3 Syntax Rules for Configuration Files

3.1 Overview of Configuration File Syntax

3.2 Syntax Rules for Configuration Files

3.3 Network Character Set for Keywords

3.4 Character Set for Listener and Net Service Names

4 Protocol Address Configuration

4.1 Protocol Addresses
    4.1.1 ADDRESS
    4.1.2 ADDRESS_LIST

4.2 Protocol Parameters

4.3 Recommended Port Numbers

4.4 Port Number Limitations

5 Parameters for the sqlnet.ora File

5.1 Overview of Profile Configuration File

5.2 sqlnet.ora Profile Parameters
    5.2.1 ACCEPT_MD5_CERTS
    5.2.2 ACCEPT_SHA1_CERTS
    5.2.3 ADD_SSLV3_TO_DEFAULT
    5.2.4 EXADIRECT_FLOW_CONTROL
    5.2.5 EXADIRECT_RECV_POLL
    5.2.6 DEFAULT SDU SIZE
    5.2.7 DISABLE_OOB
    5.2.8 DISABLE_OOB_AUTO
    5.2.9 HTTPS_SSL_VERSION
    5.2.10 IPC.KEYPATH
    5.2.11 NAMES.DEFAULT_DOMAIN
5.2.53 SQLNET.KERBEROS5_REPLAY_CACHE 5-40
5.2.54 SQLNET.OUTBOUND_CONNECT_TIMEOUT 5-40
5.2.55 SQLNET.RADIUS_ALTERNATE 5-41
5.2.56 SQLNET.RADIUS_ALTERNATE_PORT 5-41
5.2.57 SQLNET.RADIUS_ALTERNATE_RETRIES 5-42
5.2.58 SQLNET.RADIUS_AUTHENTICATION 5-42
5.2.59 SQLNET.RADIUS_AUTHENTICATION_INTERFACE 5-43

   6.8.4 RECV_BUF_SIZE 6-11
7.2.7 SEND_BUF_SIZE

7.3 Connection Rate Limiter Parameters
7.3.1 CONNECTION_RATE_listener_name
7.3.2 RATE_LIMIT

7.4 Control Parameters
7.4.1 ADMIN_RESTRICTIONS_listener_name
7.4.2 ALLOW_MULTIPLE_REDIRECTS_listener_name
7.4.3 ENABLE_EXADIRECT_listener_name
7.4.4 CRS_NOTIFICATION_listener_name
7.4.5 DEDICATED_THROUGH_BROKER_LISTENER
7.4.6 DEFAULT_SERVICE_listener_name
7.4.7 INBOUND_CONNECT_TIMEOUT_listener_name
7.4.8 LOCAL_REGISTRATION_ADDRESS_listener_name
7.4.9 MAX_ALL_CONNECTIONS_listener_name
7.4.10 MAX_REG_CONNECTIONS_listener_name
7.4.11 REGISTRATION_EXCLUDED_NODES_listener_name
7.4.12 REGISTRATION_INVITED_NODES_listener_name
7.4.13 REMOTE_REGISTRATION_ADDRESS_listener_name
7.4.14 SAVE_CONFIG_ON_STOP_listener_name
7.4.15 SERVICE_RATE_listener_name
7.4.16 SSL_CLIENT_AUTHENTICATION
7.4.17 SSL_VERSION
7.4.18 SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name
7.4.19 USE_SID_AS_SERVICE_listener_name
7.4.20 VALID_NODE_CHECKING_REGISTRATION_listener_name
7.4.21 WALLET_LOCATION

7.5 ADR Diagnostic Parameters for Oracle Net Listener
7.5.1 ADR_BASE_listener_name
7.5.2 DIAG_ADR_ENABLED_listener_name
7.5.3 LOG_FILE_NUM_listener_name
7.5.4 LOG_FILE_SIZE_listener_name
7.5.5 LOGGING_listener_name
7.5.6 TRACE_LEVEL_listener_name
7.5.7 TRACE_TIMESTAMP_listener_name

7.6 Non-ADR Diagnostic Parameters for Oracle Net Listener
7.6.1 LOG_DIRECTORY_listener_name
7.6.2 LOG_FILE_listener_name
7.6.3 TRACE_DIRECTORY_listener_name
7.6.4 TRACE_FILE_listener_name
7.6.5 TRACE_FILEAGE_listener_name
7.6.6 TRACE_FILELEN_listener_name
7.6.7 TRACE_FILENO_listener_name 7-30

7.7 Class of Secure Transports Parameters 7-30
  7.7.1 SECURE_REGISTER_listener_name 7-31
  7.7.2 Using COST Parameters in Combination 7-31
  7.7.3 DYNAMIC_REGISTRATION_listener_name 7-32
  7.7.4 SECURE_PROTOCOL_listener_name 7-32
  7.7.5 SECURE_CONTROL_listener_name 7-33

8 Oracle Connection Manager Parameters

8.1 Overview of Oracle Connection Manager Configuration File 8-1
8.2 Oracle Connection Manager Parameters 8-3
  8.2.1 ADDRESS 8-5
  8.2.2 ASO_AUTHENTICATION_FILTER 8-5
  8.2.3 COMPRESSION 8-5
  8.2.4 COMPRESSION_LEVELS 8-6
  8.2.5 COMPRESSION_THRESHOLD 8-6
  8.2.6 CONNECTION_STATISTICS 8-7
  8.2.7 EVENT_GROUP 8-7
  8.2.8 EXPIRE_TIME 8-8
  8.2.9 IDLE_TIMEOUT 8-8
  8.2.10 INBOUND_CONNECT_TIMEOUT 8-9
  8.2.11 LOG_DIRECTORY 8-9
  8.2.12 LOG_FILE_NUM 8-9
  8.2.13 LOG_FILE_SIZE 8-10
  8.2.14 LOG_LEVEL 8-10
  8.2.15 MAX_ALL_CONNECTIONS 8-10
  8.2.16 MAX_CMCTL_SESSIONS 8-11
  8.2.17 MAX_CONNECTIONS 8-11
  8.2.18 MAX_GATEWAY PROCESSES 8-11
  8.2.19 MAX_REG_CONNECTIONS 8-11
  8.2.20 MIN_GATEWAY PROCESSES 8-12
  8.2.21 OUTBOUND_CONNECT_TIMEOUT 8-12
  8.2.22 PASSWORD_instance_name 8-12
  8.2.23 REGISTRATION_EXCLUDED_NODES 8-12
  8.2.24 REGISTRATION_INVITED_NODES 8-13
  8.2.25 RULE 8-13
  8.2.26 SDU 8-15
  8.2.27 SERVICE_RATE 8-15
  8.2.28 SESSION_TIMEOUT 8-16
  8.2.29 TRACE_FILE 8-16
8.2.30  TRACE_FILELEN  8-16
8.2.31  TRACE_FILENO  8-16
8.2.32  TRACE_LEVEL  8-16
8.2.33  TRACE_TIMESTAMP  8-17
8.2.34  USE_SID_AS_SERVICE  8-17
8.2.35  VALID_NODE_CHECKING_REGISTRATION  8-18
8.2.36  WALLET_LOCATION  8-18

8.3  Oracle Connection Manager in Traffic Director Mode Parameters  8-20
  8.3.1  SERVICE_AFFINITY  8-21
  8.3.2  TDM  8-21
  8.3.3  TDM_BIND_THREAD  8-22
  8.3.4  TDM_DATATYPE_CHECK  8-22
  8.3.5  TDM_PRCP_MAX_CALL_WAIT_TIME  8-23
  8.3.6  TDM_PRCP_MAX_TXN_CALL_WAIT_TIME  8-23
  8.3.7  TDM_SHARED_THREADS_MAX  8-24
  8.3.8  TDM_SHARED_THREADS_MIN  8-24
  8.3.9  TDM_THREADING_MODE  8-24

8.4  ADR Diagnostic Parameters for Oracle Connection Manager  8-25
  8.4.1  ADR_BASE  8-25
  8.4.2  DIAG_ADR_ENABLED  8-26
  8.4.3  LOG_LEVEL  8-26
  8.4.4  TRACE_LEVEL  8-27
  8.4.5  TRACE_TIMESTAMP  8-27

8.5  Non-ADR Diagnostic Parameters for Oracle Connection Manager  8-28
  8.5.1  LOG_DIRECTORY  8-28
  8.5.2  TRACE_DIRECTORY  8-29
  8.5.3  TRACE_FILELEN  8-29
  8.5.4  TRACE_FILENO  8-29

9  Directory Usage Parameters in the ldap.ora File  9-1
  9.1  Overview of Directory Server Usage File  9-1
  9.2  Directory Usage Parameters  9-1
    9.2.1  DEFAULT_ADMIN_CONTEXT  9-2
    9.2.2  DIRECTORY_SERVER_TYPE  9-2
    9.2.3  DIRECTORY_SERVERS  9-2

Glossary

Index
Preface

Review this publication to obtain a complete listing and description of control utility commands and configuration file parameters that you can use to manage Oracle Net Services components.

• Audience
• Documentation Accessibility
• Diversity and Inclusion
• Related Documents
• Conventions

Audience

Oracle Database Net Services Reference is intended for network administrators who are responsible for configuring and administering network components.

To use this document, you should be familiar with the networking concepts and configuration tasks described in Oracle Database Net Services Administrator's Guide.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.
Related Documents

For additional information, see the following Oracle resources:

- *Oracle Database Net Services Administrator's Guide*
- Online Help for Oracle Net Services tools and utilities
- Oracle Database 19c documentation set
- *Oracle Database Global Data Services Concepts and Administration Guide*

A glossary of Oracle Net Services terms is available in *Oracle Database Net Services Administrator's Guide*.

Many books in the documentation set use the sample schemas of the seed database, which is installed by default when you install Oracle. Refer to *Oracle Database Sample Schemas* for additional information about how these schemas were created and how you can use them yourself.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><code>monospace</code></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
New Features

Review new features available with Oracle Database 19c.

**COLOCATION_TAG Parameter**

The `COLOCATION_TAG` parameter is an alphanumeric string that you can use with the `CONNECT_DATA` parameter of the TNS connect string. When you set the `COLOCATION_TAG` parameter, it attempts to route clients with the same `COLOCATION_TAG` to the same database instance.

Colocation of sessions on the same instance can help decrease inter-instance communication and thereby increase performance for workload that benefits from being executed in the same instance.

**KERBEROS5_PRINCIPAL Parameter**

When you configure Kerberos authentication for an Oracle Database client, you can use the `KERBEROS5_PRINCIPAL` parameter to specify multiple Kerberos principals with a single Oracle Database client. This is an optional parameter. When specified, it is used to verify if the principal name in the credential cache matches the parameter value.

Use this parameter with the `CONNECT_DATA` parameter. Alternatively, you can specify `KERBEROS5_CC_NAME` in the connect string along with the `KERBEROS5_PRINCIPAL` parameter to connect as a different Kerberos principal. Each Kerberos principal must have a valid credential cache.

**Related Topics**

- **COLOCATION_TAG**
- **KERBEROS5_PRINCIPAL**
  - Use this parameter to specify Kerberos principals.
- **SQLNET.KERBEROS5_CC_NAME**
  - Use the `sqlnet.ora` parameter `SQLNET.KERBEROS5_CC_NAME` to specify the complete path name to the Kerberos credentials cache file.
Deprecated Features

These features are deprecated in this release and may be desupported in a future release.

**Deprecation of the SERVICE_NAMES Initialization Parameter**

Starting with Oracle Database 19c, customer use of the `SERVICE_NAMES` parameter is deprecated. It can be desupported in a future release.

The use of the `SERVICE_NAMES` parameter is no longer actively supported. It must not be used for high availability (HA) deployments. It is not supported to use service names parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

To manage your services, Oracle recommends that you use the `SRVCTL` or `GDSCTL` command line utilities, or the `DBMS_SERVICE` package.

**Note:**

The `SERVICE_NAMES` parameter that is deprecated is different from the `SERVICE_NAME` parameter in Oracle Net connect strings. The `SERVICE_NAME` parameter is still valid.

**Deprecation of Weak Native Network Encryption and Integrity Algorithms**

The `DES`, `DES40`, `3DES112`, `3DES168`, `RC4_40`, `RC4_56`, `RC4_128`, `RC4_256`, and `MD5` algorithms are deprecated in this release.

As a result of this deprecation, Oracle recommends that you review your network encryption and integrity configuration to check if you have specified any of the deprecated weak algorithms.

To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

**Related Topics**

- **SQLNET.ALLOW_WEAK_CRYPTO**
  Use the `sqlnet.ora` Compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO` to configure your client-side network connection by reviewing the specified encryption and crypto-checksum algorithms.

- **SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS**
  Use the `sqlnet.ora` Compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS` to configure your server-side network connection by reviewing the specified encryption and crypto-checksum algorithms.
1 Listener Control Utility

This chapter describes the commands and associated syntax of the Listener Control utility. The terms “SQL*Net” and “Net Services” are used interchangeably throughout Oracle documentation and both these terms refer to the same functionality.

- **Listener Control Utility Overview**
- **SET and SHOW Commands of the Listener Control utility**
  The `SET` and `SHOW` commands enable you to alter and view listener configuration parameters.
- **Distributed Operations**
  The Listener Control utility can perform operations on a local or a remote listener.
- **Oracle Net Listener Security**
  Authentication for listener administration depends on whether you access the listener locally, or remotely.
- **Listener Control Utility Commands**
  Use the Listener Control utility commands to manage and configure listeners.

### 1.1 Listener Control Utility Overview

The Listener Control utility enables you to administer listeners. To perform basic management functions on one or more listeners, you can use the Listener Control utility commands. You can also view and change parameter settings.

The basic syntax of Listener Control utility commands is as follows:

```bash
lsnrctl command listener_name
```

In the preceding command, `listener_name` is the name of the listener that you want to administer. If you do not specify a specific listener in the command string, then the command is directed to the default listener name, `LISTENER`.

You can also issue Listener Control utility commands at the `LSNRCTL>` program prompt. To obtain the prompt, enter `lsnrctl` with no arguments at the operating system command line. When you run `lsnrctl`, the program is started. You can then enter the necessary commands from the program prompt. The basic syntax of issuing commands from `LSNRCTL>` program prompt is as follows:

```bash
lsnrctl
LSNRCTL> command listener_name
```

You can combine commands in a standard text file, and then run them as a sequence of commands. To run in batch mode, use the following format:

```bash
lsnrctl @file_name
```

To identify comments in the batch script, you can use either `REM` or `#`. All other lines are considered commands. Any commands that typically require confirmation do not require confirmation during batch processing.
For most commands, the Listener Control utility establishes an Oracle Net connection with the listener that is used to transmit the command. To initiate an Oracle Net connection to the listener, the Listener Control utility must obtain the protocol addresses for the named listener or a listener named LISTENER. This is done by resolving the listener name with one of the following mechanisms:

- listener.ora file in the directory specified by the TNS_ADMIN environment variable.
- listener.ora file in the ORACLE_HOME/network/admin directory.
- Naming method; for example, a tnsnames.ora file.

If none of the preceding mechanisms resolve the listener name, then the Listener Control utility uses the default listener name LISTENER, resolves the host name IP address, and uses port 1521.

The Listener Control utility supports the following types of commands:

- Operational commands, such as START, and STOP.
- Modifier commands, such as SET TRC_LEVEL.
- Informational commands, such as STATUS, and SHOW LOG_FILE.

Related Topics

- **START**
  The Listener Control utility command START starts the named listener.

- **STOP**
  The Listener Control utility command STOP stops the named listener.

- **SET TRC_LEVEL**
  The Listener Control utility command SET TRC_LEVEL sets a specific level of tracing for the listener.

- **STATUS**
  The Listener Control utility command STATUS displays basic status information about a listener.

### 1.2 SET and SHOW Commands of the Listener Control utility

The **SET** and **SHOW** commands enable you to alter and view listener configuration parameters.

You can use the **SET** command to alter parameter values for a specified listener. You set the name of the listener to administer using the **SET CURRENT_LISTENER** command. Parameter values remain in effect until the listener is shut down. If you want these settings to persist, then use the **SAVE_CONFIG** command to save changes to the listener.ora file.

You can use the **SHOW** command to display the current value of a configuration setting.

**Related Topics**

- **SET**
  The Listener Control utility command **SET** alters the parameter values for the listener.
1.3 Distributed Operations

The Listener Control utility can perform operations on a local or a remote listener.

Set Up a Computer to Remotely Administer a Listener

Ensure that the Listener Control utility (lsnrctl) executable is installed in the ORACLE_HOME/bin directory. You can resolve the name of the listener that you want to administer either through a listener.ora file, or by a naming method.

When you administer a listener remotely, you can issue all commands except START. However, the Listener Control utility can only start the listener on the same computer from which the utility is running.

When issuing commands, specify the listener name as an argument. If you omit the listener name in the command, then the listener name set with the command SET CURRENT_LISTENER is used. If the listener name is not set with that command, then the command is directed to the default listener name, LISTENER.

Example 1-1 Issuing Commands Using the Listener Control Utility

LSNRCTL> SERVICES lsnr

1.4 Oracle Net Listener Security

Authentication for listener administration depends on whether you access the listener locally, or remotely.

Local listener administration is secure through local operating system authentication, which restricts listener administration to the user account that started the listener, or to the super user. By default, remote listener administration is disabled.

Oracle recommends that you perform listener administration in the default mode, and access the system remotely using a remote login. When you administer the listener remotely, use either Oracle Enterprise Manager Cloud Control or Secure Shell (SSH) to access the remote host.

1.5 Listener Control Utility Commands

Use the Listener Control utility commands to manage and configure listeners.
• **EXIT**
The Listener Control utility command `EXIT` exits from the Listener Control utility, and returns you to the operating system prompt.

• **HELP**
The Listener Control utility command `HELP` provides a list of all the Listener Control utility commands, or provides syntax help for a particular Listener Control utility command.

• **QUIT**
The Listener Control utility command `QUIT` exits from the Listener Control utility and returns you to the operating system prompt.

• **RELOAD**
The Listener Control utility command `RELOAD` reloads the `listener.ora` file, so that you can add or change statically configured services without stopping the listener.

• **SAVE_CONFIG**
The Listener Control utility command `SAVE_CONFIG` save the current configuration state of the listener to the `listener.ora` file.

• **SERVICES**
The Listener Control utility command `SERVICES` returns detailed information about the database services, instances, and service handlers to which the listener forwards client connection requests.

• **SET**
The Listener Control utility command `SET` alters the parameter values for the listener.

• **SET CURRENT_LISTENER**
The Listener Control utility command `SET CURRENT_LISTENER` sets the name of the listener that you want to administer.

• **SET DISPLAYMODE**
The Listener Control utility command `SET DISPLAYMODE`

• **SET INBOUND_CONNECT_TIMEOUT**
The Listener Control utility command `SET INBOUND_CONNECT_TIMEOUT` specifies the time, in seconds, for the client to complete its connect request to the listener after establishing the network connection.

• **SET LOG_DIRECTORY**
The Listener Control utility command `SET LOG_DIRECTORY` sets the destination directory where the listener log file is written.

• **SET LOG_FILE**
The Listener Control utility command `SET LOG_FILE` sets the name for the listener log file.

• **SET LOG_STATUS**
The Listener Control utility command `SET LOG_STATUS` turns listener logging on or off.

• **SET SAVE_CONFIG_ON_STOP**
The Listener Control utility command `SET SAVE_CONFIG_ON_STOP` specifies whether changes made to the parameter values for the listener by the `SET` command are saved to the `listener.ora` file at the time that the listener is stopped with the `STOP` command.
• **SET TRC_DIRECTORY**
The Listener Control utility command `SET TRC_DIRECTORY` sets the destination directory where the listener trace files are written.

• **SET TRC_FILE**
The Listener Control utility command `SET TRC_FILE` sets the name of the listener trace file.

• **SET TRC_LEVEL**
The Listener Control utility command `SET TRC_LEVEL` sets a specific level of tracing for the listener.

• **SHOW**
The Listener Control utility command `SHOW` displays the current parameter values for the listener.

• **SPAWN**
The Listener Control utility command `SPAWN` starts a program stored on the computer on which the listener is running, and that is listed with an alias in the `listener.ora` file.

• **START**
The Listener Control utility command `START` starts the named listener.

• **STATUS**
The Listener Control utility command `STATUS` displays basic status information about a listener.

• **STOP**
The Listener Control utility command `STOP` stops the named listener.

• **TRACE**
The Listener Control utility command `TRACE` sets tracing for the listener.

• **VERSION**
The Listener Control utility command `VERSION` displays the current version of the Listener Control utility.

### 1.5.1 EXIT

The Listener Control utility command `EXIT` exits from the Listener Control utility, and returns you to the operating system prompt.

**Purpose**
To exit from the Listener Control utility, and return to the operating system prompt.

**Prerequisites**
None

**Syntax**
From the Listener Control utility:

```
LSNRCTL> EXIT
```

**Arguments**
None
Usage Notes
This command is identical to the QUIT command.

Example
LSNRCTL> EXIT

1.5.2 HELP

The Listener Control utility command HELP provides a list of all the Listener Control utility commands, or provides syntax help for a particular Listener Control utility command.

Purpose
To provide a list of all the Listener Control utility commands or provide syntax help for a particular Listener Control utility command.

Prerequisites
None

Syntax
From the operating system:

lsnrctl HELP command

From the Listener Control utility:

LSNRCTL> HELP command

Arguments

command: The Listener Control utility command. Commands are shown in the following example output.

When you enter a command as an argument to HELP, the Listener Control utility displays information about how to use the command. When you enter HELP without an argument, the Listener Control utility displays a list of all the commands.

Example

LSNRCTL> HELP
The following operations are available
An asterisk (*) denotes a modifier or extended command:
exit
quit
reload
services
set*
show*
1.5.3 QUIT

The Listener Control utility command `QUIT` exits from the Listener Control utility and returns you to the operating system prompt.

Purpose
To exit from the Listener Control utility and return to the operating system prompt.

Prerequisites
None

Syntax
From the Listener Control utility:

```
LSNRCTL> QUIT
```

Arguments
None

Usage Notes
This command is identical to the `EXIT` command.

Example

```
LSNRCTL> QUIT
```

1.5.4 RELOAD

The Listener Control utility command `RELOAD` reloads the `listener.ora` file, so that you can add or change statically configured services without stopping the listener.

Purpose
To reload the `listener.ora` file. This command enables you to add or change statically configured services without actually stopping the listener.

When you run this command, the database services, instances, service handlers, and listening endpoints previously registered dynamically with the listener are unregistered, and subsequently registered again.

To obtain a lightweight reload without dropping registration, use the option `-with_ha`. Using this option ensures that registered services remain available to clients during reload.
Prerequisites
None

Syntax
From the operating system:

lsnrctl RELOAD [-with_ha] listener_name

From the Listener Control utility:

LSNRCTL> RELOAD [-with_ha] listener_name

Arguments

listener_name: The listener name, if the default name of LISTENER is not used.

-with_ha: command option used with RELOAD that indicates that the reload of listener.ora is completed without dropping existing registrations.

Example

LSNRCTL> RELOAD
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521)))
The command completed successfully

1.5.5 SAVE_CONFIG

The Listener Control utility command SAVE_CONFIG save the current configuration state of the listener to the listener.ora file.

Purpose
To save the current configuration state of the listener, including trace level, trace file, trace directory, and logging to the listener.ora file. Any changes are stored in listener.ora, preserving formatting, comments, and case as much as possible. Before modification of the listener.ora file, a backup of the file, called listener.bak, is created.

Syntax

From the operating system:

lsnrctl SAVE_CONFIG listener_name

From the Listener Control utility:

LSNRCTL> SAVE_CONFIG listener_name
Arguments

`listener_name`: The listener name, if the default name of LISTENER is not used.

Usage Notes

This command enables you to save all runtime configuration changes to the `listener.ora` file.

Example

```
LSNRCTL> SAVE_CONFIG listener
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)
(PORT=1521)))
Saved LISTENER configuration parameters.
Listener Parameter File   /oracle/network/admin/listener.ora
Old Parameter File   /oracle/network/admin/listener.bak
The command completed successfully
```

1.5.6 SERVICES

The Listener Control utility command `SERVICES` returns detailed information about the database services, instances, and service handlers to which the listener forwards client connection requests.

Purpose

To obtain detailed information about the database services, instances, and service handlers (dispatchers and dedicated servers) to which the listener forwards client connection requests.

Prerequisites

None

Syntax

Arguments

From the operating system:

`lsnrctl SERVICES listener_name`

From the Listener Control utility:

`LSNRCTL> SERVICES listener_name`

`listener_name`: The listener name, if the default name of LISTENER is not used.

Usage Notes

The `SET DISPLAYMODE` command changes the format and the detail level of the output.
See Also:

Oracle Database Net Services Administrator's Guide for a complete description of SERVICES output

Example

This example shows SERVICES output in the default display mode. The output shows the following:

- An instance named sales belonging to two services, sales1.us.example.com and sales2.us.example.com, with a total of three service handlers.
- Service sales1.us.example.com is handled by one dispatcher only.
- Service sales2.us.example.com is handled by one dispatcher and one dedicated server, as specified by in the following output.

```
LSNRCTL> SERVICES
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
Services Summary...
Service "sales1.us.example.com" has 1 instance(s).
Instance "sales", status READY, has 1 handler(s) for this service...
   Handler(s):
      "D000" established:0 refused:0 current:0 max:10000 state:ready
      DISPATCHER <machine: sales-server, pid: 5696>
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=53411))
Service "sales2.us.example.com" has 1 instance(s).
Instance "sales", status READY, has 2 handler(s) for this service...
   Handler(s):
      "DEDICATED" established:0 refused:0 state:ready
      LOCAL SERVER
      "D001" established:0 refused:0 current:0 max:10000 state:ready
      DISPATCHER <machine: sales-server, pid: 5698>
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=52618))
The command completed successfully
```

Related Topics

- SET DISPLAYMODE
  The Listener Control utility command SET DISPLAYMODE

1.5.7 SET

The Listener Control utility command SET alters the parameter values for the listener.

Purpose

To alter the parameter values for the listener. Parameter value changes remain in effect until the listener is shut down. To make the changes permanent, use the SAVE_CONFIG command to save changes to the listener.ora file.
Prerequisites
None

Syntax
From the operating system:

```bash
lsnrctl SET parameter
```

From the Listener Control utility:

```bash
LSNRCTL> SET parameter
```

Arguments

`parameter`: A `SET` parameter to modify its configuration setting. Parameters are shown in the example output.

When you enter `SET` without an argument, the Listener Control utility displays a list of all the parameters.

Usage Notes

If you are using the `SET` commands to alter the configuration of a listener other than the default `LISTENER` listener, then use the `SET CURRENT_LISTENER` command to set the name of the listener to administer.

Example

```bash
LSNRCTL> SET
The following operations are available with set.
An asterisk (*) denotes a modifier or extended command.
current_listener
displaymode
inbound_connect_timeout
log_file
log_directory
log_status
rawmode
save_config_on_stop
trc_file
trc_directory
trc_level
```

Related Topics

- **SAVE_CONFIG**
  The Listener Control utility command `SAVE_CONFIG` save the current configuration state of the listener to the `listener.ora` file.

- **SET CURRENT_LISTENER**
  The Listener Control utility command `SET CURRENT_LISTENER` sets the name of the listener that you want to administer.
1.5.8 SET CURRENT_LISTENER

The Listener Control utility command \texttt{SET CURRENT_LISTENER} sets the name of the listener that you want to administer.

**Purpose**

To set the name of the listener that you want to administer. After you set the listener name with this command, you can issue subsequent commands that normally require \texttt{listener} without specifying the listener.

**Syntax**

From the Listener Control utility:

\texttt{LSNRCTL> SET CURRENT_LISTENER listener_name}

**Arguments**

\texttt{listener_name}: The listener name, if you are not using the default name \texttt{LISTENER}.

**Usage Notes**

When you specify a listener name using \texttt{SET CURRENT_LISTENER}, the Listener Control utility commands act on the listener name that you specify with this command. You do not have to continue to specify the name of the listener.

**Example**

\texttt{LSNRCTL> SET CURRENT_LISTENER lsnr}
\texttt{Current Listener is lsnr}

1.5.9 SET DISPLAYMODE

The Listener Control utility command \texttt{SET DISPLAYMODE}

**Purpose**

To change the format and level of detail for the \texttt{SERVICES} and \texttt{STATUS} commands.

**Syntax**

From the Listener Control utility:

\texttt{LSNRCTL> SET DISPLAYMODE \{compat | normal | verbose | raw\}}

**Arguments**

Specify one of the following modes:

\texttt{compat}: Output that is compatible with earlier releases of the listener.

\texttt{normal}: Output that is formatted and descriptive. Oracle recommends this mode.
verbose: All data received from the listener in a formatted and descriptive output.

raw: All data received from the listener without any formatting. This argument should be used only if recommended by Oracle Support Services.

Example

LSNRCTL> SET DISPLAYMODE normal
Service display mode is NORMAL

Related Topics

- **SERVICES**
  The Listener Control utility command `SERVICES` returns detailed information about the database services, instances, and service handlers to which the listener forwards client connection requests.

- **STATUS**
  The Listener Control utility command `STATUS` displays basic status information about a listener.

### 1.5.10 SET INBOUND_CONNECT_TIMEOUT

The Listener Control utility command `SET INBOUND_CONNECT_TIMEOUT` specifies the time, in seconds, for the client to complete its connect request to the listener after establishing the network connection.

**Purpose**

To specify the time, in seconds, for the client to complete its connect request to the listener after establishing the network connection.

If the listener does not receive the client request in the time specified, then it terminates the connection. In addition, the listener logs the IP address of the client and an ORA-12525:TNS: listener has not received client's request in time allowed error message to the listener.log file.

**See Also:**

*Oracle Database Net Services Administrator's Guide* for additional information about specifying the time out for client connections

**Syntax**

From the Listener Control utility:

LSNRCTL> SET INBOUND_CONNECT_TIMEOUT time

**Arguments**

*time*: The time in seconds. Default setting is 60 seconds.
Example

LSNRCTL> SET INBOUND_CONNECT_TIMEOUT 2
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "inbound_connect_timeout" set to 2
The command completed successfully.

1.5.11 SET LOG_DIRECTORY

The Listener Control utility command SET LOG_DIRECTORY sets the destination directory where the listener log file is written.

Purpose

To set destination directory where the listener log file is written. By default, the log file is written to the ORACLE_HOME/network/log directory.

Note:

This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and to use the log directory ORACLE_HOME/log/diag/product_type.

Prerequisites

None

Syntax

From the operating system:

lsnrctl SET LOG_DIRECTORY directory

From the Listener Control utility:

LSNRCTL> SET LOG_DIRECTORY directory

Arguments

directory: The directory path of the listener log file.

Example

LSNRCTL> SET LOG_DIRECTORY /usr/oracle/admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "log_directory" set to /usr/oracle/admin
The command completed successfully
1.5.12 SET LOG_FILE

The Listener Control utility command `SET LOG_FILE` sets the name for the listener log file.

**Purpose**

To set the name for the listener log file. By default, the log file name is `listener.log`.

**Note:**

This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory `ORACLE_HOME/log/diag/product_type`.

**Prerequisites**

None

**Syntax**

From the operating system:

```
lsnrctl SET LOG_FILE file_name
```

From the Listener Control utility:

```
LSNRCTL> SET LOG_FILE file_name
```

**Arguments**

`file_name`: The file name of the listener log.

**Example**

```
LSNRCTL> SET LOG_FILE list.log
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "log_file" set to list.log
The command completed successfully
```

1.5.13 SET LOG_STATUS

The Listener Control utility command `SET LOG_STATUS` turns listener logging on or off.

**Purpose**

To turn listener logging on or off.

**Prerequisites**

None
1.5.14 SET SAVE_CONFIG_ON_STOP

The Listener Control utility command SET SAVE_CONFIG_ON_STOP specifies whether changes made to the parameter values for the listener by the SET command are saved to the listener.ora file at the time that the listener is stopped with the STOP command.

Purpose

To specify whether changes made to the parameter values for the listener by the SET command are saved to the listener.ora file at the time that the listener is stopped with the STOP command.

When changes are saved, the Listener Control utility tries to preserve formatting, comments, and letter case. Before the command modifies the listener.ora file, it creates a backup of the file, called listener.bak.

To have all parameters saved immediately, use the SAVE_CONFIG command.

Syntax

From the operating system:

`lsnrctl SET SAVE_CONFIG_ON_STOP {on | off}`

From the Listener Control utility:

`LSNRCTL> SET SAVE_CONFIG_ON_STOP {on | off}`
Arguments

on: To save configuration to listener.ora.

off: To not save configuration to listener.ora.

Example

LSNRCTL> SET SAVE_CONFIG_ON_STOP on
LISTENER parameter "save_config_on_stop" set to ON
The command completed successfully

Related Topics

• SET
  The Listener Control utility command SET alters the parameter values for the listener.

• STOP
  The Listener Control utility command STOP stops the named listener.

• SAVE_CONFIG
  The Listener Control utility command SAVE_CONFIG save the current configuration state of
  the listener to the listener.ora file.

1.5.15 SET TRC_DIRECTORY

The Listener Control utility command SET TRC_DIRECTORY sets the destination directory where
the listener trace files are written.

Purpose

To set the destination directory where the listener trace files are written. By default, the trace
file are written to the \ORACLE_HOME\network\trace directory.

Note:

This command works only if Automatic Diagnostic Repository (ADR) is not enabled.
The default is for ADR to be enabled, and use the log directory
\ORACLE_HOME\log\diag\product_type.

Prerequisites

None

Syntax

From the operating system:

lsnrctl SET TRC_DIRECTORY directory
From the Listener Control utility:

LSNRCTL> SET TRC_DIRECTORY directory

Arguments

directory: The directory path of the listener trace files.

Example

LSNRCTL> SET TRC_DIRECTORY /usr/oracle/admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_directory" set to /usr/oracle/admin
The command completed successfully

1.5.16 SET TRC_FILE

The Listener Control utility command SET TRC_FILE sets the name of the listener trace file.

Purpose

To set the name of the listener trace file. By default, the trace file name is listener.trc.

Note:

This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory ORACLE_HOME/log/diag/product_type.

Prerequisites

None

Syntax

From the operating system:

lsnrctl SET TRC_FILE file_name

From the Listener Control utility:

LSNRCTL> SET TRC_FILE file_name

Arguments

file_name: The file name of the listener trace.
Example

LSNRCTL> SET TRC_FILE list.trc
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_file" set to list.trc
The command completed successfully

1.5.17 SET TRC_LEVEL

The Listener Control utility command SET TRC_LEVEL sets a specific level of tracing for the listener.

Purpose
To set a specific level of tracing for the listener.

Prerequisites
None

Syntax
From the operating system:

lsnrctl SET TRC_LEVEL level

From the Listener Control utility:

LSNRCTL> SET TRC_LEVEL level

Arguments

level: One of the following trace levels:

• off for no trace output
• user for user trace information
• admin for administration trace information
• support for Oracle Support Services trace information

Usage Notes
This command has the same functionality as the TRACE command.

Example

LSNRCTL> SET TRC_LEVEL admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_level" set to admin
The command completed successfully
Related Topics

• TRACE
  The Listener Control utility command TRACE sets tracing for the listener.

1.5.18 SHOW

The Listener Control utility command SHOW displays the current parameter values for the listener.

Purpose
To view the current parameter values for the listener.
All of the SET parameters have equivalent SHOW parameters.

Prerequisites
None

Syntax
From the operating system:

```bash
lsnrctl SHOW parameter
```

From the Listener Control utility:

```text
LSNRCTL> SHOW parameter
```

Arguments

```
parameter: A parameter whose configuration settings you want to review. Parameters are shown in the example output.
```

When you enter SHOW without an argument, the Listener Control utility displays a list of all the parameters.

Example

```text
LSNRCTL> SHOW
The following properties are available with SHOW:
An asterisk (*) denotes a modifier or extended command:
current_listener
displaymode
inbound_connect_timeout
log_file
log_directory
log_status
rawmode
save_config_on_stop
trc_file
trc_directory
trc_level
```
1.5.19 SPAWN

The Listener Control utility command SPAWN starts a program stored on the computer on which the listener is running, and that is listed with an alias in the listener.ora file.

Purpose

To start a program stored on the computer on which the listener is running, and that is listed with an alias in the listener.ora file.

Prerequisites

None

Syntax

From the operating system:

```
lsnrctl SPAWN listener_name alias (arguments='arg1,arg2,...')
```

From the Listener Control utility:

```
LSNRCTL> SPAWN listener_name alias (arguments='arg1,arg2,...')
```

Arguments

- `listener_name`: The listener name, if the default name of LISTENER is not used.
- `alias`: The alias of the program to be spawned off is specified by a listener.ora file entry, similar to the following:

```
alias = (PROGRAM=(NAME=)(ARGS=)(ENVS=))
```

For example:

```
nstest = (PROGRAM=(NAME=nstest)(ARGS=test1)(ENVS='ORACLE_HOME=/usr/oracle'))
```

Example

The nstest program, shown in the preceding section, can then be spawned off using the following command:

```
lsnrctl SPAWN listener_name nstest
```
1.5.20 START

The Listener Control utility command `START` starts the named listener.

**Purpose**

To start the named listener.

**Prerequisites**

The listener must not be running.

**Syntax**

From the operating system:

```
lsnrctl START listener_name
```

From the Listener Control utility:

```
LSNRCTL> START listener_name
```

**Note:**

On Microsoft Windows, if the database was installed with the Oracle Home User, then the utility can prompt for a password. The password is the operating system password for the Oracle Home User. The prompt is displayed only if the listener service does not exist, and it needs to be created as part of starting the listener.

**Arguments**

`listener_name`: The listener name, if the default name of `LISTENER` is not used.

**Usage Notes**

To start a listener configured in the `listener.ora` file with a name other than `LISTENER`, include that name.

For example, if the listener name is `tcp_lsnr`, enter:

```
lsnrctl START tcp_lsnr
```

From the Listener Control utility:

```
LSNRCTL> START tcp_lsnr
```
Example

LSNRCTL> START

Starting /private/sales_group/sales/bin/tnslsnr: please wait...

TNSLSNR for Linux: Version 18.0.0.0.0
System parameter file is $ORACLE_HOME/network/admin/listener.ora
Log messages written to $ORACLE_BASE/diag/tnslsnr/node_name/listener/alert/log.xml
Listening on: (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521)))
STATUS of the LISTENER

------------------------
Alias                     LISTENER
Version                   TNSLSNR for Linux: Version 18.0.0.0.0
Start Date                21-JAN-2018 21:50:49
Uptime                    0 days 0 hr. 0 min. 0 sec
Trace Level               off
Security                   ON: Local OS Authetication
SNMP                      OFF
Listener Parameter File   $ORACLE_HOME/network/admin/listener.ora
Listener Log File         $ORACLE_BASE/diag/tnslsnr/node_name/listener/alert/log.xml

Listening Endpoints Summary...
  (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
The listener supports no services
The command completed successfully

See Also:
Oracle Database Administrator's Reference for Microsoft Windows for information about the Oracle Home User

1.5.21 STATUS

The Listener Control utility command STATUS displays basic status information about a listener.

Purpose

To display basic status information about a listener, including a summary of listener configuration settings, listening protocol addresses, and a summary of services registered with the listener.
Prerequisites

None

Syntax

From the operating system:

lsnrctl STATUS listener_name

From the Listener Control utility:

LSNRCTL> STATUS listener_name

Arguments

listener_name: The listener name, if the default name of LISTENER is not used.

Usage Notes

The SET DISPLAYMODE command changes the format and level of the detail of the output.

See Also:

Oracle Database Net Services Administrator's Guide for a complete description of STATUS output

Example

The following example shows STATUS output in the default display mode. The output contains:

- Listener configuration settings
- Listening endpoints summary
- Services summary, which is an abbreviated version of the SERVICES command output

LSNRCTL> STATUS
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
STATUS of the LISTENER
------------------------
Alias                     LISTENER
Version                   TNSLSNR for Linux: Version 18.0.0.0 -
Production
Start Date                12-JAN-2018 12:02:00
Uptime                    0 days 0 hr. 5 min. 29 sec
Trace Level               support
Security                  OFF
SNMP                      OFF
Listener Parameter File   /oracle/network/admin/listener.ora
Listener Log File         /oracle/network/log/listener.log
Listener Trace File       /oracle/network/trace/listener.trc

Listening Endpoints Summary...
  (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
  (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
  (DESCRIPTION=(ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=2484)))

Services Summary...
Service "sales1.us.example.com" has 1 instance(s).
  Instance "sales", status READY, has 1 handler(s) for this service...
Service "sales2.us.example.com" has 1 instance(s).
  Instance "sales", status READY, has 2 handler(s) for this service...
The command completed successfully

Related Topics
- SET DISPLAYMODE
  The Listener Control utility command SET DISPLAYMODE
- SERVICES
  The Listener Control utility command SERVICES returns detailed information about the
database services, instances, and service handlers to which the listener forwards client
connection requests.

1.5.22 STOP

The Listener Control utility command STOP stops the named listener.

Purpose
To stop the named listener.

Prerequisites
The listener must be running.

Syntax
From the operating system:

 lsnrctl STOP listener_name

From the Listener Control utility:

 LSNRCTL> STOP listener_name
Arguments

listener_name: The listener name, if the default name of LISTENER is not used.

Example

LSNRCTL> STOP
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
The command completed successfully

1.5.23 TRACE

The Listener Control utility command TRACE sets tracing for the listener.

Purpose
To set tracing for the listener.

Syntax
From the operating system:

lsnrctl trace level listener_name

From the Listener Control utility:

LSNRCTL> trace level listener_name

Arguments

level: One of the following trace levels:

- off for no trace output
- user for user trace information
- admin for administration trace information
- support for Oracle Support Services trace information

listener_name: Specify the listener name, if the default name of LISTENER is not used.

Usage Notes
This command has the same functionality as the SET TRC_LEVEL command.

Example

LSNRCTL> TRACE ADMIN lsnr
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
Opened trace file: /oracle/networkTRACE/listener.trc
The command completed successfully
1.5.24 VERSION

The Listener Control utility command **VERSION** displays the current version of the Listener Control utility.

**Purpose**
To display the current version of Listener Control utility.

**Prerequisites**
None

**Syntax**
From the operating system:

```bash
lsnrctl VERSION listener_name
```

From the Listener Control utility:

```
LSNRCTL> VERSION listener_name
```

**Arguments**

`listener_name`: The listener name, if the default name of LISTENER is not used.

**Example**

```
LSNRCTL> version listener
Connecting to ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
TNSLSNR for Linux: Version 19.0.0.0.0
  TNS for Linux: Version 19.0.0.0.0
  Oracle Bequeath NT Protocol Adapter for Linux: Version 19.0.0.0.0
  Unix Domain Socket IPC NT Protocol Adaptor for Linux: Version 19.0.0.0.0
  TCP/IP NT Protocol Adapter for Linux: Version 19.0.0.0.0
The command completed successfully
```
Oracle Connection Manager Control Utility

This chapter describes the commands and syntax of the Oracle Connection Manager Control Utility.

- **Command Modes and Syntax**
  The Oracle Connection Manager Control Utility (CMCTL) enables you to start up, configure and alter how client connection requests are managed.

- **Oracle Connection Manager Control Utility Overview**

- **Oracle Connection Manager Control Utility Commands**
  Use the Oracle Connection Manager Control utility commands to manage and configure Oracle Connection Manager instances.

### 2.1 Command Modes and Syntax

The Oracle Connection Manager Control Utility (CMCTL) enables you to start up, configure and alter how client connection requests are managed.

The basic syntax of the Oracle Connection Manager Control utility is as follows:

```
   cmctl command [argument]
```

The Oracle Connection Manager Control utility supports the following types of commands:

- **Initialization and termination commands** such as `STARTUP` and `SHUTDOWN`
- **Alter commands** such as `SET LOG_LEVEL` and `SET EVENT`
- **Display commands**, such as `SHOW STATUS` and `SHOW RULES`
- **Gateway commands**, such as `SHOW GATEWAYS` and `RESUME GATEWAYS`
You can use SET commands to dynamically alter configuration parameters that control how the listener receives client connections. The changes only remain in effect until Oracle Connection Manager is shut down. You cannot save them to the cman.ora file. The one exception is the Oracle Connection Manager password, which you can save using the command SAVE_PASSWD.

You can use the Oracle Connection Manager Control utility in command mode, or batch mode.

- **Using command mode:**
  - From the Oracle Connection Manager Control utility:
    
    Enter `cmctl` at the command line to obtain the program prompt, and then issue the command:

    ```
    cmctl
    CMCTL> command
    ```

  - From the operating system:
    
    Enter the entire command from the operating system command prompt:

    ```
    cmctl [command] [argument1 ... argumentN] [-c instance_name]
    ```

    Each command issued this way can have an Oracle Connection Manager instance name appended as an argument. If an Oracle Connection Manager instance name is not provided, then the default instance name is assumed. The default name is `cman_hostname`. If a password was set in a previous CMCTL session, then you can be prompted for a password. If a password has been set, then to issue commands from an Oracle Connection Manager Control utility session of Oracle Connection Manager, you must enter a password once, at the beginning of the session.

- **Caution:**
  
  There is an option to specify the password on the command line. However, doing so exposes the password on the screen, and is a potential security risk. Oracle recommends not using the password option (`-p`) on the command line.

- **Using batch mode:**
You can combine commands in a standard text file, and then run them as a sequence of commands. To run in batch mode, use the following syntax:

```
cmctl @input_file
```

2.2 Oracle Connection Manager Control Utility Overview

The Oracle Connection Manager Control utility (CMCTL) enables you to administer Oracle Connection Manager. You can use Oracle Connection Manager Control utility commands to perform basic management functions on one or more Oracle Connection Manager instances. Additionally, you can view and change parameter settings.

2.3 Oracle Connection Manager Control Utility Commands

Use the Oracle Connection Manager Control utility commands to manage and configure Oracle Connection Manager instances.

- **ADMINISTER**
  The ADMINISTER command can be issued only from the Oracle Connection Manager utility and lets you select the Oracle Connection Manager instance to administer.

- **CLOSE CONNECTIONS**
  It is an Oracle Connection Manager utility command to terminate connections but Oracle Connection Manager must be running at that time.

- **EXIT**
  Oracle Connection Manager Control utility command EXIT is used to exit from the Oracle Connection Manager utility.

- **HELP**

- **QUIT**

- **RELOAD**
  Reload Oracle Connection Manager Control utility command dynamically rereads parameters and rules.

- **RESUME GATEWAYS**

- **SAVE_PASSWD**

- **SET**

- **SET ASO_AUTHENTICATION_FILTER**

- **SET CONNECTION_STATISTICS**

- **SET EVENT**
• SET IDLE_TIMEOUT
• SET INBOUND_CONNECT_TIMEOUT
• SET LOG_DIRECTORY
• SET LOG_LEVEL
• SET OUTBOUND_CONNECT_TIMEOUT
• SET PASSWORD
• SET SESSION_TIMEOUT
• SET TRACE_DIRECTORY
• SET TRACE_LEVEL
• SHOW
• SHOW ALL
• SHOW CONNECTIONS
• SHOW DEFAULTS
• SHOW EVENTS
• SHOW GATEWAYS
• SHOW PARAMETERS
• SHOW RULES
• SHOW SERVICES
• SHOW STATUS
• SHOW VERSION
• SHUTDOWN
• STARTUP
• SUSPEND GATEWAY

2.3.1 ADMINISTER

The ADMINISTER command can be issued only from the Oracle Connection Manager utility and lets you select the Oracle Connection Manager instance to administer.

**Purpose**

To select an Oracle Connection Manager instance.

**Prerequisites**

None

**Syntax**

From the Oracle Connection Manager Control utility:

CMCTL> ADMINISTER [-c] instance_name
Arguments

instance_name: The instance name of Oracle Connection Manager that you would like to administer. Instances are defined in the cman.ora file.

Usage Notes

You can issue the ADMINISTER command only within the utility. You cannot issue the command from the operating system.

ADMINISTER enables you to choose which Oracle Connection Manager instance to administer. To start the Oracle Connection Manager instance, you must issue the STARTUP command.

When you omit the instance name from the command, the instance administered defaults to the local instance.

Use the -c option when to administer an instance that is not the local instance.

A password is required only if one was provided at installation time or during a previous session of the Oracle Connection Manager.

Example

CMCTL> ADMINISTER cman_indl040ad
Enter CMAN password: password
Current instance cman_indl040ad is already started
Connections refer to (address=(protocol=TCP)(host=indl040ad)(port=1560)).
The command completed successfully

• STARTUP

2.3.2 CLOSE CONNECTIONS

It is an Oracle Connection Manager utility command to terminate connections but Oracle Connection Manager must be running at that time.

Purpose

To terminate connections, using specific qualifiers to select connections.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl CLOSE CONNECTIONS [in state] [gt time] [from source] [to destination] [for service] [using gateway_process_id] [connect_identifier_list] [-c cman_name]
From the Oracle Connection Manager Control utility:

```
CMCTL> CLOSE CONNECTIONS [in state] [gt time] [from source] [to destination]
[for service] [using gateway_process_id] [connect_identifier_list]
```

**Arguments**

**state**: One of the following values to specify the connection state:

- **idle**: Connections that are inactive in the established state.
- **connecting**: Connections that are in the process of connecting.
- **established**: Connections that are connected and are transferring data.
- **terminating**: Connections that are disconnecting.

If no state is specified, then `CLOSE CONNECTIONS` defaults to all possible states. If the time qualifier is included under these conditions, then the time specified is the amount of time that has elapsed since a client initiated a connection.

**time**: The time format. Use the following format to specify connections greater than the time indicated:

```
gt[hh:mm:]ss
```

**source**: The source address. Use one of the following formats to specify the source address:

- **from IP**
- **from hostname**
- **from subnet**

**destination**: The destination address. Use one of the following formats to specify the destination address:

- **to IP**
- **to hostname**
- **to subnet**

**service**: The service name. Use the `service_name` parameter to specify the service, such as `sales.us.example.com`.

**gateway_process_id**: The gateway process identifier is a number. Use this number to specify connections that are proxied by the gateway process indicated. To determine the gateway process identifier, use the Oracle Connection Manager control utility `show gateways` command.

**connect_identifier_list**: The connection identifiers. Use a space between multiple connection identifiers in a list.

**Usage Notes**

Because the `CLOSE CONNECTIONS` command terminates connections, it might generate error messages on both client and server sides.

The **idle** state qualifier always requires a time qualifier.
Issuing `CLOSE CONNECTIONS` without an argument closes all connections.

**Examples**

The following example shuts down connections in any state. The elapsed time of the connection must be greater than 1 hour and 30 minutes. The connection source is the specified subnet, and the destination is the specified host name.

```
CMCTL> CLOSE CONNECTIONS gt 1:30:00 from 192.0.2.32/24 to host1
```

The following example shuts down those connections proxied by gateway process 0 that have been in the idle state more than 30 minutes:

```
CMCTL> CLOSE idle CONNECTIONS gt 30:00 using 0
```

The following example shuts down connections that are connected to the service `sales.us.example.com`:

```
CMCTL> CLOSE established CONNECTIONS for sales.us.example.com
```

### 2.3.3 EXIT

Oracle Connection Manager Control utility command `EXIT` is used to exit from the Oracle Connection Manager utility.

**Purpose**

To exit from the Oracle Connection Manager Control utility.

**Prerequisites**

None

**Syntax**

From the operating system:

```
cmctl EXIT [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> EXIT
```

**Usage Notes**

This command is identical to the `QUIT` command.

**Example 2-1   Example**

```
CMCTL> EXIT
```

### 2.3.4 HELP

**Purpose**

To provide a list of all commands for the Oracle Connection Manager Control utility or to provide help with the syntax of a particular command.

**Prerequisites**

None
Syntax

From the operating system:

```
cmctl HELP [command] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> HELP [command]
```

Arguments

```
command: Specify a HELP command. Commands are shown in the following sample output.
```

When you enter a command as an argument to HELP, the Oracle Connection Manager Control utility displays information about how to use the command. When you enter HELP without an argument, the Oracle Connection Manager Control utility displays a list of all the commands.

Example

```
CMCTL> HELP
The following operations are available
An asterisk (*) denotes a modifier or extended command:

administer  close*  exit  reload
resume*      save_passwd  set*  show*
shutdown     sleep       startup  suspend*
show_version  quit
```

2.3.5 QUIT

Purpose

To exit the Oracle Connection Manager Control utility and return to the operating system prompt.

Prerequisites

None

Syntax

From the operating system:

```
cmctl QUIT
```

From the Oracle Connection Manager Control utility:

```
CMCTL> QUIT
```

Usage Notes

This command is identical to the EXIT command.

Example

```
CMCTL> QUIT
```
2.3.6 RELOAD

Reload Oracle Connection Manager Control utility command dynamically rereads parameters and rules.

**Purpose**
To dynamically reread parameters and rules.

**Prerequisites**
Oracle Connection Manager must be running.

**Syntax**
From the operating system:
```
cmctl RELOAD [-with_ha] [-c instance_name]
```
From the Oracle Connection Manager Control utility:
```
CMCTL> RELOAD [-with_ha]
```

**Arguments**
- `-with_ha`: It is used to reload `cman.ora` without dropping registrations

**Usage Notes**
Configuration information modified using the `RELOAD` command applies only to new connections. Existing connections are unaffected. The `SET RELOAD` command restores configurations set in `cman.ora`, and override the `SET` command.

`RELOAD` reregisters gateways with the Oracle Connection Manager listener during which some new connections might be refused until the registration process is complete.

- `-with_ha` option can be used with `RELOAD` to not drop registrations, thus providing high service availability during reload.

**Example**
```
CMCTL> RELOAD
The command completed successfully
```

2.3.7 RESUME GATEWAYS

**Purpose**
To resume gateway processes that have been suspended.

**Prerequisites**
Oracle Connection Manager must be running.

**Syntax**
From the operating system:
cmctl RESUME GATEWAYS [gateway_process_id] [cman_name]

From the Oracle Connection Manager Control utility:

CMCTL> RESUME GATEWAYS [gateway_process_id]

Arguments

gateway_process_id: One or more gateway processes to reopen. Separate multiple
gateway processes using a space between the process identifiers.

Usage Notes

Issuing RESUME GATEWAYS without an argument reopens all gateway processes that
have been closed.

Example

CMCTL> RESUME GATEWAYS 1
The command completed successfully

2.3.8 SAVE_PASSWD

Purpose

To save the current password to the cman.ora file, the configuration file for Oracle
Connection Manager.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl SAVE_PASSWD [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SAVE_PASSWD

Usage Notes

If you run this command, then the next session of Oracle Connection Manager uses
the password. The password is stored in an encrypted format in the cman.ora file.

Example

CMCTL> SAVE_PASSWD

2.3.9 SET

Purpose

To display a list of parameters that can be modified using this command.
Prerequisites

None

Syntax

From the operating system:

`cmctl SET`

From the Oracle Connection Manager Control utility:

`CMCTL> SET`  

Example

`CMCTL> SET`

The following operations are available after set
An asterisk (*) denotes a modifier or extended command:

- `aso_authentication_filter`
- `outbound_connect_timeout`
- `connection_statistics`
- `password`
- `event`
- `session_timeout`
- `idle_timeout`
- `trace_directory`
- `inbound_connect_timeout`
- `trace_level`
- `log_directory`
- `log_level`

### 2.3.10 SET ASO_AUTHENTICATION_FILTER

**Purpose**

To indicate whether the client must use Oracle Database security to authenticate.

**Prerequisites**

Oracle Connection Manager must be running.

**Syntax**

From the operating system:

`cmctl SET ASO_AUTHENTICATION_FILTER {on | off}[-c instance_name]`

From the Oracle Connection Manager Control utility:

`CMCTL> SET ASO_AUTHENTICATION_FILTER {on | off}`

**Arguments**

- `on`: To reject connections that are not using Secure Network Service (SNS) to perform client authentication. SNS is part of Oracle Database security.
- `off`: To specify whether no authentication is required for client connections. This is the default.
Example

CMCTL> set aso_authentication_filter ON
CMAN_user.us.example.com parameter aso_authentication_filter set to ON
The command completed successfully

2.3.11 SET CONNECTION_STATISTICS

Purpose
To specify whether gateway processes collect connection statistics.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

cmctl SET CONNECTION_STATISTICS {yes | no}[-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SET CONNECTION_STATISTICS {yes | no}

Arguments

yes: To have gateway processes collect connection statistics.

no: To not have gateway processes collect connection statistics. This is the default.

Usage Notes
If SET CONNECTION_STATISTICS is set to yes, then you can obtain statistics by issuing the SHOW CONNECTIONS command.

Example

CMCTL> set connection_statistics ON
CMAN_user.us.example.com parameter connection_statistics set to ON
The command completed successfully

2.3.12 SET EVENT

Purpose
To log information for a particular event.

Syntax
From the operating system:

cmctl SET EVENT event_group [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SET EVENT event_group {on | off}
Arguments

`event_group`: Specify one of the following event groups:

- `init_and_term`: Initialization and termination event group.
- `memory_ops`: Memory operations event group.
- `conn_hdlg`: Connection handling event group.
- `proc_mgmt`: Process management event group.
- `reg_and_load`: Registration and load update event group.
- `wake_up`: Events related to Connection Manager Administration (CMADMIN) wakeup queue event group.
- `timer`: Gateway timeouts event group.
- `cmd_proc`: Command processing event group.
- `relay`: Events associated with connection control blocks event group.

`on`: To turn an event group on.

`off`: To turn an event group off.

Usage Notes

The `SET EVENT` command accepts only one argument. To log multiple events, you must issue the command for each event separately.

Example

```
CMCTL> set event memory_ops off
  cman11 event memory_ops set to OFF.
  The command completed successfully
```

2.3.13 SET IDLE_TIMEOUT

Purpose

To specify the amount of time a client can be idle without transmitting data.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl SET IDLE_TIMEOUT [time] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SET IDLE_TIMEOUT [time]
```

Arguments

`time`: Specify the idle timeout in seconds. The default is 0 (zero), which disables this feature.
Example
CMCTL> SET IDLE_TIMEOUT 30
CMAN_user.us.example.com parameter idle_timeout set to 30
The command completed successfully

2.3.14 SET INBOUND_CONNECT_TIMEOUT

Purpose
To specify the maximum amount of time the Oracle Connection Manager listener waits for a valid connection request from the client before timing out.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

cmctl SET INBOUND_CONNECT_TIMEOUT [time] [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SET INBOUND_CONNECT_TIMEOUT [time]

Arguments

*time*: The inbound connect timeout in seconds. The default is 0 (zero), which disables this feature.

Example
CMCTL> SET INBOUND_CONNECT_TIMEOUT 30
CMAN_user.us.example.com parameter inbound_connect_timeout set to 30
The command completed successfully

2.3.15 SET LOG_DIRECTORY

\[Note:\]
This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory ORACLE_HOME/log.

Purpose
To designate where the log files for Oracle Connection Manager are written.

Prerequisites
Oracle Connection Manager must be running.
Syntax

From the operating system:

```
cmctl SET LOG_DIRECTORY [directory_path] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SET LOG_DIRECTORY [directory_path]
```

Arguments

directory_path: The location of the log directory. The default path is as follows:

- Linux and UNIX:
  
  `ORACLE_HOME/network/log directory`

- Microsoft Windows:
  
  `ORACLE_HOME\network\log directory`

Usage Notes

Use the SHOW PARAMETERS command to determine the location of the log files.

Example

```
CMCTL>
SET LOG_DIRECTORY /disk1/user_cman_test/oracle/network/admin
```

CMAN_user.us.example.com parameter log_directory set to
/disk1/user_cman_test/oracle/network/admin

The command completed successfully

2.3.16 SET LOG_LEVEL

Purpose

To set the log level for Oracle Connection Manager.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl SET LOG_LEVEL [level] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SET LOG_LEVEL [level]
```

Arguments

level: Specify one of the following log levels:

- off: No logging.
• user: User log information.
• admin: Administrative log information.
• support: Oracle Support Services log information. This is the default.

Usage Notes
Specify off to capture the minimum amount of log information. Specify support to capture the maximum amount.

Example
CMCTL> SET LOG_LEVEL SUPPORT
CMAN_user.us.example.com parameter log_level set to SUPPORT
The command completed successfully

2.3.17 SET OUTBOUND_CONNECT_TIMEOUT

Purpose
To specify the maximum amount of time the Oracle Connection Manager instance waits for a valid connection with the server before timing out.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
cmctl SET OUTBOUND_CONNECT_TIMEOUT [time] [-c instance_name]

From the Oracle Connection Manager Control utility:
CMCTL> SET OUTBOUND_CONNECT_TIMEOUT [time]

Arguments
time: The outbound connect timeout in seconds. The default is 0.

Example
CMCTL> SET OUTBOUND_CONNECT_TIMEOUT 30
CMAN_user.us.example.com parameter outbound_connect_timeout set to 30
The command completed successfully

2.3.18 SET PASSWORD

Purpose
To assign a password to the Oracle Connection Manager instance.

Prerequisites
Oracle Connection Manager must be running.
Syntax
From the operating system:
```
cmctl SET PASSWORD
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SET PASSWORD
```

Arguments
None.

Usage Notes
This command may be used either to set a password for the first time or to change an existing one.

This command does not save the password to `cman.ora`. As a result the password is valid only for the current session. To save the password after you have set it, run the `SAVE_PASSWD` command.

Example
```
CMCTL> SET PASSWORD

Enter Old password: old_password
Enter New password: new_password
Reenter New password: new_password

The command completed successfully
```

2.3.19 SET SESSION_TIMEOUT

Purpose
To specify the maximum amount of time for a session of Oracle Connection Manager.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SET SESSION_TIMEOUT [time] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SET SESSION_TIMEOUT [time]
```

Arguments

*time*: The session timeout in seconds. The default is 0 (zero), which disables this feature.
Example

CMCTL> SET SESSION_TIMEOUT 60
CMAN_user.us.example.com parameter session_timeout set to 60
The command completed successfully

2.3.20 SET TRACE_DIRECTORY

Note:
This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled.

Purpose
To designate where the trace files for an Oracle Connection Manager instance are written.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
cmctl SET TRACEDIRECTORY [directory_path] [-c instance_name]

From the Oracle Connection Manager Control utility:
CMCTL> SET TRACE_DIRECTORY [directory_path]

Arguments
directory_path: The location of the trace directory. The default path is ORACLE_HOME/network/trace.

Usage Notes
Use the SHOW PARAMETERS command to determine the location of the trace files.

Example

CMCTL> SET TRACE_DIRECTORY /disk1/mpurayat_newtest/oracle/network/trace
cman1 parameter trace_directory set to /disk1/mpurayat_newtest/oracle/network/trace
The command completed successfully

2.3.21 SET TRACE_LEVEL

Purpose
To set the trace level for an Oracle Connection Manager instance.
Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SET TRACE_LEVEL [level] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SET TRACE_LEVEL [level]
```

Arguments
level: Specify one of the following log levels:
- off: No tracing. This is the default.
- user: User trace information.
- admin: Administrative trace information.
- support: Oracle Support Services trace information.

Usage Notes
Specify off to capture the minimum amount of trace information. Specify support to capture the maximum amount.

Use the SHOW PARAMETERS command to determine the current trace level.

Example
```
CMCTL> SET TRACE_LEVEL USER
CMAN_user.us.example.com parameter trace_level set to USER
The command completed successfully
```

2.3.22 SHOW

Purpose
To display a list of parameters that may be used as arguments for this command. Entering one of these parameters with the command displays the parameter value or values.

Prerequisites
None

Syntax
From the operating system:
```
cmctl SHOW [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SHOW
```
Example

CMCTL> SHOW
The following operations are available after show
An asterisk (*) denotes a modifier or extended command:

all             gateways        status
connections     parameters      version
defaults        rules
events          services

2.3.23 SHOW ALL

Purpose

To combine and display output from the SHOW PARAMETERS and SHOW RULES commands.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl SHOW ALL [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SHOW ALL

Example

CMCTL> SHOW ALL
listener_address          |
(address=(protocol=tcp)(host=users.us.example.com)(port=1630))
aso_authentication_filter |   OFF
connection_statistics     |   OFF
event_group               |   OFF
log_directory             | /disk1/user_cman_test/oracle/network/log/
log_level                 | SUPPORT
max_connections           |   256
idle_timeout              |     0
inbound_connect_timeout   |   0
session_timeout           |   0
outbound_connect_timeout  |   0
max_gateway_processes     |    16
min_gateway_processes     |    2
max_cmctl_sessions        |    4
password                  |   OFF
trace_directory           | /disk1/user_cman_test/oracle/network/trace/
trace_level               |   OFF
trace_timestamp           |   OFF
trace_filelen             |   0
trace_filelen             |   0
(rule_list=
   (rule=
      (src=*)
      (dst=*))

The command completed successfully

2.3.24 SHOW CONNECTIONS

Purpose
To display information about specific connections or all connections.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

```
cmctl SHOW CONNECTIONS [information] [in state] [gt time] [from source] [to destination] [for service] [using gateway_process_id] [connect_identifier_list] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SHOW CONNECTIONS [information] [in state] [gt time] [from source] [to destination] [for service] [using gateway_process_id] [connect_identifier_list]
```

Arguments

- `information`: Specify one of the following values to display information about connections. Information categories include connection identifier, source, destination, service, current state, total idle time, and total elapsed time.
  - `count`: The total number of connections that meet the criteria specified by the other qualifiers. This is the default.
  - `detail`: All information about connections specified by the other qualifiers.

- `state`: Specify one of the following values to specify the connection state:
  - `idle`: Connections that are inactive in the established state.
  - `connecting`: Connections that are in the process of connecting.
  - `established`: Connections that are connected and are transferring data.
  - `terminating`: Connections that are disconnecting.

If no state is specified, then `SHOW CONNECTIONS` defaults to all possible states. If the time qualifier is included under these conditions, then the time specified is the amount of time that has elapsed since a client initiated a connection.

**Note:**
This argument is not supported with Oracle Connection Manager in Traffic Director mode.
**time**: Use the following format to specify connections greater than the time indicated:

\[ \text{gt}[\text{hh:mm:ss}] \]

**Note:**
- This argument is not supported with Oracle Connection Manager in Traffic Director mode.

**source**: Specify one of the following formats to specify the source address:
- from IP
- from hostname
- from subnet

**destination**: Specify one of the following formats to specify the destination address:
- to IP
- to hostname
- to subnet

**service**: Use the `service_name` format to request a service:

**gateway_process_id**: Use the following format to specify connections that are proxied by the gateway process indicated:

\[ \text{using gateway_process_id} \]

**connect_identifier_list**: Separate multiple connection identifiers using a space.

**Usage Notes**
- Connections are sorted by gateway process identifier and connection identifier, in ascending order.
- Issuing `SHOW CONNECTIONS` without an argument displays all connections.

**Examples**
- The following command displays a detailed description of connections in any state. The elapsed time of the connection must be greater than 1 hour and 30 minutes. The connection source is the specified subnet, and the destination the specified host name.

  CMCTL> SHOW CONNECTIONS gt 1:30:00 from 192.0.2.32/24 to host1

- The following command displays the number of connections proxied by Oracle Connection Manager using the gateway process identifier 0 that have been in the idle state more than 30 minutes:

  CMCTL> SHOW idle CONNECTIONS count gt 30:00 using 0

- The following command displays a detailed description of connections that are connected to the service `sales.us.example.com`:

  CMCTL> SHOW established CONNECTIONS detail for sales.us.example.com
Additional Statistics Shown in Traffic Director Mode

Each connection to Oracle Connection Manager in Traffic Director mode displays these additional statistics:

- **Source Host Name**: Host name of the client connection.
- **Source Process Id**: Process Id of the connected client.
- **Source Program Name**: The name of the connected client program.
- **Destination Hostname**: Host name of the database server to which the client is connected through Oracle Connection Manager.
- **State**: State of the inbound connection with one of the following values
  - **THREAD WAIT**: Connection is waiting for a worker thread, not seen in dedicated threads mode
  - **ACTIVE**: Connection is transferring data, occupying the thread
  - **IDLE**: Connection is established but inactive, can still occupy the thread if `tdm_bind_thread=true` in `cman.ora`

- **Idle time**: Cumulative time in µs the connection is in IDLE state.
- **Thread Wait time**: Cumulative time in µs the connection is in THREAD WAIT state. It is always 0 in dedicated threads mode.
- **Active time**: Cumulative time in µs the connection is in ACTIVE state.
- **PRCP State**: State of the inbound connection with respect to the Proxy Resident Connection Pool (PRCP) and can be one of the following values
  - **WAIT**: Connection is waiting for a session from the PRCP
  - **CHECKED-OUT**: Connection is holding an outbound session from PRCP but not making any OCI calls
  - **ACTIVE**: Connection is holding an outbound session from PRCP and busy with OCI calls
  - **CHECKED-IN**: Connection released the CHECKED-OUT session back to the PRCP
  - **NO STATE**: Clients to a service without a configured PRCP configured have this state

- **PRCP Wait time, PRCP Checked-out time, and PRCP Active time**: Cumulative time in µs the connection is in PRCP WAIT, CHECKED-OUT, and ACTIVE states. All these three states are zero in case of non-PRCP service.

- **Total Session Gets**: Total count of PRCP session get requests from this connection. It is always 1 if PRCP is not configured.
- **Session Get Hits**: Number of times a session is found existing in the PRCP out of all the requests. It is always 0 if PRCP is not configured.

### 2.3.25 SHOW DEFAULTS

**purpose**

To display default parameter settings.
Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SHOW DEFAULTS [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SHOW DEFAULTS
```

Example
```
CMCTL> SHOW DEFAULTS
listener_address          | (address=(protocol=tcp)(host=users.us.example.com)(port=1521))
aso_authentication_filter | OFF
connection_statistics     | OFF
event_group               | OFF
log_directory             | /disk1/user_cman_test/oracle/network/log/
log_level                 | SUPPORT
max_connections           | 256
idle_timeout              | 0
inbound_connect_timeout   | 0
session_timeout           | 0
outbound_connect_timeout  | 0
max_gateway_processes     | 16
min_gateway_processes     | 2
max_cmctl_sessions        | 4
password                  | OFF
trace_directory           | /disk1/user_cman_test/oracle/network/trace/
trace_level               | OFF
trace_timestamp           | OFF
trace_filelen             | 0
trace_fileno              | 0
The command completed successfully
```

2.3.26 SHOW EVENTS

Purpose
To display the events that are in operation.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SHOW EVENTS [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SHOW EVENTS
```
Example

CMCTL> SHOW EVENTS
Event Groups:
  memory_ops
The command completed successfully

2.3.27 SHOW GATEWAYS

Purpose

To display the current status of a specific gateway process or processes. Statistics displayed include number of active connections, number of peak active connections, total number of connections handled, and number of connections refused.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

   cmctl SHOW GATEWAYS [gateway] [-c instance_name]

From the Oracle Connection Manager Control utility:

   CMCTL> SHOW GATEWAYS [gateway]

Arguments

gateway: The identifier of the gateway or gateways whose status to display.

Issuing SHOW GATEWAYS without an argument displays the status of all gateway processes.

Usage Notes

To display multiple gateways, use a space to separate the identifiers when entering the command.

Example

   CMCTL> SHOW GATEWAYS 1
   Gateway ID                     1
   Gateway state                  READY
   Number of active connections   0
   Peak active connections        0
   Total connections              0
   Total connections refused      0
The command completed successfully

2.3.28 SHOW PARAMETERS

Purpose

To display current parameter settings for an instance.
Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

`cmctl SHOW PARAMETERS [-c instance_name]`

From the Oracle Connection Manager Control utility:

`CMCTL> SHOW PARAMETERS`

Usage Notes
Several configuration parameters can be dynamically modified using the SET command. Therefore, the information that SHOW PARAMETERS displays might be different from what appears in the `cman.ora` file.

Example

```
CMCTL> SHOW PARAMETERS
listener_address          | (address=(protocol=tcp)(host=users.us.example.com)(port=1630))
aso_authentication_filter | ON
connection_statistics     | ON
event_group               | (memory_ops)
log_directory             | /disk1/user_cman_test/oracle/network/log/
log_level                 | SUPPORT
max_connections           | 256
idle_timeout              | 0
inbound_connect_timeout   | 0
session_timeout           | 0
outbound_connect_timeout  | 0
max_gateway_processes     | 16
min_gateway_processes     | 2
max_cmctl_sessions        | 4
password                  | OFF
trace_directory           | /disk1/user_cman_test/oracle/network/trace/
trace_level               | SUPPORT
trace_timestamp           | OFF
trace_filelen             | 0
trace_fileno              | 0
The command completed successfully
```

2.3.29 SHOW RULES

Purpose
To display the access control list currently used by the instance.

Prerequisites
Oracle Connection Manager must be running.
Syntax

From the operating system:

cmctl SHOW RULES [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SHOW RULES

Usage Notes

You can update the rules list by issuing the RELOAD command.

Example

CMCTL> SHOW RULES
Number of filtering rules currently in effect: 5
(rule_list=
  (rule=
    (src=usunnae12)
    (dst=usunnae13)
    (srv=*)
    (act=accept)
    (action_list=(mit=120)(mct=1800)(conn_stats=on)(aut=off))
  )
  (rule=
    (src=usunnae12)
    (dst=usunnae14)
    (srv=service2)
    (act=accept)
  )
  (rule=
    (src=*)
    (dst=usunnae15)
    (srv=*)
    (act=accept)
    (action_list=(mit=120)(mct=3000)(moct=200)(aut=on))
  )
  (rule=
    (src=*)
    (dst=usunnae16)
    (srv=*)
    (act=reject)
    (action_list=(moct=20)(aut=on))
  )
  (rule=
    (src=users.us.example.com)
    (dst=users.us.example.com)
    (srv=cmon)
    (act=accept)
    (action_list=(mit=100)(mct=1130)(moct=200)(aut=on))
  )
)}
2.3.30 SHOW SERVICES

**Purpose**

To display comprehensive information about the Oracle Connection Manager instance. The information displayed includes number of handlers for gateway and CMADMIN processes, listening ports of handlers, and number of connections, both refused and current.

**Prerequisites**

Oracle Connection Manager must be running.

**Syntax**

From the operating system:

`cmctl SHOW SERVICES [-c instance_name]`

From the Oracle Connection Manager Control utility:

`CMCTL> SHOW SERVICES`

**Example**

```
CMCTL> SHOW SERVICES
Services Summary...
Proxy service "cmgw" has 1 instance(s).
  Instance "cman", status READY, has 2 handler(s) for this service...
    Handler(s):
      "cmgw001" established:0 refused:0 current:0 max:256 state:ready
        <machine: user-sun, pid: 29190>
        (ADDRESS=(PROTOCOL=tcp)(HOST=user-sun)(PORT=33175))
      "cmgw000" established:0 refused:0 current:0 max:256 state:ready
        <machine: user-sun, pid: 29188>
        (ADDRESS=(PROTOCOL=tcp)(HOST=user-sun)(PORT=33174))
Service "cmon" has 1 instance(s).
  Instance "cman", status READY, has 1 handler(s) for this service...
    Handler(s):
      "cmon" established:0 refused:0 current:0 max:4 state:ready
        <machine: user-sun, pid: 29184>
        (ADDRESS=(PROTOCOL=tcp)(HOST=users)(PORT=33168))
```

The command completed successfully

2.3.31 SHOW STATUS

**Purpose**

To display basic information about the instance, including version, start time, and current statistics.

**Prerequisites**

Oracle Connection Manager must be running.

**Syntax**

From the operating system:
2.3.32 SHOW VERSION

**Purpose**
To display the current version and name of the Oracle Connection Manager Control utility.

**Prerequisites**
None

**Syntax**
From the operating system:

```
cmctl SHOW VERSION [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SHOW VERSION
```

**Examples**

```
CMCTL> SHOW VERSION
CMAN for Linux: Version 18.0.0.0.0
The command completed successfully
```

2.3.33 SHUTDOWN

**Purpose**
To shut down specific gateway processes or the entire Oracle Connection Manager instance.

**Prerequisites**
Oracle Connection Manager must be running.
### Syntax

From the operating system:

```
cmctl SHUTDOWN [gateways gateway] [normal | abort] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SHUTDOWN [gateways gateway] {normal | abort}
```

#### Arguments

gateways: To shut down a specific gateway.

normal: To reject new connections and terminate after existing connections close. This is the default.

abort: To shut down Oracle Connection Manager immediately, and close all open connections.

To specify more than one gateway, separate gateways using a space.

#### Usage Notes

Issuing `SHUTDOWN` without an argument shuts down all gateways.

#### Example

```
CMCTL> SHUTDOWN GATEWAYS 0
The command completed successfully
```

### 2.3.34 STARTUP

#### Purpose

To start Oracle Connection Manager.

#### Prerequisites

Another Oracle Connection Manager instance configured with the same protocol address must not be running.

#### Syntax

From the operating system:

```
cmctl STARTUP [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> STARTUP
```

#### Usage Notes

Before issuing this command, you must use the `ADMINISTER` command to select an instance to start.
Issuing this command starts all instance components, which are the listener, CMADMIN, and the gateway processes. The command fails if any one of these components is already running.

The utility may prompt for a password if Oracle Connection Manager was installed with secure installation option.

**Example**

```bash
CMCTL> STARTUP
Starting Oracle Connection Manager instance cman_1. Please wait...
CMAN for Linux: Version 18.0.0.0.
Status of the Instance
----------------------
Instance name             cman_1
Version                   CMAN for Linux: Version 18.0.0.0.
Start date                22-JAN-2018 01:16:55
Uptime                    0 days 0 hr. 0 min. 9 sec
Num of gateways started   8
Average Load level        0
Log Level                 SUPPORT
Trace Level               OFF
Instance Config file      $ORACLE_HOME/network/admin/cman.ora
Instance Log directory    $ORACLE_BASE/diag/netcman/node_name/cman_1/alert
Instance Trace directory  $ORACLE_BASE/diag/netcman/node_name/cman_1/trace
The command completed successfully
```

**2.3.35 SUSPEND GATEWAY**

**Purpose**
To specify which gateway processes will no longer accept new client connections.

**Prerequisites**
Oracle Connection Manager must be running.

**Syntax**
From the operating system:
```
cmctl SUSPEND GATEWAY [gateway_process_id] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SUSPEND GATEWAY [gateway_process_id]
```

**Arguments**
- `gateway_process_id`: The gateway process that will no longer accept new connections. Specify multiple gateway processes by putting a space between entries.

Issuing `SUSPEND GATEWAY` without an argument suspends all gateway processes.

**Usage Notes**
Use the `RESUME GATEWAYS` command to enable gateway processes to accept new connections.
Example

CMCTL> SUSPEND GATEWAY 1
The command completed successfully
Syntax Rules for Configuration Files

Learn how to follow the syntax configuration rules for Oracle Net Services parameters, keywords, addresses, and naming methods.

- **Overview of Configuration File Syntax**
  Construct your Oracle Net Services configuration files in accordance with syntax rules and standard conventions.

- **Syntax Rules for Configuration Files**
  Follow the structure, hierarchy, and character requirements for configuration files.

- **Network Character Set for Keywords**
  Use the permitted character set for keyword values and network character sets.

- **Character Set for Listener and Net Service Names**
  Learn how to create listener names and net service names for clients that comply with character set requirements.

### 3.1 Overview of Configuration File Syntax

Construct your Oracle Net Services configuration files in accordance with syntax rules and standard conventions.

The Oracle Net Services configuration files consist of parameters that include keyword-value pairs. Keyword-value pairs are surrounded by parentheses:

```
parameter=(keyword=value)
```

Some keywords have other keyword-value pairs as their values:

```
(keyword=
  (keyword1=value1)
  (keyword2=value2))
```

For example, the address portion of a local naming configuration file (`tnsnames.ora`) can include lines such as the following:

```
ADDRESS=
  (PROTOCOL=tcp)
  (HOST=sales-server)
  (PORT=1521))
```

Set up your configuration files so that indentation reflects what keyword is the parent or owner of other keyword-value pairs. If you do not choose to indent your files in this way, then
you must still indent a wrapped line by at least one space, or it will be misread as a new parameter. The following syntax is acceptable:

```
(ADDRESS=(PROTOCOL=tcp)
 (HOST=sales-server) (PORT=1521))
```

The following syntax is not acceptable:

```
(ADDRESS=(PROTOCOL=tcp)
 (HOST=sales-server) (PORT=1521))
```

### 3.2 Syntax Rules for Configuration Files

Follow the structure, hierarchy, and character requirements for configuration files.

The following rules apply to the syntax of configuration files:

- Any keyword in a configuration file that begins a parameter that includes one or more keyword-value pairs must be in the far left column of a line. If it is indented by one or more spaces, then it is interpreted as a continuation of the previous line.
- All characters must belong to the network character set.
- Keywords are not case sensitive. However, values can be case-sensitive, depending on your operating system and protocol.
- In keyword-value pairs, spaces around the equal sign (=) are optional.
- There is a hierarchy of keywords, which requires that some keywords are always followed by others. At any level of the hierarchy, keywords can be listed in any order. For example, the following entries are equally valid:

```
(ADDRESS=
 (PROTOCOL=TCP)
 (HOST=sales-server)
 (PORT=1521))
```

```
(ADDRESS=
 (PROTOCOL=tcp)
 (PORT=1521)
 (HOST=sales-server))
```

- Keywords cannot contain spaces.
- Values must not contain spaces, unless the values with spaces are enclosed within double quotation marks ("*) or single quotation marks ('*).
- If the keyword-value pair consists of a single word, or a concatenation of words on either side of the equal sign, then no parentheses are needed.
- The maximum length of a connect descriptor is 4 KB.
- You can include comments by using the number sign (#) at the beginning of a line. Anything following the number sign to the end of the line is considered a comment.
3.3 Network Character Set for Keywords

Use the permitted character set for keyword values and network character sets.

The network character set for keyword values consists of the following characters. Connect descriptors must be made up of single-byte characters.

A-Z, a-z
0-9
( ) < > / \n, . : ; ' "=- _
$ + * # & ! % ? @

Within this character set, the following symbols are reserved:

( ) = \ " ' \\

Reserved symbols are used as delimiters, not as part of a keyword or a value, unless the keyword or value has quotation marks. If you have a value that contains reserved symbols, then use either single or double quotation marks to enclose the value. To include a quotation marks within a value that is surrounded by quotation marks, use different quotation marks. The backslash (\) is used as an escape character.

You can use the following characters within a connect descriptor, but not in a keyword or value:
• Space
• Tab
• Carriage return
• Newline

3.4 Character Set for Listener and Net Service Names

Learn how to create listener names and net service names for clients that comply with character set requirements.

Listener names and net service names are limited to the following character set:

[a...z] [A...Z] [0...9] _

The first character in the listener name or net service name must be an alphanumeric character. In general, names up to 64 characters in length are acceptable. In addition, a database service name must match the global database name defined by the database administrator, which consists of a database name, and the database domain. Both net service names and global database names are not case-sensitive.
Protocol Address Configuration

Learn how to configure connections for Oracle Database instances and clients.

A network object is identified by a protocol address. When a connection is made, the client and the receiver of the request (listener or Oracle Connection Manager) are configured with identical protocol addresses. The client uses this address to send the connection request to a particular network object location, and the recipient "listens" for requests on this address, and grants a connection based on its address information matching the client information.

- **Protocol Addresses**
  The protocol address is comprised of ADDRESS and ADDRESS_LIST elements.

- **Protocol Parameters**
  The listener and Oracle Connection Manager are identified by protocol addresses.

- **Recommended Port Numbers**
  Oracle recommends that you use the default port numbers for client and Oracle Connection Manager connections.

- **Port Number Limitations**
  Understand limitations for port numbers. If it is necessary to configure a listener to use a system port number (in the 1 to 1024 range), then use the procedure described here to configure the listener.

### 4.1 Protocol Addresses

The protocol address is comprised of ADDRESS and ADDRESS_LIST elements.

- **ADDRESS**
  The ADDRESS networking parameter specifies the protocol address under the ADDRESS_LIST or DESCRIPTION parameter.

- **ADDRESS_LIST**
  The ADDRESS_LIST networking parameter specifies the number of protocol addresses sharing common characteristics.

#### 4.1.1 ADDRESS

The ADDRESS networking parameter specifies the protocol address under the ADDRESS_LIST or DESCRIPTION parameter.

**Purpose**

To define a protocol address.

**Usage Notes**

Put this parameter under an ADDRESS_LIST or DESCRIPTION parameter. A DESCRIPTION is used in a tnsnames.ora or a listener.ora file.
Example

(ADDRESS=
 (PROTOCOL=tcp)
 (HOST=sales-server)
 (PORT=1521))

See Also:

- "Protocol Parameters" for each protocol's required parameters
- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services

4.1.2 ADDRESS_LIST

The ADDRESS_LIST networking parameter specifies the number of protocol addresses sharing common characteristics.

Purpose

To define a list of protocol addresses that share common characteristics.

Usage Notes

This parameter is not mandatory when specifying multiple addresses.

Example

(ADDRESS_LIST=
 (LOAD_BALANCE=on)
 (ADDRESS=
 (PROTOCOL=tcp)
 (HOST=sales-server)
 (PORT=1521))
 (ADDRESS=
 (PROTOCOL=tcp)
 (HOST=hr-server)
 (PORT=1521)))

4.2 Protocol Parameters

The listener and Oracle Connection Manager are identified by protocol addresses.

The following table lists the parameters used by the Oracle protocol support:
Table 4-1  Protocol-Specific Parameters

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPC</td>
<td>PROTOCOL</td>
<td>Specify ipc as the value.</td>
</tr>
<tr>
<td>IPC</td>
<td>KEYPATH</td>
<td>On UNIX variants, IPC protocol uses the UNIX domain socket and this socket</td>

</tr>
</tbody>
</table>

4.3 Recommended Port Numbers

Oracle recommends that you use the default port numbers for client and Oracle Connection Manager connections.

Table 4-2  Recommended Port Numbers

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1521</td>
<td>Default listening port for client connections to the listener. This port</td>

</tr>
<tr>
<td></td>
<td>TCP/IP, and 2484 for TCP/IP with SSL.</td>
</tr>
<tr>
<td>1521</td>
<td>Default and officially registered listening port for client connections to</td>
</tr>
<tr>
<td></td>
<td>Oracle Connection Manager.</td>
</tr>
<tr>
<td>1830</td>
<td>Default and officially registered listening port for administrative</td>
</tr>
<tr>
<td></td>
<td>commands to Oracle Connection Manager.</td>
</tr>
</tbody>
</table>

4.4 Port Number Limitations

Understand limitations for port numbers. If it is necessary to configure a listener to use a system port number (in the 1 to 1024 range), then use the procedure described here to configure the listener.
Oracle allows port numbers from 1 to 65535. However, the port numbers below 1024 (the well-known ports or system ports) are typically reserved. Normally, only privileged processes can listen for TCP connections on ports below 1024.

If you need to configure a listener to listen on a port number less than 1024, then complete the following procedure:

**Note:**
This procedure is a guideline. Your operating system can require a different procedure.

1. Use Oracle Net Configuration Assistant or Oracle Net Manager to configure the listener with protocol addresses and other configuration parameters.
2. Log in as the root user on the machine that has the listener.
3. Set file ownership and access permissions for the listener executable (tnslsnr) and the dependent shared libraries, so that these files can be modified only by the root user.
4. Starting with the root directory, ensure that the permissions of the individual directories found in the path names to these files share the same ownership and access permissions.
5. Start the listener as the root user.
6. Enter the following command at the system prompt:

   \[ \text{tnslsnr} \text{ listener_name -user user -group group} \]

In the preceding command, the following options are used:

**Table 4-3  tnslsnr Utility Options**

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listener_name</td>
<td>Specify the name of the listener that you want to configure. If omitted, then the default name LISTENER is used.</td>
</tr>
<tr>
<td>user</td>
<td>Specify the user whose privileges you want the listener to use when super user (root) privileges are not needed. After performing the privileged operations, the listener gives up root privileges irreversibly.</td>
</tr>
<tr>
<td>group</td>
<td>Specify the group whose privileges you want the listener to use when super user (root) group privileges are not needed. After performing the privileged operations, the listener gives up root group privileges irreversibly.</td>
</tr>
</tbody>
</table>

During this step, the listener changes from root to the user and group privileges that you specify. All operations are done with the specified user and group privileges, except the system calls necessary to listen on configured endpoints. The listener reverts to the root user to listen on reserved addresses, such as TCP ports less than 1024.

After the listener starts listening on all of its endpoints configured in the listener.ora file, it switches to the specified user and group irreversibly. At that point, the listener gives up
the root privilege that it initially had. The -user and -group command line arguments only accept user and group identifiers specified in numeric form.

For example, to run a listener called mylsnr with root privileges, and to have it use privileges of the Oracle user with the user identifier (UID) of 37555, and with OSDBA group dba membership, with a group identifier (GID) of 16, enter the following command at the operating system prompt:

tnslsnr mylsnr -user 37555 -group 16

7. After the listener starts, you can administer it with the Listener Control utility.

⚠️ Caution:

- Oracle recommends that the user under whose privileges the listener process runs is the oracle user, or a similarly privileged user with whose privileges the listener process normally runs on the operating system.
- Do not leave the listener process running as the root user. Running processes as the super user is a security vulnerability.
Parameters for the sqlnet.ora File

This chapter provides a complete listing of the sqlnet.ora file configuration parameters.

- Overview of Profile Configuration File
- sqlnet.ora Profile Parameters
- ADR Diagnostic Parameters in sqlnet.ora
  The diagnostic data for the critical errors is quickly captured and stored in the ADR for sqlnet.ora.
- Non-ADR Diagnostic Parameters in sqlnet.ora

5.1 Overview of Profile Configuration File

The sqlnet.ora file is the profile configuration file. It resides on the client machines and the database server. Profiles are stored and implemented using this file. The database server can be configured with access control parameters in the sqlnet.ora file. These parameters specify whether clients are allowed or denied access based on the protocol.

The sqlnet.ora file enables you to do the following:

- Specify the client domain to append to unqualified names
- Prioritize naming methods
- Enable logging and tracing features
- Route connections through specific processes
- Configure parameters for external naming
- Configure Oracle Advanced Security
- Use protocol-specific parameters to restrict access to the database

By default, the sqlnet.ora file is located in the ORACLE_HOME/network/admin directory. The sqlnet.ora file can also be stored in the directory specified by the TNS_ADMIN environment variable.
5.2 sqlnet.ora Profile Parameters

This section lists and describes the following sqlnet.ora file parameters:

- ACCEPT_MD5_CERTS
- ACCEPT_SHA1_CERTS
- ADD_SSLV3_TO_DEFAULT
- EXADIRECT_FLOW_CONTROL
- EXADIRECT_RECV_POLL
- DEFAULT_SDU_SIZE
- DISABLE_OOB
  DISABLE_OOB is a networking parameter of the sqlnet.ora file and is used to enable or disable Oracle Net to send or receive out-of-band break messages using urgent data provided by the underlying protocol.
- DISABLE_OOB_AUTO
  The DISABLE_OOB_AUTO networking parameter of the sqlnet.ora file checks the server path for out-of-band break messages support at the connection time.
- HTTPS_SSL_VERSION
- IPC.KEYPATH
- NAMES(DEFAULT_DOMAIN)
- NAMES(DIRECTORY_PATH)
- NAMES(LDAP_AUTHENTICATE_BIND)
- NAMES(LDAP_CONN_TIMEOUT)
- NAMES(LDAP_PERSISTENT_SESSION)
- NAMES.NIS.META_MAP
• **RECV_BUF_SIZE**
• **SDP.PF_INET_SDP**
• **SEC_USER_AUDIT_ACTION_BANNER**
• **SEC_USER_UNAUTHORIZED_ACCESS_BANNER**
• **SEND_BUF_SIZE**
• **SQLNET.ALLOW_WEAK_CRYPTO**
  Use the sqlnet.ora compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO` to configure your client-side network connection by reviewing the specified encryption and crypto-checksum algorithms.
• **SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS**
  Use the sqlnet.ora compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS` to configure your server-side network connection by reviewing the specified encryption and crypto-checksum algorithms.
• **SQLNET.ALLOWED_LOGON_VERSION_CLIENT**
• **SQLNET.ALLOWED_LOGON_VERSION_SERVER**
• **SQLNET.AUTHENTICATION_SERVICES**
• **SQLNET.CLIENT_REGISTRATION**
• **SQLNET.CLOUD_USER**
• **SQLNET.COMPRESSION**
• **SQLNET.COMPRESSION_ACCELERATION**
• **SQLNET.COMPRESSION_LEVELS**
• **SQLNET.COMPRESSION_THRESHOLD**
• **SQLNET.CRYPTO_CHECKSUM_CLIENT**
• **SQLNET.CRYPTO_CHECKSUM_SERVER**
• **SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT**
• **SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER**
• **SQLNET.DBFW_PUBLIC_KEY**
• **SQLNET.DOWN_HOSTS_TIMEOUT**
• **SQLNET.ENCRYPTION_CLIENT**
  The `SQLNET.ENCRYPTION_CLIENT` networking parameter turns encryption on for the client.
• **SQLNET.ENCRYPTION_SERVER**
  The `SQLNET.ENCRYPTION_SERVER` networking parameter turns encryption on for the database server.
• **SQLNET.ENCRYPTION_TYPES_CLIENT**
  Use the sqlnet.ora parameter `SQLNET.ENCRYPTION_TYPES_CLIENT` to list encryption algorithms for clients to use.
• **SQLNET.ENCRYPTION_TYPES_SERVER**
  Use the sqlnet.ora parameter `SQLNET.ENCRYPTION_TYPES_SERVER` to list the encryption algorithms for the database to use.
• **SQLNET.EXPIRE_TIME**
• **SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS**
  The `SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS` parameter is used on the server-side to ignore the value set in `SQLNET.ENCRYPTION_SERVER` for TCPS connections (effectively disabling ANO encryption on the TCPS listener).

• **SQLNET.INBOUND_CONNECT_TIMEOUT**

• **SQLNET.FALLBACK_AUTHENTICATION**

• **SQLNET.KERBEROS5_CC_NAME**
  Use the `sqlnet.ora` parameter `SQLNET.KERBEROS5_CC_NAME` to specify the complete path name to the Kerberos credentials cache file.

• **SQLNET.KERBEROS5_CLOCKSKEW**

• **SQLNET.KERBEROS5_CONF**

• **SQLNET.KERBEROS5_CONF_LOCATION**

• **SQLNET.KERBEROS5_KEYTAB**

• **SQLNET.KERBEROS5_REALMS**

• **SQLNET.KERBEROS5_REPLAY_CACHE**

• **SQLNET.OUTBOUND_CONNECT_TIMEOUT**

• **SQLNET.RADIUS_ALTERNATE**

• **SQLNET.RADIUS_ALTERNATE_PORT**

• **SQLNET.RADIUS_ALTERNATE_RETRIES**

• **SQLNET.RADIUS_AUTHENTICATION**

• **SQLNET.RADIUS_AUTHENTICATION_INTERFACE**

• **SQLNET.RADIUS_AUTHENTICATION_PORT**

• **SQLNET.RADIUS_AUTHENTICATION_RETRIES**

• **SQLNET.RADIUS_AUTHENTICATION_TIMEOUT**

• **SQLNET.RADIUS_CHALLENGE_RESPONSE**

• **SQLNET.RADIUS_SECRET**

• **SQLNET.RADIUS_SEND_ACCOUNTING**

• **SQLNET.RECV_TIMEOUT**
  Use the `sqlnet.ora` parameter `SQLNET.RECV_TIMEOUT` to specify the duration of time that a database client or server should wait for data from a peer after establishing a connection.

• **SQLNET.SEND_TIMEOUT**

• **SQLNET.URI**
  `SQLNET.URI` networking parameter of the `sqlnet.ora` file specifies a database client URI mapping on the web server.

• **SQLNET.USE_HTTPS_PROXY**

• **SQLNET.WALLET_OVERRIDE**

• **SSL_CERT_REVOCATION**

• **SSL_CRL_FILE**

• **SSL_CRL_PATH**
It is a sqlnet.ora networking parameter handling signals for Linux and UNIX systems.

5.2.1 ACCEPT_MD5_CERTS

Purpose

To accept MD5 signed certificates, in addition to sqlnet.ora, this parameter must also be set in listener.ora.

Default

FALSE

Values

- **TRUE** to accept MD5 signed certificates
- **FALSE** to not accept MD5 signed certificates

5.2.2 ACCEPT_SHA1_CERTS

Purpose

To not accept SHA1 signed certificates, in addition to sqlnet.ora, this parameter must also be set in listener.ora.

Default

TRUE
Values

- **TRUE** to accept SHA1 signed certificates
- **FALSE** to not accept SHA1 signed certificates

### 5.2.3 ADD_SSLV3_TO_DEFAULT

**Purpose**

If the server wants to accept `SSL_VERSION=3.0` in its default list of `SSL_VERSIONS`, then in addition to `sqlnet.ora`, this parameter must also be set in `listener.ora`.

**Default**

**FALSE**

**Values**

- If set to **TRUE** and `SSL_VERSION` is not specified or is set to "undetermined", then `SSL_VERSION` includes versions 1.2, 1.1, 1.0, and 3.0.
- If set to **FALSE** and `SSL_VERSION` is not specified or is set to "undetermined", then `SSL_VERSION` includes versions 1.2, 1.1, and 1.0

### 5.2.4 EXADIRECT_FLOW_CONTROL

**Purpose**

To enable or disable Exadirect flow control.

**Usage Notes**

If turned on, the parameter enables Oracle Net to broadcast available receive window to the sender. The sender limits the sends based on the receiver broadcast window.

**Default**

**off**

**Example**

`EXADIRECT_FLOW_CONTROL=on`

### 5.2.5 EXADIRECT_RECV_POLL

**Purpose**

To specify the time that a receiver polls for incoming data.

**Usage Notes**

The parameter can be set to a fixed value or **AUTO** for auto tuning of the polling value.
5.2.6 DEFAULT_SDU_SIZE

Purpose
To specify the session data unit (SDU) size, in bytes to connections.

Usage Notes
Oracle recommends setting this parameter in both the client-side and server-side sqlnet.ora file to ensure the same SDU size is used throughout a connection. When the configured values of client and database server do not match for a session, the lower of the two values is used.

You can override this parameter for a particular client connection by specifying the SDU parameter in the connect descriptor for a client.

Default
8192 bytes (8 KB)

Values
512 to 2097152 bytes

Example 5-1 Example
DEFAULT_SDU_SIZE=4096

5.2.7 DISABLE_OOB

DISABLE_OOB is a networking parameter of the sqlnet.ora file and is used to enable or disable Oracle Net to send or receive out-of-band break messages using urgent data provided by the underlying protocol.

Purpose
To enable or disable Oracle Net to send or receive out-of-band break messages using urgent data provided by the underlying protocol.

Usage Notes
If turned off, then the parameter enables Oracle Net to send and receive break messages. If turned on, then the parameter disables the ability to send and receive break messages. Once enabled, this feature applies to all protocols used by this client.
5.2.8 DISABLE_OOB_AUTO

The DISABLE_OOB_AUTO networking parameter of the sqlnet.ora file checks the server path for out-of-band break messages support at the connection time.

Purpose

Disable automatic out-of-band (OOB) support checks the server path at connection time.

Usage Notes

By default, the client checks if the server path supports out-of-band break messages or not at the connection time. If this parameter is set to TRUE, then the client does not perform this check at the connection time.

Default

FALSE

Example 5-3  Example

DISABLE_OOB_AUTO = TRUE

5.2.9 HTTPS_SSL_VERSION

Purpose

To control the Secure Sockets Layer (SSL) version used by XDB HTTPS connections separately.

Usage Notes

In particular, the SSL_VERSION parameter no longer controls the SSL version used by HTTPS. You can set this parameter to any valid SSL_VERSION values.

Default

1.1 or 1.2, meaning TLSv1.1 or TLSv1.2.

Values

Any valid SSL_VERSION value
5.2.10 IPC.KEYPATH

**Purpose**
To specify the destination directory where the internal file is created for UNIX domain sockets.

**Usage Notes**
This parameter applies only to Oracle Net's usage of UNIX domain sockets and does not apply to other usages of UNIX domain sockets in the database, such as clusterware. If `keypath` is used, then the same value should be used on both the client and the listener sides with version greater than 18.

**Default**
The directory path is either `/var/tmp/.oracle` for Oracle Linux, Oracle Solaris or `/tmp/.oracle` for other UNIX variants.

**Example**
```
ipc.keypath=/home/oracleuser.
```

5.2.11 NAMES.DEFAULT_DOMAIN

**Purpose**
To set the domain from which the client most often looks up names resolution requests.

**Usage Notes**
When this parameter is set, the default domain name is automatically appended to any unqualified net service name or service name.

For example, if the default domain is set to `us.example.com`, then the connect string `CONNECT scott@sales` gets searched as `sales.us.example.com`. If the connect string includes the domain extension, such as `CONNECT scott@sales.us.example.com`, then the domain is not appended to the string.

**Default**
None

**Example**
```
NAMES.DEFAULT_DOMAIN=example.com
```

5.2.12 NAMES.DIRECTORY_PATH

**Purpose**
To specify the order of the naming methods used for client name resolution lookups.

**Default**

```
NAMES.DIRECTORY_PATH=(tnsnames, ldap, ezconnect)
```
Values

The following table shows the NAMES.DIRECTORY_PATH values for the naming methods.

<table>
<thead>
<tr>
<th>Naming Method Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tnsnames (local naming method)</td>
<td>Set to resolve a network service name through the tnsnames.ora file on the client.</td>
</tr>
<tr>
<td>ldap (directory naming method)</td>
<td>Set to resolve a database service name, net service name, or network service alias through a directory server.</td>
</tr>
<tr>
<td>ezconnect or hostname (Easy Connect naming method)</td>
<td>Select to enable clients to use a TCP/IP connect identifier, consisting of a host name and optional port and service name.</td>
</tr>
<tr>
<td>nis (external naming method)</td>
<td>Set to resolve service information through an existing Network Information Service (NIS).</td>
</tr>
</tbody>
</table>

Example

NAMES.DIRECTORY_PATH=(tnsnames)

5.2.13 NAMES.LDAP_AUTHENTICATE_BIND

Purpose

To specify whether the LDAP naming adapter should attempt to authenticate using a specified wallet when it connects to the LDAP directory to resolve the name in the connect string.

Usage Notes

The parameter value is Boolean.

If the parameter is set to TRUE, then the LDAP connection is authenticated using a wallet whose location must be specified in the WALLET_LOCATION parameter.

If the parameter is set to FALSE, then the LDAP connection is established using an anonymous bind.

Default

false

Example

NAMES.LDAP_AUTHENTICATE_BIND=true

5.2.14 NAMES.LDAP_CONN_TIMEOUT

Purpose

To specify number of seconds for a non-blocking connect timeout to the LDAP server.
Usage Notes
The parameter value -1 is for infinite timeout.

Default
15 seconds

Values
Values are in seconds. The range is -1 to the number of seconds acceptable for your environment. There is no upper limit.

Example
names.ldap_conn_timeout = -1

5.2.15 NAMES.LDAP_PERSISTENT_SESSION

Purpose
To specify whether the LDAP naming adapter should leave the session with the LDAP server open after name lookup is complete.

Usage Notes
The parameter value is Boolean.

If the parameter is set to TRUE, then the connection to the LDAP server is left open after the name lookup is complete. The connection will effectively stay open for the duration of the process. If the connection is lost, then it is re-established as needed.

If the parameter is set to FALSE, then the LDAP connection is terminated as soon as the name lookup completes. Every subsequent lookup opens the connection, performs the lookup, and closes the connection. This option prevents the LDAP server from having a large number of clients connected to it at any one time.

Default
false

Example
NAMES.LDAP_PERSISTENT_SESSION=true

5.2.16 NAMES.NIS.META_MAP

Purpose
To specify the map file to be used to map Network Information Service (NIS) attributes to an NIS mapname.

Default
sqlnet.maps
5.2.17 RECV_BUF_SIZE

Purpose
To specify the buffer space limit for receive operations of sessions.

Usage Notes
You can override this parameter for a particular client connection by specifying the RECV_BUF_SIZE parameter in the connect descriptor for a client.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Note:
Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for additional information about additional protocols that support this parameter.

See Also:
Oracle Database Net Services Administrator's Guide for additional information about configuring this parameter.

Default
The default value for this parameter is operating system specific. The default for Linux 2.6 operating system is 87380 bytes.

Example
RECV_BUF_SIZE=11784

5.2.18 SDP.PF_INET_SDP

Purpose
To specify the protocol family or address family constant for the SDP protocol on your system.

Default
27

Values
Any positive integer
Example
SDP.PF_INET_SDP=30

5.2.19 SEC_USER_AUDIT_ACTION_BANNER

Purpose
To specify a text file containing the banner contents that warn the user about possible user action auditing.

Usage Notes
The complete path of the text file must be specified in the sqlnet.ora file on the server. Oracle Call Interface (OCI) applications can make use of OCI features to retrieve this banner and display it to the user.

Default
None

Values
Name of the file for which the database owner has read permissions.

Example
SEC_USER_AUDIT_ACTION_BANNER=/opt/oracle/admin/data/auditwarning.txt

5.2.20 SEC_USER_UNAUTHORIZED_ACCESS_BANNER

Purpose
To specify a text file containing the banner contents that warn the user about unauthorized access to the database.

Usage Notes
The complete path of the text file must be specified in the sqlnet.ora file on the server. OCI applications can make use of OCI features to retrieve this banner and display it to the user.

Default
None

Values
Name of the file for which the database owner has read permissions.

Example
SEC_USER_UNAUTHORIZED_ACCESS_BANNER=/opt/oracle/admin/data/unauthwarning.txt
5.2.21 SEND_BUF_SIZE

**Purpose**

To specify the buffer space limit for send operations of sessions.

**Usage Notes**

You can override this parameter for a particular client connection by specifying the `SEND_BUF_SIZE` parameter in the connect descriptor for a client.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

**Note:**

Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for additional information about additional protocols that support this parameter.

**See Also:**

*Oracle Database Net Services Administrator's Guide* for additional information about configuring this parameter

**Default**

The default value for this parameter is operating system specific. The default for Linux 2.6 operating system is 16 KB.

**Example**

```
SEND_BUF_SIZE=11784
```

5.2.22 SQLNET.ALLOW_WEAK_CRYPTO

Use the *sqlnet.ora* compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO` to configure your client-side network connection by reviewing the specified encryption and crypto-checksum algorithms.

**Purpose**

To configure your client-side network connection by reviewing the encryption and crypto-checksum algorithms enabled on the client and server. This ensures that the connection does not encounter compatibility issues and your configuration uses supported strong algorithms.

**Usage Notes**

- The DES, DES40, 3DES112, 3DES168, RC4_40, RC4_56, RC4_128, RC4_256, and MD5 algorithms are deprecated in this release.
As a result of this deprecation, Oracle recommends that you review your network encryption and integrity configuration to check if you have specified any of the deprecated weak algorithms.

To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

- If you set this parameter to **TRUE**, then you can specify deprecated algorithms for backward compatibility. This configuration allows patched clients to connect to unpatched servers, and thus such a connection is less secure.

- If you set this parameter to **FALSE**, then you can specify only supported algorithms so that clients and servers can communicate in a fully patched environment. The server enforces key fold-in for all Kerberos and JDBC thin clients. This configuration strengthens the connection between clients and servers by using strong native network encryption and integrity capabilities.

Using this setting, if native network encryption or checksumming is enabled and a patched server or client attempts to communicate with an unpatched old client or server, then the connection fails with an error message.

**Values**

- **TRUE**
- **FALSE**

**Default Value**

**TRUE**

**Recommended Value**

**FALSE**

**Note:**

Before setting this parameter to **FALSE**, you must remove all deprecated algorithms listed in the server and client sqlnet.ora files.

**Example**

```
SQLNET.ALLOW_WEAK_CRYPTO = FALSE
```

**Related Topics**

- *Oracle Database Security Guide*
- **SQLNET.ENCRIPTION_TYPES_CLIENT**
  
  Use the sqlnet.ora parameter SQLNET.ENCRIPTION_TYPES_CLIENT to list encryption algorithms for clients to use.

- **SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT**
5.2.23 SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS

Use the `sqlnet.ora` compatibility parameter `SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS` to configure your server-side network connection by reviewing the specified encryption and crypto-checksum algorithms.

**Purpose**

To configure your server-side network connection by reviewing the encryption and crypto-checksum algorithms enabled on the client and server. This ensures that the connection does not encounter compatibility issues and your configuration uses supported strong algorithms.

**Usage Notes**

- The DES, DES40, 3DES112, 3DES168, RC4_40, RC4_56, RC4_128, RC4_256, and MD5 algorithms are deprecated in this release. As a result of this deprecation, Oracle recommends that you review your network encryption and integrity configuration to check if you have specified any of the deprecated weak algorithms.

  To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

- If you set this parameter to `TRUE`, then you can specify deprecated algorithms for backward compatibility. This configuration allows patched servers to connect to unpatched clients, and thus such a connection is less secure.

- If you set this parameter to `FALSE`, then you can specify only supported algorithms so that clients and servers can communicate in a fully patched environment. The server enforces key fold-in for all Kerberos and JDBC thin clients. This configuration strengthens the connection between clients and servers by using strong native network encryption and integrity capabilities.

  Using this setting, if native network encryption or checksumming is enabled and a patched server or client attempts to communicate with an unpatched old client or server, then the connection fails with an error message.

**Values**

- `TRUE`
- `FALSE`

**Default Value**

`TRUE`

**Recommended Value**

`FALSE`
Note:

Before setting this parameter to FALSE, you must remove all deprecated algorithms listed in the server and client sqlnet.ora files.

Example

SQLNET.ALLOW_WEAK_CRYPTO_CLIENTS = FALSE

Related Topics

  Use the sqlnet.ora parameter SQLNET.ENCRYPTION_TYPES_SERVER to list the encryption algorithms for the database to use.
• SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER

5.2.24 SQLNET.ALLOWED_LOGON_VERSION_CLIENT

Purpose

To set the minimum authentication protocol allowed for clients, and when a server is acting as a client, such as connecting over a database link, when connecting to Oracle Database instances.

Usage Notes

The term VERSION in the parameter name refers to the version of the authentication protocol, not the Oracle Database release.

If the version does not meet or exceed the value defined by this parameter, then authentication fails with an ORA-28040: No matching authentication protocol error.

See Also:

Oracle Database Security Guide

Values

• 12a for Oracle Database 12c Release 1 (12.1.0.2) or later (strongest protection)

Note:

Using this setting, the clients can only authenticate using a de-optimized password version. For example, the 12C password version.

• 12 for the critical patch updates CPUOct2012 and later Oracle Database 11g authentication protocols (stronger protection)
Using this setting, the clients can only authenticate using a password hash value that uses salt. For example, the `11G` or `12C` password versions.

- 11 for Oracle Database 11g authentication protocols (default)
- 10 for Oracle Database 10g authentication protocols
- 8 for Oracle8i authentication protocol

Default
11

Example
If an Oracle Database 12c database hosts a database link to an Oracle Database 10g database, then the `SQLNET.ALLOWED_LOGON_VERSION_CLIENT` parameter should be set as follows in order for the database link connection to proceed:

```sql
SQLNET.ALLOWED_LOGON_VERSION_CLIENT=10
```

---

### 5.2.25 SQLNET.ALLOWED_LOGON_VERSION_SERVER

**Purpose**
To set the minimum authentication protocol allowed when connecting to Oracle Database instances.

**Usage Notes**
The term `VERSION` in the parameter name refers to the version of the authentication protocol, not the Oracle Database release.

The authentication fails with an ORA-28040: No matching authentication protocol error or an ORA-03134: Connections to this server version are no longer supported error if the client does not have the ability listed in the "Ability Required of the Client" column corresponding to the row matching the value of the `SQLNET.ALLOWED_LOGON_VERSION_SERVER` parameter in Table 1.

---

### See Also:
- Oracle Database Reference
- Oracle Database Security Guide
A setting of 8 permits all password versions, and allows any combination of the DBA_USERS.PASSWORD_VERSIONS values 10G, 11G, and 12C.

A setting of 12a permits only the 12C password version.

A greater value means the server is less compatible in terms of the protocol that clients must understand in order to authenticate. The server is also more restrictive in terms of the password version that must exist to authenticate any specific account. Whether a client can authenticate to a specific account depends on both the server’s setting of its SQLNET.ALLOWED_LOGON_VERSION_SERVER parameter, as well as on the password versions which exist for the specified account. The list of password versions can be seen in DBA_USERS.PASSWORD_VERSIONS.

Note the following implications of setting the value to 12 or 12a:

- A value of FALSE for the SEC_CASE_SENSITIVE_LOGON Oracle instance initialization parameter must not be used because password case insensitivity requires the use of the 10G password version. If the SEC_CASE_SENSITIVE_LOGON Oracle instance initialization parameter is set to FALSE, then user accounts and secure roles become unusable because Exclusive Mode excludes the use of the 10G password version. The SEC_CASE_SENSITIVE_LOGON Oracle instance initialization parameter enables or disables password case sensitivity. However, since Exclusive mode is enabled by default in this release, disabling the password case sensitivity is not supported.

- Releases of OCI clients earlier than Oracle Database 10g cannot authenticate to the Oracle database using password-based authentication.

- If the client uses Oracle Database 10g, then the client will receive an ORA-03134: Connections to this server version are no longer supported error message. To allow the connection, set the SQLNET.ALLOWED_LOGON_VERSION_SERVER value to 8. Ensure the DBA_USERS.PASSWORD_VERSIONS value for the account contains the value 10G. It may be necessary to reset the password for that account.

Note the following implication of setting the value to 12a:

- To take advantage of the new 12C password version introduced in Oracle Database release 12.2, user passwords should be expired to encourage users to change their passwords and cause the new 12C password version to be generated for their account. By default in this release, new passwords are treated in a case-sensitive fashion. When an account password is changed, the earlier 10G case-insensitive password version is automatically removed, and the new 12C password version is generated.

- When an account password is changed, the earlier 10G case-insensitive password version and the 11G password version are both automatically removed.

- JDBC Thin Client Support:
In Oracle Database release 12.1.0.2 and later, if you set the sqlnet.ora parameter `SQLNET.ALLOWED_LOGON_VERSION_SERVER` to 12a and you create a new account or change the password of an existing account, then only the new 12C password version is generated. The 12C password version is based on a SHA-2 (Secure Hash Algorithm) SHA-512 salted cryptographic hash deoptimized using the PBKDF2 (Password-Based Key Derivation Function 2) algorithm. When the database server is running with `ALLOWED_LOGON_VERSION_SERVER` set to 12a, it is running in Exclusive Mode. In this mode, to log in using a JDBC client, the JRE version must be at least version 8. The JDBC client enables its `O7L_MR` capability flag only when it is running with at least version 8 of the JRE.

**Note:**
Check the `PASSWORD_VERSIONS` column of the `DBA_USERS` catalog view to see the list of password versions for any given account.

If you set the sqlnet.ora parameter `SQLNET.ALLOWED_LOGON_VERSION_SERVER` to 12, the server runs in Exclusive Mode and only the 11G and 12C password versions (the SHA-1 and PBKDF2 SHA-2 based hashes of the password, respectively) are generated and allowed to be used. In such cases, fully-patched JDBC clients having the CPUOct2012 patch can connect because these JDBC clients provide the `O5L_NP` client ability.

Older JDBC clients which do not have the CPUOct2012 containing the fix for the stealth password cracking vulnerability CVE-2012-3132, do not provide the `O5L_NP` client ability. Therefore, ensure that all the JDBC clients are patched properly.

The client must support certain abilities of the authentication protocol before the server will authenticate. If the client does not support a specified authentication ability, then the server rejects the connection with an ORA-28040: No matching authentication protocol error message.

The following is the list of all client abilities. Some clients do not have all abilities. Clients that are more recent have all the capabilities of the older clients, but older clients tend to have less abilities than more recent clients.

- **O7L_MR**: The ability to perform the Oracle Database 10g authentication protocol using the 12C password version. For JDBC clients, only those running on at least JRE version 8 offer the O7L_MR capability.
- **O5L_NP**: The ability to perform the Oracle Database 10g authentication protocol using the 11G password version, and generating a session key encrypted for critical patch update CPUOct2012.
- **O5L**: The ability to perform the Oracle Database 10g authentication protocol using the 10G password version.
- **O4L**: The ability to perform the Oracle9i database authentication protocol using the 10G password version.
- **O3L**: The ability to perform the Oracle8i database authentication protocol using the 10G password version.

An ability which appears higher in the above list is more recent and secure than an ability which appears lower in the list. Clients that are more recent have all the capabilities of the older clients.
The following table describes:

- the allowed settings of the SQLNET.ALLOWED_LOGON_VERSION_SERVER parameter
- its effect on the generated password versions when an account is created or a password is changed
- the ability flag required of the client to authenticate while the server has this setting
- and whether the setting is considered to be an Exclusive Mode.

Table 5-1  SQLNET.ALLOWED_LOGON_VERSION_SERVER Settings

<table>
<thead>
<tr>
<th>Value of the ALLOWED_LOGON_VERSION_SERVER Parameter</th>
<th>Generated Password Version</th>
<th>Ability Required of the Client</th>
<th>Meaning for Clients</th>
<th>Server Runs in Exclusive Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>12a</td>
<td>12C</td>
<td>O7L_MR</td>
<td>Only Oracle Database 12c release 1 (12.1.0.2 or later) clients can connect to the server.</td>
<td>Yes because it excludes the use of both 10G and 11G password versions.</td>
</tr>
<tr>
<td>12</td>
<td>11G, 12C</td>
<td>O5L_NP</td>
<td>Oracle Database 11g release 2 (11.2.0.3 or later) clients can connect to the server. Older clients need the critical patch update CPUOct2012 or later, to gain the O5L_NP ability. Only older clients which have applied critical patch update CPUOct2012 or later can connect to the server.</td>
<td>Yes because it excludes the use of the 10G password version.</td>
</tr>

<tr>
<td>8</td>
<td>10G, 11G, 12C</td>
<td>03L</td>
<td>It has the same meaning as the earlier row.</td>
<td>No</td>
</tr>
</tbody>
</table>

**Values**

- **12a** for Oracle Database 12c release 12.1.0.2 or later authentication protocols (strongest protection)
- **12** for Oracle Database 12c release 12.1 authentication protocols (default and recommended value)
- **11** for Oracle Database 11g authentication protocols
- **10** for Oracle Database 10g authentication protocols
- **9** for Oracle9i Database authentication protocol
- **8** for Oracle8i Database authentication protocol
Note:

- Starting with Oracle Database 12c Release 2 (12.2), the default value is 12.
- For earlier releases, the value 12 can be used after the critical patch updates CPUOct2012 and later are applied.

Default

12

Example

SQLNET.ALLOWED_LOGON_VERSION_SERVER=12

5.2.26 SQLNET.AUTHENTICATION_SERVICES

Purpose

To enable one or more authentication services. If authentication has been installed, then it is recommended that this parameter be set to either none or to one of the listed authentication methods.

Usage Notes

When using the SQLNET.AUTHENTICATION_SERVICES value all, the server attempts to authenticate using each of the following methods. The server falls back to the ones lower on the list if the ones higher on the list were unsuccessful.

- Authentication based on a service external to the database, such as a service on the network layer, Kerberos, or RADIUS.
- Authentication based on the operating system user's membership in an administrative operating system group. Group names are platform-specific. This authentication is applicable to administrative connections only.
- Authentication performed by the database.
- Authentication based on credentials stored in a directory server.

Operating system authentication allows access to the database using any user name and any password when an administrative connection is attempted, such as using the AS SYSDBA clause when connecting using SQL*Plus. An example of a connection is as follows.

sqlplus ignored_username/ignored_password AS SYSDBA

When the operating-system user who issued the preceding command is already a member of the appropriate administrative operating system group, then the connection is successful. This is because the user name and password are ignored by the server due to checking the group membership first.
Default

all

Note:

When installing the database with Database Configuration Assistant (DBCA), this parameter may be set to `nts` in the `sqlnet.ora` file.

Values

Authentication methods available with Oracle Net Services:

- `none` for no authentication methods, including Microsoft Windows native operating system authentication. When `SQLNET.AUTHENTICATION_SERVICES` is set to `none`, a valid user name and password can be used to access the database.
- `all` for all authentication methods.
- `beb` for native operating system authentication for operating systems other than Microsoft Windows
- `kerberos5` for Kerberos authentication
- `nts` for Microsoft Windows native operating system authentication
- `radius` for Remote Authentication Dial-In User Service (RADIUS) authentication
- `tcps` for SSL authentication

Example

```
SQLNET.AUTHENTICATION_SERVICES= (kerberos5)
```

See Also:

*Oracle Database Security Guide* for additional information about authentication methods
Usage Notes

This identifier is passed to the listener with any connection request, and is included in the audit trail. The identifier can be any alphanumeric string up to 128 characters long.

Default

None

Example

SQLNET.CLIENT_REGISTRATION=1432

5.2.28 SQLNET.CLOUD_USER

Purpose

To specify a user name for the web server HTTP basic authentication.

Usage Notes

When secure websocket protocol is used, the client uses this user as the user name for authentication. The password for this user should be stored in a wallet using mkstore commands.

Configuration steps to use HTTP basic authentication with secure websockets:

1. Create wallet using orapki utility.

   `orapki wallet create -wallet wallet_directory`

   Example

   `orapki wallet create -wallet /app/wallet`

2. Add web server public certificate.

   `orapki wallet -wallet wallet_directory -trusted_cert -cert web_server_public_certificate_in_pem_format`

   Example

   `orapki wallet -wallet /app/wallet -trusted_cert -cert server_cert.txt`

3. Add web server user name to sqlnet.ora. This user name is only used for authenticating the web server. This is not a database user name. After web server authentication, the web server makes connection to the backend database server and usual database authentication happens.

   Example

   `sqlnet.cloud_user = dbuser1`

4. Add web server user password to wallet.

   `mkstore -wrl wallet_location -createEntry username password`

   Example

   `mkstore -wrl /app/wallet -createEntry dbuser1 Secretdb#`

5. Make wallet auto login and protect this wallet directory using operating system file permissions or any other means, so that ONLY database client can have read access to it. Refer to the operating system utilities for information about changing file permissions.
orapki wallet create -wallet wallet_directory -auto_login

Example

orapki wallet create -wallet /app/wallet -auto_login

6. Update sqlnet.ora with wallet entry.

Example

wallet_location=(SOURCE= (METHOD=file) (METHOD_DATA= (DIRECTORY=/app/wallet)))

Default

None

5.2.29 SQLNET.COMPRESSION

Purpose

To enable or disable data compression. If both the server and client have this parameter set to ON, then compression is used for the connection.

Note:

The SQLNET.COMPRESSION parameter applies to all database connections, except for Oracle Data Guard streaming redo and SecureFiles LOBs (Large Objects).

Default

off

Values

• on to enable data compression.
• off to disable data compression.

Example

SQLNET.COMPRESSION=on

5.2.30 SQLNET.COMPRESSION_ACCELERATION

Purpose

To specify the use of hardware accelerated version of compression using this parameter if it is available for that platform.

Usage Notes

This parameter can be specified under Oracle Connection Manager alias description.
5.2.31 SQLNET.COMPRESSION_LEVELS

Purpose
To specify the compression level.

Usage Notes
The compression levels are used at time of negotiation to verify which levels are used at both ends, and to select one level.

For Database Resident Connection Pooling (DRCP), only the compression level low is supported.

Default
low

Values

- low to use low CPU usage and low compression ratio.
- high to use high CPU usage and high compression ratio.

Example
SQLNET.COMPRESSION_LEVELS=(high)

5.2.32 SQLNET.COMPRESSION_THRESHOLD

Purpose
To specify the minimum data size, in bytes, for which compression is needed.

Usage Notes
Compression is not be done if the size of the data to be sent is less than this value.

Default
1024 bytes
Example
SQLNET.COMPRESSION_THRESHOLD=1024

5.2.33 SQLNET.CRYPTO_CHECKSUM_CLIENT

Purpose
To specify the checksum behavior for the client.

See Also:
Oracle Database Security Guide

Default
accepted

Values
• accepted to enable the security service if required or requested by the other side.
• rejected to disable the security service, even if required by the other side.
• requested to enable the security service if the other side allows it.
• required to enable the security service and disallow the connection if the other side is not enabled for the security service.

Example
SQLNET.CRYPTO_CHECKSUM_CLIENT=accepted

5.2.34 SQLNET.CRYPTO_CHECKSUM_SERVER

Purpose
To specify the checksum behavior for the database server.

Default
accepted

Values
• accepted to enable the security service if required or requested by the other side.
• rejected to disable the security service, even if required by the other side.
• requested to enable the security service if the other side allows it.
• required to enable the security service and disallow the connection if the other side is not enabled for the security service.
5.2.35 SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT

**Purpose**

To specify a list of crypto-checksum algorithms for the client to use.

**Default**

All available algorithms

**Values**

- **MD5** for the RSA Data Security MD5 algorithm.
  
  The MD5 algorithm is deprecated in this release. To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

- **SHA1** for the Secure Hash Algorithm.

- **SHA256** for SHA-2 uses 256 bits with the hashing algorithm.

- **SHA384** for SHA-2 uses 384 bits with the hashing algorithm.

- **SHA512** for SHA-2 uses 512 bits with the hashing algorithm.

**Example**

```
SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT=(SHA256, MD5)
```

**See Also:**

*Oracle Database Security Guide*

5.2.36 SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER

**Purpose**

To specify a list of crypto-checksum algorithms for the database server to use.
Default
All available algorithms

Values

- **MD5** for the RSA Data Security's MD5 algorithm
  
  The **MD5** algorithm is deprecated in this release. To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note [2118136.2](#).

- **SHA1** for the Secure Hash algorithm.

- **SHA256** for SHA-2 uses 256 bits with the hashing algorithm.

- **SHA384** for SHA-2 uses 384 bits with the hashing algorithm.

- **SHA512** for SHA-2 uses 512 bits with the hashing algorithm.

Example

```
SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER=(SHA256, MD5)
```

See Also:

*Oracle Database Security Guide*

---

5.2.37 SQLNET.DBFW_PUBLIC_KEY

Purpose

To provide Oracle Database Firewall public keys to Advanced Security Option (ASO) by specifying the file that stores the Oracle Database Firewall public keys.

Default

None

Values

Full path name of the operating system file that has the public keys.

Example

```
SQLNET.DBFW_PUBLIC_KEY="/path_to_file/dbfw_public_key_file.txt"
```

See Also:

*"SQLNET.ENCRYPTION_TYPES_SERVER"*
5.2.38 SQLNET.DOWN_HOSTS_TIMEOUT

Purpose
To specify the amount of time in seconds that information about the down state of server hosts is kept in client process cache.

Usage Notes
Clients discover the down state of server hosts when attempting connections. When a connection attempt fails, the information about the down state of the server host is added to the client process cache. Subsequent connection attempts by the same client process move the down hosts to the end of the address list, thereby reducing the priority of such hosts. When the time specified by the SQLNET.DOWN_HOSTS_TIMEOUT parameter has passed, the host is purged from the process cache, and its priority in the address list is restored.

Default
600 seconds (10 minutes)

Values
Any positive integer

Example
SQLNET.DOWN_HOSTS_TIMEOUT=60

5.2.39 SQLNET.ENCRYPTION_CLIENT

The SQLNET.ENCRYPTION_CLIENT networking parameter turns encryption on for the client.

Purpose
To turn encryption on for the client. Setting the tnsnames.ora parameter IGNORE_AND_ENCRYPTION_FOR_TCPS to TRUE disables SQLNET.ENCRYPTION_CLIENT.

Default
accepted

Values
• accepted to enable the security service if required or requested by the other side.
• rejected to disable the security service, even if required by the other side.
• requested to enable the security service if the other side allows it.
• required to enable the security service and disallow the connection if the other side is not enabled for the security service.

Example
SQLNET.ENCRYPTION_CLIENT=accepted
5.2.40 SQLNET.ENCRYPTION_SERVER

The SQLNET.ENCRYPTION_SERVER networking parameter turns encryption on for the database server.

Purpose

To turn encryption on for the database server. Setting SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS to FALSE disables SQLNET.ENCRYPTION_SERVER.

Default

accepted

Values

• accepted to enable the security service if required or requested by the other side.
• rejected to disable the security service, even if required by the other side.
• requested to enable the security service if the other side allows it.
• required to enable the security service and disallow the connection if the other side is not enabled for the security service.

Example

SQLNET.ENCRYPTION_SERVER=accepted

5.2.41 SQLNET.ENCRYPTION_TYPES_CLIENT

Use the sqlnet.ora parameter SQLNET.ENCRYPTION_TYPES_CLIENT to list encryption algorithms for clients to use.

Purpose

To specify a list of encryption algorithms for clients to use.

Default

All available algorithms.
Values

One or more of the following:

- 3des112 for triple DES with a two-key (112-bit) option
- 3des168 for triple DES with a three-key (168-bit) option
- aes128 for AES (128-bit key size)
- aes192 for AES (192-bit key size)
- aes256 for AES (256-bit key size)
- des for standard DES (56-bit key size)
- des40 for DES (40-bit key size)
- rc4_40 for RSA RC4 (40-bit key size)
- rc4_56 for RSA RC4 (56-bit key size)
- rc4_128 for RSA RC4 (128-bit key size)
- rc4_256 for RSA RC4 (256-bit key size)

The DES, DES40, 3DES112, 3DES168, RC4_40, RC4_56, RC4_128, and RC4_256 algorithms are deprecated in this release.

To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

Example

SQLNET.ENCRYPTION_TYPES_CLIENT=(rc4_56)

See Also:

Oracle Database Security Guide

5.2.42 SQLNET.ENCRYPTION_TYPES_SERVER

Use the sqlnet.ora parameter SQLNET.ENCRYPTION_TYPES_SERVER to list the encryption algorithms for the database to use.

Purpose

To specify a list of encryption algorithms for the database to use.

Default

All available algorithms.

Values

One or more of the following:

- 3des112 for triple DES with a two-key (112-bit) option
• 3des168 for triple DES with a three-key (168-bit) option
• aes128 for AES (128-bit key size)
• aes192 for AES (192-bit key size)
• aes256 for AES (256-bit key size)
• des for standard DES (56-bit key size)
• des40 for DES40 (40-bit key size)
• rc4_40 for RSA RC4 (40-bit key size)
• rc4_56 for RSA RC4 (56-bit key size)
• rc4_128 for RSA RC4 (128-bit key size)
• rc4_256 for RSA RC4 (256-bit key size)

The DES, DES40, 3DES112, 3DES168, RC4_40, RC4_56, RC4_128, and RC4_256 algorithms are deprecated in this release.

To transition your Oracle Database environment to use stronger algorithms, download and install the patch described in My Oracle Support note 2118136.2.

Example

SQLNET.ENCRYPTION_TYPES_SERVER=(rc4_56, des, ...)

See Also:
Oracle Database Security Guide

5.2.43 SQLNET.EXPIRE_TIME

Purpose
To specify a time interval, in minutes, to send a check to verify that client/server connections are active.

Usage Notes
Setting a value greater than 0 ensures that connections are not left open indefinitely, due to an abnormal client termination. If the system supports TCP keepalive tuning, then Oracle Net Services automatically uses the enhanced detection model, and tunes the TCP keepalive parameters.

If the probe finds a terminated connection, or a connection that is no longer in use, then it returns an error, causing the server process to exit.

This parameter is primarily intended for the database server, which typically handles multiple connections at any one time.

Limitations on using this terminated connection detection feature are:

• It is not allowed on bequeathed connections.
• Though very small, a probe packet generates additional traffic that may downgrade network performance.
• Depending on which operating system is in use, the server may need to perform additional processing to distinguish the connection probing event from other events that occur. This can also result in degraded network performance.

Default
0

Minimum Value
0

Recommended Value
10

Example
SQLNET.EXPIRE_TIME=10

5.2.44 SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS

The SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS parameter is used on the server-side to ignore the value set in SQLNET.ENCRYPTION_SERVER for TCPS connections (effectively disabling ANO encryption on the TCPS listener).

Purpose
Used on the server-side to ignore the value set in SQLNET.ENCRYPTION_SERVER for TCPS connections (effectively disabling ANO encryption on the TCPS listener).

Usage Notes
If you set the SQLNET.ENCRYPTION_CLIENT parameter on the client to required and SQLNET.ENCRYPTION_SERVER on the server to required, and if a TCPS listener is used, then the ORA-12696 Double Encryption Turned On, login disallowed error appears. Starting with this release, you can set a new parameter, SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS, to TRUE to ignore the SQLNET.ENCRYPTION_CLIENT or SQLNET.ENCRYPTION_SERVER when there is a conflict between the use of a TCPS client and these two parameters are set to required.

Default
FALSE

Example 5-5   Example
SQLNET.IGNORE_ANO_ENCRYPTION_FOR_TCPS=TRUE

5.2.45 SQLNET.INBOUND_CONNECT_TIMEOUT

Purpose
To specify the time, in ms, sec, or min, for a client to connect with the database server and provide the necessary authentication information.
Usage Notes

If the client fails to establish a connection and complete authentication in the time specified, then the database server terminates the connection. In addition, the database server logs the IP address of the client and an ORA-12170: TNS:Connect timeout occurred error message to the sqlnet.log file. The client receives either an ORA-12547: TNS:lost contact or an ORA-12637: Packet receive failed error message.

The default value of this parameter is appropriate for typical usage scenarios. However, if you need to explicitly set a different value, then Oracle recommends setting this parameter in combination with the INBOUND_CONNECT_TIMEOUT_listener_name parameter in the listener.ora file. When specifying the values for these parameters, note the following recommendations:

- Set both parameters to an initial low value.
- Set the value of the INBOUND_CONNECT_TIMEOUT_listener_name parameter to a lower value than the SQLNET.INBOUND_CONNECT_TIMEOUT parameter.

It accepts different timeouts with or without space between the value and the unit. In case, no unit is mentioned, the default unit is sec. For example, you can set INBOUND_CONNECT_TIMEOUT_listener_name to 2 seconds and SQLNET.INBOUND_CONNECT_TIMEOUT parameter to 3 seconds. If clients are unable to complete connections within the specified time due to system or network delays that are normal for the particular environment, then increment the time as needed.

Default

60 seconds

Example

SQLNET.INBOUND_CONNECT_TIMEOUT=3ms

5.2.46 SQLNET.FALLBACK_AUTHENTICATION

Purpose

To specify whether password-based authentication is going to be attempted if Kerberos authentication fails. This is relevant for direct connections as well as database link connections.

Default

FALSE

Example

SQLNET.FALLBACK_AUTHENTICATION=TRUE

See Also:

Oracle Database Security Guide
5.2.47 SQLNET.KERBEROS5_CC_NAME

Use the sqlnet.ora parameter SQLNET.KERBEROS5_CC_NAME to specify the complete path name to the Kerberos credentials cache file.

Purpose
To specify the complete path name to the Kerberos credentials cache file.

Usage Notes
The MSLSA option specifies that the file is on Microsoft Windows and is running Microsoft KDC.

The OS_MEMORY option specifies that an operating system-managed memory credential is used for the credential cache file. This option is supported for all operating systems with such a feature.

Default
/usr/tmp/krbcache on Linux and UNIX operating systems
\c:\tmp\krbcache on Microsoft Windows operating systems

Examples
SQLNET.KERBEROS5_CC_NAME=/usr/tmp/krbcache
SQLNET.KERBEROS5_CC_NAME=MSLSA
SQLNET.KERBEROS5_CC_NAME=OS_MEMORY

Note:
If you want to authenticate multiple Kerberos principals, then you can specify additional Kerberos principals either directly through the connect string or in the tnsnames.ora file.

Related Topics
• KERBEROS5_PRINCIPAL
  Use this parameter to specify Kerberos principals.
• Oracle Database Security Guide

5.2.48 SQLNET.KERBEROS5_CLOCKSKEW

Purpose
To specify how many seconds can pass before a Kerberos credential is considered out of date.

Default
300
Example

SQLNET.KERBEROS5_CLOCKSKEW=1200

See Also:
Oracle Database Security Guide

5.2.49 SQLNET.KERBEROS5_CONF

Purpose
To specify the complete path name to the Kerberos configuration file, which contains
the realm for the default Key Distribution Center (KDC) and maps realms to KDC
hosts.

Usage Notes
The KDC maintains a list of user principals and is contacted through the kinit
program for the user’s initial ticket.

The AUTO_DISCOVER option allows the automatic discovery of KDC and realms. It is the
default configuration for Kerberos clients. If there are multiple realms to be specified,
then Oracle recommends creating configuration files instead of using the
AUTO_DISCOVER option. This option is supported for all operating systems with such a
feature.

Default
/krb5/krb.conf on Linux and UNIX operating systems
c:\krb5\krb.conf on Microsoft Windows operating systems

Values
• Directory path to krb.conf file
• AUTO_DISCOVER

Example
SQLNET.KERBEROS5_CONF=/krb5/krb.conf

See Also:
Oracle Database Security Guide
5.2.50 SQLNET.KERBEROS5_CONF_LOCATION

Purpose
To specify the directory for the Kerberos configuration file. The parameter also specifies the file is created by the system, and not by the client.

Usage Notes
The configuration file uses DNS lookup to obtain the realm for the default KDC, and maps realms to the KDC hosts. This option is supported for all operating systems with such a feature.

Default
/krb5 on Linux and UNIX operating systems
c:\krb5 on Microsoft Windows operating systems

Example
SQLNET.KERBEROS5_CONF_LOCATION=/krb5

5.2.51 SQLNET.KERBEROS5_KEYTAB

Purpose
To specify the complete path name to the Kerberos principal/secret key mapping file, which is used to extract keys and decrypt incoming authentication information.

Default
/etc/v5srvtab on Linux and UNIX operating systems
c:\krb5\v5srvtab on Microsoft Windows operating systems

Example
SQLNET.KERBEROS5_KEYTAB=/etc/v5srvtab

See Also:
Oracle Database Security Guide

5.2.52 SQLNET.KERBEROS5_REALMS

Purpose
To specify the complete path name to the Kerberos realm translation file, which provides a mapping from a host name or domain name to a realm.
5.2.53 SQLNET.KERBEROS5_REPLAY_CACHE

Purpose
To specify replay cache is stored in operating system-managed memory on the server, and that file-based replay cache is not used.

Usage Notes
The OS_MEMORY option specifies the replay cache is stored in operating system-managed memory on the server, and file-based replay cache is not used.

Example
SQLNET.KERBEROS5_REPLAY_CACHE=OS_MEMORY

5.2.54 SQLNET.OUTBOUND_CONNECT_TIMEOUT

Purpose
To specify the time, in ms, sec, or min, for a client to establish an Oracle Net connection to the database instance.

Usage Notes
If an Oracle Net connection is not established in the time specified, then the connect attempt is terminated. The client receives an ORA-12170: TNS:Connect timeout occurred error.

The outbound connect timeout interval is a superset of the TCP connect timeout interval, which specifies a limit on the time taken to establish a TCP connection. Additionally, the outbound connect timeout interval includes the time taken to be connected to an Oracle instance providing the requested service. It accepts different timeouts with or without space between the value and the unit.

Without this parameter, a client connection request to the database server may block for the default TCP connect timeout duration (60 seconds) when the database server host system is unreachable. In case, no unit is mentioned, the default unit is sec.
The outbound connect timeout interval is only applicable for TCP, TCP with SSL, and IPC transport connections.

This parameter is overridden by the CONNECT_TIMEOUT parameter in the address description.

Default
None

Example

```
SQLNET.OUTBOUND_CONNECT_TIMEOUT=10 ms
```

5.2.55 SQLNET.RADIUS_ALTERNATE

Purpose
To specify an alternate RADIUS server to use in case the primary server is unavailable.

Usage Notes
The value can be either the IP address or host name of the server.

Default
None

Example

```
SQLNET.RADIUS_ALTERNATE=radius2
```

See Also:

Oracle Database Security Guide

5.2.56 SQLNET.RADIUS_ALTERNATE_PORT

Purpose
To specify the listening port of the alternate RADIUS server.

Default
1645

Example

```
SQLNET.RADIUS_ALTERNATE_PORT=1667
```
5.2.57 SQLNET.RADIUS_ALTERNATE_RETRIES

Purpose
To specify the number of times the database server should resend messages to the alternate RADIUS server.

Default
3

Example
SQLNET.RADIUS_ALTERNATE_RETRIES=4

5.2.58 SQLNET.RADIUS_AUTHENTICATION

Purpose
To specify the location of the primary RADIUS server, either by its host name or IP address.

Default
Local host

Example
SQLNET.RADIUS_AUTHENTICATION=officeacct
5.2.59 SQLNET.RADIUS_AUTHENTICATION_INTERFACE

Purpose
To specify the class containing the user interface used to interact with the user.

Default
DefaultRadiusInterface

Example
SQLNET.RADIUS_AUTHENTICATION_INTERFACE=DefaultRadiusInterface

See Also:
Oracle Database Security Guide

5.2.60 SQLNET.RADIUS_AUTHENTICATION_PORT

Purpose
To specify the listening port of the primary RADIUS server.

Default
1645

Example
SQLNET.RADIUS_AUTHENTICATION_PORT=1667

See Also:
Oracle Database Security Guide

5.2.61 SQLNET.RADIUS_AUTHENTICATION_RETRIES

Purpose
To specify the number of times the database server should resend messages to the primary RADIUS server.

Default
3
Example
SQLNET.RADIUS_AUTHENTICATION_RETRIES=4

See Also:
Oracle Database Security Guide

5.2.62 SQLNET.RADIUS_AUTHENTICATION_TIMEOUT

Purpose
To specify the time, in seconds, that the database server should wait for a response from the primary RADIUS server.

Default
5

Example
SQLNET.RADIUS_AUTHENTICATION_TIMEOUT=10

See Also:
Oracle Database Security Guide

5.2.63 SQLNET.RADIUS_CHALLENGE_RESPONSE

Purpose
To turn challenge response on or off.

Default
off

Values
on | off

Example
SQLNET.RADIUS_CHALLENGE_RESPONSE=on
5.2.64 SQLNET.RADIUS_SECRET

**Purpose:**
To specify the location of the RADIUS secret key.

**Default**
The `ORACLE_HOME/network/security/radius.key` file.

**Example**
```
SQLNET.RADIUS_SECRET=oracle/bin/admin/radiuskey
```

---

5.2.65 SQLNET.RADIUS_SEND_ACCOUNTING

**Purpose**
To turn accounting on and off. If enabled, then packets are sent to the active RADIUS server at listening port plus one.

**Usage Notes**
The default port is 1646.

**Default**
off

**Values**
on | off

**Example**
```
SQLNET.RADIUS_SEND_ACCOUNTING=on
```
5.2.66 SQLNET.RECV_TIMEOUT

Use the sqlnet.ora parameter SQLNET.RECV_TIMEOUT to specify the duration of time that a database client or server should wait for data from a peer after establishing a connection.

Purpose

To specify the time, in ms, sec, or min, for a database client or server to wait for data from the peer after establishing a connection. The peer must send data within the time interval that you specify.

Usage Notes

Setting this parameter for clients ensures that receive operations are not left in a wait state indefinitely or for a long period due to an abnormal termination of the server process or server busy state. If a client does not receive response data in the time specified, then the client logs ORA-12535: TNS:operation timed out and ORA-12609: TNS: Receive timeout occurred messages to the sqlnet.log file. If you set the value, then set the value initially to a low value and adjust the value according to the system and network capacity. If necessary, use this parameter with the SQLNET.SEND_TIMEOUT parameter.

You can also set this parameter on the server-side to specify the time, in ms, sec, or min, for a server to wait for client data after a connection is established. If a client does not send data in time specified, then the database server logs ORA-12535: TNS:operation timed out and ORA-12609: TNS: Receive timeout occurred messages to the sqlnet.log file. Without this parameter, the database server might continue to wait for data from clients that may be down or are experiencing problems. The server usually blocks input from the client and gets these timeouts frequently if you set it to a low value. If you do not specify a unit of measurement, then the default unit is sec.

Default

None

Example

SQLNET.RECV_TIMEOUT=10ms

See Also:

Oracle Database Security Guide

Oracle Database Net Services Administrator’s Guide for additional information about configuring these parameters
5.2.67 SQLNET.SEND_TIMEOUT

**Purpose**

To specify the time, in ms, sec, or min, for a database server to complete a send operation to clients after establishing a connection.

**Usage Notes**

Setting this parameter is recommended for environments in which clients shut down occasionally or abnormally.

If the database server cannot complete a send operation in the time specified, then it logs ORA-12535: TNS:operation timed out and ORA-12608: TNS: Send timeout occurred messages to the sqlnet.log file. Without this parameter, the database server may continue to send responses to clients that are unable to receive data due to a downed computer or a busy state.

You can also set this parameter on the client-side to specify the time, in ms, sec, or min, for a client to complete send operations to the database server after connection establishment. It accepts different timeouts with or without space between the value and the unit. In case, no unit is mentioned, the default unit is sec. Without this parameter, the client may continue to send requests to a database server already saturated with requests. If you choose to set the value, then set the value to an initial low value and adjust according to system and network capacity. If necessary, use this parameter with the SQLNET.RECV_TIMEOUT parameter.

**Default**

None

**Example**

SQLNET.SEND_TIMEOUT=3 ms

---

**See Also:**

*Oracle Database Net Services Administrator's Guide* for additional information about configuring this parameter

---

5.2.68 SQLNET.URI

**SQLNET.URI** networking parameter of the sqlnet.ora file specifies a database client URI mapping on the web server.

**Purpose**

To specify a database client URI mapping on the web server.
Usage Notes

You can use this parameter to customize URI for mapping the database websocket requests coming onto web server to the backend database server. Secure websocket handshaking requests are sent with this URI.

Default

/sqlnet

Example 5-6  

sqlnet.uri="/my_uri_prefix/database/"

5.2.69 SQLNET.USE_HTTPS_PROXY

Purpose

To enable forward HTTP proxy tunneling client connections.

Usage Notes

If turned on, the clients can tunnel secure connections over forward HTTP proxy using HTTP CONNECT method. This helps in accessing the public cloud database service as it eliminates the requirement to open an outbound port on a client side firewall.

This parameter is applicable with Oracle Connection Manager on the server side.

Default

on

Example

SQLNET.USE_HTTPS_PROXY=on

5.2.70 SQLNET.WALLET_OVERRIDE

OracleMetaLink note 340559.1.

Purpose

To determine whether the client should override the strong authentication credential with the password credential in the stored wallet to log in to the database.

Usage Notes

When wallets are used for authentication, the database credentials for user name and password are securely stored in an Oracle wallet. The auto-login feature of the wallet is turned on so the database does not need a password to open the wallet. From the wallet, the database gets the credentials to access the database for the user.

Wallet usage can simplify large-scale deployments that rely on password credentials for connecting to databases. When this feature is configured, application code, batch jobs, and scripts do not need embedded user names and passwords. Risk is reduced because such passwords are no longer exposed in the clear, and password
management policies are more easily enforced without changing application code whenever user names or passwords change.

Users connect using the `connect /@database_name` command instead of specifying a user name and password explicitly. This simplifies the maintenance of the scripts and secures the password management for the applications.

Middle-tier applications create an Oracle Applications wallet at installation time to store the application's specific identity. The password may be randomly generated rather than hardcoded. When an Oracle application accesses the database, it sets appropriate values for `SQLNET.AUTHENTICATION_SERVICES` and `WALLET_LOCATION`. The new wallet-based password authentication code uses the password credential in the Oracle Applications wallet to log on to the database.

**Values**

true | false

**Examples**

`SQLNET.WALLET_OVERRIDE=true`

---

5.2.71 SSL_CERT_REVOCATION

**Purpose**

To configure a revocation check for a certificate.

---

**See Also:**

Oracle Database Security Guide

---

**Default**

none

**Values**

- none disables certificate revocation status checking. This is the default value.
Note:

Oracle recommends that you do not set the `SSL_CERT_REVOCATION` parameter to `none` because this removes a critical component in certificate-based authentication. Without certificate revocation status checking, you cannot protect against stolen certificates that are used for authentication. Set the `none` value only in cases where mitigating controls safeguard the use of certificates for authentication, such as network access control lists or Oracle Database Vault policies that limit the database connection to trusted clients.

- **requested** to perform certificate revocation in case a Certificate Revocation List (CRL) is available. Reject SSL connection if the certificate is revoked. If no appropriate CRL is found to determine the revocation status of the certificate and the certificate is not revoked, then accept the SSL connection.
- **required** to perform certificate revocation when a certificate is available. If a certificate is revoked and no appropriate CRL is found, then reject the SSL connection. If no appropriate CRL is found to ascertain the revocation status of the certificate and the certificate is not revoked, then accept the SSL connection.

Example

`SSL_CERT_REVOCATION=required`

5.2.72 SSL_CRL_FILE

**Purpose**

To specify the name of the file where you can assemble the CRL for client authentication.

**Usage Notes**

This file contains the PEM-encoded CRL files, in order of preference. You can use this file alternatively or in addition to the `SSL_CERT_PATH` parameter. This parameter is only valid if `SSL_CERT_REVOCATION` is set to either `requested` or `required`.

**Default**

None

**Example**

`SSL_CRL_FILE=`

5.2.73 SSL_CRL_PATH

**Purpose**

To specify the destination directory of the CRL of CA.

**Usage Notes**

The files in this directory are hashed symbolic links created by Oracle Wallet Manager.
This parameter is only valid if SSL_CERT_REVOCATION is set to either requested or required.

**Default**

None

**Example**

SSL_CRL_PATH=

### 5.2.74 SSL_CIPHER_SUITES

**Purpose**

To control which combination of encryption and data integrity is used by the Secure Sockets Layer (SSL). Cipher suites that use Advanced Encryption Standard (AES) only work with Transport Layer Security (TLS 1.0).

**Default**

None

**Values**

- SSL_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- SSL_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
- SSL_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
- SSL_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
- SSL_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384
- SSL_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- SSL_RSA_WITH_AES_128_CBC_SHA256
- SSL_RSA_WITH_AES_128_GCM_SHA256
- SSL_RSA_WITH_AES_128_CBC_SHA
- SSL_RSA_WITH_AES_256_CBC_SHA
- SSL_RSA_WITH_AES_256_CBC_SHA256
- SSL_RSA_WITH_AES_256_GCM_SHA384
- SSL_RSA_WITH_RC4_128_MD5
- SSL_RSA_WITH_RC4_128_SHA
- SSL_RSA_WITH_3DES_EDE_CBC_SHA
- SSL_DH_anon_WITH_3DES_EDE_CBC_SHA
- SSL_DH_anon_WITH_RC4_128_MD5
Note:

SSL_DH_anon_WITH_3DES_EDE_CBC_SHA and SSL_DH_anon_WITH_RC4_128_MD5 do not provide authentication of the communicating parties, and can be vulnerable to man-in-the-middle attacks. Oracle recommends that you do not use these cipher suites to protect sensitive data. However, they are useful if the communicating parties want to remain anonymous or simply do not want the overhead caused by mutual authentication.

Example

SSL_CIPHER_SUITES=(ssl_rsa_with_aes_128_cbc_sha256)

See Also:

Oracle Database Security Guide for additional information about cipher suite values

5.2.75 SSL_EXTENDED_KEY_USAGE

Purpose

To specify the purpose of the key in the certificate.

Usage Notes

When this parameter is specified, the certificate with the matching extended key is used.

Values

client authentication

Example

SSL_EXTENDED_KEY_USAGE="client authentication"

5.2.76 SSL_SERVER_DN_MATCH

Purpose

To enforce server-side certification validation through distinguished name (DN) matching.

Usage Notes

If you enforce the DN matching, in addition to verifying the server's certificate chain, the client performs another check through DN matching. There are two flavors of DN matching. Partial DN matching happens if the server's CN contains its host name. Complete DN matching happens against the server's complete DN. Not enforcing the
match allows the server to potentially fake its identity. This parameter must be set to \texttt{TRUE} to do both full or partial DN matching.

In addition to the \texttt{sqlnet.ora} file, configure the \texttt{tnsnames.ora} parameter \texttt{SSL_SERVER_CERT_DN} to enable full DN matching.

**Default**

no

**Values**

- \texttt{yes} | \texttt{on} | \texttt{true} to enforce a match. If the DN matches the service name, then the connection succeeds. If the DN does not match the service name, then the connection fails.
- \texttt{no} | \texttt{off} | \texttt{false} to not enforce a match. If the DN does not match the service name, then the connection is successful, but an error is logged to the \texttt{sqlnet.log} file.

**Example**

\texttt{SSL_SERVER_DN_MATCH=yes}

**See Also:**

\textit{Oracle Database Security Guide}

### 5.2.77 SSL_VERSION

**Purpose**

To limit allowable SSL or TLS versions used for connections.

**Usage Notes**

Clients and database servers must use a compatible version. This parameter should only be used when absolutely necessary for backward compatibility. The current default uses TLS version 1.2 which is the version required for multiple security compliance requirements.

If you set \texttt{SSL_VERSION} to \texttt{undetermined}, then by default it uses 3.0.

**Default**

1.2

**Values**

**Note:**

The \texttt{sqlnet.ora} parameter \texttt{ADD_SSLV3_TO_DEFAULT} has no impact on this parameter.
undetermined | 3.0 | 1.0 | 1.1 | 1.2

If you want to specify one version or another version, then use “or”. The following values are permitted:

1.0 or 3.0 | 1.2 or 3.0 | 1.1 or 1.0 | 1.2 or 1.0 | 1.2 or 1.1 | 1.1 or 1.0 or 3.0
1.2 or 1.0 or 3.0 | 1.2 or 1.1 or 1.0 | 1.2 or 1.1 or 3.0 | 1.2 or 1.1 or 1.0 or 3.0

Example

SSL_VERSION=1.2

The remaining version numbers correspond to the TLS versions, such as, TLSv1.0, TLSv1.1, and TLSv1.2.

See Also:

Oracle Database Security Guide

5.2.78 TCP.CONNECT_TIMEOUT

Purpose

To specify the time, in ms, sec, or min, for a client to establish a TCP connection (PROTOCOL=tcp in the TNS connect address) to the database server.

Usage Notes

If a TCP connection to the database host is not established in the specified time, then the connection attempt is terminated. The client receives an ORA-12170: TNS:Connect timeout occurred error.

The timeout applies to each IP address that resolves to a host name. It accepts different timeouts with or without space between the value and the unit. For example, if a host name resolves to an IPv6 and an IPv4 address, and if the host is not reachable through the network, then the connection request times out twice because there are two IP addresses. In this example, the default timeout setting of 60 causes a timeout in 120 seconds. In case, no unit is mentioned, the default unit is sec.

Default

60

Example

TCP.CONNECT_TIMEOUT=10 ms

5.2.79 TCP.EXCLUDED_NODES

Purpose

To specify which clients are denied access to the database.
Usage Notes
This parameter is only valid when the TCP.VALIDNODE_CHECKING parameter is set to yes.
This parameter can use wildcards for IPv4 addresses and CIDR notation for IPv4 and IPv6 addresses.

Syntax
TCP.EXCLUDED_NODES=(hostname | ip_address, hostname | ip_address, ...)

Example
TCP.EXCLUDED_NODES=(finance.us.example.com, mktg.us.example.com, 192.0.2.25, 172.30.*, 2001:DB8:200C:417A/32)

5.2.80 TCP.INVITED_NODES

Purpose
To specify which clients are allowed access to the database. This list takes precedence over the TCP.EXCLUDED_NODES parameter if both lists are present.

Syntax
TCP.INVITED_NODES=(hostname | ip_address, hostname | ip_address, ...)

Usage Notes
• This parameter is only valid when the TCP.VALIDNODE_CHECKING parameter is set to yes.
• This parameter can use wildcards for IPv4 addresses and CIDR notation for IPv4 and IPv6 addresses.

Example
TCP.INVITED_NODES=(sales.us.example.com, hr.us.example.com, 192.0.*, 2001:DB8:200C:433B/32)

5.2.81 TCP.NODELAY

Purpose
To preempt delays in buffer flushing within the TCP/IP protocol stack.

Default
yes

Values
yes | no

Example
TCP.NODELAY=yes
5.2.82 TCP.QUEUESIZE

**Purpose**
To configure the maximum length of the queue for pending connections on a TCP listening socket.

**Default**
System-defined maximum value. The defined maximum value for Linux is 128.

**Values**
Any integer value up to the system-defined maximum.

**Examples**
TCP.QUEUESIZE=100

5.2.83 TCP.VALIDNODE_CHECKING

**Purpose**
To enable and disable valid node checking for incoming connections.

**Usage Notes**
If this parameter is set to yes, then incoming connections are allowed only if they originate from a node that conforms to list specified by TCP.INVITED_NODES or TCP.EXCLUDED_NODES parameters.

The TCP.INVITED_NODES and TCP.EXCLUDED_NODES parameters are valid only when the TCP.VALIDNODE_CHECKING parameter is set to yes.

This parameter and the depending parameters, TCP.INVITED_NODES and TCP.EXCLUDED_NODES must be set in the sqlnet.ora file of the listener. This is important in an Oracle RAC environment where the listener runs out of the Oracle Grid Infrastructure home. Setting the parameter in the database home does not have any effect in Oracle RAC environments. In such environments, the address of all Single Client Access Name (SCANs), Virtual IPs (VIPs), local IP must be included in the TCP.INVITED_NODES list.

In VLAN environments, the sqlnet.ora file present in the Oracle Grid Infrastructure home should include all the addresses of all the VLANs. The VLANs perform the network segregation, whereas the INVITED_NODES allows or restricts access to databases within the VLANs.

If multiple databases within the same VLAN require different INVITED_NODE lists, then separate listeners are required.

**Default**
no

**Values**
yes | no
Example

TCP.VALIDNODE_CHECKING=yes

5.2.84 TNSPING.TRACE_DIRECTORY

Purpose
To specify the destination directory for the TNSPING utility trace file, tnsping.trc.

Default
The ORACLE_HOME/network/trace directory.

Example
TNSPING.TRACE_DIRECTORY=/oracle/traces

5.2.85 TNSPING.TRACE_LEVEL

Purpose
To turn TNSPING utility tracing on at a specified level or to turn it off.

Default
off

Values
- off for no trace output
- user for user trace information
- admin for administration trace information
- support for Oracle Support Services trace information

Example
TNSPING.TRACE_LEVEL=admin

5.2.86 USE_CMAN

Purpose
To specify client routing to Oracle Connection Manager.

Usage Notes
If set to true, then the parameter routes the client to a protocol address for Oracle Connection Manager.

If set to false, then the client picks one of the address lists at random and fails over to the other address list if the chosen ADDRESS_LIST fails. With USE_CMAN=true, the client always uses the first address list.
If no Oracle Connection Manager addresses are available, then connections are routed through any available listener address.

**Default**

false

**Values**

ture | false

**Example**

USE_CMAN=true

---

### 5.2.87 USE_DEDICATED_SERVER

**Purpose**

To append (SERVER=dedicated) to the CONNECT_DATA section of the connect descriptor used by the client.

**Usage Notes**

It overrides the current value of the SERVER parameter in the tnsnames.ora file.

If set to on, then the parameter USE_DEDICATED_SERVER automatically appends (SERVER=dedicated) to the connect data for a connect descriptor. This way connections from this client use a dedicated server process, even if shared server is configured.

**Default**

off

**Values**

- on to append (SERVER=dedicated)
- off to send requests to existing server processes

**Example**

USE_DEDICATED_SERVER=on

---

**See Also:**

*Oracle Database Net Services Administrator's Guide* for complete configuration information
5.2.88 WALLET_LOCATION

Purpose
To specify the location of wallets. Wallets are certificates, keys, and trustpoints processed by SSL.

Usage Notes
The key/value pair for Microsoft certificate store (MCS) omits the METHOD_DATA parameter because MCS does not use wallets. Instead, Oracle PKI (public key infrastructure) applications obtain certificates, trustpoints and private keys directly from the user’s profile.

If an Oracle wallet is stored in the Microsoft Windows registry and the wallet’s key (KEY) is SALESAPP, then the storage location of the encrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\EWALLET.P12. The storage location of the decrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\CWALLET.SSO.

Syntax
The syntax depends on the wallet, as follows:

• Oracle wallets on the file system:
  WALLET_LOCATION=
  (SOURCE=  
   (METHOD=file)  
   (METHOD_DATA=  
     (DIRECTORY=directory)  
     [[PKCS11=TRUE/FALSE]])

• Microsoft certificate store:
  WALLET_LOCATION=
  (SOURCE=  
   (METHOD=mcs))

• Oracle wallets in the Microsoft Windows registry:
  WALLET_LOCATION=
  (SOURCE=  
   (METHOD=reg)  
   (METHOD_DATA=  
     (KEY=registry_key)))

• Entrust wallets:
  WALLET_LOCATION=
  (SOURCE=  
   (METHOD=entr)  
   (METHOD_DATA=  
     (PROFILE=file.epf)  
     (INIFILE=file.ini)))

Additional Parameters
WALLET_LOCATION supports the following parameters:

• SOURCE: The type of storage for wallets, and storage location.
• **METHOD**: The type of storage.
• **METHOD_DATA**: The storage location.
• **DIRECTORY**: The location of Oracle wallets on file system.
• **KEY**: The wallet type and location in the Microsoft Windows registry.
• **PROFILE**: The Entrust profile file (.epf).
• **INIFILE**: The Entrust initialization file (.ini).

**Default**
None

**Values**
true | false

**Examples**

Oracle wallets on file system:

```
WALLET_LOCATION=
  (SOURCE=
    (METHOD=file)
    (METHOD_DATA=
      (DIRECTORY=/etc/oracle/wallets/databases)))
```

Microsoft certificate store:

```
WALLET_LOCATION=
  (SOURCE=
    (METHOD=mcs))
```

Oracle Wallets in the Microsoft Windows registry:

```
WALLET_LOCATION=
  (SOURCE=
    (METHOD=REG)
    (METHOD_DATA=
      (KEY=SALESAPP)))
```

Entrust Wallets:

```
WALLET_LOCATION=
  (SOURCE=
    (METHOD=entr)
    (METHOD_DATA=
      (PROFILE=/etc/oracle/wallets/test.epf)
      (INIFILE=/etc/oracle/wallets/test.ini)))
```

**See Also:**

*Oracle Database Enterprise User Security Administrator’s Guide*
5.2.89 BEQUEATH_DETACH

It is a sqlnet.ora networking parameter handling signals for Linux and UNIX systems.

**Purpose**
To turn signal handling on or off for Linux and UNIX systems

**Default**
no

**Values**
- yes to turn signal handling off
- no to leave signal handling on

**Example**
BEQUEATH_DETACH=yes

5.3 ADR Diagnostic Parameters in sqlnet.ora

The diagnostic data for the critical errors is quickly captured and stored in the ADR for sqlnet.ora.

- **About ADR Diagnostic Parameters**
  You can use ADR diagnostic parameters when ADR is enabled. ADR is enabled by default. Non-ADR parameters listed in the sqlnet.ora file are ignored when ADR is enabled.

- **ADR_BASE**
  It is a diagnostic parameter in the sqlnet.ora file and it specifies the base location of the ADR files.

- **DIAG_ADR_ENABLED**
  DIAG_ADR_ENABLED diagnostic parameter of the sqlnet.ora file specifies whether ADR tracing is enabled.

- **TRACE_LEVEL_CLIENT**
  The TRACE_LEVEL_CLIENT diagnostic parameter of the sqlnet.ora file turns client tracing on or off at a specified level.

- **TRACE_LEVEL_SERVER**
  The TRACE_LEVEL_SERVER diagnostic parameter of the sqlnet.ora file turns server tracing on or off at a specified level.

- **TRACE_TIMESTAMP_CLIENT**
  The TRACE_TIMESTAMP_CLIENT diagnostic parameter of the sqlnet.ora file adds a time stamp to every trace event in the client trace file.

- **TRACE_TIMESTAMP_SERVER**
  The TRACE_TIMESTAMP_CLIENT diagnostic parameter of the sqlnet.ora file adds a time stamp to every trace event in the database server trace file.
5.3.1 About ADR Diagnostic Parameters

You can use ADR diagnostic parameters when ADR is enabled. ADR is enabled by default. Non-ADR parameters listed in the sqlnet.ora file are ignored when ADR is enabled.

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, are immediately captured and tagged with the incident number. The data is then stored in the Automatic Diagnostic Repository (ADR), a file-based repository outside the database.

The following sqlnet.ora parameters are used when ADR is enabled (when DIAG_ADR_ENABLED is set to on):

5.3.2 ADR_BASE

It is a diagnostic parameter in the sqlnet.ora file and it specifies the base location of the ADR files.

Purpose

To specify the base directory into which tracing and logging incidents are stored when ADR is enabled.

Usage Notes

This parameter is applicable only to clients. On the server side, the ADR base location is defined by the DIAGNOSTIC_DEST initialization parameter in the init.ora file. See DIAGNOSTIC_DEST in Oracle Database Reference.

Default

ORACLE_BASE or ORACLE_HOME/log (if ORACLE_BASE is not defined)

Values

Any valid directory path to a directory with write permission.

Example

ADR_BASE=/oracle/network/trace

5.3.3 DIAG_ADR_ENABLED

DIAG_ADR_ENABLED diagnostic parameter of the sqlnet.ora file specifies whether ADR tracing is enabled.

Purpose

To specify whether ADR tracing is enabled.
Usage Notes

If the `DIAG_ADR_ENABLED` parameter is set to `OFF`, then non-ADR file tracing is used.

Default

`on`

Values

`on` | `off`

Example 5-7   Example

`DIAG_ADR_ENABLED=on`

5.3.4 TRACE_LEVEL_CLIENT

The `TRACE_LEVEL_CLIENT` diagnostic parameter of the `sqlnet.ora` file turns client tracing on or off at a specified level.

Purpose

To turn client tracing on at a specified level or to turn it off.

Usage Notes

This parameter is also applicable when non-ADR tracing is used.

Default

`off` or `0`

Values

- `off` or `0` for no trace output
- `user` or `4` for user trace information
- `admin` or `10` for administration trace information
- `support` or `16` for Oracle Support Services trace information

Example

`TRACE_LEVEL_CLIENT=user`

5.3.5 TRACE_LEVEL_SERVER

The `TRACE_LEVEL_SERVER` diagnostic parameter of the `sqlnet.ora` file turns server tracing on or off at a specified level.

Purpose

To turn server tracing on at a specified level or to turn it off.

Usage Notes

This parameter is also applicable when non-ADR tracing is used.
Default
off or 0

Values
• off or 0 for no trace output
• user or 4 for user trace information
• admin or 10 for administration trace information
• support or 16 for Oracle Support Services trace information

Example
TRACE_LEVEL_SERVER=admin

5.3.6 TRACE_TIMESTAMP_CLIENT

The TRACE_TIMESTAMP_CLIENT diagnostic parameter of the sqlnet.ora file adds a time stamp to every trace event in the client trace file.

Purpose
To add a time stamp in the form of dd-mmm-yyyy hh:mm:ss:mil to every trace event in the client trace file, which has a default name of sqlnet.trc.

Usage Notes
This parameter is also applicable when non-ADR tracing is used.

Default
on

Values
on or true | off or false

Example
TRACE_TIMESTAMP_CLIENT=true

5.3.7 TRACE_TIMESTAMP_SERVER

The TRACE_TIMESTAMP_CLIENT diagnostic parameter of the sqlnet.ora file adds a time stamp to every trace event in the database server trace file.

Purpose
To add a time stamp in the form of dd-mmm-yyyy hh:mm:ss:mil to every trace event in the database server trace file, which has a default name of svr_pid.trc.

Usage Notes
This parameter is also applicable when non-ADR tracing is used.
Default
on

Values
on or true | off or false

Example
TRACE_TIMESTAMP_SERVER=true

5.4 Non-ADR Diagnostic Parameters in sqlnet.ora

This section lists the sqlnet.ora parameters used when ADR is disabled.

Note:
The default value of DIAG_ADR_ENABLED is on. Therefore, the DIAG_ADR_ENABLED parameter must explicitly be set to off in order for non-ADR tracing to be used.

• LOG_DIRECTORY_CLIENT
  The LOG_DIRECTORY_CLIENT non-ADR diagnostic parameter of the sqlnet.ora file specifies the destination directory for the client log file.
• LOG_DIRECTORY_SERVER
• LOG_FILE_CLIENT
• LOG_FILE_SERVER
• TRACE_DIRECTORY_CLIENT
• TRACE_DIRECTORY_SERVER
• TRACE_FILE_CLIENT
• TRACE_FILE_SERVER
• TRACE_FILEAGE_CLIENT
• TRACE_FILEAGE_SERVER
• TRACE_FILELEN_CLIENT
• TRACE_FILELEN_SERVER
• TRACE_FILENO_CLIENT
• TRACE_FILENO_SERVER
• TRACE_UNIQUE_CLIENT
5.4.1 LOG_DIRECTORY_CLIENT

The LOG_DIRECTORY_CLIENT non-ADR diagnostic parameter of the sqlnet.ora file specifies the destination directory for the client log file.

**Purpose**

To specify the destination directory for the client log file.

**Usage Notes**

Use this parameter when ADR is not enabled.

**Default**

ORACLE_HOME/network/log

**Values**

Any valid directory path.

**Example**

LOG_DIRECTORY_CLIENT=/oracle/network/log

5.4.2 LOG_DIRECTORY_SERVER

**Purpose**

To specify the destination directory for the database server log file.

**Usage Notes**

Use this parameter when ADR is not enabled.

**Default**

ORACLE_HOME/network/trace

**Values**

Any valid directory path to a directory with write permission.

**Example**

LOG_DIRECTORY_SERVER=/oracle/network/trace

5.4.3 LOG_FILE_CLIENT

**Purpose**

To specify the name of the log file for the client.
Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/log/sqlnet.log

Values
The default value cannot be changed.

5.4.4 LOG_FILE_SERVER

Purpose
To specify the name of the log file for the database server.

Usage Notes
Use this parameter when ADR is not enabled.

Default
sqlnet.log

Values
Any valid directory path to a directory with write permission.

Example
LOG_FILE_SERVER=svr.log

5.4.5 TRACE_DIRECTORY_CLIENT

Purpose
To specify the destination directory for the client trace file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace

Values
Any valid directory path to a directory with write permission.

Example
TRACE_DIRECTORY_CLIENT=/oracle/traces
5.4.6 TRACE_DIRECTORY_SERVER

Purpose
To specify the destination directory for the database server trace file. Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace

Values
Any valid directory path to a directory with write permission.

Example
TRACE_DIRECTORY_SERVER=/oracle/traces

5.4.7 TRACE_FILE_CLIENT

Purpose
To specify the name of the client trace file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace/cli.trc

Values
Any valid file name.

Example
TRACE_FILE_CLIENT=clientsqlnet.trc

5.4.8 TRACE_FILE_SERVER

Purpose
To specify the destination directory for the database server trace output.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace/svr_pid.trc
Values
Any valid file name. The process identifier (pid) is appended to the name automatically.

Example
TRACE_FILE_SERVER=svrsqlnet.trc

5.4.9 TRACE_FILEAGE_CLIENT

Purpose
To specify the maximum age of client trace files in minutes.

Usage Notes
When the age limit is reached, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_CLIENT parameter. Use this parameter when ADR is not enabled.

Default
Unlimited
This is the same as setting the parameter to 0.

Example 5-8 Example
TRACE_FILEAGE_CLIENT=60

5.4.10 TRACE_FILEAGE_SERVER

Purpose
To specify the maximum age of database server trace files in minutes.

Usage Notes
When the age limit is reached, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_SERVER parameter. Use this parameter when ADR is not enabled.

Default
Unlimited
This is the same as setting the parameter to 0.

Example 5-9 Example
TRACE_FILEAGE_SERVER=60

5.4.11 TRACE_FILELEN_CLIENT

Purpose
To specify the size of the client trace files in kilobytes (KB).
Usage Notes
When the size is met, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_CLIENT parameter. Use this parameter when ADR is not enabled.

Example
TRACE_FILELEN_CLIENT=100

5.4.12 TRACE_FILELEN_SERVER

Purpose
To specify the size of the database server trace files in kilobytes (KB).

Usage Notes
When the size is met, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_SERVER parameter. Use this parameter when ADR is not enabled.

Example
TRACE_FILELEN_SERVER=100

5.4.13 TRACE_FILENO_CLIENT

Purpose
To specify the number of trace files for client tracing.

Usage Notes
When this parameter is set with the TRACE_FILELEN_CLIENT parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, then the first file is re-used, and so on.

When this parameter is set with the TRACE_FILEAGE_CLIENT parameter, trace files are cycled based on their age. The first file is used until the age limit is reached, then the second file is used, and so on. When the last file's age limit is reached, the first file is re-used, and so on.

When this parameter is set with both the TRACE_FILELEN_CLIENT and TRACE_FILEAGE_CLIENT parameters, trace files are cycled when either the size limit or the age limit is reached.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of sqlnet.trc is used, and this parameter is set to 3, then the trace files would be named sqlnet1.trc, sqlnet2.trc and sqlnet3.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

Default
None
5.4.14 TRACE_FILENO_SERVER

Purpose
To specify the number of trace files for database server tracing.

Usage Notes
When this parameter is set with the TRACE_FILELEN_SERVER parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, then the first file is re-used, and so on.

When this parameter is set with the TRACE_FILEAGE_SERVER parameter, trace files are cycled based on the age of the trace file. The first file is used until the age limit is reached, then the second file is used, and so on. When the last file's age limit is reached, the first file is re-used, and so on.

When this parameter is set with both the TRACE_FILELEN_SERVER and TRACE_FILEAGE_SERVER parameters, trace files are cycled when either the size limit or the age limit is reached.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of svr_pid.trc is used, and this parameter is set to 3, then the trace files would be named svr1_pid.trc, svr2_pid.trc and svr3_pid.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

Default
None

Example
TRACE_FILENO_SERVER=3

5.4.15 TRACE_UNIQUE_CLIENT

Purpose
To specify whether a unique trace file is created for each client trace session.

Usage Notes
When the value is set to on, a process identifier is appended to the name of each trace file, enabling several files to coexist. For example, trace files named sqlnetpid.trc are created if default trace file name sqlnet.trc is used. When the value is set to off, data from a new client trace session overwrites the existing file. Use this parameter when ADR is not enabled.

Default
on
Values

on or off

Example

TRACE_UNIQUE_CLIENT=on
6

Local Naming Parameters in the tnsnames.ora File

This chapter provides a complete listing of the tnsnames.ora file configuration parameters.

- **Overview of Local Naming Parameters**
- **General Syntax of tnsnames.ora**
- **Multiple Descriptions in tnsnames.ora**
- **Multiple Address Lists in tnsnames.ora**
- **Connect-Time Failover and Client Load Balancing with Oracle Connection Managers**
  When a connect descriptor in a tnsnames.ora file contains at least two protocol addresses for Oracle Connection Manager, parameters for connect-time failover and load balancing can be included in the file.
- **Connect Descriptor Descriptions**
  Each connect descriptor is contained within the DESCRIPTION parameter. Multiple connect descriptors are characterized by the DESCRIPTION_LIST parameter.
- **Protocol Address Section**
- **Optional Parameters for Address Lists**
  For multiple addresses, you can use the optional parameters to configure address lists.
- **Connection Data Section**
  Learn how to configure network connections with protocol addresses.
- **Security Section**
- **Timeout Parameters**
  The timeout section of the tnsnames.ora file provides the ability to specify timeout and retry configuration through the TNS connect string.
- **Compression Parameters**
  The compression section of the tnsnames.ora file provides the ability to enable compression and specify compression levels. These parameters can be set at the DESCRIPTION level of a connect string.

6.1 Overview of Local Naming Parameters

The tnsnames.ora file is a configuration file that contains network service names mapped to connect descriptors for the local naming method, or net service names mapped to listener protocol addresses.

A net service name is an alias mapped to a database network address contained in a connect descriptor. A connect descriptor contains the location of the listener through a protocol address and the service name of the database to which to connect. Clients and database servers (that are clients of other database servers) use the net service name when making a connection with an application.
By default, the tnsnames.ora file is located in the ORACLE_HOME/network/admin directory. Oracle Net will check the other directories for the configuration file. For example, the order checking the tnsnames.ora file is as follows:

1. The directory specified by the TNS_ADMIN environment variable. If the file is not found in the directory specified, then it is assumed that the file does not exist.
2. If the TNS_ADMIN environment variable is not set, then Oracle Net checks the ORACLE_HOME/network/admin directory.

**Note:**

On Microsoft Windows, the TNS_ADMIN environment variable is used if it is set in the environment of the process. If the TNS_ADMIN environment variable is not defined in the environment, or the process is a service which does not have an environment, then Microsoft Windows scans the registry for a TNS_ADMIN parameter.

**See Also:**

- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services
- Oracle operating system-specific documentation

### 6.2 General Syntax of tnsnames.ora

The basic syntax for a tnsnames.ora file is shown in Example 6-1.

**Example 6-1  Basic Format of tnsnames.ora File**

```plaintext
net_service_name=
(DESCRIPTION=
 (ADDRESS=(protocol_address_information))
 (CONNECT_DATA=
 (SERVICE_NAME=service_name)))
```

In the preceding example, DESCRIPTION contains the connect descriptor, ADDRESS contains the protocol address, and CONNECT_DATA contains the database service identification information.

### 6.3 Multiple Descriptions in tnsnames.ora

A tnsnames.ora file can contain net service names with one or more connect descriptors. Each connect descriptor can contain one or more protocol addresses. Example 6-2 shows two connect descriptors with multiple addresses. DESCRIPTION_LIST defines a list of connect descriptors.
Example 6-2  Net Service Name with Multiple Connect Descriptors in tnsnames.ora

net_service_name=
  (DESCRIPTION_LIST=
   (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521))
    (CONNECT_DATA=
     (SERVICE_NAME=sales.us.example.com)))
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr1-svr)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr2-svr)(PORT=1521))
    (CONNECT_DATA=
     (SERVICE_NAME=hr.us.example.com))))

Note:
Oracle Net Manager does not support the creation of multiple connect descriptors for a net service name when using Oracle Connection Manager.

6.4 Multiple Address Lists in tnsnames.ora

The tnsnames.ora file also supports connect descriptors with multiple lists of addresses, each with its own characteristics. In Example 6-3, two address lists are presented. The first address list features client load balancing and no connect-time failover, affecting only those protocol addresses within its ADDRESS_LIST. The second protocol address list features no client load balancing, but does have connect-time failover, affecting only those protocol addresses within its ADDRESS_LIST. The client first tries the first or second protocol address at random, then tries protocol addresses three and four sequentially.

Example 6-3  Multiple Address Lists in tnsnames.ora

net_service_name=
  (DESCRIPTION=
   (ADDRESS_LIST=
    (LOAD_BALANCE=on)
    (FAILOVER=off)
    (ADDRESS=(protocol_address_information))
    (ADDRESS=(protocol_address_information)))
   (ADDRESS_LIST=
    (LOAD_BALANCE=off)
    (FAILOVER=on)
    (ADDRESS=(protocol_address_information))
    (ADDRESS=(protocol_address_information)))
  (CONNECT_DATA=
   (SERVICE_NAME=service_name)))
6.5 Connect-Time Failover and Client Load Balancing with Oracle Connection Managers

When a connect descriptor in a tnsnames.ora file contains at least two protocol addresses for Oracle Connection Manager, parameters for connect-time failover and load balancing can be included in the file.

Example 6-4 Multiple Oracle Connection Manager Addresses in tnsnames.ora

This example illustrates failover of multiple Oracle Connection Manager protocol addresses.

```sql
sample1=
  (DESCRIPTION=
    (SOURCE_ROUTE=yes)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630)) # 1
      (ADDRESS_LIST=
        (FAILOVER=on)
        (LOAD_BALANCE=off) # 2
        (ADDRESS=(PROTOCOL=tcp)(HOST=host2a)(PORT=1630))
        (ADDRESS=(PROTOCOL=tcp)(HOST=host2b)(PORT=1630)))
      (ADDRESS=(PROTOCOL=tcp)(HOST=host3)(PORT=1521))) # 3
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))
```

Here, the syntax does the following:

1. The client is instructed to connect to the protocol address of the first Oracle Connection Manager, as indicated by:
   ```sql
   (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630))
   ```

2. The first Oracle Connection Manager is instructed to connect to the first protocol address of another Oracle Connection Manager. If the first protocol address fails,
then it tries the second protocol address. This sequence is specified with the following configuration:

```
(ADDRESS_LIST=
  (FAILOVER=on)
  (LOAD_BALANCE=off)
  (ADDRESS=(PROTOCOL=tcp)(HOST=host2a)(PORT=1630))
  (ADDRESS=(PROTOCOL=tcp)(HOST=host2b)(PORT=1630)))
```

3. Oracle Connection Manager connects to the database service using the following protocol address:

```
(ADDRESS=(PROTOCOL=tcp) (HOST=host3) (PORT=1521))
```

**Example 6-5  Client Load Balancing in tnsnames.ora**

This example illustrates client load balancing among two Oracle Connection Managers and two protocol addresses:

```
sample2=
  (DESCRIPTION=
    (LOAD_BALANCE=on)                                    # 1
    (FAILOVER=on)
    (ADDRESS_LIST=
      (SOURCE_ROUTE=yes)
      (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630))    # 2
      (ADDRESS=(PROTOCOL=tcp)(HOST=host2)(PORT=1521)))
    (ADDRESS_LIST=
      (SOURCE_ROUTE=yes)
      (ADDRESS=(PROTOCOL=tcp)(HOST=host3)(PORT=1630))
      (ADDRESS=(PROTOCOL=tcp)(HOST=host4)(PORT=1521)))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))  # 3
```

Here, the syntax does the following:

1. The client is instructed to pick an ADDRESS_LIST at random and to fail over to the other if the chosen ADDRESS_LIST fails. This is indicated by the LOAD_BALANCE and FAILOVER parameters being set to on.
2. When an ADDRESS_LIST is chosen, the client first connects to Oracle Connection Manager, using the Oracle Connection Manager protocol address that uses port 1630 indicated for the ADDRESS_LIST.
3. Oracle Connection Manager then connects to the database service, using the protocol address indicated for the ADDRESS_LIST.

### 6.6 Connect Descriptor Descriptions

Each connect descriptor is contained within the DESCRIPTION parameter. Multiple connect descriptors are characterized by the DESCRIPTION_LIST parameter.

- **DESCRIPTION_LIST**
  DESCRIPTION_LIST networking parameter of the tnsnames.ora file defines a list of connect descriptors for a particular net service name.
• DESCRIPTION
   DESCRIPTION networking parameter of the tnsnames.ora file specifies a container for a connect descriptor.

6.6.1 DESCRIPTION_LIST

DESCRIPTION_LIST networking parameter of the tnsnames.ora file defines a list of connect descriptors for a particular net service name.

Purpose
To define a list of connect descriptors for a particular net service name.

Example 6-6    Example

net_service_name=
 (DESCRIPTION_LIST=
   (DESCRIPTION=
     (ADDRESS=...)  
     (CONNECT_DATA=(SERVICE_NAME=sales.example.com)))
   (DESCRIPTION=

6.6.2 DESCRIPTION

DESCRIPTION networking parameter of the tnsnames.ora file specifies a container for a connect descriptor.

Purpose
To specify a container for a connect descriptor.

Usage Notes
When using more than one DESCRIPTION parameter, put the parameters under the DESCRIPTION_LIST parameter.

Example 6-7    Example

net_service_name=
 (DESCRIPTION=
   (ADDRESS=...)
   (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))

6.7 Protocol Address Section

The protocol address section of the tnsnames.ora file specifies the protocol addresses of the listener. If there is only one listener protocol address, then use the ADDRESS parameter. If there is more than one address, then use the ADDRESS_LIST parameter.

• ADDRESS
   The ADDRESS networking parameter is in the tnsnames.ora file and it specifies the protocol address under the ADDRESS_LIST or the DESCRIPTION parameter for one listener.
• HTTPS_PROXY
• HTTPS_PROXY_PORT
• ADDRESS_LIST

The ADDRESS_LIST networking parameter specifies the number of protocol addresses.

6.7.1 ADDRESS

The ADDRESS networking parameter is in the tnsnames.ora file and it specifies the protocol address under the ADDRESS_LIST or the DESCRIPTION parameter for one listener.

Purpose

To specify a single listener protocol address.

Usage Notes

Put this parameter under either the ADDRESS_LIST parameter or the DESCRIPTION parameter.

Example

```sql
net_service_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-svr)(PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

6.7.2 HTTPS_PROXY

Purpose

To specify HTTP proxy host name for tunneling SSL client connections.

Usage Notes

The clients can tunnel secure connections over forward HTTP proxy using HTTP CONNECT method. This helps in accessing the public cloud database service as it eliminates the requirement to open an outbound port on a client side firewall. This parameter is applicable only to the connect descriptors where PROTOCOL=TCPS. This is similar to the web browser setting for intranet users who want to connect to internet hosts. Increase the forward web proxy read timeout for requests to a higher value depending on client queries. Otherwise, the forward web proxy closes the connection assuming that no requests are made from the client.

Successful connection depends on specific proxy configurations. The performance of data transfers depends on proxy capacity. Oracle recommends not to use this feature in production environments where performance is critical.

Configuring tnsnames.ora for the HTTP proxy may not be enough depending your organization’s network configuration and security policies. For example, some networks require a username and password for the HTTP proxy.

Oracle Client versions earlier than 18c does not support connections through HTTP proxy.
Contact your network administrator to open outbound connections to hosts in the oraclecloud.com domain using the relevant port, without going through an HTTP proxy. For example, port 1522.

Default
None

Values
HTTP proxy host name that can make an outbound connection to the internet hosts.

Example
HTTPS_PROXY=www-proxy.mycompany.com

6.7.3 HTTPS_PROXY_PORT

Purpose
To specify forward HTTP proxy host port for tunneling SSL client connections.

Usage Notes
It forwards the HTTP proxy host port that receives HTTP CONNECT method. This parameter should be used along with HTTPS_PROXY_PORT. This value takes effect only when SQLNET.USE_HTTPS_PROXY=1 is set in sqlnet.ora.

Default
none

Values
port number

Example
HTTPS_PROXY_PORT=80

6.7.4 ADDRESS_LIST

The ADDRESS_LIST networking parameter specifies the number of protocol addresses.

Purpose
To define a list of protocol addresses.

Usage Notes
If there is only one listener protocol address, then ADDRESS_LIST is not necessary.

Put this parameter either under the DESCRIPTION parameter or the DESCRIPTION_LIST parameter.
Example

```
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))
```

### 6.8 Optional Parameters for Address Lists

For multiple addresses, you can use the optional parameters to configure address lists.

- **ENABLE**
- **FAILOVER**
- **LOAD_BALANCE**
- **RECV_BUF_SIZE**
- **SDU**
- **SEND_BUF_SIZE**
- **SOURCE_ROUTE**
- **TYPE_OF_SERVICE**

#### 6.8.1 ENABLE

**Purpose**

To allow the caller to detect a terminated remote server, typically it takes 2 hours or more to notice.

**Usage Notes**

The keepalive feature on the supported TCP transports can be enabled for a net service client by putting `(ENABLE=broken)` under the `DESCRIPTION` parameter in the connect string. On the client side, the default for `tcp_keepalive` is off. Operating system TCP configurables, which vary by platform, define the actual keepalive timing details.

**Values**

- `broken`

**Example**

```
net_service_name=
  (DESCRIPTION=
    (ENABLE=broken)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))
```

Although the preceding example has multiple addresses, the `ADDRESS_LIST` parameter was not used. This is because the `ADDRESS_LIST` parameter is not mandatory.
6.8.2 FAILOVER

Purpose
To enable or disable connect-time failover for multiple protocol addresses.

Usage Notes
When you set the parameter to on, yes, or true, Oracle Net fails over at connect time to a different address if the first protocol address fails. When you set the parameter to off, no, or false, Oracle Net tries one protocol address.

Put this parameter under the DESCRIPTION_LIST parameter, the DESCRIPTION parameter, or the ADDRESS_LIST parameter.

Note:
Do not set the GLOBAL_DBNAME parameter in the SID_LIST_listener_name section of the listener.ora. A statically configured global database name disables connect-time failover.

Default
on for the DESCRIPTION_LIST, DESCRIPTION, and ADDRESS_LIST parameters

Values
• yes | on | true
• no | off | false

Example
net_service_name=
{DESCRIPTION=
{FAILOVER=on}
{ADDRESS_LIST=
 {ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
 {ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521))
 {CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))

6.8.3 LOAD_BALANCE

Purpose
To enable or disable client load balancing for multiple protocol addresses.

Usage Notes
When you set the parameter to on, yes, or true, Oracle Net goes through the list of addresses in a random sequence, balancing the load on the various listener or Oracle Connection Manager protocol addresses. When you set the parameter to off, no, or false, Oracle Net tries the protocol addresses sequentially until one succeeds.
Put this parameter under the DESCRIPTION_LIST parameter, the DESCRIPTION parameter, or the ADDRESS_LIST parameter.

Default

on for DESCRIPTION_LIST

Values

• yes | on | true
• no | off | false

Example

net_service_name=
{DESCRIPTION=
 {LOAD_BALANCE=on}
 {ADDRESS_LIST=
 {ADDRESS=(PROTOCOL=tcp) (HOST=sales1-svr) (PORT=1521)}
 {ADDRESS=(PROTOCOL=tcp) (HOST=sales2-svr) (PORT=1521))}
 {CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))

6.8.4 RECVD_BUF_SIZE

Purpose

To specify, in bytes, the buffer space for receive operations of sessions.

Usage Notes

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Put this parameter under the DESCRIPTION parameter or at the end of the protocol address.

Setting this parameter in the connect descriptor for a client overrides the RECV_BUF_SIZE parameter at the client-side sqlnet.ora file.

Note:

Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for additional information about additional protocols.

Default

The default value for this parameter is specific to the operating system. The default for the Linux 2.6 operating system is 87380 bytes.

Example

net_service_name=
{DESCRIPTION=
 {ADDRESS_LIST=
 {ADDRESS=(PROTOCOL=tcp) (HOST=sales1-server) (PORT=1521) (RECV_BUF_SIZE=11784))

(ADDRESS_LIST= (DESCRIPTION_LIST= (LOAD_BALANCE=on) (ADDRESS_LIST= (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-svr) (PORT=1521)) (ADDRESS=(PROTOCOL=tcp) (HOST=sales2-svr) (PORT=1521)) (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))

Chapter 6

Optional Parameters for Address Lists

6-11
6.8.5 SDU

Purpose

To instruct Oracle Net to optimize the transfer rate of data packets being sent across the network with a specified session data unit (SDU) size.

Usage Notes

Put this parameter under the DESCRIPTION parameter.

Setting this parameter in the connect descriptor for a client overrides the DEFAULT_SDU_SIZE parameter at client-side sqlnet.ora file.

Default

8192 bytes (8 KB)

Values

512 to 2097152 bytes.

Example

```sql
net_service_name=
  (DESCRIPTION=
    (SDU=8192)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-server)(PORT=1521)))
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com))
```
6.8.6 SEND_BUF_SIZE

Purpose
To specify, in bytes, the buffer space for send operations of sessions.

Usage Notes
This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.
Put this parameter under the DESCRIPTION parameter or at the end of the protocol address.
Setting this parameter in the connect descriptor for a client overrides the SEND_BUF_SIZE parameter at the client-side sqlnet.ora file.

Note:
Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for information about additional protocols.

Default
The default value for this parameter is operating system specific. The default for the Linux 2.6 operating system is 16 KB.

Example

```
net_service_name=
(DESCRIPTION=
 (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-server)(PORT=1521)
    (SEND_BUF_SIZE=11784))
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-server)(PORT=1521)
    (SEND_BUF_SIZE=11784))
 (CONNECT_DATA=
  (SERVICE_NAME=sales.us.example.com)))

net_service_name=
(DESCRIPTION=
 (SEND_BUF_SIZE=11784)
 (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp)(HOST=hr1-server)(PORT=1521)
    (SEND_BUF_SIZE=11784))
   (ADDRESS=(PROTOCOL=tcp)(HOST=hr2-server)(PORT=1521))
 (CONNECT_DATA=
  (SERVICE_NAME=hr.us.example.com)))
```

See Also:
Oracle Database Net Services Administrator's Guide for additional information about configuring this parameter
6.8.7 SOURCE_ROUTE

Purpose
To enable routing through multiple protocol addresses.

Usage Notes
When you set this parameter to on or yes, Oracle Net uses each address in order until the destination is reached.

To use Oracle Connection Manager, an initial connection from the client to Oracle Connection Manager is required, and a second connection from Oracle Connection Manager to the listener is required.

Put this parameter under either the DESCRIPTION_LIST parameter, the DESCRIPTION parameter, or the ADDRESS_LIST parameter.

Default
off

Values
• yes | on
• no | off

Example
net_service_name=
(DESCRIPTION=
   (SOURCE_ROUTE=on)
   (ADDRESS=(PROTOCOL=tcp)(HOST=cman-pc)(PORT=1630))
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
   (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))

See Also:
Oracle Database Net Services Administrator’s Guide for complete configuration information

6.8.8 TYPE_OF_SERVICE

Purpose
To specify the type of service to use for an Oracle Rdb database.

Usage Notes
This parameter should only be used if the application supports both an Oracle Rdb and Oracle database service, and you want the application to load balance between the two.
Put this parameter under the DESCRIPTION parameter.

Example

```
net_service_name=
  (DESCRIPTION_LIST=
    (DESCRIPTION=
      (ADDRESS=...)
      (CONNECT_DATA=
        (SERVICE_NAME=generic)
        (RDB_DATABASE=[.mf]mf_personal.rdb)
        (GLOBAL_NAME=alpha5))
      (TYPE_OF_SERVICE=rdb_database))
    (DESCRIPTION=
      (ADDRESS=...)
      (CONNECT_DATA=
        (SERVICE_NAME=sales.us.example.com})
      (TYPE_OF_SERVICE=oracle11_database)))
```

6.9 Connection Data Section

Learn how to configure network connections with protocol addresses.

A network object is identified by a protocol address. When a connection is made, the client and the receiver of the request (listener or Oracle Connection Manager) are configured with identical protocol addresses. The client uses this address to send the connection request to a particular network object location, and the recipient "listens" for requests on this address, and grants a connection based on its address information matching the client information.

- CONNECT_DATA
- FAILOVER_MODE
- GLOBAL_NAME
- HS
- INSTANCE_NAME
- RDB_DATABASE
- SHARDING_KEY
  Use this parameter to route the database request to a particular shard.

- SUPER_SHARDING_KEY
  Use this parameter to route the database request to a collection of shards.

- SERVER
- SERVICE_NAME
- COLOCATION_TAG
- KERBEROS5_PRINCIPAL
  Use this parameter to specify Kerberos principals.

6.9.1 CONNECT_DATA

Purpose

To define the service to which to connect, such as SERVICE_NAME.
Usage Notes

Put this parameter under the DESCRIPTION parameter.

CONNECT_DATA permits the following additional parameters:

- FAILOVER_MODE
- GLOBAL_NAME
- HS
- INSTANCE_NAME
- RDB_DATABASE
- SHARDING_KEY
- SUPER_SHARDING_KEY
- SERVER
- SERVICE_NAME
- COLOCATION_TAG
- KERBEROS5_PRINCIPAL

Example

```
net_service_name=
(DESCRIPTION=
  {ADDRESS_LIST=
    {ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
    {ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521))}
  {CONNECT_DATA=
    {SERVICE_NAME=sales.us.example.com)))
```

6.9.2 FAILOVER_MODE

Purpose

To instruct Oracle Net to fail over to a different listener if the first listener fails during run time.

Usage Notes

Depending upon the configuration, the session or any SELECT statements which were in progress are automatically failed over.

This type of failover is called Transparent Application Failover (TAF) and should not be confused with the connect-time failover FAILOVER parameter.

Put this parameter under the CONNECT_DATA parameter.

Additional Parameters

FAILOVER_MODE supports the following parameters:

- BACKUP: Specifies the failover node by its net service name. A separate net service name must be created for the failover node.
• **TYPE**: Specifies the type of failover. Three types of Oracle Net failover functionality are available by default to Oracle Call Interface (OCI) applications:
  
  – **SESSION**: Fails over the session. For example, if a user's connection is lost, then a new session is automatically created for the user on the backup. This type of failover does not attempt to recover selects.
  
  – **SELECT**: Allows users with open cursors to continue fetching them after failure. However, this mode involves overhead on the client side in normal select operations.
  
  – **NONE**: This is the default, in which no failover functionality is used. This can also be explicitly specified to prevent failover from happening.

• **METHOD**: Specifies how fast failover is to occur from the primary node to the backup node:
  
  – **BASIC**: Establishes connections at failover time. This option requires almost no work on the backup database server until failover time.
  
  – **PRECONNECT**: Pre-establishes connections. This provides faster failover but requires that the backup instance be able to support all connections from every supported instance.

• **TRANSACTION**: Allows the database to complete the current database transaction following a recoverable error. This parameter is used with the `COMMIT_OUTCOME=TRUE` parameter.

• **RETRIES**: Specifies the number of times to attempt to connect after a failover. If `DELAY` is specified, then `RETRIES` defaults to five retry attempts.

• **DELAY**: Specifies the amount of time in seconds to wait between connect attempts. If `RETRIES` is specified, then `DELAY` defaults to one second.

---

**Note:**

If a callback function is registered, then `RETRIES` and `DELAY` parameters are ignored.

**See Also:**

*Oracle Database Net Services Administrator's Guide* for additional configuration information

---

### 6.9.3 GLOBAL_NAME

**Purpose**

To identify the Oracle Rdb database.

**Usage Notes**

Put this parameter under the `CONNECT_DATA` parameter.
Example

```
net_service_name=
(DESCRIPTION=
 (ADDRESS_LIST=
  (ADDRESS=...)
  (ADDRESS=...))
 (CONNECT_DATA=
  (SERVICE_NAME=generic)
  (RDB_DATABASE=[.mf]mf_personal.rdb)
  (GLOBAL_NAME=alpha5)))
```

6.9.4 HS

**Purpose**

To direct Oracle Net to connect to a non-Oracle system through Heterogeneous Services.

**Usage Notes**

Put this parameter under the CONNECT_DATA parameter.

**Default**

None

**Values**

ok

**Example**

```
net_service_name=
(DESCRIPTION=
 (ADDRESS_LIST=
  (ADDRESS=...)
  (ADDRESS=...))
 (CONNECT_DATA=
  (SID=sales6)
 )
 (HS=ok))
```

**See Also:**

*Oracle Database Net Services Administrator's Guide* for complete configuration information

6.9.5 INSTANCE_NAME

**Purpose**

To identify the database instance to access.
Usage Notes

Set the value to the value specified by the INSTANCE_NAME parameter in the initialization parameter file.

Put this parameter under the CONNECT_DATA parameter.

Example

```
net_service_name=
(DOCUMENTATION=
  (ADDRESS_LIST=
    (ADDRESS=...)
    (ADDRESS=...))
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com)
    (INSTANCE_NAME=sales1)))
```

See Also:

*Oracle Database Net Services Administrator's Guide* for additional information about the use of INSTANCE_NAME

6.9.6 RDB_DATABASE

**Purpose**

To specify the file name of an Oracle Rdb database.

**Usage Notes**

Put this parameter under the CONNECT_DATA parameter.

**Example**

```
net_service_name=
(DOCUMENTATION=
  (ADDRESS_LIST=
    (ADDRESS=...)
    (ADDRESS=...))
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com)
    (RDB_DATABASE= [.mf]mf_personal.rdb)))
```

6.9.7 SHARDING_KEY

Use this parameter to route the database request to a particular shard.

**Usage Notes**

Put this parameter under the CONNECT_DATA parameter.
Example 6-8

\[
\text{net_service_name} = \begin{array}{l}
(\text{DESCRIPTION}= \\
(\text{ADDRESS_LIST}= \\
(\text{ADDRESS}=...) \\
(\text{ADDRESS}=...)) \\
(\text{CONNECT_DATA}= \\
(\text{SERVICE_NAME}=\text{sales.us.example.com}) \\
(\text{SHARDING_KEY}=40598230)))
\end{array}
\]

\[\text{Note:}\]
Use the \text{SHARDING_KEY} parameter for sharding values in simplified text format. This parameter does not support special characters. Use the \text{SHARDING_KEY_B64} parameter for base64 encoded binary representation of shard key. The indicator for base64 format is a '+' sign prepended to the shard key value.

Related Topics
• Oracle Database Net Services Administrator's Guide

6.9.8 SUPER_SHARDING_KEY

Use this parameter to route the database request to a collection of shards.

Usage Notes
Put this parameter under the \text{CONNECT_DATA} parameter.

Example 6-9

\[
\text{net_service_name} = \begin{array}{l}
(\text{DESCRIPTION}= \\
(\text{ADDRESS_LIST}= \\
(\text{ADDRESS}=...) \\
(\text{ADDRESS}=...)) \\
(\text{CONNECT_DATA}= \\
(\text{SERVICE_NAME}=\text{sales.us.example.com}) \\
(\text{SHARDING_KEY}=40598230) \text{(SUPER_SHARDING_KEY}=\text{gold}))
\end{array}
\]

\[\text{Note:}\]
Use the \text{SUPER_SHARDING_KEY} parameter for specifying group key values in simplified text format. This parameter does not support special characters. Use the \text{SUPER_SHARDING_KEY_B64} parameter for base64 encoded binary representation of group key. The indicator for base64 format is a '+' sign prepended to the shard key value.
6.9.9 SERVER

Purpose
To direct the listener to connect the client to a specific type of service handler.

Usage Notes
Put this parameter under the CONNECT_DATA parameter.

Values
- dedicated to specify whether client requests be served by dedicated server.
- shared to specify whether client requests be served by a dispatcher or shared server.
- pooled to get a connection from the connection pool if database resident connection pooling is enabled on the server.

**Note:**
- Shared server must be configured in the database initialization file in order for the client to connect to the database with a shared server process.
- The USE_DEDICA TED_SERVER parameter in the sqlnet.ora file overrides this parameter.

Example
```plaintext
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...
      (ADDRESS=...))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)
      (SERVER=dedicated)))
```

6.9.10 SERVICE_NAME

Purpose
To identify the Oracle Database database service to access.

Usage Notes
Set the value to a value specified by the SERVICE_NAMES parameter in the initialization parameter file.

Put this parameter under the CONNECT_DATA parameter.
Example

```plaintext
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
      (ADDRESS=...))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)))
```

Related Topics
• *Oracle Database Net Services Administrator's Guide*

### 6.9.11 COLOCATION_TAG

**Purpose**

To direct the listener to route all connections with the same `colocation_tag` to the same database instance.

**Usage Notes**

Use this parameter with the `CONNECT_DATA` parameter.

The parameter value must be an alphanumeric string.

**Example**

```plaintext
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
      (ADDRESS=...))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)
      (COLOCATION_TAG=abc))
```

**Note:**

Under certain conditions, such as, when maximum load of an instance is reached or when new instances are added or deleted for a service, the colocation of client connections that have the same `colocation_tag` to the same database instance may not be consistent.
6.9.12 KERBEROS5_PRINCIPAL

Use this parameter to specify Kerberos principals.

**Purpose**

When you configure Kerberos authentication for an Oracle Database client, you can specify multiple Kerberos principals with a single Oracle Database client.

This is an optional parameter. When specified, it is used to verify if the principal name in the credential cache matches the parameter value.

**Usage Notes**

Use this parameter with the `CONNECT_DATA` parameter. Alternatively, you can specify `KERBEROS5_CC_NAME` in the connect string along with the optional `KERBEROS5_PRINCIPAL` parameter to connect as a different Kerberos principal. Each Kerberos principal must have a valid credential cache.

**Example**

For a user `krbuser1`, who is externally authenticated using the Kerberos principal `krbprinc1.example.com` and the credential cache for this principal is located at `/tmp/krbuser1/krb.cc`, the connect string is:

```sql
net_service_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-svr)(PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=sales.example.com))
    (SECURITY=
      (KERBEROS5_CC_NAME=/tmp/krbuser1/krb.cc)
      (KERBEROS5_PRINCIPAL=krbprinc1@example.com)))
```

**Note:**

The connection fails if the principal in the `/tmp/krbuser1/krb.cc` file does not contain the `krbprinc1@example.com` value.

Similarly, for a user `krbuser2`, who is externally authenticated using the Kerberos principal `krbprinc2.example.com` and the credential cache for this principal is located at `/tmp/krbuser2/krb.cc`, the connect string is:

```sql
net_service_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-svr)(PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=sales.example.com))
    (SECURITY=
      (KERBEROS5_CC_NAME=/tmp/krbuser2/krb.cc)
      (KERBEROS5_PRINCIPAL=krbprinc2@example.com)))
```
6.10 Security Section

The security section of the tnsnames.ora file specifies the following security-related parameters for use with Oracle security features:

- **SECURITY**
- **SSL_SERVER_CERT_DN**
- **IGNORE_ANO_ENCRYPTION_FOR_TCPS**

The **IGNORE_ANO_ENCRYPTION_FOR_TCPS** parameter specifies if the SQLNET.ENCRYPTION_CLIENT parameter should be ignored for this specific TNS alias.

### 6.10.1 SECURITY

#### Purpose

To change the security properties of the connection. Put this parameter under the DESCRIPTION parameter.

#### Usage Notes

The parameters permitted under SECURITY are SSL_SERVER_CERT_DN and AUTHENTICATION_SERVICE.

#### Example

```sql
net_service_name=
(DESCRIPTION=
 (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
 (CONNECT_DATA=
   (SERVICE_NAME=sales.us.example.com))
 (SECURITY=
   (SSL_SERVER_CERT_DN="cn=sales,cn=OracleContext,dc=us,dc=acme,dc=com")))
```

### 6.10.2 SSL_SERVER_CERT_DN

#### Purpose

To specify the distinguished name (DN) of the database server.

#### Usage Notes

The server DN must be known by the client ahead of time. Otherwise, the client cannot specify the server's DN in SSL_SERVER_CERT_DN. The client uses this information to obtain the list of DNs it expects for each of the servers, enforcing the database server DN to match its service name. This parameter must be set to the server DN (for example, SSL_SERVER_CERT_DN="finance, cn=OracleContext,c=us,o=example") to use full DN matching. For partial DN matching, do not include this parameter.

Use this parameter with the sqlnet.ora parameter SSL_SERVER_DN_MATCH to enable full DN matching.
Example

finance=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL = tcps) (HOST = finance) (PORT = 1575))
    (CONNECT_DATA=
      (SERVICE_NAME=finance.us.example.com)
      (SECURITY=
        (SSL_SERVER_CERT_DN="cn=finance, cn=OracleContext,c=us,o=example")))

See Also:
Oracle Database Security Guide

6.10.3 IGNORE_ANO_ENCRYPTION_FOR_TCPS

The IGNORE_ANO_ENCRYPTION_FOR_TCPS parameter specifies if the SQLNET.ENCRYPTION_CLIENT parameter should be ignored for this specific TNS alias.

Purpose

To specify if the SQLNET.ENCRYPTION_CLIENT parameter should be ignored for this specific TNS alias.

Usage Notes

If your requirements are that SQLNET.ENCRYPTION_SERVER be set to required, then you can set the IGNORE_ANO_ENCRYPTION_FOR_TCPS parameter in both SQLNET.ENCRYPTION_CLIENT and SQLNET.ENCRYPTION_SERVER to TRUE. This forces the client to ignore the value that is set for the SQLNET.ENCRYPTION_CLIENT parameter for all outgoing TCPS connections.

Default

FALSE

Example 6-10

Example

test_ssl=
  (DESCRIPTION =
    (ADDRESS=(PROTOCOL=tcps) (HOST=) (PORT=1750))
    (CONNECT_DATA=(SID="ORACLE_SID"))
    (SECURITY=(IGNORE_ANO_ENCRYPTION_FOR_TCPS=TRUE))
  )

6.11 Timeout Parameters

The timeout section of the tnsnames.ora file provides the ability to specify timeout and retry configuration through the TNS connect string.
The following parameters can be set at the DESCRIPTION level of a connect string:

- **CONNECT_TIMEOUT**
- **RETRY_COUNT**
- **RETRY_DELAY**
- **TRANSPORT_CONNECT_TIMEOUT**
- **RECV_TIMEOUT**

Use the `tnsnames.ora` parameter `RECV_TIMEOUT` to specify the duration of time that a database client or server should wait for data from a peer after establishing a connection.

### 6.11.1 CONNECT_TIMEOUT

**Purpose**

To specify the timeout duration in ms, sec, or min for a client to establish an Oracle Net connection to an Oracle database.

**Usage Notes**

Put this parameter under the DESCRIPTION parameter.

The timeout interval specified by **CONNECT_TIMEOUT** is a superset of the TCP connect timeout interval. It includes the time to be connected to the database instance providing the requested service, not just the duration of the TCP connection. It accepts different timeouts with or without space between the value and the unit. In case, no unit is mentioned, the default unit is sec.

The timeout interval is applicable for each ADDRESS in an ADDRESS_LIST, and each IP address to which a host name is mapped.

The **CONNECT_TIMEOUT** parameter is equivalent to the `sqlnet.ora` parameter `SQLNET.OUTBOUND_CONNECT_TIMEOUT`, and overrides it.

**Example**

```
net_service_name=
  (DESCRIPTION=
    (CONNECT_TIMEOUT=10 ms) (RETRY_COUNT=3)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-svr) (PORT=1521))
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales2-svr) (PORT=1521)))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)))
```

### 6.11.2 RETRY_COUNT

**Purpose**

To specify the number of times an ADDRESS list is traversed before the connection attempt is terminated.

**Usage Notes**

Put this parameter under the DESCRIPTION parameter.
When a DESCRIPTION_LIST is specified, each DESCRIPTION is traversed multiple times based on the specified number of retries.

Example

```
net_service_name=
(DESCRIPTION_LIST=
 (DESCRIPTION=
  (CONNECT_TIMEOUT=10) (RETRY_COUNT=3)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1b-svr) (PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales1.example.com)))
 (DESCRIPTION=
  (CONNECT_TIMEOUT=60) (RETRY_COUNT=1)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2b-svr) (PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales2.us.example.com))))
```

6.11.3 RETRY_DELAY

Purpose

To specify the delay in seconds between subsequent retries for a connection. This parameter works in conjunction with RETRY_COUNT parameter.

Usage Notes

Put this parameter under the DESCRIPTION parameter.

When a DESCRIPTION_LIST is specified, each DESCRIPTION is traversed multiple times based on the specified number of retries, and the specific delay for the description.

Example

```
net_service_name=
(DESCRIPTION_LIST=
 (DESCRIPTION=
  (CONNECT_TIMEOUT=10) (RETRY_COUNT=3) (RETRY_DELAY=2)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1b-svr) (PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales1.example.com)))
 (DESCRIPTION=
  (CONNECT_TIMEOUT=60) (RETRY_COUNT=2) (RETRY_DELAY=1)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2b-svr) (PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales2.us.example.com))))
```

6.11.4 TRANSPORT_CONNECT_TIMEOUT

Purpose

To specify the transport connect timeout duration in ms, sec, or min for a client to establish an Oracle Net connection to an Oracle database.
Usage Notes

This parameter is put under the DESCRIPTION parameter.

The TRANSPORT_CONNECT_TIMEOUT parameter specifies the time, in ms, sec, or min, for a client to establish a TCP connection to the database server. It accepts different timeouts with or without space between the value and the unit. The default value is 60 seconds. In case, no unit is mentioned, the default unit is sec.

The timeout interval is applicable for each ADDRESS in an ADDRESS_LIST description, and each IP address that a host name is mapped. The TRANSPORT_CONNECT_TIMEOUT parameter is equivalent to the sqlnet.ora parameter TCP.CONNECT_TIMEOUT, and overrides it.

Example

net_service_name =
{DESCRIPTION=
  (TRANSPORT_CONNECT_TIMEOUT=10 ms)
  (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com))}

6.11.5 RECV_TIMEOUT

Use the tnsnames.ora parameter RECV_TIMEOUT to specify the duration of time that a database client or server should wait for data from a peer after establishing a connection.

Purpose

To specify the time, in ms, sec, or min, for a database client or server to wait for data from the peer after establishing a connection. The peer must send data within the time interval that you specify.

Usage Notes

This parameter is put under the DESCRIPTION parameter.

Setting this parameter for clients ensures that receive operations are not left in a wait state indefinitely or for a long period due to either server host being down or server busy state or network connectivity. If a client does not receive response data in the time specified, then the client logs ORA-12535: TNS:operation timed out and ORA-12609: TNS: Receive timeout occurred messages to the sqlnet.log file.

Default

None

Example

RECV_TIMEOUT=10ms
6.12 Compression Parameters

The compression section of the tnsnames.ora file provides the ability to enable compression and specify compression levels. These parameters can be set at the DESCRIPTION level of a connect string.

- **COMPRESSION**
  The tnsnames.ora file's compression parameter enables or disables the data compression.

- **COMPRESSION_LEVELS**
  The COMPRESSION_LEVELS parameter of the tnsnames.ora file specifies the compression level.

### 6.12.1 COMPRESSION

The tnsnames.ora file's compression parameter enables or disables the data compression.

**Purpose**

To enable or disable data compression.

**Usage Notes**

Put this parameter under the DESCRIPTION parameter.

Setting this parameter in the connect descriptor for a client overrides the SQLNET.COMPRESSION parameter in the client-side sqlnet.ora file.

**Default**

off

**Values**

- **on** to enable data compression.
- **off** to disable data compression.

**Example**

```plaintext
net_service_name=
  (DESCRIPTION=
    (COMPRESSION=on)
    (ADDRESS_LIST=
      (ADDRESS= (PROTOCOL=tcp) (HOST=sales1-server) (PORT=1521))
```
6.12.2 COMPRESSION_LEVELS

The COMPRESSION_LEVELS parameter of the tnsnames.ora file specifies the compression level.

Purpose
To specify the compression level.

Usage Notes
The compression levels are used at the time of negotiation to verify which levels are used at both ends, and select one level. Put this parameter under the DESCRIPTION parameter.

This parameter is used with the COMPRESSION parameter. Setting this parameter in the connect descriptor for a client overrides the SQLNET.COMPRESSION_LEVELS parameter in the client-side sqlnet.ora file.

Default
low

Values

• low for low CPU usage and a low compression ratio.
• high for high CPU usage and a high compression ratio.

Example

net_service_name=
  (DESCRIPTION=
    (COMPRESSION=on)
    (COMPRESSION_LEVELS=(LEVEL=low) (LEVEL=high))
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-server) (PORT=1521))
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales2-server) (PORT=1521)))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)))

Related Topics

• SQLNET.COMPRESSION_LEVELS
Oracle Net Listener Parameters in the listener.ora File

This chapter provides a complete listing of the listener.ora file configuration parameters.

- **Overview of Oracle Net Listener Configuration File**
- **Protocol Address Parameters**
- **Connection Rate Limiter Parameters**
  The connection rate limiter feature in Oracle Net Listener enables a database administrator to limit the number of new connections handled by the listener. When this feature is enabled, Oracle Net Listener imposes a user-specified maximum limit on the number of new connections handled by the listener every second. Depending on the configuration, the rate can be applied to a collection of endpoints, or to a specific endpoint.
- **Control Parameters**
  This section describes the following parameters that control the behavior of the listener:
  - **ADR Diagnostic Parameters for Oracle Net Listener**
    The diagnostic data for the critical errors is quickly captured and stored in the ADR for Oracle Net listener.
  - **Non-ADR Diagnostic Parameters for Oracle Net Listener**
    This section lists the parameters used when ADR is disabled. The default value of DIAG_ADR_ENABLED_listener_name is on. Therefore, the DIAG_ADR_ENABLED_listener_name parameter must explicitly be set to off to use non-ADR tracing.
  - **Class of Secure Transports Parameters**
    The class of secure transports (COST) parameters specify a list of transports that are considered secure for administration and registration of a particular listener.

### 7.1 Overview of Oracle Net Listener Configuration File

Oracle Net Listener configuration, stored in the listener.ora file, consists of the following elements:

- Name of the listener
- Protocol addresses that the listener is accepting connection requests on
- Valid nodes that the listener allows to register with the database
- Database services
- Control parameters

Dynamic service registration, eliminates the need for static configuration of supported services. However, static service configuration is required if you plan to use Oracle Enterprise Manager Cloud Control.
By default, the listener.ora file is located in the ORACLE_HOME/network/admin directory. The listener.ora file can also be stored the following locations:

- The directory specified by the TNS_ADMIN environment variable or registry value.
- On Linux and UNIX operating systems, it is the global configuration directory. For example, on the Oracle Solaris operating system, the directory is /var/opt/oracle.

See Also:

- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services
- Oracle operating system-specific documentation

- In the read-only Oracle home mode, the listener.ora file default location is ORACLE_BASE_HOME/network/admin.
- In the read-only Oracle home mode, the parameters that default to ORACLE_HOME location change to default to ORACLE_BASE_HOME location.

It is possible to configure multiple listeners, each with a unique name, in one listener.ora file. Multiple listener configurations are possible because each of the top-level configuration parameters has a suffix of the listener name or is the listener name itself.

Note:

- It is often useful to configure multiple listeners in one listener.ora file. However, Oracle recommends running only one listener for each node in most customer environments.
- Oracle Net Services supports the IFILE parameter in the listener.ora file, with up to three levels of nesting. The parameter is added manually to the file. The following is an example of the syntax:

  IFILE=/tmp/listener_em.ora
  IFILE=/tmp/listener_cust1.ora
  IFILE=/tmp/listener_cust2.ora

  Refer to Oracle Database Reference for additional information.

Example 7-1 shows a listener.ora file for a listener named LISTENER, which is the default name of the listener.

Example 7-1 listener.ora File

LISTENER=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sale-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc)))

Example 7-1 listener.ora File

LISTENER=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sale-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc)))
7.2 Protocol Address Parameters

The **protocol address** section of the `listener.ora` file defines the protocol addresses on which the listener is accepting connection requests. This section describes the most common parameters used in protocol addresses. The `ADDRESS_LIST` parameter is also supported. This section lists and describes the following parameters:

- **ADDRESS**
  - The protocol `ADDRESS` parameter's networking parameter is in the `listener.ora` file. It specifies the protocol address under the `DESCRIPTION` parameter for one listener.

- **DESCRIPTION**
  - Description networking parameter of the `listener.ora` file contains listener protocol addresses.

- **Firewall**

- **IP**
  - The protocol address parameter `IP` determine which IP address the listener listens on when a host name is specified.

- **QUEUESIZE**

- **RECV_BUF_SIZE**

- **SEND_BUF_SIZE**

7.2.1 ADDRESS

The protocol `ADDRESS` parameter's networking parameter is in the `listener.ora` file. It specifies the protocol address under the `DESCRIPTION` parameter for one listener.

**Purpose**

Specifies a single listener protocol address in the `DESCRIPTION` parameter

**Usage Notes**

Use this parameter to define the protocol, the host, and the port number for the listener.

**Example**

```plaintext
listener_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=hr-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
```

7.2.2 DESCRIPTION

`DESCRIPTION` networking parameter of the `listener.ora` file contains listener protocol addresses.

**Purpose**

To contain listener protocol addresses.
7.2.3 Firewall

Purpose
It can be set in endpoint to enable firewall functionality.

Related Topics
• Oracle Database Net Services Administrator's Guide

7.2.4 IP

The protocol address parameter IP determine which IP address the listener listens on when a host name is specified.

Purpose
To determine which IP address the listener listens on when a host name is specified.

Usage Notes
This parameter is only applicable when the HOST parameter specifies a host name.

Values
• first
  Listen on the first IP address returned by the DNS resolution of the host name. If the user wants the listener to listen on the first IP to which the specified host name resolves, then the address must be qualified with (IP=first).
• v4_only
  Listen only on IPv4 addresses.
• v6_only
  Listen only on IPv6 addresses.

Default
This feature is disabled by default.

Example

```sql
listener_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=rancode1-vip)(PORT=1522)(IP=v6_only))
```

7.2.5 QUEUESIZE

Purpose
To specify the number of concurrent connection requests that the listener can accept on a TCP/IP or IPC listening endpoint (protocol address).
Usage Notes

The number of concurrent connection requests is dependent on the platform and listener usage scenarios. If the listener is heavily-loaded, then set the parameter to a higher number. Put this parameter at the end of the protocol address with its value set to the expected number of concurrent connection requests.

Default

The default number of concurrent connection requests is operating system specific.

Example

```
listener_name=
(DESCRIPTION=
  (ADDRESS=(PROTOCOL=tcp)(HOST=hr-server)(PORT=1521)(QUEUESIZE=20)))
```

See Also:

Oracle Database Net Services Administrator's Guide for additional information about configuring this parameter

7.2.6 RECV_BUF_SIZE

Purpose

To specify, in bytes, the buffer space for receive operations of sessions.

Usage Notes

Put this parameter under the DESCRIPTION parameter or at the end of the protocol address with its value set to the expected number of bytes. This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Note:

Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for information about additional protocols that support this parameter.

Default

The default value for this parameter is operating system specific. The default for the Linux operating system is 87380 bytes.

Example

```
listener_name=
  (DESCRIPTION=
```
7.2.7 SEND_BUF_SIZE

Purpose
To specify, in bytes, the buffer space for send operations of sessions.

Usage Notes
Put this parameter under the DESCRIPTION parameter or at the end of the protocol address.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Default
The default value for this parameter is operating system specific. The default for the Linux operating system is 16 KB.

Example

listener_name=
{DESCRIPTION=
{ADDRESS_LIST=
  (ADDRESS=(PROTOCOL=tcp) (HOST=sales-server) (PORT=1521) (SEND_BUF_SIZE=11280))
  (ADDRESS=(PROTOCOL=ipc) (KEY=extproc) (SEND_BUF_SIZE=11280)))
}

See Also:
Oracle Database Net Services Administrator's Guide for additional information about configuring this parameter.
7.3 Connection Rate Limiter Parameters

The connection rate limiter feature in Oracle Net Listener enables a database administrator to limit the number of new connections handled by the listener. When this feature is enabled, Oracle Net Listener imposes a user-specified maximum limit on the number of new connections handled by the listener every second. Depending on the configuration, the rate can be applied to a collection of endpoints, or to a specific endpoint.

This feature is controlled through the following listener.ora configuration parameters:

- **CONNECTION_RATE_listener_name**
  The CONNECTION_RATE_listener_name configuration parameter of the listener.ora file specifies a global rate that is enforced across all listening endpoints that are rate-limited.

- **RATE_LIMIT**
  The RATE_LIMIT configuration parameter of the listener.ora file indicates that a particular listening endpoint is rate-limited.

### 7.3.1 CONNECTION_RATE_listener_name

The CONNECTION_RATE_listener_name configuration parameter of the listener.ora file specifies a global rate that is enforced across all listening endpoints that are rate-limited.

**Purpose**

To specify a global rate that is enforced across all listening endpoints that are rate-limited.

**Usage Notes**

When this parameter is specified, it overrides any endpoint-level numeric rate values that might be specified.

**Syntax**

CONNECTION_RATE_listener_name=number_of_connections_per_second
7.3.2 RATE_LIMIT

The RATE_LIMIT configuration parameter of the listener ora file indicates that a particular listening endpoint is rate-limited.

Purpose
To indicate that a particular listening endpoint is rate-limited.

Usage Notes
The parameter is specified in the ADDRESS section of the listener endpoint configuration.

Syntax

```
LISTENER=
    (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1521)(RATE_LIMIT=yes))
```

- When the RATE_LIMIT parameter is set to yes for an endpoint, that endpoint is included in the enforcement of the global rate configured by the
  CONNECTION_RATE_listener_name parameter. The global rate limit is enforced individually at each endpoint that has RATE_LIMIT set to yes.
- Dynamic endpoints for listeners managed by Oracle Clusterware have the RATE_LIMIT parameter set to yes.
- When the RATE_LIMIT parameter is set to a value greater than 0, then the rate limit is enforced at that endpoint level.

Examples

The following examples use the CONNECTION_RATE_listener name and RATE_LIMIT parameters.

Example 1

```
CONNECTION_RATE_LISTENER=10
```

```
LISTENER=
    (ADDRESS_LIST=
        (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1521)(RATE_LIMIT=yes))
        (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1522)(RATE_LIMIT=yes))
        (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1523)))
```

In the preceding example, the global rate of new connections is enforced separately for each endpoint. Connections through port 1521 are limited at 10 every second, and the connections through port 1522 are also separately limited at 10 every second. Connections through port 1523 are not limited.

Example 2

```
LISTENER= (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1521)(RATE_LIMIT=5))
    (ADDRESS=(PROTOCOL=tcp)(HOST=)(PORT=1522)(RATE_LIMIT=10))
```
In the preceding example, the connection rates are enforced at the endpoint level. A maximum of 5 connections are processed through port 1521 every second. The limit for connections through port 1522 is 10 every second. Connections through port 1523 are not limited.

**Note:**
The global CONNECTON_RATE_listener_name parameter is not specified in the preceding configuration. If it is specified, then the limits on ports 1521 and 1522 are ignored, and the global value is used instead.

### 7.4 Control Parameters

This section describes the following parameters that control the behavior of the listener:

- **ADMIN_RESTRICTIONS_listener_name**
The listener.ora control parameter ADMIN_RESTRICTIONS_listener_name restricts runtime administration of the listener.

- **ALLOW_MULTIPLE_REDIRECTS_listener_name**
The listener.ora control parameter ALLOW_MULTIPLE_REDIRECTS_listener_name enables multiple redirects of the client.

- **ENABLE_EXADIRECT_listener_name**

- **CRS_NOTIFICATION_listener_name**
CRS_NOTIFICATION_listener_name control parameter of the listener.ora file sets notification to allow or disallow Cluster Ready Services (CRS) to manage the listener in an Oracle Real Application Clusters environment.

- **DEDICATED_THROUGH_BROKER_LISTENER**
DEDICATED_THROUGH_BROKER_LISTENER networking parameter of the listener.ora file enables the server to spawn a thread or process when a connection to the database is requested through the listener.

- **DEFAULT_SERVICE_listener_name**
DEFAULT_SERVICE_listener_name control parameter of the listener.ora file enables users to connect to the database without having to specify a service name from the client side.

- **INBOUND_CONNECT_TIMEOUT_listener_name**

- **LOCAL_REGISTRATION_ADDRESS_listener_name**

- **MAX_ALL_CONNECTIONS_listener_name**

- **MAX_REG_CONNECTIONS_listener_name**

- **REGISTRATION_EXCLUDED_NODES_listener_name**

- **REGISTRATION_INVITED_NODES_listener_name**

- **REMOTE_REGISTRATION_ADDRESS_listener_name**
• SAVE_CONFIG_ON_STOP_listener_name
• SERVICE_RATE_listener_name
  The SERVICE_NAME_listener_name control parameter specifies incoming
  connection rate that is allowed per service for an instance.
• SSL_CLIENT_AUTHENTICATION
• SSL_VERSION
• SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name
• USE_SID_AS_SERVICE_listener_name
• VALID_NODE_CHECKING_REGISTRATION_listener_name
  The listener.ora control parameter
  VALID_NODE_CHECKING_REGISTRATION_listener_name determines if valid node
  checking registration is performed, or if the subnet is allowed.
• WALLET_LOCATION

7.4.1 ADMIN_RESTRICTIONS_listener_name

The listener.ora control parameter ADMIN_RESTRICTIONS_listener_name restricts
runtime administration of the listener.

Purpose
To restrict runtime administration of the listener.

Usage Notes
Setting ADMIN_RESTRICTIONS_listener_name=on disables the runtime modification of
parameters in listener.ora. That is, the listener refuses to accept SET commands
that alter its parameters. To change any of the parameters in listener.ora, including
ADMIN_RESTRICTIONS_listener_name itself, modify the listener.ora file manually and
reload its parameters using the RELOAD command for the new changes to take effect
without explicitly stopping and restarting the listener.

Default
off

Example
ADMIN_RESTRICTIONS_listener=on

Related Topics
• SET
  The Listener Control utility command SET alters the parameter values for the
  listener.
• RELOAD
  The Listener Control utility command RELOAD reloads the listener.ora file, so that
  you can add or change statically configured services without stopping the listener.
7.4.2 ALLOW_MULTIPLE_REDIRECTS_listener_name

The listener ora control parameter ALLOW_MULTIPLE_REDIRECTS_listener_name enables multiple redirects of the client.

**Purpose**
To support multiple redirects of the client.

**Usage Notes**
This parameter should only be set on the SCAN listener on the Oracle Public Cloud. When set to on, multiple redirects of the client are allowed.

Do not set this parameter for a node listener if that is used as a SCAN listener.

**Default**
off

**Values**
on | off

**Example**
ALLOW_MULTIPLE_REDIRECTS_listener=on

7.4.3 ENABLE_EXADIRECT_listener_name

**Purpose**
To enable Exadirect protocol.

**Usage Notes**
The parameter enables Exadirect support.

**Default**
Off

**Values**
on | off

**Example 7-3 Example**
ENABLE_EXADIRECT_listener=on
7.4.4 CRS_NOTIFICATION_listener_name

CRS_NOTIFICATION_listener_name control parameter of the listener.ora file sets notification to allow or disallow Cluster Ready Services (CRS) to manage the listener in an Oracle Real Application Clusters environment.

Purpose
To set notification.

Usage Notes
By default, the Oracle Net listener notifies Cluster Ready Services (CRS) when it is started or stopped. These notifications allow CRS to manage the listener in an Oracle Real Application Clusters environment. This behavior can be prevented by setting the CRS_NOTIFICATION_listener_name parameter to off.

Default
on

Values
on | off

7.4.5 DEDICATED_THROUGH_BROKER_LISTENER

DEDICATED_THROUGH_BROKER_LISTENER networking parameter of the listener.ora file enables the server to spawn a thread or process when a connection to the database is requested through the listener.

Purpose
To enable the server to spawn a thread or process when a connection to the database is requested through the listener.

Default
off

Values
on | off

Example 7-4   Example
(Optional) Enter an example to illustrate your reference here.
7.4.6 DEFAULT_SERVICE_listener_name

DEFAULT_SERVICE_listener_name control parameter of the listener.ora file enables users to connect to the database without having to specify a service name from the client side.

Purpose

To enable users to connect to the database without having to specify a service name from the client side.

Usage Notes

When a client tries to connect to the database, the connection request passes through the listener. The listener may be servicing several different databases. If a service name is configured in this parameter, then users may not necessarily need to specify a service name in the connect syntax. If a user specifies a service name, then the listener connects the user to that specific database, otherwise the listener connects to the service name specified by the DEFAULT_SERVICE_listener_name parameter. For container databases, the client must explicitly specify the service name.

Default

There is no default value for the DEFAULT_SERVICE_listener_name parameter. If this parameter is not configured and a user does not specify a fully-qualified service name in the connect syntax, then the connection attempt fails. This parameter only accepts one value.

Example 7-5  Example

DEFAULT_SERVICE_listener=sales.us.example.com

7.4.7 INBOUND_CONNECT_TIMEOUT_listener_name

Purpose

To specify the time, in seconds, for the client to complete its connect request to the listener after the network connection had been established.

Usage Notes

If the listener does not receive the client request in the time specified, then it terminates the connection. In addition, the listener logs the IP address of the client and an ORA-12525:TNS: listener has not received client's request in time allowed error message to the listener.log file.

To protect both the listener and the database server, Oracle recommends setting this parameter in combination with the SQLNET.INBOUND_CONNECT_TIMEOUT parameter in the sqlnet.ora file. When specifying values for these parameters, consider the following recommendations:

- Set both parameters to an initial low value.
- Set the value of the INBOUND_CONNECT_TIMEOUT_listener_name parameter to a lower value than the SQLNET.INBOUND_CONNECT_TIMEOUT parameter.

For example, you can set the INBOUND_CONNECT_TIMEOUT_listener_name parameter to 2 seconds and the INBOUND_CONNECT_TIMEOUT parameter to 3 seconds. If clients are unable to
complete connections within the specified time due to system or network delays that are normal for the particular environment, then increment the time as needed.

**Default**

60 seconds

**Example**

```
INBOUND_CONNECT_TIMEOUT_listener=2
```

### 7.4.8 LOCAL_REGISTRATION_ADDRESS_listener_name

**Purpose**

To secure registration requests through dedicated secure registration endpoints for local listeners. Service ACLs are accepted by listener only if `LOCAL_REGISTRATION_ADDRESS_listener_name` is configured. The parameter specifies the group that is allowed to send ACLs.

**Usage Notes**

The local registration endpoint accepts local registration connections from the specified group. All local registration requests coming on normal listening endpoints are redirected to the local registration endpoint. If the registrar is not a part of the group, then it cannot connect to the endpoint.

**Default**

OFF

**Values**

ON, OFF, or IPC endpoint address with group

When set to ON, listener defaults the group to `oinstall` on UNIX and `ORA_INSTALL` on Windows.

**Example 7-6**

```
LOCAL_REGISTRATION_ADDRESS_listener_name = (address=(protocol=ipc) (group=xyz)) LOCAL_REGISTRATION_ADDRESS_listener_name =ON
```

**Related Topics**

- **Firewall**
- **DBMS_SFW_ACL_ADMIN**

### 7.4.9 MAX_ALL_CONNECTIONS_listener_name

**Purpose**

To specify the maximum number of concurrent registration and client connection sessions that can be supported by Oracle Net Listener.
Usage Notes

This number includes registration connections from databases, and ongoing client connection establishment requests. After a connection is established, the clients do not maintain a connection to the listener. This limit only applies to client connections that are in the initial connection establishment phase from a listener perspective.

Default

Operating system-specific

Example

MAX_ALL_CONNECTIONS_listener=4096

7.4.10 MAX_REG_CONNECTIONS_listener_name

Purpose

To specify the maximum number of concurrent registration connection sessions that can be supported by Oracle Net Listener.

Default

512

Example

MAX_REG_CONNECTIONS_listener=2048

7.4.11 REGISTRATION_EXCLUDED_NODES_listener_name

Purpose

To specify the list of nodes that cannot register with the listener.

Usage Notes

The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the REGISTRATION_INVITED_NODES_listener_name parameter and the REGISTRATION_EXCLUDED_NODES_listener_name parameter are set, then the REGISTRATION_EXCLUDED_NODES_listener_name parameter is ignored.

Values

Valid nodes and subnet IP addresses or names.

Example

REGISTRATION_EXCLUDED_NODES_listener = (10.1.26.*, 10.16.40.0/24, \
2001:DB8:3eff:fe38, node2)
7.4.12 REGISTRATION_INVITED_NODES_listener_name

Purpose
To specify the list of node that can register with the listener.

Usage Notes
- The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.
- If the REGISTRATION_INVITED_NODES_listener_name parameter and the REGISTRATION_EXCLUDED_NODES_listener_name parameter are set, then the REGISTRATION_EXCLUDED_NODES_listener_name parameter is ignored.
- Starting with Oracle Grid Infrastructure 12c, for a SCAN listener, if the VALID_NODE_CHECKING_REGISTRATION_listener_name and REGISTRATION_INVITED_NODES_listener_name parameters are set in the listener.ora file, then the listener agent overwrites these parameters.

Values
Valid nodes and subnet IP addresses or names.

Example
REGISTRATION_INVITED_NODES_listener = (10.1.35.*, 10.1.34.0/24, \
2001:DB8:fe38:7303, node1)

See Also:
Oracle Real Application Clusters Administration and Deployment Guide for information about valid node checking for registration

7.4.13 REMOTE_REGISTRATION_ADDRESS_listener_name

Purpose
To secure registration requests through dedicated secure registration endpoints for SCAN listeners.

Usage Notes
The registration endpoint is on a private network within the cluster. All remote registration requests coming in on normal listening endpoints are redirected to the registration endpoint. Any system which is not a part of the cluster cannot connect to the endpoint. This feature is not supported when ADMIN_RESTRICTIONS_listener_name is set to ON as the Cluster Ready Services agent configures the remote_registration_address dynamically at run time.
Default

This parameter is configured internally in listeners managed by Oracle Clusterware to restrict registrations to the private network. The value of this parameter should not be modified or specified explicitly. The only supported explicit setting is for turning this feature off by setting the value to OFF.

Values

off

Example

REMOTE_REGISTRATION_ADDRESS_listener=off

7.4.14 SAVE_CONFIG_ON_STOP_listener_name

Purpose

To specify whether runtime configuration changes are saved to the listener.ora file.

Usage Notes

When you set the parameter to true, any parameters that were modified while the listener was running using the Listener Control utility SET command are saved to the listener.ora file when the STOP command is issued. When you set the parameter to false, the Listener Control utility does not save the runtime configuration changes to the listener.ora file.

Default

false

Values

true | false

Example

SAVE_CONFIG_ON_STOP_listener=true

7.4.15 SERVICE_RATE_listener_name

The SERVICE_NAME_listener_name control parameter specifies incoming connection rate that is allowed per service for an instance.

Purpose

To specify incoming connection rate that is allowed per service for an instance.

Usage Notes

Any user-specified value greater than 0 sets the maximum limit on the number of new connections per service-instance handled by the proxy listener every second. Listener rejects connections after it reaches the maximum limit. Client side connection failure is reported with “TNS:listener: rate limit reached”.
7.4.16 SSL_CLIENT_AUTHENTICATION

**Purpose**
To specify whether a client is authenticated using the Secure Sockets Layer (SSL).

**Usage Notes**
The database server authenticates the client. Therefore, this value should be set to false. If this parameter is set to true, then the listener attempts to authenticate the client, which can result in a failure.

**Default**
true

**Values**
ture | false

**Example**
SSL_CLIENT_AUTHENTICATION=false

---

7.4.17 SSL_VERSION

**Purpose**
To limit allowable SSL or TLS versions used for connections.

**Usage Notes**
Clients and database servers must use a compatible version. This parameter should only be used when absolutely necessary for backward compatibility. The current default uses TLS version 1.2 which is the version required for multiple security compliance requirements.

If you set SSL_VERSION to undetermined, then by default it uses 3.0.
Default

1.2

Values

**Note:**
The sqlnet.ora parameter ADD_SSLV3_TO_DEFAULT has no impact on this parameter.

undetermined | 3.0 | 1.0 | 1.1 | 1.2

If you want to specify one version or another version, then use “or”. The following values are permitted:

1.0 or 3.0 | 1.2 or 3.0 | 1.1 or 1.0 | 1.2 or 1.0 | 1.2 or 1.1 | 1.1 or 1.0 or 3.0 | 1.2 or 1.0 or 3.0 | 1.2 or 1.1 or 1.0 | 1.2 or 1.1 or 3.0 | 1.2 or 1.1 or 1.0 or 3.0

**Example**

SSL_VERSION=1.2

The remaining version numbers correspond to the TLS versions, such as, TLSv1.0, TLSv1.1, and TLSv1.2.

**See Also:**
Oracle Database Security Guide

### 7.4.18 SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name

#### Purpose
To subscribe to Oracle Notification Service (ONS) notifications for downed events.

#### Usage Notes
By default, the listener subscribes to the ONS node down event on startup, if ONS is available. This subscription enables the listener to remove the affected service when it receives node down event notification from ONS. The listener uses asynchronous subscription for the event notification. Alter this behavior by setting SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name=off in listener.ora.

**Default**
on

**Values**
on | off
7.4.19 USE_SID_AS_SERVICE_listener_name

**Purpose**

To enable the system identifier (SID) in the connect descriptor to be interpreted as a service name when a user attempts a database connection.

**Usage Notes**

Database clients with earlier releases of Oracle Database that have hard-coded connect descriptors can use this parameter to connect to a container or pluggable database.

For an Oracle container database, the client must specify a service name in order to connect to it. Setting this parameter to `on` instructs the listener to use the SID in the connect descriptor as a service name and connect the client to the specified database.

**Default**

off

**Example**

`USE_SID_AS_SERVICE_listener=on`

7.4.20 VALID_NODE_CHECKING_REGISTRATION_listener_name

The `listener.ora` control parameter `VALID_NODE_CHECKING_REGISTRATION_listener_name` determines if valid node checking registration is performed, or if the subnet is allowed.

**Purpose**

To determine whether valid node checking registration is performed, or the subnet is allowed.

**Usage Notes**

- When set to `on`, valid node checking registration is performed at the listener for any incoming registration request, and only local IP addresses are allowed.

- Starting with Oracle Grid Infrastructure 12c, for a SCAN listener, if the `VALID_NODE_CHECKING_REGISTRATION_listener_name` and `REGISTRATION_INVITED_NODES_listener_name` parameters are set in the `listener.ora` file, then the listener agent overwrites these parameters.

**Default**

on

**Values**

- `off` | 0 to specify valid node checking registration is off, and no checking is performed.
• on | 1 | local to specify valid node checking registration is on, and all local IP addresses can register. If a list of invited nodes is set, then all IP addresses, host names, or subnets in the list as well as local IP addresses are allowed.

• subnet | 2 to specify valid node checking registration is on, and all machines in the local subnets are allowed to register. If a list of invited nodes is set, then all nodes in the local subnets as well as all IP addresses, host names and subnets in the list are allowed.

Example

VALID_NODE_CHECKING_REGISTRATION_listener=on

See Also:

Oracle Real Application Clusters Administration and Deployment Guide for information about valid node checking for registration

7.4.21 WALLET_LOCATION

Purpose

To specify the location of wallets.

Usage Notes

Wallets are certificates, keys, and trustpoints processed by SSL that allow for secure connections.

The key/value pair for Microsoft certificate store (MCS) omits the METHOD_DATA parameter because MCS does not use wallets. Instead, Oracle PKI (public key infrastructure) applications obtain certificates, trustpoints and private keys directly from the user’s profile.

If an Oracle wallet is stored in the Microsoft Windows registry and the wallet’s key (KEY) is SALESAPP, then the storage location of the encrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\EWALLET.P12. The storage location of the decrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\CWALLET.SSO.

Syntax

Table 7-1 shows the syntax for the WALLET_LOCATION parameter based on wallet storage location.
Table 7-1  Syntax for WALLET_LOCATION

<table>
<thead>
<tr>
<th>Wallet Location</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle wallets on file system</td>
<td><code>WALLET_LOCATION= (SOURCE= (METHOD=file) (METHOD_DATA= (DIRECTORY=directory) [(PKCS11=TRUE/FALSE)]))</code></td>
</tr>
<tr>
<td>Microsoft certificate store</td>
<td><code>WALLET_LOCATION= (SOURCE= (METHOD=mcs))</code></td>
</tr>
<tr>
<td>Oracle wallets in the Microsoft Windows registry</td>
<td><code>WALLET_LOCATION= (SOURCE= (METHOD=reg) (METHOD_DATA= (KEY=registry_key)))</code></td>
</tr>
<tr>
<td>Entrust wallets</td>
<td><code>WALLET_LOCATION= (SOURCE= (METHOD=entr) (METHOD_DATA= (PROFILE=file.epf) (INIFILE=file.ini)))</code></td>
</tr>
</tbody>
</table>

Additional Parameters

The following additional parameters are available for `WALLET_LOCATION`:

- **SOURCE**: Type of storage for wallets and storage location.
- **METHOD**: Type of storage.
- **METHOD_DATA**: Storage location.
- **DIRECTORY**: Location of Oracle wallets on file system.
- **KEY**: Wallet type and location in the Microsoft Windows registry.
- **PROFILE**: Entrust profile file (.epf).
- **INIFILE**: Entrust initialization file (.ini).

Default

None

Examples

Oracle wallets on file system:

```
WALLET_LOCATION= (SOURCE= (METHOD=file)
```
Microsoft certificate store:

WALLET_LOCATION=
  (SOURCE=
    (METHOD=mcs))

Oracle Wallets in the Microsoft Windows registry:

WALLET_LOCATION=
  (SOURCE=
    (METHOD=REG)
    (METHOD_DATA=
      (KEY=SALESAPP)))

Entrust Wallets:

WALLET_LOCATION=
  (SOURCE=
    (METHOD=entr)
    (METHOD_DATA=
      (PROFILE=/etc/oracle/wallets/test.epf)
      (INIFILE=/etc/oracle/wallets/test.ini)))

7.5 ADR Diagnostic Parameters for Oracle Net Listener

The diagnostic data for the critical errors is quickly captured and stored in the ADR for Oracle Net listener.

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, are immediately captured and tagged with the incident number. The data is then stored in the Automatic Diagnostic Repository (ADR), a file-based repository outside the database.

This section includes the parameters used when ADR is enabled. ADR is enabled by default. Non-ADR parameters listed in the listener.ora file are ignored when ADR is enabled.

The following listener.ora parameters are used when ADR is enabled (when DIAG_ADR_ENABLED is set to on):

- **ADR_BASE_listener_name**
  The ADR_BASE_listener_name parameter is a diagnostic parameter specifies the base directory that stores tracing and logging incidents when ADR is enabled.
7.5.1 ADR_BASE_listener_name

The ADR_BASE_listener_name parameter is a diagnostic parameter that specifies the base directory that stores tracing and logging incidents when ADR is enabled.

Purpose

To specify the base directory that stores tracing and logging incidents when ADR is enabled.

Default

The default is ORACLE_BASE, or ORACLE_HOME/log if ORACLE_BASE is not defined.

Values

Any valid directory path to a directory with write permission.

Example

ADR_BASE_listener=/oracle/network/trace

7.5.2 DIAG_ADR_ENABLED_listener_name

The DIAG_ADR_ENABLED_listener_name is a diagnostic parameter of the listener.ora file. It indicates whether ADR is enabled.

Purpose

To indicate whether ADR tracing is enabled.
Usage Notes

When the `DIAG_ADR_ENABLED_listener_name` parameter is set to `on`, then ADR file tracing is used. When the `DIAG_ADR_ENABLED_listener_name` parameter is set to `off`, then non-ADR file tracing is used.

Default

`on`

Values

`on` | `off`

Example 7-8  Example

```
DIAG_ADR_ENABLED_listener=on
```

### 7.5.3 LOG_FILE_NUM_listener_name

The `LOG_FILE_NUM_listener_name` is a diagnostic parameter of the `listener.ora` file that specifies the number of log file segments.

**Purpose**

To specify the number of log file segments. At any point of time there can be only \( n \) log file segments where \( n \) is `LOG_FILE_NUM_listener_name`. If the log grows beyond this number, then the older segments are deleted.

**Default**

No default. If you don't specify a value, or set the value to zero, then the number of segments grows indefinitely.

**Values**

Any integer value.

Example 7-9

```
LOG_FILE_NUM_listener=3
```

### 7.5.4 LOG_FILE_SIZE_listener_name

The `LOG_FILE_SIZE_listener_name` diagnostic parameter of the `listener.ora` file specifies the size of each log file segment.

**Purpose**

To specify the size of each log file segment. The size is in MB.

**Default**

300 MB
Values
Any integer value.

Example 7-10  Example
LOG_FILE_SIZE_listener=10

7.5.5 LOGGING_listener_name

The LOGGING_listener_name diagnostic parameter of the listener.ora file turns logging on or off.

Purpose
To turn logging on or off.

Usage Notes
This parameter is also applicable when non-ADR tracing is used.

Default
on

Values
on | off

Example
LOGGING_listener=on

7.5.6 TRACE_LEVEL_listener_name

The TRACE_LEVEL_listener_name diagnostic parameter of the listener.ora file turns listener tracing on, at a specific level, or turns it off.

Purpose
To turn listener tracing on, at a specific level, or to turn it off.

Usage Notes
This parameter is also applicable when non-ADR tracing is used.

Default
off | 0

Values

• off or 0 for no trace output
• user or 4 for user trace information
• admin or 10 for administration trace information
• support or 16 for Oracle Support Services trace information

Example

TRACE_LEVEL_listener=admin

7.5.7 TRACE_TIMESTAMP_listener_name

The TRACE_TIMESTAMP_listener_name diagnostic parameter of the listener.ora file adds a time stamp to every trace event in the trace file for the listener.

Purpose

To add a time stamp in the form of dd-mmm-yyyy hh:mm:ss:mill to every trace event in the trace file for the listener.

Usage Notes

This parameter is used with the TRACE_LEVEL_listener_name parameter. This parameter is also applicable when non-ADR tracing is used.

Default

on

Values

• on | true
• off | false

Example

TRACE_TIMESTAMP_listener=true

7.6 Non-ADR Diagnostic Parameters for Oracle Net Listener

This section lists the parameters used when ADR is disabled. The default value of DIAG_ADR_ENABLED_listener_name is on. Therefore, the DIAG_ADR_ENABLED_listener_name parameter must explicitly be set to off to use non-ADR tracing.

• LOG_DIRECTORY_listener_name
• LOG_FILE_listener_name
• TRACE_DIRECTORY_listener_name
• TRACE_FILE_listener_name
• TRACE_FILEAGE_listener_name
• TRACE_FILELEN_listener_name
• TRACE_FILENO_listener_name
7.6.1 LOG_DIRECTORY_listener_name

**Purpose**
To specify the destination directory of the listener log file.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
ORACLE_HOME/network/log

**Example**
LOG_DIRECTORY_listener=/oracle/network/admin/log

7.6.2 LOG_FILE_listener_name

**Purpose**
To specify the name of the log file for the listener.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
listener.log

**Example**
LOG_FILE_listener=list.log

7.6.3 TRACE_DIRECTORY_listener_name

**Purpose**
To specify the destination directory of the listener trace file.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
ORACLE_HOME/network/trace

**Example**
TRACE_DIRECTORY_listener=/oracle/network/admin/trace
7.6.4 TRACE_FILE_listener_name

**Purpose**
To specify the name of the trace file for the listener.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
listener.trc

**Example**
```
TRACE_FILE_listener=list.trc
```

7.6.5 TRACE_FILEAGE_listener_name

**Purpose**
To specify the maximum age of listener trace files in minutes.

**Usage Notes**
When the age limit is reached, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_listener_name parameter. Use this parameter when ADR is not enabled.

**Default**
Unlimited

This is the same as setting the parameter to 0.

**Example 7-11 Example**
```
TRACE_FILEAGE_listener=60
```

7.6.6 TRACE_FILELEN_listener_name

**Purpose**
To specify the size of the listener trace files in kilobytes (KB).

**Usage Notes**
When the size is met, the trace information is written to the next file. The number of files is specified using the TRACE_FILENO_listener_name parameter. Use this parameter when ADR is not enabled.

**Default**
Unlimited
7.6.7 TRACE_FILENO_listener_name

**Purpose**
To specify the number of trace files for listener tracing.

**Usage Notes**
When this parameter is set along with the TRACE_FILELEN_listener_name parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is re-used, and so on.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of listener.trc is used, and this parameter is set to 3, then the trace files would be named listener1.trc, listener2.trc and listener3.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

**Default**
1

**Example**
TRACE_FILENO_listener=3

### 7.7 Class of Secure Transports Parameters

The class of secure transports (COST) parameters specify a list of transports that are considered secure for administration and registration of a particular listener.

The COST parameters identify which transports are considered secure for that installation and whether the administration of a listener requires secure transports. Configuring these parameters is optional.

- **SECURE_REGISTER_listener_name**
- **Using COST Parameters in Combination**
- **DYNAMIC_REGISTRATION_listener_name**
  
  DYNAMIC_REGISTRATION_listener_name is a class of secure transports (COST) parameter and it enables or disables dynamic registration of a listener.

- **SECURE_PROTOCOL_listener_name**
- **SECURE_CONTROL_listener_name**
7.7.1 SECURE_REGISTER_listener_name

Purpose
To specify the transports on which registration requests are to be accepted.

Usage Notes
If the SECURE_REGISTER_listener_name parameter is configured with a list of transport names, then only the connections arriving on the specified transports are able to register the service with the listener. Connections arriving by other transport protocols are refused. The following is an example:

SECURE_REGISTER_listener1 = (TCPS, IPC)

In the preceding example, registration requests are accepted only on TCPS and IPC transports.

If no values are entered for this parameter, then the listener accepts registration requests from any transport.

Syntax
SECURE_REGISTER_listener_name = 
[()]transport1[,transport2, ....,transportn]

In the preceding example, transport1, transport2, and transportn are valid, installed transport protocol names.

If this parameter and SECURE_CONTROL_listener_name are configured, then they override the SECURE_PROTOCOL_listener_name parameter.

Example
LISTENER1=
{DESCRIPTION=
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales-server) (PORT=1521))
   (ADDRESS=(PROTOCOL=ipc) (KEY=extproc))
   (ADDRESS=(PROTOCOL=tcps) (HOST=sales-server) (PORT=1522)))
  SECURE_REGISTER_listener1=tcps
}

7.7.2 Using COST Parameters in Combination

COST parameters can also be used in combination to further control which transports accept service registration and control commands.

In Example 7-12, control commands are accepted only on the IPC channel and the TCPS transport, and service registrations are accepted only on an IPC channel.
Example 7-12  Combining COST Parameters

LISTENER1=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))
      (ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=1522)))
  SECURE_CONTROL_listener1=(tcps,ipc)
  SECURE_REGISTER_listener1=ipc

In Example 7-13, control commands are accepted only on the TCPS transport, and service registrations are accepted only on the IPC channel.

Example 7-13  Combining COST Parameters

LISTENER1=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))
      (ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=1522)))
  SECURE_CONTROL_listener1=tcps
  SECURE_PROTOCOL_listener1=ipc

7.7.3 DYNAMIC_REGISTRATION_listener_name

DYNAMIC_REGISTRATION_listener_name is a class of secure transports (COST) parameter and it enables or disables dynamic registration of a listener.

Purpose
To enable or disable dynamic registration.

Usage Notes
Static registrations are not affected by this parameter.

Default
The default value is on. Unless this parameter is explicitly set to off, all registration connections are accepted.

Values
•  on: The listener accepts dynamic registration.
•  off: The listener refuses dynamic registration.

Example 7-14  Example

DYNAMIC_REGISTRATION_listener_name=on

7.7.4 SECURE_PROTOCOL_listener_name

Purpose
To specify the transports on which administration and registration requests are accepted.
Usage Notes

If this parameter is configured with a list of transport names, then the control commands and service registration can happen only if the connection belongs to the list of transports.

If this parameter is not present and neither SECURE_CONTROL_listener_name or SECURE_REGISTER_listener_name are configured, then all supported transports accept control and registration requests.

If the SECURE_CONTROL_listener_name and SECURE_REGISTER_listener_name parameters are configured, then they override the SECURE_PROTOCOL_listener_name parameter.

Syntax

SECURE_PROTOCOL_listener_name = [(transport1[ transport2, ...., transportn)]

In the preceding syntax, transport1, transport2, and transportn are valid, installed transport protocol names.

Example

LISTENER1 = (DESCRIPTION= (ADDRESS_LIST= (ADDRESS=(PROTOCOL=tcp) (HOST=sales-server) (PORT=1521)) (ADDRESS=(PROTOCOL=ipc) (KEY=extproc)) (ADDRESS=(PROTOCOL=tcps) (HOST=sales-server) (PORT=1522))))
SECURE_PROTOCOL_listener1=tcps

7.7.5 SECURE_CONTROL_listener_name

Purpose
To specify the transports on which control commands are to be serviced.

Usage Notes

If the SECURE_CONTROL_listener_name parameter is configured with a list of transport names, then the control commands are serviced only if the connection is one of the listed transports. Connections arriving by other transport protocols are refused. The following is an example:

SECURE_CONTROL_listener1 = (TCPS,IPC)

In the preceding example, administration requests are accepted only on TCPS and IPC transports.

If no values are entered for this parameter, then the listener accepts any connection on any endpoint.

Syntax

SECURE_CONTROL_listener_name = [(transport1[ transport2, ...., transportn)]

In the preceding syntax, transport1, transport2, and transportn are valid, installed transport protocol names.
Example

LISTENER1=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))
      (ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=1522))))
  SECURE_CONTROL_LISTENER1=tcps
Oracle Connection Manager Parameters

This chapter provides a complete listing of the `cman.ora` file configuration parameters.

- **Overview of Oracle Connection Manager Configuration File**
  Oracle Connection Manager configuration information is stored in the `cman.ora` file.

- **Oracle Connection Manager Parameters**
  This section lists and describes the following `cman.ora` file parameters:

- **Oracle Connection Manager in Traffic Director Mode Parameters**

- **ADR Diagnostic Parameters for Oracle Connection Manager**
  The diagnostic data for critical errors is quickly captured and stored in the ADR for Oracle Connection Manager.

- **Non-ADR Diagnostic Parameters for Oracle Connection Manager**
  This section lists the parameters used when ADR is disabled:

### 8.1 Overview of Oracle Connection Manager Configuration File

Oracle Connection Manager configuration information is stored in the `cman.ora` file.

**Oracle Connection Manager Configuration File**

Oracle Connection Manager configuration information consists of the following elements:

- Protocol address of the Oracle Connection Manager listener
- Access control parameters
- Performance parameters

By default, the `cman.ora` file is located in the `ORACLE_HOME/network/admin` directory. The `cman.ora` file can also be stored in the following locations:

- The directory specified by the `TNS_ADMIN` environment variable or registry value.
- On Linux and UNIX operating systems, the global configuration directory. For example, on the Oracle Solaris operating system, this directory is `/var/opt/oracle`.

**Example 8-1 Sample cman.ora File**

```ora
CMAN=
(CONFIGURATION=
 (ADDRESS=(PROTOCOL=tcp)(HOST=proxysvr)(PORT=1521))
 (RULE_LIST=
   (RULE=(SRC=192.0.2.32/27)(DST=sales-server)(SRV=*)(ACT=accept))
   (ACTION_LIST=(AUT=on)(MCT=120)(MIT=30))
   (RULE=(SRC=foo)(DST=hr-server)(SRV=cmon)(ACT=accept)))
 (PARAMETER_LIST=
   (MAX_GATEWAY_PROCESSES=8)
   (MIN_GATEWAY_PROCESSES=3))
```

---

8-1
cman.ora File Sections

- Listening address: Preceded by `ADDRESS=`, this section contains information pertinent to the listener. The `ADDRESS` parameter is required.

- Rule list: Preceded by `RULE_LIST=`, this section contains rule information. The `RULE` parameter is listed in the rule list section of the file. The `RULE` parameter is required.

- Parameter list: Preceded by `PARAMETER_LIST=`, this section contains all other parameters including those listed in "ADR Diagnostic Parameters for Oracle Connection Manager", and "Non-ADR Diagnostic Parameters for Oracle Connection Manager".

The following parameters are allowed in the parameter list section of the cman.ora file. The default values are bold. To override the default setting for a parameter, enter the parameter and a nondefault value.

```plaintext
ASO_AUTHENTICATION_FILTER={off | on}
CONNECTION_STATISTICS={no | yes}
EVENT_GROUP={init_and_term | memory_ops | conn_hdlg | proc_mgmt | reg_and_load | wake_up | timer | cmd_proc | relay}
IDLE_TIMEOUT=0 or greater
INBOUND_CONNECT_TIMEOUT=0 or greater. The default value is 60.
LOG_DIRECTORY=log_directory. The default value is ORACLE_HOME/network/log.
LOG_LEVEL={off | user | admin | support}
MAX_CMCTL_SESSIONS= Any positive number. The default value is 4.
MAX_CONNECTIONS= A value between 1 and 1024. The default value is 256.
MAX_GATEWAY_PROCESSES= Any number greater than the minimum number of gateway processes up to 64. The default value is 16.
MIN_GATEWAY_PROCESSES= Any positive number less than or equal to 64. Must be less than or equal to the maximum number of gateway processes. The default value is 2.
OUTBOUND_CONNECT_TIMEOUT=0 or greater
PASSWORD_instance_name= Value is the encrypted instance password, if one has been set. The default value is no value.
SESSION_TIMEOUT=0 or greater
TRACE_DIRECTORY=trace_directory. The default value is ORACLE_HOME/network/trace.
TRACE_FILELEN= Any positive number. The default value is 0 (zero).
TRACE_FILENO= Any positive number. The default value is 0 (zero).
TRACE_LEVEL={off | user | admin | support}
TRACE_TIMESTAMP={off | on}
```
(PARAMETER_LIST=
  (ASO_AUTHENTICATION_FILTER=ON)
  (CONNECTION_STATISTICS=NO)
  (EVENT_GROUP=INIT_AND_TERM, MEMORY_OPS, PROCESS_MGMT)
  (IDLE_TIMEOUT=30)
  (INBOUND_CONNECT_TIMEOUT=30)
  (LOG_DIRECTORY=/home/user/network/admin/log)
  (LOG_LEVEL=SUPPORT)
  (MAX_CMCTL_SESSIONS=6)
  (MAX_CONNECTIONS=512)
  (MAX_GATEWAY_PROCESSES=10)
  (MIN_GATEWAY_PROCESSES=4)
  (OUTBOUND_CONNECT_TIMEOUT=30)
  (SESSION_TIMEOUT=60)
  (TRACE_DIRECTORY=/home/user/network/admin/trace)
  (TRACE_FILELEN=100)
  (TRACE_FILENO=2)
  (TRACE_LEVEL=SUPPORT)
  (TRACE_TIMESTAMP=ON)
  (VALID_NODE_CHECKING_REGISTRATION=ON)
  (REGISTRATION_EXCLUDED_NODES = 10.1.26.*)
  (REGISTRATION_INVITED_NODES = 10.1.35.*)
)

8.2 Oracle Connection Manager Parameters

This section lists and describes the following cman.ora file parameters:

- **ADDRESS**
  The ADDRESS networking parameter specifies the protocol address of Oracle Connection Manager.

- **ASO_AUTHENTICATION_FILTER**
  It is a networking parameter for Oracle Connection Manager. It instructs Oracle Connection Manager to check the connection requests for Secure Network Services (SNS).

- **COMPRESSION**

- **COMPRESSION_LEVELS**
  The COMPRESSION_LEVELS networking parameter of the cman.ora file specifies the CPU usage and compression ratio.

- **COMPRESSION_THRESHOLD**

- **CONNECTION_STATISTICS**
  CONNECTION_STATISTICS networking parameter of the cman.ora file specifies whether the SHOW_CONNECTIONS command displays connection statistics.
• **EVENT_GROUP**
  The **EVENT_GROUP** networking parameter of the `cman.ora` file specifies which event groups are logged.

• **EXPIRE_TIME**
  The **EXPIRE_TIME** networking parameter of `cman.ora` file specifies a time interval, in minutes, to send a check to verify that client/gateway connections are active.

• **IDLE_TIMEOUT**
• **INBOUND_CONNECT_TIMEOUT**
• **LOG_DIRECTORY**
• **LOG_FILE_NUM**
  The **LOG_FILE_NUM** networking parameter of the `cman.ora` file specifies the number of log file segments.

• **LOG_FILE_SIZE**
  The **LOG_FILE_SIZE** networking parameter of the `cman.ora` file specifies the size of each log file segment.

• **LOG_LEVEL**
• **MAX_ALL_CONNECTIONS**
• **MAX_CMCTL_SESSIONS**
• **MAX_CONNECTIONS**
• **MAX_GATEWAY PROCESSES**
• **MAX_REG_CONNECTIONS**
• **MIN_GATEWAY PROCESSES**
• **OUTBOUND_CONNECT_TIMEOUT**
• **PASSWORD_instance_name**

• **REGISTRATION EXCLUDED NODES**
  The Oracle Connection Manager parameter file (`cman.ora`) **REGISTRATION EXCLUDED NODES** parameter specifies the list of nodes that cannot register with the listener.

• **REGISTRATION_INVITED NODES**
  The Oracle Connection Manager parameter file (`cman.ora`) **REGISTRATION_INVITED NODES** parameter specifies the list of node that can register with the listener.

• **RULE**
• **SDU**
• **SERVICE RATE**
  The **SERVICE_RATE** parameter of `cman.ora` file specifies incoming connection rate that is allowed per service for an instance.

• **SESSION_TIMEOUT**
• **TRACE_FILE**
• **TRACE_FILELEN**
• **TRACE_FILENO**
• **TRACE_LEVEL**
8.2.1 ADDRESS

The ADDRESS networking parameter specifies the protocol address of Oracle Connection Manager.

Purpose
To specify the protocol address of Oracle Connection Manager.

Syntax

\[
\text{(ADDRESS= (PROTOCOL= protocol) (HOST= host_name) (PORT= port_number))}
\]

Example

\[
\text{(ADDRESS= (PROTOCOL= tcp) (HOST= sales-server) (PORT= 1521))}
\]

8.2.2 ASO_AUTHENTICATION_FILTER

It is a networking parameter for Oracle Connection Manager. It instructs Oracle Connection Manager to check the connection requests for Secure Network Services (SNS).

Purpose
To specify whether Oracle Database security authentication settings must be used by the client.

Usage Notes
The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values

- **on** to instruct Oracle Connection Manager to reject connection requests that are not using Secure Network Services (SNS). SNS is part of Oracle Database security.
- **off** to instruct Oracle Connection Manager not to check for SNS between the client and server. This is the default.

8.2.3 COMPRESSION

Purpose
To enable or disable data compression. If both the Oracle Connection Manager and the other end (server or client or Oracle Connection Manager) have this parameter set to **ON**, then compression is used for the connection.
Default

off

Values

• on to enable data compression.
• off to disable data compression.

Example

COMPRESSION=on

8.2.4 COMPRESSION_LEVELS

The `COMPRESSION_LEVELS` networking parameter of the `cman.ora` file specifies the CPU usage and compression ratio.

Purpose

To specify the compression level.

Usage Notes

The compression levels are used at the time of negotiation to verify which levels are used at both ends, and select one level.

Default

low

Values

• low for low CPU usage and a low compression ratio.
• high for high CPU usage and a high compression ratio.

Example 8-2

COMPRESSION_LEVELS=high,low

8.2.5 COMPRESSION_THRESHOLD

Purpose

To specify the minimum data size, in bytes, for which compression is required.

Usage Notes

Compression is not be done if the size of the data to be sent is less than this value.

Default

1024 bytes
Example

COMPRESSION_THRESHOLD=1024

8.2.6 CONNECTION_STATISTICS

CONNECTION_STATISTICS networking parameter of the cman.ora file specifies whether the SHOW_CONNECTIONS command displays connection statistics.

Purpose
To specify whether the SHOW_CONNECTIONS command displays connection statistics.

Usage Notes
The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values
• yes to display statistics.
• no to not display statistics. This is the default.

8.2.7 EVENT_GROUP

EVENT_GROUP networking parameter of the cman.ora file specifies which event groups are logged.

Purpose
To specify which event groups are logged.

Usage Notes
Multiple events may be designated using a comma-delimited list.

Values
• alert for alert notifications.
• cmd_proc for command processing.
• conn_hdlg for connection handling.
• init_and_term for initialization and termination.
• memory_ops for memory operations.
• proc_mgmt for process management.
• reg_and_load for registration and load update.
• relay for events associated with connection control blocks.
• timer for gateway timeouts.
• wake_up for events related to Connection Manager Administration (CMADMIN) wake-up queue.
8.2.8 EXPIRE_TIME

The EXPIRE_TIME networking parameter of cman.ora file specifies a time interval, in minutes, to send a check to verify that client/gateway connections are active.

Purpose
To specify a time interval, in minutes, to send a check to verify that client/server connections are active.

Usage Notes
Setting a value greater than 0 ensures that connections are not left open indefinitely, due to an abnormal client termination. If the system supports TCP keepalive tuning, then Oracle Net Services automatically uses the enhanced detection model, and tunes the TCP keepalive parameters.

If the probe finds a terminated connection, or a connection that is no longer in use, then it returns an error, causing the server process to exit.

This parameter is primarily intended for the database server, which typically handles multiple connections at any one time.

Limitations on using this terminated connection detection feature are:

• It is not allowed on bequeathed connections.
• Though very small, a probe packet generates additional traffic that may downgrade network performance.
• Depending on which operating system is in use, the server may need to perform additional processing to distinguish the connection probing event from other events that occur. This can also result in degraded network performance.

Values

• 0 to disable dead connection detection. This is the default.
• Any number greater than 0 to enable dead connection detection. The number equals the time interval in minutes.

Example 8-3 Example

EXPIRE_TIME=10

8.2.9 IDLE_TIMEOUT

Purpose
To specify the amount of time that an established connection can remain active without transmitting data.
Usage Notes
The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values

- 0 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

8.2.10 INBOUND_CONNECT_TIMEOUT

Purpose
To specify how long in seconds the Oracle Connection Manager listener waits for a valid connection from a client or another instance of Oracle Connection Manager.

Values

- 60 sec is the default. Use value 0 to disable timeout.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

8.2.11 LOG_DIRECTORY

Purpose
To specify the directory for the Oracle Connection Manager log files.

Default
ORACLE_BASE_HOME/network/log

8.2.12 LOG_FILE_NUM

LOG_FILE_NUM networking parameter of the cman.ora file specifies the number of log file segments.

Purpose
To specify the number of log file segments. At any point of time there can be only \( n \) log file segments where \( n \) is LOG_FILE_NUM and if the log grows beyond this number, then the older segments are deleted.

Default
No default. Number of segments grow indefinitely, if not specified or set to zero.

Values
Any integer value.

Example 8-4 Example
LOG_FILE_NUM=3
8.2.13 LOG_FILE_SIZE

LOG_FILE_SIZE networking parameter of the `cman.ora` file specifies the size of each log file segment.

**Purpose**

To specify the size of each log file segment. The size is in MB.

**Default**

300 MB

**Values**

Any integer value.

**Example 8-5  Example**

LOG_FILE_SIZE=10

8.2.14 LOG_LEVEL

**Purpose**

To specify the level for log messages.

**Values**

- off for no logging. This is the default.
- user for user-induced errors log information.
- admin for administration log information, such as installation-specific.
- support for Oracle Support Services information.

8.2.15 MAX_ALL_CONNECTIONS

**Purpose**

To specify the maximum number of concurrent registration and client connection sessions that can be supported by Oracle Connection Manager.

**Usage Notes**

This number includes registration connections from databases, and ongoing client connection establishment requests. After a connection is established, the clients do not maintain a connection to the listener. This limit only applies to client connections that are in the initial connection establishment phase from a listener perspective.

**Default**

Operating system-specific
Example

MAX_ALL_CONNECTIONS=40

8.2.16 MAX_CMCTL_SESSIONS

Purpose
To specify the maximum number of concurrent local or remote sessions of the Oracle Connection Manager control utility allowable for a given instance.

Usage Notes
One of the sessions must be a local session.

Values
Any number of sessions can be designated.

8.2.17 MAX_CONNECTIONS

Purpose
To specify the maximum number of connection slots that a gateway process can handle.

Values
Any number in the range of 1 to 1024.

8.2.18 MAX_GATEWAY_PROCESSES

Purpose
To specify the maximum number of gateway processes that an instance of Oracle Connection Manager supports.

Values
The number designated must be greater than the minimum number of gateway processes. The maximum is 64.

8.2.19 MAX_REG_CONNECTIONS

Purpose
To specify the maximum number of concurrent registration connection sessions that can be supported by Oracle Connection Manager.

Default
512

Example
MAX_REG_CONNECTIONS=20
8.2.20 MIN_GATEWAY_PROCESSES

**Purpose**
To specify the minimum number of gateway processes that an instance of Oracle Connection Manager supports.

**Values**
Any number of sessions can be designated up to 64.

8.2.21 OUTBOUND_CONNECT_TIMEOUT

**Purpose**
To specify the length of time in seconds that the Oracle Connection Manager instance waits for a valid connection to be established with the database server or with another Oracle Connection Manager instance.

**Values**
- 60 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

8.2.22 PASSWORD_instance_name

**Purpose**
To specify the encrypted instance password, if one has been set.

8.2.23 REGISTRATION_EXCLUDED_NODES

The Oracle Connection Manager parameter file (cman.ora) REGISTRATION_EXCLUDED_NODES specifies the list of nodes that cannot register with the listener.

**Purpose**
To specify the list of nodes that cannot register with the listener.

**Usage Notes**
The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the REGISTRATION_INVITED_NODES parameter and the REGISTRATION_EXCLUDED_NODES parameter are set, then the REGISTRATION_EXCLUDED_NODES parameter is ignored.
Values
Valid nodes and subnet IP addresses or names.

Example

REGISTRATION_EXCLUDED_NODES = 10.1.26.*, 10.16.40.0/24, \
2001:DB8:3eff:fe38, node2

8.2.24 REGISTRATION_INVITED_NODES

The Oracle Connection Manager parameter file (cman.ora) REGISTRATION_EXCLUDED_NODES parameter specifies the list of node that can register with the listener.

Purpose
To specify the list of node that can register with the listener.

Usage Notes
The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the REGISTRATION_INVITED_NODES parameter and the REGISTRATION_EXCLUDED_NODES parameter are set, then the REGISTRATION_EXCLUDED_NODES parameter is ignored.

Values
Valid nodes and subnet IP addresses or names.

Example

REGISTRATION_INVITED_NODES = 10.1.35.*, 10.1.34.0/24, \
2001:DB8:fe38:7303, node1

8.2.25 RULE

Purpose
To specify an access control rule list to filter incoming connections.

Usage Notes
A rule list specifies which connections are accepted, rejected, or dropped.
If no rules are specified, then all connections are rejected.
The source and destination can be a host name, IP address, or subnet mask.
There must be at least one rule for client connections and one rule for CMCTL connections. Omitting one or the other results in the rejection of all connections for the rule type omitted. The last rule in the example that follows is a CMCTL rule.
Oracle Connection Manager does not support wildcards for partial IP addresses. If you use a wildcard, then use it in place of a full IP address. The IP address of the client may, for example, be (SRC=\*).

Oracle Connection Manager supports only the /nn notation for subnet addresses. In the first rule in Example “Sample cman.ora File”, /27 represents a subnet mask that comprises 27 left-most bits.

Values

This parameter is listed in the rule list section of the cman.ora file preceded by RULE_LIST=.

Syntax

(RULE_LIST=
  (RULE=
    (SRC=host)
    (DST=host)
    (SRV=service_name)
    (ACT={accept|reject|drop})
    (ACTION_LIST=AUT={on|off}
      ((CONN_STATS={yes|no}) (MCT=time) (MIT=time) (MOCT=time)))
  (RULE= ...))

Additional Parameters

The RULE parameter filters a connection or group of connections using the following parameters:

SRC: The source host name or IP address of the client.

DST: The destination server host name or IP address of the database server.

SRV: The database service name of Oracle Database obtained from the SERVICE_NAME parameter in the initialization parameter file.

ACT: The action for the connection request. Use accept to accept incoming requests, reject to reject incoming requests, or drop to reject incoming requests without sending an error message.

ACTION_LIST: The rule-level parameter settings for some parameters. These parameters are as follows:

- AUT: Oracle Database security authentication on client side.
- CONN_STATS: Log input and output statistics.
- MCT: Maximum connect time.
- MIT: Maximum idle timeout.
- MOCT: Maximum outbound connect time.

Rule-level parameters override their global counterparts.

Example

(RULE_LIST=
  (RULE=
    (SRC=client1-pc)
    (DST=sales-server)
8.2.26 SDU

**Purpose**

To specify the session data unit (SDU) size, in bytes, to connections

**Usage Notes**

Oracle Connection Manager can negotiate large SDU with client and server when configured. When the configured values of client, database server, and Oracle Connection Manager do not match for a session, the least value of all the three values is used.

**Default**

8192 bytes (8 KB)

**Values**

512 to 2097152 bytes

**Example**

SDU=32768

8.2.27 SERVICE_RATE

The SERVICE_RATE parameter of cman.ora file specifies incoming connection rate that is allowed per service for an instance.

**Purpose**

To specify incoming connection rate that is allowed per service for an instance.

**Usage Notes**

Any user-specified value greater than 0 sets the maximum limit on the number of new connections per service-instance handled by the proxy listener every second. Listener rejects connections after it reaches the maximum limit. Client side connection failure is reported with “TNS:listener: rate limit reached”.

**Values**

- 0 to disable service rate limit. This is the default.
- Any number greater than 0 to enable service rate limit.
Example 8-6  Example

SERVICE_RATE=10

8.2.28 SESSION_TIMEOUT

Purpose
To specify the maximum time in seconds allowed for a user session.

Usage Notes
The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values
- 0 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

8.2.29 TRACE_FILE

Purpose
To specify the directory for Oracle Connection Manager trace files.

8.2.30 TRACE_FILELEN

Purpose
To specify the size of the trace file in KB.

Usage Notes
When the size is reached, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO parameter.

8.2.31 TRACE_FILENO

Purpose
To specify the number of trace files.

Usage Notes
When this parameter is set along with the TRACE_FILELEN parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is reused, and so on.

8.2.32 TRACE_LEVEL

Purpose
To specify the level for trace messages.
8.2.33 TRACE_TIMESTAMP

**Purpose**
To specify the use of a timestamp for the tracing logs.

**Usage Notes**
If the TRACING parameter is enabled, then a time stamp in the form of dd-mmm-yyyy hh:mm:ss:mil for every trace event in the trace file.

**Values**
- off for no timestamp to be included in the file.
- on for timestamp to be included in the file.

8.2.34 USE_SID_AS_SERVICE

The USE_SID_AS_SERVICE Oracle Connection Manager parameter enables the system identifier (SID) in the connect descriptor to be interpreted as a service name when a user attempts a database connection.

**Purpose**
To enable the system identifier (SID) in the connect descriptor to be interpreted as a service name when a user attempts a database connection.

**Usage Notes**
Database clients with earlier releases of Oracle Database that have hard-coded connect descriptors can use this parameter to connect to a container or pluggable database.

For an Oracle container database, the client must specify a service name in order to connect to it. Setting this parameter to on instructs the Oracle Connection Manager listener to use the SID in the connect descriptor as a service name and connect the client to the specified database.

**Values**
- off. This is the default.
- on.

**Example 8-7   Example**
USE_SID_AS_SERVICE=on.
8.2.35 VALID_NODE_CHECKING_REGISTRATION

Purpose
To determine whether valid node checking registration is performed, and if the subnet is allowed.

Usage Notes
When set to on, valid node checking registration is performed at the listener for any incoming registration request, and only local IP addresses are allowed.

Default
on

Values
• off | 0 to specify valid node checking registration is off, and no checking is performed.
• on | 1 | local to specify valid node checking registration is on, and all local IP addresses can register. If a list of invited nodes is set, then all IP addresses, host names, or subnets in the list as well as local IP addresses are allowed.
• subnet | 2 to specify valid node checking registration is on, and all machines in the local subnets are allowed to register. If a list of invited nodes is set, then all nodes in the local subnets as well as all IP addresses, host names and subnets in the list are allowed.

Example
VALID_NODE_CHECKING_REGISTRATION = on

8.2.36 WALLET_LOCATION

Purpose
To specify the location of wallets. Wallets are certificates, keys, and trustpoints processed by SSL.

Usage Notes
The key/value pair for Microsoft certificate store (MCS) omits the METHOD_DATA parameter because MCS does not use wallets. Instead, Oracle PKI (public key infrastructure) applications obtain certificates, trustpoints and private keys directly from the user's profile.

If an Oracle wallet is stored in the Microsoft Windows registry and the wallet's key (KEY) is SALESAPP, then the storage location of the encrypted wallet is \HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\EWALLET.P12. The storage location of the decrypted wallet is \HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\CWALLET.SSO.
Syntax

The syntax depends on the wallet, as follows:

- **Oracle wallets on the file system:**
  
  ```
  WALLET_LOCATION=
  (SOURCE=)
  (METHOD=file)
  (METHOD_DATA=)
  (DIRECTORY=directory)
  [(PKCS11=TRUE/FALSE)]
  ```

- **Microsoft certificate store:**
  
  ```
  WALLET_LOCATION=
  (SOURCE=)
  (METHOD=mcs)
  ```

- **Oracle wallets in the Microsoft Windows registry:**
  
  ```
  WALLET_LOCATION=
  (SOURCE=)
  (METHOD=reg)
  (METHOD_DATA=)
  (KEY=registry_key)
  ```

- **Entrust wallets:**
  
  ```
  WALLET_LOCATION=
  (SOURCE=)
  (METHOD=entr)
  (METHOD_DATA=)
  (PROFILE=file.epf)
  (INIFILE=file.ini)
  ```

**Additional Parameters**

`WALLET_LOCATION` supports the following parameters:

- **SOURCE:** The type of storage for wallets, and storage location.
- **METHOD:** The type of storage.
- **METHOD_DATA:** The storage location.
- **DIRECTORY:** The location of Oracle wallets on file system.
- **KEY:** The wallet type and location in the Microsoft Windows registry.
- **PROFILE:** The Entrust profile file (.epf).
- **INIFILE:** The Entrust initialization file (.ini).

**Default**

None
Values
true | false

Examples
Oracle wallets on file system:

```
WALLET_LOCATION=
  (SOURCE=
    (METHOD=file)
    (METHOD_DATA=
      (DIRECTORY=/etc/oracle/wallets/databases)))
```

Microsoft certificate store:

```
WALLET_LOCATION=
  (SOURCE=  
    (METHOD=mcs))
```

Oracle Wallets in the Microsoft Windows registry:

```
WALLET_LOCATION=
  (SOURCE=  
    (METHOD=REG)
    (METHOD_DATA= 
      (KEY=SALESAPP)))
```

Entrust Wallets:

```
WALLET_LOCATION=
  (SOURCE=  
    (METHOD=entr)
    (METHOD_DATA= 
      (PROFILE=/etc/oracle/wallets/test.epf)
      (INIFILE=/etc/oracle/wallets/test.ini)))
```

8.3 Oracle Connection Manager in Traffic Director Mode Parameters

This section lists and describes the following `cman.ora` file parameters:

- **SERVICE_AFFINITY**
  Use the `cman.ora` parameter SERVICE_AFFINITY to modify the default load distribution mechanism for Oracle Connection Manager in Traffic Director Mode.

- **TDM**
- **TDM_BIND_THREAD**
- **TDM_DATATYPE_CHECK**
- **TDM_PRCP_MAX_CALL_WAIT_TIME**
- **TDM_PRCP_MAX_TXN_CALL_WAIT_TIME**
- **TDM_SHARED_THREADS_MAX**
- **TDM_SHARED_THREADS_MIN**
8.3.1 SERVICE_AFFINITY

Use the `cman.ora` parameter `SERVICE_AFFINITY` to modify the default load distribution mechanism for Oracle Connection Manager in Traffic Director Mode.

**Purpose**

To configure load distribution mechanism for Oracle Connection Manager in Traffic Director Mode. By default, Oracle Connection Manager in Traffic Director Mode uses service affinity to select a gateway for routing incoming connection requests. All new connection requests are routed to the gateways associated with database services.

**Usage Notes**

If you set this parameter to `ON`, then all new connection requests are routed to the gateways associated with database services.

If you set this parameter to `OFF`, then all new connection requests are routed to the least-loaded gateways.

**Values**

- ON
- OFF

**Default**

ON

**Example**

`SERVICE_AFFINITY = {ON | OFF}`

**Related Topics**

- *Oracle Database Net Services Administrator’s Guide*
- *Oracle Multitenant Administrator’s Guide*

8.3.2 TDM

**Purpose**

To configure Oracle Connection Manager to act as Oracle Connection Manager in Traffic Director Mode.

**Default**

FALSE

**Values**

- TRUE
- FALSE
**Example**

tdm = TRUE

### 8.3.3 TDM_BINDTHREAD

**Purpose**

To make the application connection hold on to the TDM thread and has different implications with and without PRCP. This parameter only applies when `TDM_THREADING_MODE` is set to `SHARED`.

**Usage Notes**

Without PRCP, setting this parameter to `yes` makes the application connection hold on the TDM worker thread as long as there is a transaction in progress.

With PRCP, setting this parameter to `yes` makes the application connection hold on to the TDM thread from the time `OCISessionGet` is done by the application till it does an `OCISessionRelease`.

**Default**

no

**Values**

- yes
- no

**Example**

TDM_BIND_THREAD = yes

### 8.3.4 TDM_DATATYPE_CHECK

**Purpose**

To validate all the inbound data to the database, of the data type `NUMBER`, `DATE`, `TIMESTAMP`, `TIMESTAMP WITH LOCAL TIMEZONE`, `TIMESTAMP WITH TIMEZONE`, `BLOB`, `CLOB`, `BFILE`, `UROWID` and `REF`. The following error is received by the application if there is any problem with the data sent to the Oracle Connection Manager in Traffic Director Mode.

ORA-03137: malformed TTC packet from client rejected: [3101]

**Usage Notes**

Turning ON/OFF this parameter enables or disables the data validation.

**Default**

OFF
Values

- **ON**
- **OFF**

**Example**

tdm_datatype_check={ON | OFF}

### 8.3.5 TDM_PRCP_MAX_CALL_WAIT_TIME

**Purpose**

To record the maximum time of inactivity, in seconds, for a client after obtaining a session from the PRCP pool. This parameter is applicable when the Oracle Connection Manager in Traffic Director Mode is configured to have Proxy Resident Connection Pool.

**Usage Notes**

After obtaining a session from the PRCP pool, if the client application does not issue a database call for the time specified by `TDM_PRCP_MAX_CALL_WAIT_TIME` parameter, then the PRCP session is freed and the client connection is terminated. As a result, if the client application attempts a round trip call on such a connection, then it receives an ORA-3113 or ORA-3115 error.

**Default**

30 seconds

**Values**

Any non-negative value. However, Oracle recommends not to use a value of 0 as that implies that a connection can acquire a PRCP session for an indefinite amount of time.

### 8.3.6 TDM_PRCP_MAX_TXN_CALL_WAIT_TIME

**Purpose**

To record the maximum time of inactivity, in seconds, for a client after it obtains a session from the Proxy Resident Connection Pool and starts a transaction. This parameter is applicable when the Oracle Connection Manager in Traffic Director Mode is configured to have PRCP.

**Usage Notes**

If the client application does not issue a database call for the time specified by `TDM_PRCP_MAX_TXN_CALL_WAIT_TIME` parameter while in a transaction, the PRCP session is freed, the transaction is rolled back, and the client connection is terminated. As a result, if the client application attempts a round trip call on such a connection, then it receives an ORA-3113 or ORA-3115 error.

**Default**

0
Values
Any nonnegative value. However, it is recommended not to use a value of 0 as it implies that a connection can acquire a PRCP session for an indefinite amount of time.

8.3.7 TDM_SHARED_THREADS_MAX

Purpose
To configure the maximum number of threads that an Oracle Connection Manager process in Traffic Director Mode should have, when `tdm_threading_mode` is set to SHARED.

Values
Any number can be designated for the maximum number of threads. For DEDICATED mode, the maximum number of threads is same as the maximum number of connections. In SHARED mode, though there is no fixed upper bound, it should ideally be proportional to the load.

8.3.8 TDM_SHARED_THREADS_MIN

Purpose
To configure the minimum number of threads that an Oracle Connection Manager process in Traffic Director Mode should have, when `tdm_threading_mode` is set to SHARED.

Values
Any number can be designated for the minimum number of threads. For SHARED mode, there is no limit enforced. However, the number of threads should be proportional to the load.

8.3.9 TDM_THREADING_MODE

Purpose
To configure the usage of threads by the Oracle Connection Manager in Traffic Director Mode.

Usage Notes
If this parameter is set to DEDICATED, then a worker thread is spawned for each inbound connection and the maximum number of threads is determined by the `max_connections` parameter.

If this parameter is set to SHARED, then a shared pool of worker threads handle all inbound connections. The minimum number of worker threads is specified by the `tdm_shared_threads_min` setting and the maximum number of worker threads is specified by the `tdm_shared_threads_max` setting. The thread pool is internally managed within these bounds.
8.4 ADR Diagnostic Parameters for Oracle Connection Manager

The diagnostic data for critical errors is quickly captured and stored in the ADR for Oracle Connection Manager.

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, are immediately captured and tagged with the incident number. The data is then stored in the Automatic Diagnostic Repository (ADR), a file-based repository outside the database.

This section describes the parameters used when ADR is enabled. ADR is enabled by default. Non-ADR parameters listed in the cman.ora file are ignored when ADR is enabled.

- **ADR_BASE**
  It is a diagnostic parameter in the cman.ora file and it specifies the base directory to store tracing and logging incidents when ADR is enabled.

- **DIAG_ADR_ENABLED**
  DIAG_ADR_ENABLED diagnostic parameter of the cman.ora file indicates whether ADR tracing is enabled.

- **LOG_LEVEL**
- **TRACE_LEVEL**
- **TRACE_TIMESTAMP**

8.4.1 ADR_BASE

It is a diagnostic parameter in the cman.ora file and it specifies the base directory to store tracing and logging incidents when ADR is enabled.

**Purpose**

To specify the base directory to store tracing and logging incidents when ADR is enabled.
The default is ORACLE_BASE, or ORACLE_HOME/log if ORACLE_BASE is not defined.

Values
Any valid directory path to a directory with write permission.

Example 8-8 Example
ADR_BASE=/oracle/network/trace

8.4.2 DIAG_ADR_ENABLED

DIAG_ADR_ENABLED diagnostic parameter of the cman.ora file indicates whether ADR tracing is enabled.

Purpose
To indicate whether ADR tracing is enabled.

Usage Notes
When the DIAG_ADR_ENABLED parameter is set to OFF, then non-ADR file tracing is used.

Values
on | off

Example 8-9 Example
DIAG_ADR_ENABLED=on

8.4.3 LOG_LEVEL

Purpose
To specify the level of logging performed by Oracle Connection Manager.

Usage Notes
This parameter is also applicable when non-ADR logging is used.

The following log files are used with Oracle Connection Manager:

- instance-name_pid.log for the listener.
- instance-name_cmadmin_pid.log for CMADMIN.
- instance-name_cmgw_pid.log for the gateway processes.

The log files are located in the ORACLE_HOME/network/log directory.

Default
off or 0
Values

- off or 0 for no log output.
- user or 4 for user log information.
- admin or 10 for administration log information.
- support or 16 for Oracle Support Services log information.

Example

LOG_LEVEL=admin

8.4.4 TRACE_LEVEL

Purpose
To specify the trace level for the Oracle Connection Manager instance.

Usage Notes
This parameter is also applicable when non-ADR tracing is used.

The following trace files are used with Oracle Connection Manager:

- instance-name_pid.trc for the listener.
- instance-name_cmadmin_pid.trc for CMADMIN.
- instance-name_cmgw_pid.trc for the gateway processes.

The log files are located in the ORACLE_HOME/network/log directory.

Default

off

Values

- off for no trace output.
- user for user trace information.
- admin for administration trace information.
- support for Oracle Support Services trace information.

Example

TRACE_LEVEL=admin

8.4.5 TRACE_TIMESTAMP

Purpose
To add a time stamp in the form of dd–mmm–yyyy hh:mm:ss:mill to every trace event in the trace file for the listener.
Usage Notes
This parameter is used with the TRACE_LEVEL parameter. This parameter is also applicable when non-ADR tracing is used.

Default
on

Values
- on or true
- off or false

Example
TRACE_TIMESTAMP=true

8.5 Non-ADR Diagnostic Parameters for Oracle Connection Manager

This section lists the parameters used when ADR is disabled:

- LOG_DIRECTORY
- TRACE_DIRECTORY
- TRACE_FILELEN
- TRACE_FILENO

8.5.1 LOG_DIRECTORY

Purpose
To specify the location of Oracle Connection Manager log files.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_BASE_HOME/network/log

Values
Any valid directory path to a directory with write permission.

Example
LOG_DIRECTORY=/oracle/network/log
8.5.2 TRACE_DIRECTORY

**Purpose**
To specify the location of the Oracle Connection Manager trace files.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
```
ORACLE_BASE_HOME/network/trace
```

**Values**
Any valid directory path to a directory with write permission.

**Example**
```
TRACE_DIRECTORY=/oracle/network/admin/trace
```

8.5.3 TRACE_FILELEN

**Purpose**
To specify the size, in KB, of the trace file.

**Usage Notes**
When the size is met, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO parameter. Any size can be designated. Use this parameter when ADR is not enabled.

**Default**
Unlimited

**Example**
```
TRACE_FILELEN=100
```

8.5.4 TRACE_FILENO

**Purpose**
To specify the number of trace files for Oracle Connection Manager tracing.

**Usage Notes**
When this parameter is set along with the TRACE_FILELEN parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is reused, and so on. Any number of files can be designated.
The trace file names are distinguished from one another by their sequence number. For example, if this parameter is set to 3, then the gateway trace files would be named instance-name_cmgw1_pid.trc, instance_name_cmgw2_pid.trc and instance_name_cmgw3_pid.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

**Default**

1

**Example**

TRACE_FILENO=3
This chapter provides a complete listing of the *ldap.ora* file configuration parameters.

- **Overview of Directory Server Usage File**
  The *ldap.ora* file contains directory usage configuration parameters created by Oracle Internet Directory Configuration Assistant, or Oracle Net Configuration Assistant. Do not modify these parameters or their settings.

- **Directory Usage Parameters**
  This section lists and describes the following *ldap.ora* file configuration parameters.

### 9.1 Overview of Directory Server Usage File

The *ldap.ora* file contains directory usage configuration parameters created by Oracle Internet Directory Configuration Assistant, or Oracle Net Configuration Assistant. Do not modify these parameters or their settings.

When created with Oracle Internet Directory Configuration Assistant, *ldap.ora* is located in the `ORACLE_HOME/ldap/admin` directory. When created with Oracle Net Configuration Assistant, the *ldap.ora* file is located in the `ORACLE_HOME/network/admin` directory. The *ldap.ora* file can also be stored in the directory specified by the `LDAP_ADMIN` or `TNS_ADMIN` environment variable.

**Related Topics**
- Oracle Internet Directory
- Oracle Net Configuration Assistant

### 9.2 Directory Usage Parameters

This section lists and describes the following *ldap.ora* file configuration parameters.

- **DEFAULT_ADMIN_CONTEXT**
  `DEFAULT_ADMIN_CONTEXT` *ldap.ora* file configuration parameter specifies the default directory for the creation, modification, or search of the connect identifiers.

- **DIRECTORY_SERVER_TYPE**
  `DIRECTORY_SERVER_TYPE` is a networking parameter of the *ldap.ora* file and it specifies the type of directory server that is being used.

- **DIRECTORYSERVERS**
  `DIRECTORYSERVER` is a directory usage parameter and it lists the host names and port number of the primary and alternate LDAP directory servers.
9.2.1 DEFAULT_ADMIN_CONTEXT

DEFAULT_ADMIN_CONTEXT ldap.ora file configuration parameter specifies the default directory for the creation, modification, or search of the connect identifiers.

**Purpose**

To specify the default directory entry that contains an Oracle Context from which connect identifiers can be created, modified, or looked up.

**Values**

Valid distinguished name (DN)

**Example 9-1**  

```
DEFAULT_ADMIN_CONTEXT="o=OracleSoftware,c=US"
```

9.2.2 DIRECTORY_SERVER_TYPE

DIRECTORY_SERVER_TYPE is a networking parameter of the ldap.ora file and it specifies the type of directory server that is being used.

**Purpose**

To specify the type of directory server that is being used.

**Values**

- oid for Oracle Internet Directory
- ad for Microsoft Active Directory

**Example 9-2**  

```
DIRECTORY_SERVER_TYPE=oid
```

9.2.3 DIRECTORY_SERVERS

DIRECTORY_SERVERS is a directory usage parameter and it lists the host names and port number of the primary and alternate LDAP directory servers.

**Purpose**

To list the host names and port number of the primary and alternate LDAP directory servers.

**Values**

`host:port[:sslport]`

**Example 9-3**  

```
DIRECTORY_SERVERS=(ldap-server:389, raffles:400:636)
```
Appendices

Review information about features no longer supported in this release, upgrade concerns, and information about the Oracle Net Services LDAP schema.

- **Features Not Supported in this Release**
  This appendix describes features no longer supported by Oracle Net Services.

- **Upgrade Considerations for Oracle Net Services**
  This appendix describes the coexistence and upgrade issues for Oracle Net Services.

- **LDAP Schema for Oracle Net Services**
  This appendix describes the Oracle schema object classes and attributes defined in the directory server for Oracle Net Services objects. It does not describe object classes and attributes reserved for future functionality or used by other Oracle products.
Features Not Supported in this Release

This appendix describes features no longer supported by Oracle Net Services.

- **Overview of Unsupported Features**
  This section describes the features and the configuration file that are no longer being supported in Oracle Database.

- **Unsupported Parameters**
  This section describes the unsupported or obsolete parameters.

- **Unsupported Control Utility Commands**
  This section describes the control utility commands not supported by this release.

- **Unsupported or Deprecated Protocols**
  This section describes the protocols not supported or deprecated since Oracle Database 12c.

### A.1 Overview of Unsupported Features

This section describes the features and the configuration file that are no longer being supported in Oracle Database.

- **Oracle Net Connection Pooling**
  In Oracle Database 12c Release 2 (12.2), Oracle Net connection pooling is no longer supported.

- **Oracle Names**
  Oracle Names is not supported in this release.

- **Oracle Net Listener Password**
  In Oracle Database 12c Release 2 (12.2), the Oracle Net Listener password feature is no longer supported.

### A.1.1 Oracle Net Connection Pooling

In Oracle Database 12c Release 2 (12.2), Oracle Net connection pooling is no longer supported.

#### Deprecation of Oracle Net Connection Pooling

It was deprecated in Oracle Database 11g release. Refer to My Oracle Support note 1469466.1.
A.1.2 Oracle Names

Oracle Names is not supported in this release.

Naming Method

Oracle Names has not been supported as a naming method since Oracle Database 11g. You must migrate to directory naming.

A.1.3 Oracle Net Listener Password

In Oracle Database 12c Release 2 (12.2), the Oracle Net Listener password feature is no longer supported.

Oracle Net Listener Password Support

In Oracle Database 12c Release 2 (12.2), the Oracle Net Listener password feature is no longer supported. This does not cause a loss of security because authentication is enforced through local operating system authentication.

A.2 Unsupported Parameters

This section describes the unsupported or obsolete parameters.

Table A-1  Unsupported Networking Parameters

<table>
<thead>
<tr>
<th>File</th>
<th>Parameter</th>
<th>Description</th>
<th>Last Supported Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlnet.ora</td>
<td>SQLNET.KERBEROS5_CONF_MIT</td>
<td>This parameter was used to specify that MIT Kerberos configuration format was used. Starting with Oracle Database 12c Release 2 (12.2), only the current MIT Kerberos configuration is supported.</td>
<td>11.2</td>
</tr>
<tr>
<td>sqlnet.ora</td>
<td>SQLNET.ALLOWED_LOGON_VERSION</td>
<td>This parameter has been divided into SQLNET.ALLOWED_LOGON_VERSION_CLIENT and SQLNET.ALLOWED_LOGON_VERSION_SERVER.</td>
<td>11.2</td>
</tr>
</tbody>
</table>

A.3 Unsupported Control Utility Commands

This section describes the control utility commands not supported by this release.
A.4 Unsupported or Deprecated Protocols

This section describes the protocols not supported or deprecated since Oracle Database 12c.

Table A-3   Unsupported Protocols

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
<th>Last Supported Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>NT LAN Manager (NTLM) protocol for domain authentication</td>
<td>NTLM domain authentication has been deprecated from the Oracle Windows adapter. Only Kerberos authentication is used for the NTS adapter. NTLM is still used for local user authentication, as well as in the case in which the database service runs as a local user.</td>
<td>11.2</td>
</tr>
</tbody>
</table>
B

Upgrade Considerations for Oracle Net Services

This appendix describes the coexistence and upgrade issues for Oracle Net Services.

- **Anonymous Access to Oracle Internet Directory**
  Typical users of directory naming (LDAP) require anonymous access to the Oracle Internet Directory for name lookup.

**B.1 Anonymous Access to Oracle Internet Directory**

Typical users of directory naming (LDAP) require anonymous access to the Oracle Internet Directory for name lookup.

**Oracle Internet Directory Setting**

If you upgrade your Oracle Internet Directory software release 11g or later, then the default setting for Oracle Internet Directory changes to disallow anonymous access to the directory. The directory administrator must configure the directory to enable anonymous binds after upgrading the directory to release 11g. In addition, the way anonymous binds are configured in Oracle Internet Directory changed between Oracle Database 10g and Oracle Database 11g.
This appendix describes the Oracle schema object classes and attributes defined in the directory server for Oracle Net Services objects. It does not describe object classes and attributes reserved for future functionality or used by other Oracle products.

- **Structural Object Classes**
  The Oracle schema supports the structural object classes for Oracle Net directory naming lookups.

- **Attributes**
  It lists the attributes used for the object classes. This list is subject to change.

### C.1 Structural Object Classes

The Oracle schema supports the structural object classes for Oracle Net directory naming lookups.

#### Table C-1  Oracle Net Structural Object Classes

</tbody>
</table>

C.2 Attributes

It lists the attributes used for the object classes. This list is subject to change.

Table C-2  LDAP Schema Attributes for Oracle Net Services

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orclCommonContextMap</td>
<td>Allows the mapping of more than one default Oracle Context in the directory server.</td>
</tr>
<tr>
<td>orclNetAddrList</td>
<td>Identifies one or more listener protocol addresses.</td>
</tr>
<tr>
<td>orclNetAddressString</td>
<td>Defines a listener protocol address.</td>
</tr>
<tr>
<td>orclNetConnParamList</td>
<td>Placeholder for connect data parameters.</td>
</tr>
<tr>
<td>orclNetDescList</td>
<td>Identifies one or more connect descriptors.</td>
</tr>
<tr>
<td>orclNetDescName</td>
<td>Identifies a connect descriptor or a list of connect descriptors.</td>
</tr>
<tr>
<td>orclNetFailover</td>
<td>Turns connect-time failover on for a protocol address list.</td>
</tr>
<tr>
<td>orclNetFailoverModeString</td>
<td>Instructs Oracle Net to fail over to a different listener if the first listener fails during runtime. Depending on the configuration, session or any SELECT statements that were in progress are automatically failed over.</td>
</tr>
<tr>
<td>orclNetHostname</td>
<td>Specifies the host name.</td>
</tr>
<tr>
<td>orclNetInstanceName</td>
<td>Specifies the instance name to access.</td>
</tr>
<tr>
<td>orclNetInstanceRole</td>
<td>Specifies a connection to the primary or secondary instance of an Oracle Real Application Clusters (Oracle RAC) configuration.</td>
</tr>
<tr>
<td>orclNetLoadBalance</td>
<td>Turns client load balancing on for a protocol address list.</td>
</tr>
<tr>
<td>orclNetProtocol</td>
<td>Identifies the protocol used in the orclAddressString attribute.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>orclNetReceiveBufSize</code></td>
<td>Specifies the buffer space limit for receive operations of sessions.</td>
</tr>
<tr>
<td><code>orclNetSdu</code></td>
<td>Specifies the session data unit (SDU) size.</td>
</tr>
<tr>
<td><code>orclNetSendBufSize</code></td>
<td>Specifies the buffer space limit for send operations of sessions.</td>
</tr>
<tr>
<td><code>orclNetServiceName</code></td>
<td>Specifies the database service name in the <code>CONNECT_DATA</code> portion.</td>
</tr>
<tr>
<td><code>orclNetSourceRoute</code></td>
<td>Instructs Oracle Net to use each address in order until the destination is reached.</td>
</tr>
<tr>
<td><code>orclSid</code></td>
<td>Specifies the Oracle system identifier (SID) in the <code>CONNECT_DATA</code> portion of a connection descriptor.</td>
</tr>
<tr>
<td><code>orclVersion</code></td>
<td>Specifies the version of software used to create the entry.</td>
</tr>
</tbody>
</table>
Glossary

access control list (ACL)
The group of access directives that you define. The directives grant levels of access to specific data for specific clients or groups of clients.

ACL
See access control list (ACL).

access control
A feature of Oracle Connection Manager that sets rules for denying or allowing certain clients to access designated servers.

address
See protocol address.

ADR
See Automatic Diagnostic Repository (ADR).

alias
An alternative name for a network object in a server. An alias stores the name of the object it is referencing. When a client requests a lookup of an alias, Oracle completes the lookup as if it is the referenced object.

application gateway
A host computer that runs the Oracle Net Firewall Proxy. An application gateway looks and acts like a real server from the client's point of view, and a real client from the server's point of view. An application gateway sits between the Internet and company's internal network and provides middleman services (or proxy services) to users on either side.
ASCII character set
American Standard Code for Information Interchange character set, a convention for representing alphanumeric information using digital data. The collation sequence used by most computers with the exception of IBM and IBM-compatible computers.

attribute
A piece of information that describes an aspect of a directory entry. An entry comprises a set of attributes, each of which belongs to an object class. Moreover, each attribute has both a type, which describes the kind of information in the attribute, and a value which contains the actual data.

authentication method
A security method that enables you to have high confidence in the identity of users, clients, and servers in distributed environments. Network authentication methods can also provide the benefit of single sign-on for users. The following authentication methods are supported:

- RADIUS (Remote Authentication Dial-In User Service)
- Kerberos
- SSL
- Microsoft Windows NT native authentication

Automatic Diagnostic Repository (ADR)
Automatic Diagnostic Repository is a systemwide central repository for tracing and logging files. The repository is a file-based hierarchical data store for depositing diagnostic information.

cache
Memory that stores recently-accessed data so that subsequent requests to access the same data can be processed quickly.

CIDR
Classless Inter-Domain Routing. In CIDR notation, an IPv6 subnet is denoted by the subnet prefix and the size in bits of the prefix (in decimal), separated by the slash (/) character. For example, 2001:0db8:0000:0000::/64 denotes a subnet with addresses 2001:0db8:0000:0000:0000:0000:0000:0000 through 2001:0db8:0000:0000:FFFF:FFFF:FFFF:FFFF. The CIDR notation includes support for IPv4 addresses. For example, 192.0.2.1/24 denotes the subnet with addresses 192.0.2.1 through 192.0.2.255.
Classless Inter-Domain Routing (CIDR)
See CIDR.

client
A user, software application, or computer that requests the services, data, or processing from another application or computer. The client is the user process. In a network environment, the client is the local user process and the server may be local or remote.

client load balancing
Load balancing, whereby if more than one listener services a single database, a client can randomly choose between the listeners for its connect requests. This randomization enables all listeners to share the burden of servicing incoming connect requests.

client profile
The properties of a client, which may include the preferred order of naming methods, client and server logging and tracing, the domain from which to request names, and other client options.

client/server architecture
Software architecture based on a separation of processing between two CPUs. One CPU acts as the client in the transaction, requesting and receiving services. The other acts as the server that provides service for the requests.

cman.ora file
An Oracle Connection Manager configuration file that specifies protocol addresses for incoming requests and administrative commands, as well as Oracle Connection Manager parameters and access control rules.

CMADMIN (Connection Manager Administration)
An Oracle Connection Manager process that monitors the health of the listener and Oracle Connection Manager gateway processes, shutting down and starting processes as needed. CMADMIN registers information about gateway processes with the listener and processes commands run with the Oracle Connection Manager Control utility.

CMGW (Connection Manager gateway)
An Oracle Connection Manager process that receives client connections screened and forwarded by the listener located at the Oracle Connection Manager instance. The gateway process forwards the requests to the database server. In addition, it can multiplex or process multiple client connections through a single protocol connection.
connect data
A portion of the connect descriptor that defines the destination database service name or Oracle system identifier (SID). In the following example, SERVICE_NAME defines a database service called sales.us.example.com:

(DESCRIPTION=
  (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com)))

connect descriptor
A specially-formatted description of the destination for a network connection. A connect descriptor contains destination service and network route information.

The destination service is indicated by using its service name. The network route provides, at a minimum, the location of the listener through use of a network address.

connect identifier
A connect descriptor or a name that maps to a connect descriptor. A connect identifier can be a network service name, database service name, or network service alias.

Users initiate a connect request by passing a user name and password along with a connect identifier in a connect string for the service to which they want to connect:

CONNECT username@connect_identifier

connect string
Information the user passes to a service to connect, such as user name, and connect identifier:

CONNECT username@net_service_name

connect-time failover
A client connect request is forwarded to a another listener if a listener is not responding. Connect-time failover is enabled by service registration, because the listener knows if an instance is running to attempt a connection.

connection
An interaction between two processes on a network. Connections are originated by an initiator (client) that requests a connection with a destination (server).

connection load balancing
The method for balancing the number of active connections for the same service across the instances and dispatchers. Connection load balancing enables listeners to
make routing decisions based on how many connections for each dispatcher and the load on the nodes.

connection pooling
A resource utilization and user scalability feature used to maximize the number of sessions over a limited number of protocol connections to a shared server.

connection request
A notification sent by an initiator and received by a listener that indicates that the initiator wants to start a connection.

data packet
See packet.

database link
A pointer that defines a one-way communication path from an Oracle database server to another database server. Public and private database links are a defined entries in a data dictionary table. Global database links are stored in an LDAP directory and can be accessed by all users on the network. To access public and private links, the user must be connected to the local database that contains the data dictionary entry.

A client connected to local database A can use a public or private link stored in database A to access information in remote database B. However, users connected to database B cannot use the same link to access data in database A. If local users on database B want to access data on database A, then a link must be defined and stored in the data dictionary of database B. Global links may be used between any clients and database on the network.

The following database links are supported:

- A private database link in a specific schema of a database. Only the owner of a private database link can use it.
- A public database link for a database. All users in the database can use it.
- A global database link is a database link stored in the LDAP directory.

dedicated connection
A dedicated server with a database session.

dedicated server
A server process that is dedicated to one client connection. Contrast with shared server.
default domain
The domain within which most client requests take place. It could be the domain where the client resides, or it could be a domain from which the client requests network services often. Default domain is also the client configuration parameter that determines what domain should be appended to unqualified network name requests. A name request is unqualified if it does not have a period (.) character within it.

directory information tree (DIT)
A hierarchical tree-like structure in a directory server of the distinguished names (DNs) of the entries. This structure is specific to x500 and LDAP.

directory naming
A naming method that resolves a database service, network service name, or network service alias to a connect descriptor stored in a central directory server. A directory server provides central administration of directory naming objects, reducing the work effort associated with adding or relocating services.

directory server
A directory server that is accessed with the Lightweight Directory Access Protocol (LDAP). Support of LDAP-compliant directory servers provides a centralized method for managing and configuring a distributed Oracle network. The directory server can replace client-side and server-side localized tnsnames.ora files.

dispatcher
A process that enables many clients to connect to the same server without the need for a dedicated server process for each client. A dispatcher handles and directs multiple incoming network session requests to shared server processes.

distinguished name (DN)
Name of entry in a directory server. The DN specifies where the entry resides in the LDAP directory hierarchy, similar to the way a directory path specifies the exact location of a file.

distributed processing
Division of front-end and back-end processing to different computers. Oracle Net Services supports distributed processing by transparently connecting applications to remote databases.
domain
Any tree or subtree within the Domain Name System (DNS) namespace. Domain most commonly refers to a group of computers whose host names share a common suffix, the domain name.

Domain Name System (DNS)
A system for naming computers and network services that is organized into a hierarchy of domains. DNS is used in TCP/IP networks to locate computers through user-friendly names. DNS resolves a friendly name into an IP address, which is understood by computers.

For Oracle Net Services, DNS translates the host name in a TCP/IP address into an IP address.

DNS
See Domain Name System (DNS).

enterprise role
An enterprise role is analogous to a regular database role, except that it spans authorization on multiple databases. An enterprise role is a category of roles that define privileges on a particular database. An enterprise role is created by the database administrator of a particular database. An enterprise role can be granted to or revoked from one or more enterprise users. The information for granting and revoking these roles is stored in the directory server.

enterprise user
A user that has a unique identity across an enterprise. Enterprise users connect to individual databases through a schema. Enterprise users are assigned enterprise roles that determine their access privileges on databases.

entry
The building block of a directory server, it contains information about an object of interest to directory users.

external naming
A naming method that uses a third-party naming service, such as Network Information Service (NIS).

external procedure
Function or procedure written in a third-generation language (3GL) that can be called from PL/SQL code. Only C is supported for external procedures.
failover
See connect-time failover.

firewall support
See access control.

FTP
File Transfer Protocol. A client/server protocol which allows a user on one computer to transfer files to and from another computer over a TCP/IP network.

global database link
A database link definition stored in an LDAP directory which can be accessed by all users on the network. This definition is the same as the one used for client connections to the database (name/connect-descriptor).

Global database links cannot include user or password clauses. They only work when the database initiating the link uses the identity of the existing client to establish the link.

global database name
The full name of the database which uniquely identifies it from any other database. The global database name is of the form "database_name.database_domain," for example, sales.us.example.com.

The database name portion, sales, is a simple name to call a database. The database domain portion, us.example.com, specifies the database domain which the database is located, making the global database name unique. When possible, Oracle recommends that your database domain mirror the network domain.

The global database name is the default service name of the database, as specified by the SERVICE_NAMES parameter in the initialization parameter file.

Heterogeneous Services
An integrated component that provides the generic technology for accessing non-Oracle systems from the Oracle database server. Heterogeneous Services enables you to:

- Use Oracle SQL to transparently access data stored in non-Oracle systems as if the data resides within an Oracle server.
- Use Oracle procedure calls to transparently access non-Oracle systems, services, or application programming interfaces (APIs), from your Oracle distributed environment.
hierarchical naming model
An infrastructure in which names are divided into multiple hierarchically-related domains.

host naming
A naming method resolution that enables users in a TCP/IP environment to resolve names through their existing name resolution service. This name resolution service might be Domain Name System (DNS), Network Information Service (NIS), or simply a centrally-maintained set of /etc/hosts files. Host naming enables users to connect to an Oracle database server by simply providing the server computer's host name or host name alias. No client configuration is required to take advantage of this feature. This method is recommended for simple TCP/IP environments.

HTTP
Hypertext Transfer Protocol. A protocol that provides the language that enables Web browsers and application Web servers to communicate.

identity management realm
A collection of identities, all of which are governed by the same administrative policies. In an enterprise, all employees having access to the intranet may belong to one realm, while all external users who access the public applications of the enterprise may belong to another realm. An identity management realm is represented in the directory by a specific entry with a special object class associated with it.

instance
The combination of the System Global Area (SGA) and the Oracle background processes. When a database is started on a database server (regardless of the type of computer), Oracle allocates a memory area called the SGA, and starts one or more Oracle processes. The memory and processes of an instance efficiently manage the associated database data and serve the database users. You can connect to any instance to access information within a cluster database.

instance name
A name of an Oracle database instance. The instance name is identified by the INSTANCE_NAME parameter in the database initialization parameter file. INSTANCE_NAME corresponds to the Oracle system identifier (SID) of the instance. Clients can connect to a specific instance by specifying the INSTANCE_NAME parameter in the connect descriptor.

The instance name is included in the connect data part of the connect descriptor.

IP address
Used to identify a node on a network. Each computer on the network is assigned a unique Internet Protocol (IP) address, which is made up of the network ID, and a unique host ID.
This address is typically represented in dotted-decimal notation, with the decimal value of each octet separated by a period, for example 192.0.2.22.

IPC
Interprocess Communication is a protocol used by client applications that resides on the same node as the listener to communicate with the database. IPC can provide a faster local connection than TCP/IP.

IPv4
Internet Protocol Version 4. IPv4 is the current standard for the IP protocol. IPv4 uses 32-bit (four-byte) addresses, which are typically represented in dotted-decimal notation. The decimal value of each octet is separated by a period, as in 192.0.2.22.

IPv6
Internet Protocol Version 6. The protocol designed to replace IPv4. In IPv6, an IP address is typically represented in eight fields of hexadecimal values separated by colons, as in 2001:0db8:0000:0000:0000:0000:1428:57AB. In some cases, fields with 0 values can be compressed, as in 2001:DB8::1428:57AB.

IP Version 4 (IPv4)
See IPv4.

IP Version 6 (IPv6)
See IPv6.

Java Database Connectivity (JDBC) Driver
A driver that provides Java applications and applets access to an Oracle database.

JDBC OCI Driver
A Type II driver for use with client/server Java applications. This driver requires an Oracle client installation.

JDBC Thin Driver
A Type IV driver for Oracle JDBC applets and applications. Because it is written entirely in Java, this driver is platform-independent. It does not require any additional Oracle software on the client side. The Thin driver communicates with the server using Two-Task Common (TTC), a protocol developed by Oracle to access the database server.
keyword-value pair
The combination of a keyword and a value, used as the standard unit of information in connect descriptors and many configuration files. Keyword-value pairs may be nested; that is, a keyword may have another keyword-value pair as its value.

latency
The amount of time it takes to send a request and receive an answer.

LDAP Data Interchange Format (LDIF)
See LDIF

ldap.ora file
A file created by Oracle Internet Directory Configuration Assistant or Oracle Net Configuration Assistant that contains the following directory server access information:

• Type of directory server
• Location of the directory server
• Default Oracle Context that the client or server use to look up or configure connect identifiers for connections to database services

When created with Oracle Internet Directory Configuration Assistant, the ldap.ora file is located in the ORACLE_HOME/ldap/admin directory. When created with Oracle Net Configuration Assistant, the ldap.ora file is located in the ORACLE_HOME/network/admin directory.

LDIF
LDAP Data Interchange Format (LDIF) is the set of standards for formatting an input file for any of the LDAP command line utilities.

Lightweight Directory Access Protocol (LDAP)
A standard, extensible directory access protocol. It is a common language that LDAP clients and servers use to communicate. The framework of design conventions supporting industry-standard directory servers.

link qualifier
An extension to the database link name which specifies the connect name used to connect to the database. It provides alternate settings for the database user name and password credentials. For example, a link qualifier of fieldrep can be appended to a global database link of sales.us.example.com.

SQL> SELECT * FROM emp@sales.us.example.com@fieldrep
listener
See Oracle Net Listener.

Listener Control utility
A utility included with Oracle Net Services to control listener functions, such as starting, stopping, and getting the status of the listener.

listener.ora file
A configuration file for the listener that identifies the following for a listener:

- Unique name
- Protocol addresses that it is accepting connection requests on
- Services it is listening for

The listener.ora file typically resides in the ORACLE_HOME/network/admin directory.

Oracle does not require identification of the database service because of service registration. However, static service configuration is required if you plan to use Oracle Enterprise Manager Cloud Control.

Listener Registration (LREG)
As a part of service registration, LREG registers instance information with the listener. LREG is an instance background process of each database instance that is configured in the database initialization parameter file.

load balancing
A feature by which client connections are distributed evenly among multiple listeners, dispatchers, instances, and nodes so that no single component is overloaded.

Oracle Net Services support client load balancing and connection load balancing.

local naming
A naming method that locates network addresses by using information configured and stored on each individual client's tnsnames.ora file. Local naming is most appropriate for simple distributed networks with a small number of services that change infrequently.

location transparency
A distributed database characteristic that enables applications to access data tables without knowing where they reside. All data tables appear to be in a single database, and the system determines the actual data location based on the table name. The user can reference data on multiple nodes in a single statement, and the system automatically and transparently routes (parts of) SQL statements to remote nodes for
execution if needed. The data can move among nodes with no impact on the user or application.

logging
A feature in which errors, service activity, and statistics are written to a log file. The log file provides additional information for an administrator when the error message on the screen is inadequate to understand the failure. The log file, by way of the error stack, shows the state of the software at various layers.
See also tracing.

loopback test
A connection from the server back to itself. Performing a successful loopback verifies that Oracle Net is functioning on the database server.

map
Files used by the Network Information Service (NIS) ypser v program to handle name requests.

Microsoft Active Directory
An LDAP-compliant directory server included with Microsoft Windows 2000 Server. It stores information about objects on the network, and makes this information available to users and network administrators. Active Directory also provides access to resources on the network using a single logon process.
Microsoft Active Directory can be configured as a directory naming method to store service information that clients can access.

Microsoft Windows NT native authentication
An authentication method that enables a client single login access to a Microsoft Windows NT server and a database running on the server.

Named Pipes protocol
A high-level interface protocol providing interprocess communications between clients and servers using distributed applications. Named Pipes enables client/server conversation over a network using Named Pipes protocol.

naming context
A subtree that resides entirely on one directory server. It is a contiguous subtree, that is, it must begin at an entry that serves as the top of the subtree, and extend downward to either leaf entries or references to subordinate naming contexts. It can range in size from a single entry to the entire directory information tree (DIT).
Oracle Context can be created under a naming context.

**naming method**
The resolution method used by a client application to resolve a connect identifier to a connect descriptor when attempting to connect to a database service. Oracle Net provides four naming methods:

- Domain Name System (DNS)
- directory naming
- Easy Connect naming
- external naming

**network service alias**
An alternative name for a directory naming object in a directory server. A directory server stores network service aliases for any defined network service name or database service. A network service alias entry does not have connect descriptor information. Instead, it only references the location of the object for which it is an alias. When a client requests a directory lookup of a network service alias, the directory determines that the entry is a network service alias and completes the lookup as if it was actually the entry it is referencing.

**network service name**
A simple name for a service that resolves to a connect descriptor. Users initiate a connect request by passing a user name and password along with a network service name in a connect string for the service to which they want to connect:

```plaintext
CONNECT username/password@net_service_name
```

Depending on your needs, network service names can be stored in a variety of places, including:

- Local configuration file, tnsnames.ora, on each client
- Directory server
- External naming service, such as NIS

**network**
A group of two or more computers linked through hardware and software to allow the sharing of data and peripherals.

**network administrator**
The person who performs network management tasks such as installing, configuring, and testing network components. The administrator typically maintains the
configuration files, connect descriptors and service names, aliases, and public and global database links.

network character set
As defined by Oracle, the set of characters acceptable for use as values in keyword-value pairs (that is, in connect descriptors and configuration files). The set includes alphanumeric uppercase, and lowercase, and some special characters.

Network Information Service (NIS)
The client/server protocol for distributing system configuration data such as user and host names between computers on a network. This service was formerly known as "Sun Microsystems Yellow Pages (yp)."

Network Interface (NI)
A network layer that provides a generic interface for Oracle clients, servers, or external processes to access Oracle Net functions. The network interface layer handles the break and reset requests for a connection.

network listener
See listener.

network object
Any service that can be directly addressed on a network, such as a listener.

network protocol
See Oracle protocol support.

Network Program Interface
An interface for server-to-server interactions that performs all of the functions that the Oracle Call Interface (OCI) does for clients, allowing a coordinating server to construct SQL requests for additional servers.

Network Session (NS)
A session layer that is used in typical Oracle Net connections to establish and maintain the connection between a client application and a database server.
NIS
See Network Information Service (NIS).

node
A computer or terminal that is part of a network

object class
In a directory server, a named group of attributes. To assign attributes to an entry, do so by assigning the object classes that hold those attributes to that entry.

All objects associated with the same object class share the attributes of that object class.

OCI
See Oracle Call Interface (OCI).

OPI
See Oracle Program Interface (OPI).

Open Systems Interconnection (OSI)
Open Systems Interconnection is a network architecture model developed by ISO as a framework for international standards in heterogeneous computer network architecture.

The OSI architecture has seven layers, from lowest to highest:

1. Physical layer
2. Data link layer
3. Network layer
4. Transport layer
5. Session layer
6. Presentation layer
7. Application layer

Oracle Advanced Security
An Oracle product that provides Transparent Data Encryption (TDE) and data redaction.
Oracle Call Interface (OCI)
An application programming interface (API) that enables creation of applications that use the native procedures or function calls of a third-generation language to access an Oracle database server and control all phases of SQL statement execution. OCI supports the data types, calling conventions, syntax, and semantics of a number of third-generation languages including C, C++, COBOL and FORTRAN.

Oracle Connection Manager
A router through which a client connection request may be sent either to its next hop or directly to the database server. Clients who route their connection requests through Oracle Connection Manager can then take advantage of the session multiplexing, access control, or protocol conversion features configured for that Oracle Connection Manager.

Oracle Connection Manager Control utility
A utility included with Oracle Net Services to control various functions, such as starting, stopping, and getting the status of Oracle Connection Manager.

Oracle Context
An entry in an LDAP-compliant Internet directory called cn=OracleContext, under which all Oracle software relevant information is kept, including entries for Oracle Net Services directory naming and checksumming security. There may be one or more than one Oracle Context in a directory. An Oracle Context entry can be associated with a directory naming context.

Oracle Internet Directory automatically creates an Oracle Context at the root of the DIT structure. This root Oracle Context has a DN of dn:cn=OracleContext.

Oracle Enterprise Manager Cloud Control
A separate Oracle product that combines a graphical console, agents, common services, and tools to provide an integrated and comprehensive systems management platform for managing Oracle products.

Oracle Identity Management
An infrastructure enabling deployments to manage centrally and securely all enterprise identities and their access to various applications in the enterprise.

Oracle Internet Directory
A directory server implemented as an application on the Oracle database. It enables retrieval of information about dispersed users and network resources. It combines Lightweight Directory Access Protocol (LDAP) Version 3, the open Internet standard directory server...
access protocol, with the high performance, scalability, robustness, and availability of the Oracle database.

Oracle Net
Communication software that enables a network session from a client application to an Oracle database server. After a network session is established, Oracle Net acts as a data courier for the client application and the database server. It is responsible for establishing and maintaining the connection between the client application and database server, as well as exchanging messages between them. Oracle Net can perform these jobs because it is located on each computer in the network.

Oracle Net Configuration Assistant
A postinstallation tool that configures basic network components after installation, including:

• Listener names and protocol addresses
• Naming methods the client uses to resolve connect identifiers
• Net service names in a tnsnames.ora file
• Directory server usage

Oracle Net Firewall Proxy
Product offered by some firewall vendors that supplies Oracle Connection Manager functionality.

Oracle Net foundation layer
A networking communication layer that is responsible for establishing and maintaining the connection between the client application and server, as well as exchanging messages between them.

Oracle Net Listener
A process that resides on the server whose responsibility is to listen for incoming client connection requests and manage the traffic to the server.

When a client requests a network session with a database server, a listener receives the actual request. If the client information matches the listener information, then the listener grants a connection to the database server.

Oracle Net Manager
A tool that combines configuration abilities with component control to provide an integrated environment for configuring and managing Oracle Net Services.

You can use Oracle Net Manager to configure the following network components:
• Naming
  Define connect identifiers and map them to connect descriptors to identify the network location and identification of a service. Oracle Net Manager supports configuration of connect descriptors in a local `tnsnames.ora` file or directory server.

• Naming Methods
  Configure the ways in which connect identifiers are resolved into connect descriptors.

• Listeners
  Create and configure listeners to receive client connections.

Oracle Net Services
A suite of networking components that provide enterprise-wide connectivity solutions in distributed, heterogeneous computing environments. Oracle Net Services is comprised of Oracle Net, listener, Oracle Connection Manager, Oracle Net Configuration Assistant, and Oracle Net Manager.

Oracle Program Interface (OPI)
Oracle Program Interface is the networking layer responsible for responding to each of the possible messages sent by OCI. For example, an OCI request to fetch 25 rows would have an OPI response to return the 25 rows after they have been fetched.

Oracle protocol support
A software layer responsible for mapping Transparent Network Substrate (TNS) functionality to industry-standard protocols used in the client/server connection.

Oracle Real Application Clusters (Oracle RAC)
An architecture that allows multiple instances to access a shared database of data files. Oracle RAC is also a software component that provides the necessary cluster database scripts, initialization files, and data files needed for Oracle Enterprise Edition and Oracle RAC.

Oracle Rdb
A database for Digital's 64-bit platforms. Because Oracle Rdb has its own listener, the client interacts with Rdb in the same manner as it does with an Oracle database.

Oracle schema
A set of rules that determine what can be stored in a directory server. Oracle has its own schema that is applied to many types of Oracle entries, including Oracle Net Services entries.
The Oracle schema for Oracle Net Services entries includes the attributes the entries may contain.

**Oracle system identifier (SID)**
A name that identifies a specific instance of an Oracle database. For any database, there is at least one instance referencing the database.

For Oracle databases earlier than release 8.1, a SID is used to identify the database. The SID is included in the connect descriptor of a `tnsnames.ora` file and in the definition of the listener in the `listener.ora` file.

**Oracle XML DB**
A high-performance XML storage and retrieval technology provided with Oracle database server. It is based on the W3C XML data model.

**ORACLE_HOME**
An alternate name for the top directory in the Oracle directory hierarchy on some directory-based operating systems.

**OSI**
See *Open Systems Interconnection (OSI)*.

**packet**
A block of information sent over the network each time a connection or data transfer is requested. The information contained in packets depends on the type of packet, such as connect, accept, redirect, data, and so on. Packet information can be useful in troubleshooting.

**PMON process**
A process monitor (PMON) database process that performs process recovery when a user process fails. PMON is responsible for cleaning the cache and freeing resources that the process was using. PMON also checks on dispatcher and server processes and restarts them if they have failed.

**presentation layer**
A networking communication layer that manages the representation of information that application layer entities either communicate or reference in their communication. Two-Task Common (TTC) is an example of presentation layer.
private database link
A database link created by one user for exclusive use.
See also database link and public database link.

profile
A collection of parameters that specifies preferences for enabling and configuring Oracle Net Services features on the client or server. A profile is stored and implemented through the sqlnet.ora file.

protocol
A set of rules that defines how data is transported across the network.

protocol address
An address that identifies the network address of a network object.
When a connection is made, the client and the receiver of the request, such as the listener or Oracle Connection Manager, are configured with identical protocol addresses. The client uses this address to send the connection request to a particular network object location, and the recipient listens for requests on this address. It is important to install the same protocols for the client and the connection recipient, as well as configure the same addresses.

protocol conversion
A feature of Oracle Connection Manager that enables a client and server with different networking protocols to communicate with each other. This feature replaces functionality previously provided by the Oracle Multi-Protocol Interchange with SQL*Net version 2.

protocol stack
Designates a particular presentation layer and session layer combination.

proxy server
A server that substitutes for a real server, forwarding client connection requests to the real server or to other proxy servers. Proxy servers provide access control, data and system security, monitoring, and caching.

public database link
A database link created by a DBA on a local database that is accessible to all users on that database.
See also database link and private database link.
realm Oracle Context
An Oracle Context contained in each identity management realm. It stores the following information:

- User naming policy of the identity management realm, that is, how users are named and located
- Mandatory authentication attributes
- Location of groups in the identity management realm
- Privilege assignments for the identity management realm, for example, who has privileges to add more users to the realm
- Application specific data for that realm including authorizations

RDBMS
Relational Database Management System.

RDN
See relative distinguished name (RDN).

relative distinguished name (RDN)
The local, most granular level entry name. It has no other qualifying entry names that would serve to address the entry uniquely. It is a fully-qualified X.500 name. For example, cn=sales,dc=us,dc=example,dc=com, cn=sales is a RDN.

root Oracle Context
In the Oracle Identity Management infrastructure, the root Oracle Context is an entry in Oracle Net Services containing a pointer to the default identity management realm in the infrastructure. It also contains information about how to locate an identity management realm given the simple name of the realm.

RPC
Remote procedure call.

SDP
Sockets Direct Protocol.
Secure Sockets Layer (SSL)
An industry-standard protocol designed by Netscape Communications Corporation for securing network connections. SSL provides authentication, encryption, and data integrity using public key infrastructure (PKI).

server parameter file
A binary file containing initialization parameter settings that is maintained on the Oracle Database host. You cannot manually edit this file with a text editor. A server parameter file is initially built from a text initialization parameter file by means of the `CREATE SPFILE` statement or created directly.

server process
Database processes that handle a client request on behalf of a database.

service
A program that responds to requests from various clients or performs some operation. The database is a service that stores and retrieves data for clients.

service handler
A process that acts a connection point from the listener to the database server. A service handler can be a dispatcher or dedicated server.

service name
A logical representation of a database, which is the way a database is presented to clients. The service name is a string that is the global database name, that is, a name comprised of the database name and domain name, entered during installation or database creation. If you are not sure what the global database name is, then you can obtain it from the value of the SERVICE_NAMES parameter in the initialization parameter file.

The service name is included in the connect data part of the connect descriptor.

service registration
A feature by which the Listener Registration (LREG) automatically registers information with a listener. Because this information is registered with the listener, the listener.ora file does not need to be configured with this static information.

Service registration provides the listener with information about:

- Service names for each running instance of the database
- Instance names of the database
- Service handlers (dispatcher or dedicated server) available for each instance

These enable the listener to direct a client request appropriately.
- Dispatcher, instance, and node load information

This load information enables the listener to determine which dispatcher can best handle a client connection request. If all dispatchers are blocked, then the listener can spawn a dedicated server for the connection.

**session data unit (SDU)**

A buffer that Oracle Net uses to place data before transmitting it across the network. Oracle Net sends the data in the buffer either when requested or when it is full.

**session layer**

A network layer that provides the services needed by the protocol address entities that enable them to organize and synchronize their dialog and manage their data exchange. This layer establishes, manages, and terminates network sessions between the client and server. An example of a session layer is Network Session (NS).

**session multiplexing**

Combining multiple sessions for transmission over a single network connection to conserve the operating system's resources.

**shared server**

A database server that is configured to allow many user processes to share very few server processes, so the number of users that can be supported is increased. With shared server configuration, many user processes connect to a dispatcher. The dispatcher directs multiple incoming network session requests to a common queue. An idle shared server process from a shared pool of server processes picks up a request from the queue. This means that a small pool of server processes can serve a large number of clients. Contrast with dedicated server.

**shared server process**

A process type used with shared server configuration.

**SID**

See Oracle system identifier (SID).

**SID_LIST_listener_name**

A section of the listener.ora file that defines the Oracle system identifier (SID) of the database served by the listener. This section is valid only for Oracle databases release 8.0, as information for Oracle8i or later instances is automatically registered with the
listener. Static configuration is also required for other services, such as external procedure calls and Heterogeneous Services.

single sign-on
The ability for a user to log in to different servers using a single password. This permits the user to authenticate to all servers the user is authorized to access.

sqlnet.ora file
A configuration file for the client or server that specifies:

- Client domain to append to unqualified service names or net service names
- Order of naming methods the client should use when resolving a name
- Logging and tracing features to use
- Route of connections
- External naming parameters
- Oracle Advanced Security parameters

The sqlnet.ora file typically resides in the ORACLE_HOME/network/admin directory.

SSL
See Secure Sockets Layer (SSL).

System Global Area (SGA)
A group of shared memory structures that contain data and control information for an Oracle instance.

TCP/IP
Transmission Control Protocol/Internet Protocol. The standard communication protocol used for client/server conversation over a network.

TCP/IP with SSL protocol
A protocol that enables an Oracle application on a client to communicate with remote Oracle databases through the TCP/IP and Secure Sockets Layer (SSL).

tick
The amount of time it takes for a message to be sent and processed from the client to the server or from the server to the client.
TNS
See Transparent Network Substrate (TNS).

tnsnames.ora file
A configuration file that maps network service names to connect descriptors. This file is used for the local naming method. The tnsnames.ora file typically resides in the ORACLE_HOME/network/admin directory.

tracing
A facility that writes detailed information about an operation to an output file. The trace facility produces a detailed sequence of statements that describe the events of an operation as they are run. Administrators use the trace facility for diagnosing an abnormal condition. It is not normally turned on.
See also logging.

Transparent Application Failover (TAF)
A runtime failover for high-availability environments, such as Oracle Real Application Clusters and Oracle Fail Safe, that refers to the failover and re-establishment of application-to-service connections. It enables client applications to automatically reconnect to the database if the connection fails, and, optionally, resume a SELECT statement that was in progress. This reconnect happens automatically from within the Oracle Call Interface (OCI) library.

Transparent Network Substrate (TNS)
A foundation technology, built into the Oracle Net foundation layer that works with any standard network transport protocol.

transport
A networking layer that maintains end-to-end reliability through data flow control and error recovery methods. The Oracle Net foundation layer uses Oracle protocol support for the transport layer.

TTC
See Two-Task Common (TTC).
Two-Task Common (TTC)
A presentation layer type that is used in a typical Oracle Net connection to provide character set and data type conversion between different character sets or formats on the client and server.

UPI
User Program Interface.

virtual circuit
A piece of shared memory used by the dispatcher for client database connection requests and replies. The dispatcher places a virtual circuit on a common queue when a request arrives. An idle shared server picks up the virtual circuit from the common queue, services the request, and relinquishes the virtual circuit before attempting to retrieve another virtual circuit from the common queue.

WebDAV protocol
World Wide Web Distributed Authoring and Versioning. A protocol with a set of extensions to HTTP which allows users to manage files on remote Web servers.
