLE to a dump file in same schema
   SQL> EXECUTE DBMS_DATA_MINING.EXPORT_MODEL (filename =>'NMF_SH_SAMPLE_out', directory =>'DATA_PUMP_DIR', model_filter => 'name = ''NMF_SH_SAMPLE''');

   -- import the model back into the same schema
   SQL> EXECUTE DBMS_DATA_MINING.IMPORT_MODEL (filename => 'NMF_SH_SAMPLE_out01.dmp', directory => 'DATA_PUMP_DIR', model_filter => 'name = ''NMF_SH_SAMPLE''', operation =>'IMPORT', remote_link => NULL);
The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. User MARY has been assigned a tablespace named USER2; user SCOTT was assigned the tablespace USERS when the models were exported into the dump file model_exp_001.dmp. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```sql
-- import all models
DECLARE
  file_name  VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
    filename=> 'file_name',
    directory=>'DM_DUMP',
    schema_remap=>'SCOTT:MARY',
    tablespace_remap=>'USERS:USER2');
  DBMS_OUTPUT.PUT_LINE('DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

2. This example shows how the user xuser could import the model dmuser.r1mod from a remote database. The SQL*Net connection alias for the remote database is R1DB. The user xuser is assigned the SYSAUX tablespace; the user dmuser is assigned the TBS_1 tablespace.

```sql
CONNECT / AS SYSDBA;
GRANT CREATE DATABASE LINK TO xuser;
GRANT imp_full_database TO xuser;
CONNECT xuser/xuserpassword
CREATE DATABASE LINK dmuser_link
  CONNECT TO dmuser IDENTIFIED BY dmuserpassword USING 'R1DB';
EXEC dbms_data_mining.import_model (  
  NULL,
  'DMUSER_DIR',
  'R1MOD',
  remote_link => 'DMUSER_LINK', schema_remap => 'DMUSER:XUSER',
  tablespace_remap => 'TBS_1:SYSAUX' );
SELECT name FROM dm_user_models;
```

3. This example shows how a PMML document called SamplePMML1.xml could be imported from a location referenced by directory object PMMLDIR into the schema of the current user. The imported model will be called PMMLMODEL1.

```sql
BEGIN
  dbms_data_mining.import_model ('PMMLMODEL1',
    XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
      nls_charset_id ('AL32UTF8'))
  );
END;
```
47.7.41 IMPORT_SERMODEL Procedure

This procedure imports the serialized format of the model back into a database.

The import routine takes the serialized content in the BLOB and the name of the model to be created with the content. This import does not create model views or tables that are needed for querying model details. The import procedure only provides the ability to score the model.

Syntax

DBMS_DATA_MINING.IMPORT_SERMODEL (  
    model_data     IN BLOB,  
    model_name     IN VARCHAR2,);  

Parameters

Table 47-109 IMPORT_SERMODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_data</td>
<td>Provides model data in BLOB format.</td>
</tr>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>

Examples

The following statement imports the serialized format of the models.

```sql
declare  
v_blob blob;  
BEGIN  
dbms_lob.createtemporary(v_blob, FALSE);  
-- fill in v_blob from somewhere (e.g., bfile, etc.)  
dbms_data_mining.import_sermodel(v_blob, 'MY_MODEL');  
dbms_lob.freetemporary(v_blob);  
END;  
/```

Related Topics

- **EXPORT_SERMODEL Procedure**
  This procedure exports the model in a serialized format so that they can be moved to another platform for scoring.

See Also:

*Oracle Data Mining User's Guide* for more information about exporting and importing mining models.
47.7.42 JSON Schema for R Extensible Algorithm

Follow JSON schema when creating a new JSON object with flexibility.

Usage Note

Some flexibility when creating a new JSON object are as follows:

- Partial registration is allowed. For example, detail function can be missing.
- Different orders are allowed. For example, detail function can be written before build function or after the build function.

Example 47-1  JSON Schema

JSON schema 1.1 for R extensible algorithm:

```json
{
    "type": "object",
    "properties": {
        "algo_name_display": {
            "type": "object",
            "properties": {
                "language": {
                    "type": "string",
                    "enum": ["English", " Spanish", "French"],
                    "default": "English"},
                "name": {
                    "type": "string"}
            },
            "string",
            "enum": ["English", "Spanish", "French"],
            "default": "English"},
        "function_language": {
            "type": "string"},
        "mining_function": {
            "type": "array",
            "items": [
                {"type": "object",
                 "properties": {
                    "mining_function_name": {"type": "string"},
                    "build_function": {
                        "type": "object",
                        "properties": {
                            "function_body": {"type": "CLOB"}
                        }
                    }
                },
                {"type": "object",
                 "properties": {
                    "function_body": {"type": "CLOB"},

Chapter 47

Summary of DBMS_DATA_MINING Subprograms
47.7.43 REGISTER_ALGORITHM Procedure

User can register a new algorithm by providing algorithm name, mining function, and all other algorithm metadata to this function.

Syntax

```
DBMS_DATA_MINING.REGISTER_ALGORITHM (
  algorithm_name           IN VARCHAR2,
  algorithm_metadata       IN CLOB,
  algorithm_description    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm_name</td>
<td>Name of the algorithm.</td>
</tr>
<tr>
<td>algorithm_metadata</td>
<td>Metadata of the algorithm.</td>
</tr>
<tr>
<td>algorithm_description</td>
<td>Description of the algorithm.</td>
</tr>
</tbody>
</table>

Usage Notes

The registration procedure performs the following:

- Checks whether `algorithm_metadata` has correct JSON syntax.
- Checks whether the input JSON object follows the predefined JSON schema.
- Checks whether current user has `RQADMIN` privilege.
- Checks duplicate algorithms such that the same algorithm is not registered twice.
- Checks for missing entries. For example, algorithm name, algorithm type, metadata, and build function.

Register Algorithms After the JSON Object Is Created

SQL users can register new algorithms by following the given procedure:
Create a JSON object following JSON schema and pass it to `REGISTER_ALGORITHM` procedure.

```
BEGIN
  DBMS_DATA_MINING.register_algorithm(
    algorithm_name => 't1',
    algorithm_metadata =>
      "function_language" : "R",
      "mining_function" :
        { "mining_function_name" : "CLASSIFICATION",
          "build_function" : {"function_body": "function(dat, formula, family) {
            set.seed(1234);
            mod <- glm(formula = formula, data=dat, family=eval(parse(text=family)));
            res <- predict(mod, newdata = dat, type='response');
            res2=data.frame(1-res, res);
            res2}"
        },
      "score_function" : {"function_body": "function(mod, dat) {
            res <- predict(mod, newdata = dat, type='response');
            res2=data.frame(1-res, res);
            res2}"
      }',
    algorithm_description => 't1');
END;
```

47.7.44 RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results.

For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

**Syntax**

```
DBMS_DATA_MINING.RANK_APPLY (  
  apply_result_table_name IN VARCHAR2,  
  case_id_column_name IN VARCHAR2,  
  score_column_name IN VARCHAR2,  
  score_criterion_column_name IN VARCHAR2,  
  ranked_apply_table_name IN VARCHAR2,  
  top_N IN NUMBER (38) DEFAULT 1,  
  cost_matrix_table_name IN VARCHAR2 DEFAULT NULL,  
  apply_result_schema_name IN VARCHAR2 DEFAULT NULL,  
  cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 47-111  RANK_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test data set (see Usage Notes)</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column. This must be the same as the one used for generating APPLY results.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the prediction column in the apply results table</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the probability column in the apply results table</td>
</tr>
<tr>
<td>ranked_apply_result_table_name</td>
<td>Name of the table containing the ranked apply results</td>
</tr>
<tr>
<td>top_N</td>
<td>Top N predictions to be considered from the APPLY results for precision recall computation</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table</td>
</tr>
</tbody>
</table>

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB and SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id           VARCHAR2/NUMBER,
prediction        NUMBER,
probability       NUMBER,
cost              NUMBER,
rank              INTEGER)
```

For categorical targets, the ranked results table will have the following definition:
Clustering Using k-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id VARCHAR2/NUMBER,
cluster_id NUMBER,
probability NUMBER,
rank INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id VARCHAR2/NUMBER,
feature_id NUMBER,
match_quality NUMBER,
rank INTEGER)
```

Examples

BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
    apply_result_table_name       => 'census_apply_result',
    case_id_column_name           => 'person_id',
    score_column_name             => 'prediction',
    score_criterion_column_name   => 'probability',
    ranked_apply_result_tab_name  => 'census_ranked_apply_result',
    top_N                         => 3,
    cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
FROM census_ranked_apply_result;
47.7.45 REMOVE_COST_MATRIX Procedure

The REMOVE_COST_MATRIX procedure removes the default scoring matrix from a classification model.

See Also:
- "ADD_COST_MATRIX Procedure"
- "REMOVE_COST_MATRIX Procedure"

Syntax

DBMS_DATA_MINING.REMOVE_COST_MATRIX (  
    model_name   IN  VARCHAR2);

Parameters

Table 47-112  Remove_Cost_Matrix Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

SQL> SELECT *  
            FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))  
            ORDER BY predicted, actual;

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>.75</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

You can remove the cost matrix with REMOVE_COST_MATRIX.

SQL> EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');

SQL> SELECT *  
            FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))  
            ORDER BY predicted, actual;
47.7.46 RENAME_MODEL Procedure

This procedure changes the name of the mining model indicated by `model_name` to the name that you specify as `new_model_name`.

If a model with `new_model_name` already exists, then the procedure optionally renames `new_model_name` to `versioned_model_name` before renaming `model_name` to `new_model_name`.

The model name is in the form `[schema_name].model_name`. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see the Usage Notes for "CREATE_MODEL Procedure".

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL(
    model_name            IN VARCHAR2,
    new_model_name        IN VARCHAR2,
    versioned_model_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Model to be renamed.</td>
</tr>
<tr>
<td>new_model_name</td>
<td>New name for the model <code>model_name</code>.</td>
</tr>
<tr>
<td>versioned_model_name</td>
<td>New name for the model <code>new_model_name</code> if it already exists.</td>
</tr>
</tbody>
</table>

Usage Notes

If you attempt to rename a model while it is being applied, then the model will be renamed but the apply operation will return indeterminate results.

Examples

1. This example changes the name of model `census_model` to `census_model_2012`.

   ```sql
   BEGIN
   DBMS_DATA_MINING.RENAME_MODEL(
       model_name => 'census_model',
       new_model_name => 'census_model_2012');
   END;
   /
   
   2. In this example, there are two classification models in the user's schema: `clas_mod`, the working model, and `clas_mod_tst`, a test model. The RENAME_MODEL procedure preserves `clas_mod` as `clas_mod_old` and makes the test model the new working model.

   ```sql
   SELECT model_name FROM user_mining_models;
   MODEL_NAME
   -----------------------------------------------
   CLAS_MOD
   CLAS_MOD_TST
   ```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name => 'clas_mod_tst',
    new_model_name => 'clas_mod',
    versioned_model_name => 'clas_mod_old');
END;
/

SELECT model_name FROM user_mining_models;
MODEL_NAME
-----------------------------
CLAS_MOD
CLAS_MOD_OLD
48.1 DBMS_DATA_MINING_TRANSFORM Overview

A transformation is a SQL expression that modifies the data in one or more columns. Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements.

Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

External or Embedded Transformations

DBMS_DATA_MINING_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the CREATE_MODEL Procedure
- Create a view that implements the transformations and pass the name of the view to the CREATE_MODEL Procedure

If you create a transformation list and pass it to CREATE_MODEL, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.
If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

**Note:**
Embedded transformations significantly enhance the model's usability while simplifying the process of model management.

**Automatic Transformations**

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are automatically embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

**See Also:**

- "Automatic Data Preparation" in DBMS_DATA_MINING
- Oracle Data Mining User's Guide for a more information about ADP
- "DBMS_DATA_MINING_TRANSFORM-About Transformation Lists"

**Transformations in DBMS_DATA_MINING_TRANSFORM**

The transformations supported by DBMS_DATA_MINING_TRANSFORM are summarized in this section.

**Binning**

Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- Supervised Binning (Categorical and Numerical)
  Binning is based on intrinsic relationships in the data as determined by a decision tree model.
  See "INSERT_BIN_SUPER Procedure".
- Top-N Frequency Categorical Binning
  Binning is based on the number of cases in each category.
  See "INSERT_BIN_CAT_FREQ Procedure"
- Equi-Width Numerical Binning
  Binning is based on equal-range partitions.
See "INSERT_BIN_NUM_EQWIDTH Procedure".

• Quantile Numerical Binning
  Binning is based on quantiles computed using the SQL NTILE function.
  See "INSERT_BIN_NUM_QTILE Procedure".

Linear Normalization

Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the shift) and dividing the result by another number (the scale).

\[ x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \]

• Min-Max Normalization
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = \text{min} \]
  \[ \text{scale} = \text{max} - \text{min} \]
  See "INSERT_NORM_LIN_MINMAX Procedure".

• Scale Normalization
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = 0 \]
  \[ \text{scale} = \max\{\abs{\text{max}}, \abs{\text{min}}\} \]
  See "INSERT_NORM_LIN_SCALE Procedure".

• Z-Score Normalization
  Normalization is based on the mean and standard deviation with the following shift and scale:
  \[ \text{shift} = \text{mean} \]
  \[ \text{scale} = \text{standard deviation} \]
  See "INSERT_NORM_LIN_ZSCORE Procedure".

Outlier Treatment

An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

• Winsorizing
  Outliers are replaced with the nearest value that is not an outlier.
  See "INSERT_CLIP_WINSOR_TAIL Procedure"

• Trimming
  Outliers are set to NULL.
  See "INSERT_CLIP_TRIM_TAIL Procedure"

Missing Value Treatment

Missing data may indicate sparsity or it may indicate that some values are missing at random. DBMS_DATA_MINING_TRANSFORM supports the following transformations for minimizing the effects of missing values:
• Missing numerical values are replaced with the mean.
  See "INSERT_MISS_NUM_MEAN Procedure".
• Missing categorical values are replaced with the mode.
  See "INSERT_MISS_CAT_MODE Procedure".

![Note:]
Oracle Data Mining also has default mechanisms for handling missing data.
See Oracle Data Mining User's Guide for details.

48.2 DBMS_DATA_MINING_TRANSFORM Operational Notes

The DBMS_DATA_MINING_TRANSFORM package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you create a transformation list object and pass it to the CREATE_MODEL Procedure. If you choose to transform the data without embedding, you create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

Transformation Definitions

Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the DBMS_DATA_MINING_TRANSFORM package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

Transformation Definition Tables

DBMS_DATA_MINING_TRANSFORM provides INSERT procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

XFORM routines use populated definition tables to transform data in external views.
STACK routines use populated definition tables to build transformation lists.

To specify transformations based on definition tables, follow these steps:

1. Use CREATE routines to create transformation definition tables.
   The tables have columns to hold the transformation definitions for a given type of transformation. For example, the CREATE_BIN_NUM Procedure creates a definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use INSERT routines to compute and insert transformation definitions in the tables.
Each INSERT routine uses a specific technique for computing the transformation definitions. For example, the INSERT_BIN_NUM_EQWIDTH Procedure computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use STACK or XFORM routines to generate transformation expressions based on the information in the definition tables:
   - Use STACK routines to add the transformation expressions to a transformation list. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.
   - Use XFORM routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.

Transformations Without Definition Tables

STACK routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See "Reverse Transformations and Model Transparency" in "DBMS_DATA_MINING_TRANSFORM-About Transformation Lists").
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See "Disabling Automatic Data Preparation" in "DBMS_DATA_MINING_TRANSFORM - About Transformation Lists").
4. Specify the SQL expressions and ADP instructions in a call to the SET_TRANSFORM Procedure, which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.

---

**Note:**

SQL expressions that you specify with SET_TRANSFORM must fit within a VARCHAR2. To specify a longer expression, you can use the SET_EXPRESSION Procedure. With SET_EXPRESSION, you can build an expression by appending rows to a VARCHAR2 array.

---

About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Related Topics

- CREATE_MODEL Procedure
  - This procedure creates a mining model with a given mining function.
48.2.1 DBMS_DATA_MINING_TRANSFORM — About Transformation Lists

The elements of a transformation list are transformation records. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- **attribute_name** — Name of the column of data to be transformed
- **attribute_subname** — Name of the nested attribute if **attribute_name** is a nested column, otherwise NULL
- **expression** — SQL expression for transforming the attribute
- **reverse_expression** — SQL expression for reversing the transformation
- **attribute_spec** — Identifies special treatment for the attribute during the model build. See Table 48-33 for details.

Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example, if attribute x has been transformed into bins 1 — 4, the bin names 1, 2, 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.
To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you specify the transformation expression 'log(10, y)' for attribute y, you could specify the reverse transformation expression 'power(10, y)'.

Reverse transformations enable model transparency. They make internal processing transparent to the user.

**Note:**

STACK procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION procedure to specify or update reverse transformations expressions for an existing model.

**See Also:**

Table 48-1  "ALTER_REVERSE_EXPRESSION Procedure"
"Summary of DBMS_DATA_MINING Subprograms" for links to the model details functions

Disabling Automatic Data Preparation

ADP is controlled by a model-specific setting (`PREP_AUTO`). The `PREP_AUTO` setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set `attribute_spec` to NOPREP, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do *not* set `attribute_spec` to NOPREP, the automatic transformations will be evaluated after the transformations that you specify for the attribute.

If ADP is not enabled for the model, the `attribute_spec` field of the transformation record is ignored.

**See Also:**

"Automatic Data Preparation" for information about the `PREP_AUTO` setting

Adding Transformation Records to a Transformation List

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See "About Stacking" for details.)
When you use SET_TRANSFORM to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use STACK procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both STACK procedures and SET_TRANSFORM to build one transformation list. Each STACK procedure call adds transformation records for all the attributes in a specified transformation definition table. Each SET_TRANSFORM call adds a transformation record for a single attribute.

48.2.2 DBMS_DATA_MINING_TRANSFORM — About Stacking and Stack Procedures

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example, STACK_BIN_NUM builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table and in the transformation list, the STACK procedure stacks the transformation expression from the definition table on top of the transformation expression in the transformation record and updates the reverse transformation. See Table 48-1 and Example 48-4.

Example 48-1  Stacking a Clipping Transformation

This example shows how STACK_CLIP Procedure would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in "Reverse Transformations and Model Transparency" in "DBMS_DATA_MINING_TRANSFORM-About Transformation Lists").

Refer to:
- CREATE_CLIP Procedure — Creates the definition table
- INSERT_CLIP_TRIM_TAIL Procedure — Inserts definitions in the table
- INSERT_CLIP_WINSOR_TAIL Procedure — Inserts definitions in the table
- Table 48-1 — Describes the structure of the transformation list (TRANSFORM_LIST object)

Assume a clipping definition table populated as follows.
Assume the following transformation list before stacking.

-------------------------
| transformation record #1: |
-------------------------
| attribute_name       = COL1 |
| attribute_subname    = null |
| expression           = log(10, COL1) |
| reverse_expression   = power(10, COL1) |
-------------------------

After stacking, the transformation list is as follows.

-------------------------
| transformation record #1: |
-------------------------
| attribute_name       = COL1 |
| attribute_subname    = null |
| expression           = CASE WHEN log(10, COL1) < -1.5 THEN -1.5 |
|                        WHEN log(10, COL1) > 4.5 THEN 4.5 |
|                        ELSE log(10, COL1) END;         |
| reverse_expression   = power(10, COL1) |
-------------------------

--------------------
| transformation record #2: |
--------------------
| attribute_name       = COL3 |
| attribute_subname    = null |
| expression           = ln(COL3) |
| reverse_expression   = exp(COL3) |
--------------------

-------------------------
| transformation record #3: |
-------------------------
| attribute_name       = COL2 |
| attribute_subname    = null |
| expression           = CASE WHEN COL2 < 0 THEN 0 |
|                        WHEN COL2 > 1 THEN 1 |
|                        ELSE COL2 END;         |
| reverse_expression   = null |
-------------------------

48.2.3 DBMS_DATA_MINING_TRANSFORM — Nested Data Transformations

The CREATE routines create transformation definition tables that include two columns, col and att, for identifying attributes. The column col holds the name of a column in the data table. If
the data column is not nested, then \texttt{att} is null, and the name of the attribute is \texttt{col}. If the data column is nested, then \texttt{att} holds the name of the nested attribute, and the name of the attribute is \texttt{col.att}.

The \texttt{INSERT} and \texttt{XFORM} routines ignore the \texttt{att} column in the definition tables. Neither the \texttt{INSERT} nor the \texttt{XFORM} routines support nested data.

Only the \texttt{STACK} procedures and \texttt{SET_TRANSFORM} support nested data. Nested data transformations are always embedded in the model.

feature 322331-1 Native doubles in DMFs

Nested columns in Oracle Data Mining can have the following types:

- \texttt{DM_NESTED_NUMERICALS}
- \texttt{DM_NESTED_CATEGORICALS}
- \texttt{DM_NESTED_BINARY_DOUBLES}
- \texttt{DM_NESTED_BINARY_FLOATS}

\textit{Oracle Data Mining User's Guide} for details about nested attributes in Oracle Data Mining

Specifying Nested Attributes in a Transformation Record

A transformation record (\texttt{TRANSFORM_REC}) includes two fields, \texttt{attribute_name} and \texttt{attribute_subname}, for identifying the attribute. The field \texttt{attribute_name} holds the name of a column in the data table. If the data column is not nested, then \texttt{attribute_subname} is null, and the name of the attribute is \texttt{attribute_name}. If the data column is nested, then \texttt{attribute_subname} holds the name of the nested attribute, and the name of the attribute is \texttt{attribute_name.attribute_subname}.

Transforming Individual Nested Attributes

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the \texttt{attribute_name} field and the name of the nested column in the \texttt{attribute_subname} field as shown in \textbf{Example 48-2}. Note that the keyword \texttt{VALUE} is used to represent the value of a nested attribute in a transformation expression.

\textbf{Example 48-2}    Transforming a Nested Column

The following statement transforms two of the nested attributes in \texttt{COL_N1}. Attribute \texttt{ATTR1} is transformed with normalization; Attribute \texttt{ATTR2} is set to null, which causes attribute removal transformation (\texttt{ATTR2} is not used in training the model). All the remaining attributes in \texttt{COL_N1} are divided by 10.

```
DECLARE
  stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(
    stk,'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE *20 + (-1.5)');
```

Chapter 48

\textbf{DBMS_DATA_MINING_TRANSFORM} Operational Notes

48-10
The following SQL is generated from this statement.

```sql
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
  "ATTRIBUTE_NAME",
  DECODE("ATTRIBUTE_NAME",
    'ATTR1', ("VALUE" - (-1.5))/20,
    "VALUE"/10))
FROM TABLE("COL_N1")
WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for `COL_N1.ATTR1` and `COL_N1.ATTR2`, then the default transformation is used for all the attributes in `COL_N1`, and the resulting SQL does not include a `DECODE`.

```sql
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
  "ATTRIBUTE_NAME",
  "VALUE"/10)
FROM TABLE("COL_N1"))
AS DM_NESTED_NUMERICALS)
```

Since `DECODE` is limited to 256 arguments, multiple `DECODE` functions are nested to support an arbitrary number of individual nested attribute specifications.

### Adding a Nested Column

You can specify a transformation that adds a nested column to the data, as shown in **Example 48-3**.

#### Example 48-3 Adding a Nested Column to a Transformation List

```sql
DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
    'YOB_CREDLIM', NULL,
    'dm_nested_numericals(
      dm_nested_numerical(''CUST_YEAR_OF_BIRTH'', cust_year_of_birth),
      dm_nested_numerical(''CUST_CREDIT_LIMIT'', cust_credit_limit)),
    NULL);
  dbms_data_mining_transform.SET_TRANSFORM(  
    v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM(  
    v_xlst, 'CUST_CREDIT_LIMIT', NULL, NULL, NULL);
  dbms_data_mining_transform.XFORM_STACK(  
    v_xlst, 'mining_data', 'mining_data_v');
END;
/

set long 2000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_V';
```
TEXT

SELECT "CUST_ID","CUST_POSTAL_CODE", dm_nested_numericals(
  dm_nested_numerical(
    'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
  dm_nested_numerical(
    'CUST_CREDIT_LIMIT', cust_credit_limit)) "YOB_CREDLIM" FROM
mining_data

SELECT * FROM mining_data_v WHERE cust_id = 104500;

<table>
<thead>
<tr>
<th>CUST_ID</th>
<th>CUST_POSTAL_CODE</th>
<th>YOB_CREDLIM(ATTRIBUTE_NAME, VALUE)</th>
</tr>
</thead>
</table>
| 104500  | 68524            | DM_NESTED_NUMERICALS(DM_NESTED_NUMERICAL(
|         |                  | 'CUST_YEAR_OF_BIRTH', 1962),
|         |                  | DM_NESTED_NUMERICAL('CUST_CREDIT_LIMIT', 15000)) |

Stacking Nested Transformations

Example 48-4 shows how the STACK_NORM_LIN Procedure would add transformation records for nested column COL_N to a transformation list.

Refer to:

- CREATE_NORM_LIN Procedure — Creates the definition table
- INSERT_NORM_LIN_MINMAX Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_SCALE Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_ZSCORE Procedure — Inserts definitions in the table
- Table 48-1 — Describes the structure of the transformation list

Example 48-4  Stacking a Nested Normalization Transformation

Assume a linear normalization definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>shift</th>
<th>scale</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL_N</td>
<td>ATT2</td>
<td>0</td>
<td>20</td>
</tr>
<tr>
<td>null</td>
<td>COL_N</td>
<td>0</td>
<td>10</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

-------------------------
transformation record #1:
-------------------------
attribute_name = COL_N
attribute_subname = ATT1
expression = log(10, VALUE)
reverse_expression = power(10, VALUE)
-------------------------
transformation record #2:
-------------------------
attribute_name = null
attribute_subname = COL_N
expression = ln(VALUE)
reverse_expression = exp(VALUE)
After stacking, the transformation list is as follows.

-------------------------
transformation record #1:
-------------------------
attribute_name       = COL_N
attribute_subname    = ATT1
expression           = (log(10, VALUE) - 0)/10
reverse_expression   = power(10, VALUE*10 + 0)
-------------------------
transformation record #2:
-------------------------
attribute_name       = NULL
attribute_subname    = COL_N
expression           = (ln(VALUE)- 0)/10
reverse_expression   = exp(VALUE *10 + 0)
-------------------------
transformation record #3:
-------------------------
attribute_name       = COL_N
attribute_subname    = ATT2
expression           = (ln(VALUE) - 0)/20
reverse_expression   = exp(VALUE * 20 + 0)

48.3 DBMS_DATA_MINING_TRANSFORM Security Model

The DBMS_DATA_MINING_TRANSFORM package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures have a data_table_name parameter that enables the user to provide the input data for transformation purposes. The value of data_table_name can be the name of a physical table or a view. The data_table_name parameter can also accept an inline query.

Note:

Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

See Also:

"Operational Notes" for a description of the DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures

48.4 DBMS_DATA_MINING_TRANSFORM Datatypes

DBMS_DATA_MINING_TRANSFORM defines the datatypes described in the following table.
Table 48-1  Datatypes in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_LIST</td>

<td>col_charsetform BINARY_INTEGER := 0,</td>
<td>The DESCRIPTION types are defined in &quot;DESC_REC2 Record Type&quot;.</td>
</tr>
<tr>
<td></td>
<td>col_null_ok BOOLEAN := TRUE);</td>
<td>The DESCRIPTION types are defined in &quot;DESC_REC2 Record Type&quot;.</td>
</tr>
</tbody>
</table>
Table 48-1  (Cont.) Datatypes in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSFORM</td>
<td>TABLE OF transform_rec</td>
<td>TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the CREATE_MODEL Procedure. Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null. The expression field holds a SQL expression for transforming the attribute. See &quot;About Transformation Lists&quot; for an explanation of reverse expressions. The attribute_spec field can be used to cause the attribute to be handled in a specific way during the model build. See Table 48-33 for details. The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2A, which is a table of VARCHAR2(32767). The VARCHAR2A datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2A type is defined in the DBMS_SQL package. See &quot;VARCHAR2A Table Type&quot;. The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2A table. If ub &lt; lb (default) the EXPRESSION_REC is empty; if lb=ub=1 there is one row; if lb=1 and ub=2 there are 2 rows, and so on.</td>
</tr>
</tbody>
</table>

48.5 DBMS_DATA_MINING_TRANSFORM Constants

DBMS_DATA_MINING_TRANSFORM defines the constants described in the following table.

Table 48-2  Constants in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEST_NUM_COL_TYPE</td>
<td>100001</td>

48.6.1 CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning.

The columns are described in the following table.

Table 48-4 Columns in a Transformation Definition Table for Categorical Binning

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
    bin_table_name     IN VARCHAR2,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 48-5  CREATE_BIN_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about categorical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_BIN_CAT_FREQ Procedure — frequency-based binning
   - INSERT_BIN_SUPER Procedure — supervised binning

See Also:

   "Binning" in DBMS_DATA_MINING_TRANSFORM Overview
   "Operational Notes"

Examples

The following statement creates a table called bin_cat_xtbl in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
DESCRIBE bin_cat_xtbl
```

```
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                VARCHAR2(4000)
BIN                                                VARCHAR2(4000)
```

48.6.2 CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning.

The columns are described in the following table.
Table 48-6  Columns in a Transformation Definition Table for Numerical Binning

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (  
    bin_table_name    IN VARCHAR2,  
    bin_schema_name   IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 48-7  CREATE_BIN_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.

2. See “Nested Data Transformations” for information about transformation definition tables and nested data.

3. You can use the following procedures to populate the transformation definition table:
   - INSERT_AUTOBIN_NUM_EQWIDTH Procedure — automatic equi-width binning
   - INSERT_BIN_NUM_EQWIDTH Procedure — user-specified equi-width binning
   - INSERT_BIN_NUM_QTILE Procedure — quantile binning
   - INSERT_BIN_SUPER Procedure — supervised binning
Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/
```

```
DESCRIBE bin_num_xtbl
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>VAL</td>
<td></td>
<td>NUMBER</td>
</tr>
<tr>
<td>BIN</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

**48.6.3 CREATE_CLIP Procedure**

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers.

The columns are described in the following table.

**Table 48-8  Columns in a Transformation Definition Table for Clipping or Winsorizing**

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code>. If <code>col</code> is nested, the attribute name is <code>col.att</code>. If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>lcut</td>
<td>NUMBER</td>
<td>The lowest typical value for the attribute. If the attribute values were plotted on an <code>xy</code> axis, <code>lcut</code> would be the left-most boundary of the range of values considered typical for this attribute. Any values to the left of <code>lcut</code> are outliers.</td>
</tr>
<tr>
<td>lval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the left of <code>lcut</code></td>
</tr>
</tbody>
</table>
Table 48-8  (Cont.) Columns in a Transformation Definition Table for Clipping or Winsorizing

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rcut</td>
<td>NUMBER</td>
<td>The highest typical value for the attribute. If the attribute values were plotted on an (xy) axis, (rcut) would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of (rcut) are outliers.</td>
</tr>
<tr>
<td>rval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the right of (rcut)</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
    clip_table_name    IN VARCHAR2,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 48-9  CREATE_CLIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of (clip_table_name). If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_CLIP_TRIM_TAIL Procedure — replaces outliers with nulls
   - INSERT_CLIP_WINSOR_TAIL Procedure — replaces outliers with an average value

See Also:

"Outlier Treatment" in DBMS_DATA_MINING_TRANSFORM Overview
"Operational Notes"

Examples

The following statement creates a table called \(clip_xtbl\) in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.
48.6.4 CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table.

The columns are described in the following table.

Table 48-10   Columns in a Transformation Definition Table for Column Removal

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
</tbody>
</table>

Syntax

DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (rem_table_name VARCHAR2, rem_schema_name VARCHAR2 DEFAULT NULL);

Parameters

Table 48-11   CREATE_COL_REM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See "Nested Data Transformations" for information about transformation definition tables and nested data.
2. See "Operational Notes".
Examples

The following statement creates a table called `rem_att_xtbl` in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```sql
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

48.6.5 CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values.

The columns are described in the following table.

**Table 48-12  Columns in a Transformation Definition Table for Categorical Missing Value Treatment**

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of DM_NESTED_CATEGORICALS. If <code>col</code> is nested, the attribute name is <code>col.att</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
  miss_table_name       IN VARCHAR2,
  miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 48-13  CREATE_MISS_CAT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of <code>miss_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User's Guide for details about categorical data.

2. See "Nested Data Transformations" for information about transformation definition tables and nested data.

3. You can use the INSERT_MISS_CAT_MODE Procedure to populate the transformation definition table.

See Also:

"Missing Value Treatment" in DBMS_DATA_MINING_TRANSFORM Overview
"Operational Notes"

Examples

The following statement creates a table called miss_cat_xtbl in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
/
```

```
DESCRIBE miss_cat_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                VARCHAR2(4000)
```

48.6.6 CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values.

The columns are described in Table 48-14.

Table 48-14  Columns in a Transformation Definition Table for Numerical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the attribute name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is nested, the attribute name is col.att.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is not nested, att is null.</td>
</tr>
</tbody>
</table>
Table 48-14  (Cont.) Columns in a Transformation Definition Table for Numerical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (   
    miss_table_name       IN VARCHAR2,   
    miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 48-15  CREATE_MISS_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of <code>miss_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the `INSERT_MISS_NUM_MEAN` Procedure to populate the transformation definition table.

See Also:

- "Missing Value Treatment" in DBMS_DATA_MINING_TRANSFORM Overview
- "Operational Notes"

Example

The following statement creates a table called `miss_num_xtbl` in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```sql
BEGIN   
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');   
END;   
/
```

DESCRIBE miss_num_xtbl

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
48.6.7 CREATE_NORM_LIN Procedure

This procedure creates a transformation definition table for linear normalization.

The columns are described in **Table 48-16**.

**Table 48-16  Columns in a Transformation Definition Table for Linear Normalization**

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the attribute name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information about attribute names, see <em>Oracle Data Mining User's Guide</em>.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is nested, the attribute name is col.att.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is not nested, att is null.</td>
</tr>
<tr>
<td>shift</td>
<td>NUMBER</td>
<td>A constant to subtract from the attribute values</td>
</tr>
<tr>
<td>scale</td>
<td>NUMBER</td>
<td>A constant by which to divide the shifted values</td>
</tr>
</tbody>
</table>

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN(
    norm_table_name IN VARCHAR2,
    norm_schema_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 48-17  CREATE_NORM_LIN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of norm_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. See *Oracle Data Mining User's Guide* for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - **INSERT_NORM_LIN_MINMAX Procedure** — Uses linear min-max normalization
   - **INSERT_NORM_LIN_SCALE Procedure** — Uses linear scale normalization
   - **INSERT_NORM_LIN_ZSCORE Procedure** — Uses linear zscore normalization
Examples

The following statement creates a table called `norm_xtbl` in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/

DESCRIBE norm_xtbl
<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>SHIFT</td>
<td></td>
<td>NUMBER</td>
</tr>
<tr>
<td>SCALE</td>
<td></td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

48.6.8 DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied.

Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the XFORM_STACK Procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (  
xform_list IN TRANSFORM_LIST,  
data_table_name IN VARCHAR2,  
describe_list OUT DESCRIBE_LIST,  
data_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 48-18**  DESCRIPTE_STACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformations. See Table 48-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
</tbody>
</table>
Table 48-18  (Cont.) DESCRIBE_STACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>describe_list</td>
<td>Descriptions of the columns in the data table after the transformations specified in xform_list have been applied. See Table 48-1 for a description of the DESCRIBE_LIST object type.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" for information about transformation lists and embedded transformations.

Examples

This example shows the column name and datatype, the column name length, and the column maximum length for the view dmuser.cust_info after the transformation list has been applied. All the transformations are user-specified. The results of DESCRIBE_STACK do not include one of the columns in the original table, because the SET_TRANSFORM procedure sets that column to NULL.

```sql
CREATE OR REPLACE VIEW cust_info AS
    SELECT a.cust_id, c.country_id, c.cust_year_of_birth,
           CAST(COLLECT(DM_Nested_Numerical(
                b.prod_name, 1))
        AS DM_Nested_Numericals) custprods
    FROM sh.sales a, sh.products b, sh.customers c
    WHERE a.prod_id = b.prod_id AND
          a.cust_id=c.cust_id AND
          a.cust_id between 100001 AND 105000
    GROUP BY a.cust_id, country_id, cust_year_of_birth;

DESCRIBE cust_info
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
CUST_ID                                   NOT NULL NUMBER
COUNTRY_ID                                 NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                         NOT NULL NUMBER(4)
CUSTPRODS                                 SYS.DM_NESTED_NUMERICALS

DECLARE
cust_stack   dbms_data_mining_transform.TRANSFORM_LIST;
cust_cols    dbms_data_mining_transform.DESCRIBE_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
                                             'country_id', NULL, 'country_id/10', 'country_id*10');
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
                                             'cust_year_of_birth', NULL, NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
                                             'custprods', 'Mouse Pad', 'value*100', 'value/100');
    dbms_data_mining_transform.DESCRIBE_STACK(
        xform_list => cust_stack,
        data_table_name => 'cust_info',
        describe_list => cust_cols);
    dbms_output.put_line('====');
    for i in 1..cust_cols.COUNT loop
```
48.6.9 GET_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (  
    expression           IN EXPRESSION_REC,  
    chunk_num            IN PLS_INTEGER DEFAULT NULL);  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 48-1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>
Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

2. See "About Transformation Lists".

3. See "Operational Notes".

Examples

See the example for the SET_EXPRESSION Procedure.

Related Topics

- **SET_EXPRESSION Procedure**
  This procedure appends a row to a VARCHAR2 array that stores a SQL expression.

- **SET_TRANSFORM Procedure**
  This procedure appends the transformation instructions for an attribute to a transformation list.

48.6.10 INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the INSERT_BIN_NUM_EQWIDTH Procedure.

INSERT_AUTOBIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    bin_num               IN PLS_INTEGER DEFAULT 3,
    max_bin_num           IN PLS_INTEGER DEFAULT 100,
    exclude_list          IN COLUMN_LIST DEFAULT NULL,
    round_num             IN PLS_INTEGER DEFAULT 6,
    sample_size           IN PLS_INTEGER DEFAULT 50000,
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    rem_table_name        IN VARCHAR2 DEFAULT NULL,
    rem_schema_name       IN VARCHAR2 DEFAULT NULL));
```
## Parameters

Table 48-20  INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **bin_table_name** | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:  
- COL  VARCHAR2(30)  
- VAL  NUMBER  
- BIN  VARCHAR2(4000)  

CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH. |
| **data_table_name** | Name of the table containing the data to be transformed |
| **bin_num** | Minimum number of bins. If bin_num is 0 or NULL, it is ignored. The default value of bin_num is 3. |
| **max_bin_num** | Maximum number of bins. If max_bin_num is 0 or NULL, it is ignored. The default value of max_bin_num is 100. |
| **exclude_list** | List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned. The format of exclude_list is:  
dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln') |
| **round_num** | Specifies how to round the number in the VAL column of the transformation definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of round_num is 6. |
| **sample_size** | Size of the data sample. If sample_size is less than the total number of non-NULL values in the column, then sample_size is used instead of the SQL COUNT function in computing the number of bins. If sample_size is 0 or NULL, it is ignored. See the Usage Notes. The default value of sample_size is 50,000. |
| **bin_schema_name** | Schema of bin_table_name. If no schema is specified, the current schema is used. |
| **data_schema_name** | Schema of data_table_name. If no schema is specified, the current schema is used. |
| **rem_table_name** | Name of a transformation definition table for column removal. The table must have the columns described in "CREATE_COL_REM Procedure". INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for rem_table_name, these columns are removed from the mining data. If you do not specify a value for rem_table_name, these unbinned columns remain in the data. |
Table 48-20  (Cont.) INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant C=3.49/0.9:

   \[N = \text{floor}(\text{power}(\text{COUNT}, 1/3) \times (\text{max-min})/(c \times \text{dev}))\]

   If the sample_size parameter is specified, it is used instead of COUNT.

   See Oracle Database SQL Language Reference for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.

3. INSERT_AUTOBIN_NUM_EQWIDTH uses absolute values to compute the number of bins. The sign of the parameters bin_num, max_bin_num, and sample_size has no effect on the result.

4. In computing the number of bins, INSERT_AUTOBIN_NUM_EQWIDTH evaluates the following criteria in the following order:
   a. The minimum number of bins (bin_num)
   b. The maximum number of bins (max_bin_num)
   c. The maximum number of bins for integer columns, calculated as the number of distinct values in the range \(\text{max-min} + 1\).

5. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:

   For a value of 308.162:
   - when round_num = 1   result is 300
   - when round_num = 2   result is 310
   - when round_num = 3   result is 308
   - when round_num = 0   result is 308.162
   - when round_num = -1  result is 308.16
   - when round_num = -2  result is 308.2

Examples

In this example, INSERT_AUTOBIN_NUM_EQWIDTH computes the bin boundaries for the cust_year_of_birth column in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table. The CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

CREATE OR REPLACE VIEW mining_data AS

48.6.11 INSERT_BIN_CAT_FREQ Procedure

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

INSERT_BIN_CAT_FREQ bins all the CHAR and VARCHAR2 columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (bin_table_name IN VARCHAR2,
data_table_name IN VARCHAR2,
bin_num IN PLS_INTEGER DEFAULT 9,
exclude_list IN COLUMN_LIST DEFAULT NULL,
default_num IN PLS_INTEGER DEFAULT 2,
bin_support IN NUMBER DEFAULT NULL,
bin_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 48-21 INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>

<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>VAL VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>BIN VARCHAR2(4000)</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
</tbody>
</table>
Table 48-21 (Cont.) INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| bin_num         | The number of bins to fill using frequency-based binning. The total number of bins will be $bin_num + 1$. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin.  

   The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for $bin_num$. The negative sign causes the binning order to be from lowest to highest.

   If the total number of distinct values (classes) in the column is less than $bin_num$, then a separate bin will be created for each value and the default bin will be empty.

   If you specify NULL or 0 for $bin_num$, no binning is performed.

   The default value of $bin_num$ is 9.  |
| exclude_list    | List of categorical columns to be excluded from the binning process. If you do not specify exclude_list, all categorical columns in the data source are binned.  

   The format of exclude_list is:  

   `dbms_data_mining_transform.COLUMN_LIST('col1', 'col2', ... 'coln')`  |
| default_num     | The number of class occurrences (rows of the same class) required for assignment to the default bin  

   By default, $default_num$ is the minimum number of occurrences required for assignment to the default bin. For example, if $default_num$ is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for $default_num$. For example, if $default_num$ is -3 and a given class occurs only once, it will be assigned to the default bin, but a class that occurs four or more times will not be included.

   If you specify NULL or 0 for $default_num$, there are no requirements for assignment to the default bin.

   The default value of $default_num$ is 2.  |
| bin_support     | The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. $bin_support$ is expressed as a fraction of the total number of rows.

   By default, $bin_support$ is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify .2 for $bin_support$, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change $bin_support$ from a minimum percentage to a maximum percentage by specifying a negative number for $bin_support$. For example, if there are twenty rows of data and you specify -.2 for $bin_support$, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin.

   Classes that occur less than a positive $bin_support$ or more than a negative $bin_support$ will be assigned to the default bin.

   If you specify NULL or 0 for $bin_support$, then there is no support requirement for frequency-based binning.

   The default value of $bin_support$ is NULL. |
Table 48-21  (Cont.) INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about categorical data.

2. If values occur with the same frequency, INSERT_BIN_CAT_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

Examples

1. In this example, INSERT_BIN_CAT_FREQ computes the bin boundaries for the cust_postal_code and cust_city columns in sh_customers and inserts the transformations in a transformation definition table. The STACK_BIN_CAT Procedure creates a transformation list from the contents of the definition table, and the CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

   The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_city
FROM sh_customers;

DESCRIBE mining_data

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>

        xform_list    => city_xform);  
    dbms_data_mining.CRE...
2. The binning order in example 1 is from most frequent to least frequent. The following example shows reverse order binning (least frequent to most frequent). The binning order is reversed by setting \texttt{bin\_num} to -4 instead of 4.

```
BEGIN
    dbms_data_mining_transform.CREATE_BIN_CAT(
        bin_table_name   => 'bin_tbl_reverse');
    dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (  
        bin_table_name   => 'bin_tbl_reverse',
        data_table_name  => 'mining\_data',
        bin_num          => -4);
END;
/
```

```

### 48.6.12 INSERT\_BIN\_NUM\_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

\texttt{INSERT\_BIN\_NUM\_EQWIDTH} computes a specified number of bins \((n)\) and assigns \((\text{max-min})/n\) values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the \texttt{INSERT\_AUTOBIN\_NUM\_EQWIDTH} Procedure.

\texttt{INSERT\_BIN\_NUM\_EQWIDTH} bins all the \texttt{NUMBER} and \texttt{FLOAT} columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```
DBMS\_DATA\_MINING\_TRANSFORM.INSERT\_BIN\_NUM\_EQWIDTH (  
    bin_table_name   IN VARCHAR2,
    data_table_name  IN VARCHAR2,
    bin_num          IN PLS\_INTEGER DEFAULT 10,
    exclude_list     IN COLUMN\_LIST DEFAULT NULL,
    round_num        IN PLS\_INTEGER DEFAULT 6,
    bin\_schema\_name IN VARCHAR2 DEFAULT NULL,
    data\_schema\_name IN VARCHAR2 DEFAULT NULL);
```
## Parameters

### Table 48-22  INSERT_BIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>round_num</td>
<td>Specifies how to round the number in the VAL column of the transformation definition table.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

### Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:

   **For a value of 308.162:**
   - when round_num = 1  result is 300
   - when round_num = 2  result is 310
   - when round_num = 3  result is 308
   - when round_num = 0  result is 308.162
   - when round_num = -1 result is 308.16
   - when round_num = -2 result is 308.2
3. **INSERT_BIN_NUM_EQWIDTH** ignores columns with all NULL values or only one unique value.

**Examples**

In this example, **INSERT_BIN_NUM_EQWIDTH** computes the bin boundaries for the **affinity_card** column in **mining_data_build** and inserts the transformations in a transformation definition table. The **STACK_BIN_NUM Procedure** creates a transformation list from the contents of the definition table. The **CREATE_MODEL Procedure** embeds the transformation list in a new model called **glm_model**.

The transformation and reverse transformation expressions embedded in **glm_model** are returned by the **GET_MODEL_TRANSFORMATIONS Function**.

```sql
CREATE OR REPLACE VIEW mining_data AS
BEGIN
    dbms_data_mining_transform.CREATE_BIN_NUM(
        bin_table_name   => 'bin_tbl');
    dbms_data_mining_transform.INSERT_BIN_NUM_EQWIDTH (bin_table_name   => 'bin_tbl',
                                                        data_table_name  => 'mining_data',
                                                        bin_num          => 4,
                                                        exclude_list     => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/
```

```sql
set numwidth 10
column val off
column col format a20
column bin format a10
SELECT col, val, bin FROM bin_tbl
ORDER BY val ASC;
```

<table>
<thead>

48.6.13 INSERT_BIN_NUM_QTILE Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL NTILE function to order the data and divide it equally into the specified number of bins (quantiles).

INSERT_BIN_NUM_QTILE bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (bin_table_name IN VARCHAR2,
    data_table_name IN VARCHAR2,
Parameters

Table 48-23  INSERT_BIN_NUM_QTILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>VAL NUMBER</td>
</tr>
<tr>
<td></td>
<td>BIN VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_QTILE.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned.</td>
</tr>
<tr>
<td></td>
<td>The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. After dividing the data into quantiles, the NTILE function distributes any remainder values one for each quantile, starting with the first. See Oracle Database SQL Language Reference for details.

3. Columns with all NULL values are ignored by INSERT_BIN_NUM_QTILE.

Examples

In this example, INSERT_BIN_NUM_QTILE computes the bin boundaries for the cust_year_of_birth and cust_credit_limit columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in STACK_VIEW. The view is for display purposes only; it cannot be used to embed the transformations in a model.

48.6.14 INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as supervised binning. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
    num_table_name        IN VARCHAR2,        
    cat_table_name        IN VARCHAR2,        
    data_table_name       IN VARCHAR2,        
    target_column_name    IN VARCHAR2,        
    max_bin_num           IN PLS_INTEGER  DEFAULT 1000, 
    exclude_list          IN COLUMN_LIST  DEFAULT NULL, 
    num_schema_name       IN VARCHAR2     DEFAULT NULL, 
    cat_schema_name       IN VARCHAR2     DEFAULT NULL, 
    data_schema_name      IN VARCHAR2     DEFAULT NULL, 
    rem_table_name        IN VARCHAR2     DEFAULT NULL, 
    rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. See Oracle Data Mining User's Guide for details about numerical and categorical data.
2. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.
3. See Oracle Data Mining Concepts to learn more about decision trees in Oracle Data Mining

**Examples**

In this example, INSERT_BIN_SUPER computes the bin boundaries for predictors of `cust_credit_limit` and inserts the transformations in transformation definition tables.
One predictor is numerical, the other is categorical. (INSERT_BIN_SUPER determines that the cust_postal_code column is not a significant predictor.) STACK procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views MINING_DATA_STACK_NUM and MINING_DATA_STACK_CAT. The views are for display purposes only; they cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_marital_status,
  cust_postal_code, cust_credit_limit
  FROM sh.customers;

48.6.15 INSERT_CLIP_TRIM_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_TRIM_TAIL computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the INSERT_CLIP_WINSOR_TAIL Procedure.

INSERT_CLIP_TRIM_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the clipping process. If you do not specify exclude_list, all numerical columns in the data are clipped. The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2','...','coln')</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of clip_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.

2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:
   - Count the number of non-null values, n, and sort them in ascending order
   - Calculate the number of outliers, t, as n*tail_frac
   - Define the lower boundary lcut as the value at position 1+floor(t)
   - Define the upper boundary rcut as the value at position n-floor(t)
     (The SQL FLOOR function returns the largest integer less than or equal to t.)
   - All values that are <= lcut or => rcut are designated as outliers.

INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.
INSERT_CLIP_WINSOR_TAIL assigns lcut to the low outliers and rcut to the high outliers.

Examples

In this example, INSERT_CLIP_TRIM_TAIL trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
   SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
   FROM sh.customers;

DESCRIBE mining_data
Name Null? Type
------------------------------------------- ------- --------------------
### 48.6.16 INSERT_CLIP_WINSOR_TAIL Procedure

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

**INSERT_CLIP_WINSOR_TAIL** computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the **INSERT_CLIP_TRIM_TAIL** Procedure.
INSERT_CLIP_WINSOR_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (  
    clip_table_name    IN VARCHAR2,  
    data_table_name    IN VARCHAR2,  
    tail_frac          IN NUMBER DEFAULT 0.025,  
    exclude_list       IN COLUMN_LIST DEFAULT NULL,  
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,  
    data_schema_name   IN VARCHAR2 DEFAULT NULL);  

Parameters

Table 48-26  INSERT_CLIP_WINSOR_TAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| clip_table_name    | Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required:  
  | COL VARCHAR2(30)  
  | LCUT NUMBER  
  | LVAL NUMBER  
  | RCUT NUMBER  
  | RVAL NUMBER  
  | CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_WINSOR_TAIL.  
| data_table_name    | Name of the table containing the data to be transformed                  |
| tail_frac          | The percentage of non-null values to be designated as outliers at each end of the data. For example, if tail_frac is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.  
  | If tail_frac is greater or equal to .5, no clipping occurs.  
  | The default value of tail_frac is 0.025.  
| exclude_list       | List of numerical columns to be excluded from the clipping process. If you do not specify exclude_list, all numerical columns in the data are clipped.  
  | The format of exclude_list is:  
  | dbms_data_mining_transform.COLUMN_LIST('col1','col2',  
  | ...'coln') |
| clip_schema_name   | Schema of clip_table_name. If no schema is specified, the current schema is used. |
| data_schema_name   | Schema of data_table_name. If no schema is specified, the current schema is used. |

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.
2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_WINSOR_TAIL and INSERT_CLIP_TRIM_TAIL. Both procedures compute the boundaries as follows:

- Count the number of non-null values, $n$, and sort them in ascending order
- Calculate the number of outliers, $t$, as $n \times \text{tail_frac}$
- Define the lower boundary $lcut$ as the value at position $1 + \text{floor}(t)$
- Define the upper boundary $rcut$ as the value at position $n - \text{floor}(t)$
  (The SQL FLOOR function returns the largest integer less than or equal to $t$.)
- All values that are $\leq lcut$ or $\geq rcut$ are designated as outliers.

INSERT_CLIP_WINSOR_TAIL assigns $lcut$ to the low outliers and $rcut$ to the high outliers.
INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

Examples

In this example, INSERT_CLIP_WINSOR_TAIL winsorizes 10% of the data in two columns (5% from the high end, and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

48.6.17 INSERT_MISS_CAT_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

INSERT_MISS_CAT_MODE replaces missing values in all VARCHAR2 and CHAR columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
  miss_table_name    IN VARCHAR2,
  data_table_name    IN VARCHAR2,
  exclude_list       IN COLUMN_LIST DEFAULT NULL,
  miss_schema_name   IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-27  INSERT_MISS_CAT_MODE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>exclude_list</td>
<td></td>
</tr>
<tr>
<td>miss_schema_name</td>
<td></td>
</tr>
<tr>
<td>data_schema_name</td>
<td></td>
</tr>
</tbody>
</table>

CREATE_MISS_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_CAT_MODE.

</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about categorical data.
2. If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

Example

In this example, INSERT_MISS_CAT_MODE computes missing value treatment for cust_city and inserts the transformation in a transformation definition table. The STACK_MISS_CAT Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

describe mining_data

    xform_list      => xforms);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list         => xforms,
    data_table_name    => 'mining_data',
    xform_view_name    => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT
--------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_YEAR_OF_BIRTH",NVL("CUST_CITY",'Los Angeles') "CUST_CITY"
FROM mining_data

48.6.18 INSERT_MISS_NUM_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and
inserts the transformation definitions in a transformation definition table.

INSERT_MISS_NUM_MEAN replaces missing values in all NUMBER and FLOAT columns in
the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
  miss_table_name    IN VARCHAR2,
  data_table_name    IN VARCHAR2,
  exclude_list       IN COLUMN_LIST DEFAULT NULL,
  round_num          IN PLS_INTEGER DEFAULT 6,
  miss_schema_name   IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
Parameters

<tr>
<td></td>
<td>schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. If you wish to replace numerical missing values with a value other than the mean, you can edit the transformation definition table.

See Also:

Oracle Data Mining User’s Guide for information about default missing value treatment in Oracle Data Mining

Example

In this example, INSERT_MISS_NUM_MEAN computes missing value treatment for cust_year_of_birth and inserts the transformation in a transformation definition table. The STACK_MISS_NUM Procedure creates a transformation list from the contents of the definition table.
The SQL expression that computes the transformation is shown in the view
MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed
the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

DESCRIBE mining_data

48.6.19 INSERT_NORM_LIN_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[ shift = \text{min} \]
\[ scale = \text{max} - \text{min} \]

Normalization is computed as:

\[ x_{\text{new}} = \frac{x_{\text{old}} - shift}{scale} \]

INSERT_NORM_LIN_MINMAX rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX(
    norm_table_name   IN VARCHAR2,
    data_table_name   IN VARCHAR2,
    exclude_list      IN COLUMN_LIST DEFAULT NULL,
    round_num         IN PLS_INTEGER DEFAULT 6,
    norm_schema_name  IN VARCHAR2 DEFAULT NULL,
    data_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-29 INSERT_NORM_LIN_MINMAX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td>data_table_name</td>
<td>IN VARCHAR2,</td>
</tr>
<tr>
<td>exclude_list</td>
<td>IN COLUMN_LIST DEFAULT NULL,</td>
</tr>
<tr>
<td>round_num</td>

</tr>
</tbody>
</table>

### Usage Notes

See *Oracle Data Mining User's Guide* for details about numerical data.

### Examples

In this example, `INSERT_NORM_LIN_MINMAX` normalizes the `cust_year_of_birth` column and inserts the transformation in a transformation definition table. The `STACK_NORM_LIN Procedure` creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_gender, cust_year_of_birth
FROM sh.customers;

describe mining_data
Name                                      Null?    Type
----------------------------------------- -------- ----------------
CUST_ID                                   NOT NULL NUMBER
CUST_GENDER                                NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                         NOT NULL NUMBER(4)

BEGIN
    dbms_data_mining_transform.CREATE_NORM_LIN(
        norm_table_name  => 'norm_tbl');
    dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
        norm_table_name  => 'norm_tbl',
        data_table_name  => 'mining_data',
        exclude_list     => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
        round_num        => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>SHIFT</th>
<th>SCALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1910</td>
<td>77</td>
</tr>
</tbody>
</table>

DECLARE
    xforms    dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_NORM_LIN (}
```
norm_table_name    => 'norm_tbl',
xform_list        => xforms);
dbms_data_mining_transform.XFORM_STACK (    
xform_list         => xforms,  
data_table_name    => 'mining_data',  
xform_view_name    => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT

SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRTH" FROM mining_data

48.6.20 INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_SCALE computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[
\begin{align*}
\text{shift} & = 0 \\
\text{scale} & = \max(\abs{\max}, \abs{\min})
\end{align*}
\]

Normalization is computed as:

\[
\text{x_new} = \frac{\text{x_old}}{\text{scale}}
\]

INSERT_NORM_LIN_SCALE rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (    
norm_table_name IN VARCHAR2,    
data_table_name IN VARCHAR2,    
exclude_list IN COLUMN_LIST DEFAULT NULL,    
round_num IN PLS_INTEGER DEFAULT 6,    
norm_schema_name IN VARCHAR2 DEFAULT NULL,    
data_schema_name IN VARCHAR2 DEFAULT NULL);
Parameters

Table 48-30  INSERT_NORM_LIN_SCALE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| norm_table_name   | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:  
|                   | COL VARCHAR2(30) |
|                   | SHIFT NUMBER     |
|                   | SCALE NUMBER     |
|                   | CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_SCALE. |
| data_table_name   | Name of the table containing the data to be transformed                                                                                     |
| exclude_list      | List of numerical columns to be excluded from normalization. If you do not specify exclude_list, all numerical columns are transformed.  
|                   | The format of exclude_list is:                                                           |
|                   | dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln') |
| round_num         | The number of significant digits to use for scale. The default number is 6.                                                              |
| norm_schema_name  | Schema of norm_table_name. If no schema is specified, the current schema is used.                                                          |
| data_schema_name  | Schema of data_table_name. If no schema is specified, the current schema is used.                                                          |

Usage Notes

See Oracle Data Mining User’s Guide for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_SCALE normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_gender, cust_year_of_birth
FROM sh.customers;

DESCRIBE mining_data
Name Null? Type
------------------------------- -------- ---------------
CUST_ID NOT NULL NUMBER
CUST_GENDER NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH NOT NULL NUMBER(4)
BEGIN
  dbms_data_mining_transform.CREATE_NORM_LIN(
      norm_table_name => 'norm_tbl');
  dbms_data_mining_transform.INSERT_NORM_LIN_SCALE(
      norm_table_name => 'norm_tbl',
      data_table_name => 'mining_data',
      exclude_list     => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
      round_num        => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>SHIFT</th>
<th>SCALE</th>
</tr>

SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-0)/1990 "CUST_YEAR_OF_BIRTH" FROM mining_data

48.6.21 INSERT_NORM_LIN_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

`INSERT_NORM_LIN_ZSCORE` computes the mean and the standard deviation from the data and sets the value of `shift` and `scale` as follows:

\[
\text{shift} = \text{mean} \\
\text{scale} = \text{stddev}
\]

Normalization is computed as:

\[
\text{x}_{\text{new}} = (\text{x}_{\text{old}} - \text{shift})/\text{scale}
\]

`INSERT_NORM_LIN_ZSCORE` rounds the value of `scale` to a specified number of significant digits before storing it in the transformation definition table.

`INSERT_NORM_LIN_ZSCORE` normalizes all the `NUMBER` and `FLOAT` columns in the data unless you specify a list of columns to ignore.
Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the <a href="#">CREATE_NORM_LIN Procedure</a> to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_ZSCORE.</td>
</tr>
<tr>

--------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-1960)/15 "CUST_YEAR_OF_BIRT H" FROM mining_data

48.6.22 SET_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression.

The array can be used for specifying a transformation expression that is too long to be used with the SET_TRANSFORM Procedure.

The GET_EXPRESSION Function returns a row in the array.
When you use **SET_EXPRESSION** to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

**Syntax**

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
    expression    IN OUT NOCOPY EXPRESSION_REC,
    chunk                       VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (<strong>EXPRESSION_REC</strong>) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a <strong>VARCHAR2</strong> array and index fields for specifying upper and lower boundaries within the array. There are two <strong>EXPRESSION_REC</strong> fields within a transformation record (<strong>TRANSFORM_REC</strong>): one for the transformation expression; the other for the reverse transformation expression. See Table 48-1 for a description of the <strong>EXPRESSION_REC</strong> type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A <strong>VARCHAR2</strong> chunk (row) to be appended to <strong>expression</strong>.</td>
</tr>
</tbody>
</table>

**Notes**

1. You can pass **NULL** in the **chunk** argument to **SET_EXPRESSION** to clear the previous chunk. The default value of **chunk** is **NULL**.
2. See "About Transformation Lists".
3. See "Operational Notes".

**Examples**

In this example, two calls to **SET_EXPRESSION** construct a transformation expression and two calls construct the reverse transformation.

```
Note:

This example is for illustration purposes only. It shows how **SET_EXPRESSION** appends the text provided in **chunk** to the text that already exists in **expression**. The **SET_EXPRESSION** procedure is meant for constructing very long transformation expressions that cannot be specified in a **VARCHAR2** argument to **SET_TRANSFORM**.

Similarly while transformation lists are intended for embedding in a model, the transformation list **v_xlst** is shown in an external view for illustration purposes.
```

```
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
```
FROM sh.customers;

DECLARE
  v_expr dbms_data_mining_transform.EXPRESSION_REC;
  v_rexp dbms_data_mining_transform.EXPRESSION_REC;
  v_xrec dbms_data_mining_transform.TRANSFORM_REC;
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST :=
    dbms_data_mining_transform.TRANSFORM_LIST(NULL);
BEGIN
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION  => v_expr,
    CHUNK       => '("CUST_YEAR_OF_BIRTH"-1910)');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION  => v_expr,
    CHUNK       => '/77');
  dbms_data_mining_transform.SET_EXPRESSION(

====
48.6.23 SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list               IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name           VARCHAR2,
    attribute_subname        VARCHAR2,
    expression               VARCHAR2,
    reverse_expression       VARCHAR2,
    attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-33  SET_TRANSFORM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 48-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be transformed</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression that specifies the transformation of the attribute.</td>
</tr>
<tr>
<td>reverse_expression</td>
<td>A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)</td>
</tr>
<tr>
<td>attribute_spec</td>
<td>One or more keywords that identify special treatment for the attribute during model build. Values are:</td>
</tr>
<tr>
<td></td>
<td>• NOPREP — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect.</td>
</tr>
<tr>
<td></td>
<td>• TEXT — Causes the attribute to be treated as unstructured text data</td>
</tr>
<tr>
<td></td>
<td>• FORCE_IN — Forces the inclusion of the attribute in the model build. Applies only to GLM models with feature selection enabled (ftr_selection_enable = yes). Feature selection is disabled by default.</td>
</tr>
</tbody>
</table>

If the model is not using GLM with feature selection, this value has no effect.

See “Specifying Transformation Instructions for an Attribute” in Oracle Data Mining User's Guide for more information about attribute_spec.

Usage Notes

1. See the following relevant sections in ”Operational Notes”:
   • About Transformation Lists
   • Nested Data Transformations
2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column (CREATE_COL_REM Procedure and STACK_COL_REM Procedure).

### 48.6.24 STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
    bin_table_name     IN            VARCHAR2,
    xform_list         IN OUT NOCOPY TRANSFORM_LIST,
    literal_flag       IN            BOOLEAN  DEFAULT FALSE,
    bin_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 48-4.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 48-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

**Examples**

This example shows how a binning transformation for the categorical column `cust_postal_code` could be added to a stack called `mining_data_stack`. 
Note:

This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

CREATE or REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
  dbms_data_mining_transform.CREATE_BIN_CAT ('bin_cat_tbl');
  dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
    bin_table_name => 'bin_cat_tbl',
    data_table_name => 'mining_data',
    bin_num => 3);
END;
/
DECLARE
  MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.STACK_BIN_CAT (
    bin_table_name       => 'bin_cat_tbl',
    xform_list           =>  mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list           =>  mining_data_stack,
    data_table_name      => 'mining_data',
    xform_view_name      => 'mining_data_stack_view');
END;
/

-- Before transformation
column cust_postal_code format a16
SELECT * from mining_data
WHERE cust_id BETWEEN 100050 AND 100053
ORDER BY cust_id;

CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
---------- ---------------- -----------------
100050 76486                         1500
100051 73216                         9000
100052 69499                         5000
100053 45704                         7000

-- After transformation
SELECT * FROM mining_data_stack_view
WHERE cust_id BETWEEN 100050 AND 100053
ORDER BY cust_id;

CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
---------- ---------------- -----------------
100050 4                             1500
100051 1                             9000
100052 4                             5000
100053 4                             7000
48.6.25 STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (  
    bin_table_name IN VARCHAR2,  
    xform_list IN OUT NOCOPY TRANSFORM_LIST,  
    literal_flag IN BOOLEAN DEFAULT FALSE,  
    bin_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See Table 48-35.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 48-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes". The following sections are especially relevant:
- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

Examples

This example shows how a binning transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.
Note:

This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 and 100100;
BEGIN
  dbms_data_mining_transform.create_bin_num ('bin_num_tbl');
  dbms_data_mining_transform.insert_bin_num_qtile (
    bin_table_name => 'bin_num_tbl',
    data_table_name => 'mining_data',
    bin_num => 5,
    exclude_list => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/
DECLARE

100052    69499
48.6.26 STACK_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
    clip_table_name     IN            VARCHAR2,
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    clip_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-36  STACK_CLIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_CLIP. To populate the table, you can use one of the INSERT procedures for clipping or you can write your own SQL. See Table 48-8</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 48-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of clip_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See DBMS_DATA_MINING_TRANSFORM Operational Notes. The following sections are especially relevant:

- “About Transformation Lists”
- “About Stacking”
- “Nested Data Transformations”

Examples

This example shows how a clipping transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.
Note:

This example invokes the `XFORM_STACK` Procedure to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See `INSERT_BIN_NUM_EQWIDTH Procedure` for an example.

```sql
CREATE OR REPLACE VIEW mining_data AS
