## 5.397 DBA\_HIST\_DB\_CACHE\_ADVICE

DBA\_HIST\_DB\_CACHE\_ADVICE displays historical predictions of the number of physical reads for the cache size corresponding to each row.

This view contains snapshots of V\$DB\_CACHE\_ADVICE.

| Column               | Datatype     | NULL     | Description                                                                                                                                                                              |
|----------------------|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.398 DBA\_HIST\_DISPATCHER

DBA\_HIST\_DISPATCHER displays historical information for each dispatcher process present at the time of the snapshot.

This view contains snapshots of information from V\$DISPATCHER and V\$QUEUE.

| Column          | Datatype    | NULL     | Description                                                                                                                            |
|-----------------|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER      | NOT NULL | Unique snapshot ID                                                                                                                     |
| DBID            | NUMBER      | NOT NULL | Database ID for the snapshot                                                                                                           |
| INSTANCE_NUMBER | NUMBER      | NOT NULL | Instance number for the snapshot                                                                                                       |
| NAME            | VARCHAR2(4) | NOT NULL | Name of the dispatcher process                                                                                                         |
| SERIAL#         | NUMBER      |          | Serial number of the dispatcher process                                                                                                |
| IDLE            | NUMBER      |          | Total idle time for the dispatcher (in hundredths of a second)                                                                         |
| BUSY            | NUMBER      |          | Total busy time for the dispatcher (in hundredths of a second)                                                                         |
| WAIT            | NUMBER      |          | Total time that all items in the dispatcher queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item. |
| TOTALQ          | NUMBER      |          | Total number of items that have ever been in the dispatcher queue                                                                      |

| Column             | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLED_TOTAL_CONN | NUMBER   |      | Cumulative sum of total number of connections to the dispatcher over all samples. To determine the average number of connections to the dispatcher between two snapshots, divide the difference in SAMPLED_TOTAL_CONN by the difference in NUM_SAMPLES (obtained from DBA_HIST_SHARED_SERVER_SUMMARY).                                                                                                                                                 |
| CON_DBID           | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID             | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.400 DBA\_HIST\_DYN\_REMASTER\_STATS

DBA\_HIST\_DYN\_REMASTER\_STATS displays historical statistical information about the dynamic remastering process.

All times are given in hundredths of a second, and total values reflect what has been collected since instance startup. This view contains snapshots of V\$DYNAMIC\_REMASTER\_STATS.

| Column                  | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|--------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                        |

## 5.401 DBA\_HIST\_ENQUEUE\_STAT

DBA\_HIST\_ENQUEUE\_STAT displays historical statistics on the number of enqueue (lock) requests for each type of lock.

This view contains snapshots of V\$ENQUEUE\_STATISTICS.

| Column          | Datatype     | NULL     | Description                                                                                |
|-----------------|--------------|----------|--------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER       | NOT NULL | Unique snapshot ID                                                                         |
| DBID            | NUMBER       | NOT NULL | Database ID for the snapshot                                                               |
| INSTANCE_NUMBER | NUMBER       | NOT NULL | Instance number for the snapshot                                                           |
| EQ_TYPE         | VARCHAR2(2)  | NOT NULL | Type of enqueue requested                                                                  |
| REQ_REASON      | VARCHAR2(64) | NOT NULL | Reason for the enqueue request                                                             |
| TOTAL_REQ#      | NUMBER       |          | Total number of enqueue requests or enqueue conversions for this type of enqueue           |
| TOTAL_WAIT#     | NUMBER       |          | Total number of times an enqueue request or conversion resulted in a wait                  |
| SUCC_REQ#       | NUMBER       |          | Number of times an enqueue request or conversion was granted                               |
| FAILED_REQ#     | NUMBER       |          | Number of times an enqueue request or conversion failed                                    |
| CUM_WAIT_TIME   | NUMBER       |          | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion |
| EVENT#          | NUMBER       |          | Event number                                                                               |
| CON_DBID        | NUMBER       |          | The database ID of the PDB for the sampled session                                         |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.404 DBA\_HIST\_FILEMETRIC\_HISTORY

DBA\_HIST\_FILEMETRIC\_HISTORY displays the history of file metrics collected in the Workload Repository.

| Column          | Datatype | NULL     | Description                               |
|-----------------|----------|----------|-------------------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID                        |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot              |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot          |
| FILEID          | NUMBER   | NOT NULL | File number                               |
| CREATIONTIME    | NUMBER   | NOT NULL | File creation time                        |
| BEGIN_TIME      | DATE     | NOT NULL | Begin time of the interval                |
| END_TIME        | DATE     | NOT NULL | End time of the interval                  |
| INTSIZE         | NUMBER   | NOT NULL | Interval size (in hundredths of a second) |

| Column        | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_ID      | NUMBER   | NOT NULL | ID of the group to which the file belongs                                                                                                                                                                                                                                                                                                                                                                                                              |
| AVGREADTIME   | NUMBER   | NOT NULL | Average file read time                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AVGWRTETIME   | NUMBER   | NOT NULL | Average file write time                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PHYSICALREAD  | NUMBER   | NOT NULL | Number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PHYSICALWRITE | NUMBER   | NOT NULL | Number of physical writes                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PHYBLKREAD    | NUMBER   | NOT NULL | Number of physical block reads                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PHYBLKWRITE   | NUMBER   | NOT NULL | Number of physical block writes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_DBID      | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID        | NUMBER   |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.405 DBA\_HIST\_FILESTATXS

DBA\_HIST\_FILESTATXS displays information about file read/write statistics.

This view contains snapshots of V\$FILESTAT.

| Column           | Datatype      | NULL     | Description                                                                                                                   |
|------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                            |
| DBID             | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                  |
| INSTANCE_NUMBER  | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                              |
| FILE#            | NUMBER        | NOT NULL | File identification number                                                                                                    |
| CREATION_CHANGE# | NUMBER        | NOT NULL | Change number at which the data file was created                                                                              |
| FILENAME         | VARCHAR2(513) | NOT NULL | Name of the data file                                                                                                         |
| TS#              | NUMBER        | NOT NULL | Tablespace number                                                                                                             |
| TSNAME           | VARCHAR2(30)  |          | Name of the tablespace                                                                                                        |
| BLOCK_SIZE       | NUMBER        |          | Block size of the data file                                                                                                   |
| PHYRDS           | NUMBER        |          | Number of physical reads done                                                                                                 |
| PHYWRTS          | NUMBER        |          | Number of times DBWR is required to write                                                                                     |
| SINGLEBLKRDS     | NUMBER        |          | Number of single block reads                                                                                                  |
| READTIM          | NUMBER        |          | Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if TIMED_STATISTICS is false  |
| WRITETIM         | NUMBER        |          | Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if TIMED_STATISTICS is false |
| SINGLEBLKRDTIM   | NUMBER        |          | Cumulative single block read time (in hundredths of a second)                                                                 |

| Column             | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHYBLKRD           | NUMBER   |      | Number of physical blocks read                                                                                                                                                                                                                                                                                                                                                                                                                |
| PHYBLKWRT          | NUMBER   |      | Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks                                                                                                                                                                                                                                                                                                                                            |
| WAIT_COUNT         | NUMBER   |      | Shows the number of waits at the file level for contended buffers. This value includes the individual wait events that are included in the buffer busy waits wait event.<br><b>See Also:</b> <a href="#">"buffer busy waits"</a>                                                                                                                                                                                                              |
| TIME               | NUMBER   |      | Time spent waiting for the wait events in the WAIT_COUNT column                                                                                                                                                                                                                                                                                                                                                                               |
| OPTIMIZED_PHYBLKRD | NUMBER   |      | Number of physical reads from Database Smart Flash Cache blocks                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID           | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID             | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.406 DBA\_HIST\_IC\_CLIENT\_STATS

DBA\_HIST\_IC\_CLIENT\_STATS displays information about the usage of an interconnect device by the instance.

The information is divided into several areas of the Oracle Database, each identified by the NAME value.

| Column          | Datatype    | NULL     | Description                                                                                                                                                                                                                                                                                             |
|-----------------|-------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER      | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                      |
| DBID            | NUMBER      | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                            |
| INSTANCE_NUMBER | NUMBER      | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                        |
| NAME            | VARCHAR2(9) | NOT NULL | Identifies the area of the Oracle Database: <ul style="list-style-type: none"> <li>ipq - Parallel query communications</li> <li>d1m - Database lock management</li> <li>cache - Global cache communications</li> </ul> All other values are internal to Oracle and are not expected to have high usage. |

| Column         | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BYTES_SENT     | NUMBER   |      | Number of bytes sent by the instance since instance startup for the software area identified by NAME. This information is aggregated across all devices used by the instance.                                                                                                                                                                                                                                                                    |
| BYTES_RECEIVED | NUMBER   |      | Number of bytes received by the instance since instance startup for the software area identified by NAME. This information is aggregated across all devices used by the instance.                                                                                                                                                                                                                                                                |
| CON_DBID       | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID         | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.407 DBA\_HIST\_IC\_DEVICE\_STATS

DBA\_HIST\_IC\_DEVICE\_STATS displays operating system information about the usage of interconnect devices by the machine.

This usage contains Oracle usage but is not limited to it. The quality of the information depends on the operating system.

| Column            | Datatype      | NULL     | Description                                                                |
|-------------------|---------------|----------|----------------------------------------------------------------------------|
| SNAP_ID           | NUMBER        | NOT NULL | Unique snapshot ID                                                         |
| DBID              | NUMBER        | NOT NULL | Database ID for the snapshot                                               |
| INSTANCE_NUMBER   | NUMBER        | NOT NULL | Instance number for the snapshot                                           |
| IF_NAME           | VARCHAR2(256) | NOT NULL | Name of the device (same as NAME in DBA_HIST_CLUSTER_INTERCON)             |
| IP_ADDR           | VARCHAR2(64)  | NOT NULL | IP address of the device (same as IP_ADDRESS in DBA_HIST_CLUSTER_INTERCON) |
| NET_MASK          | VARCHAR2(16)  |          | Network mask                                                               |
| FLAGS             | VARCHAR2(32)  |          | Flags                                                                      |
| MTU               | NUMBER        |          | Maximum transmission unit                                                  |
| BYTES_RECEIVED    | NUMBER        |          | Number of bytes received since operating system start time                 |
| PACKETS_RECEIVED  | NUMBER        |          | Number of packets received since operating system start time               |
| RECEIVE_ERRORS    | NUMBER        |          | Number of receive errors since operating system start time                 |
| RECEIVE_DROPPED   | NUMBER        |          | Number of receive messages that were dropped                               |
| RECEIVE_BUF_OR    | NUMBER        |          | Number of receive buffer overruns experienced                              |
| RECEIVE_FRAME_ERR | NUMBER        |          | Number of receive errors due to frame error                                |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BYTES_SENT        | NUMBER   |      | Number of bytes sent since operating system start time                                                                                                                                                                                                                                                                                                                                                                                                     |
| PACKETS_SENT      | NUMBER   |      | Number of packets sent since operating system start time                                                                                                                                                                                                                                                                                                                                                                                                   |
| SEND_ERRORS       | NUMBER   |      | Number of send errors since operating system start time                                                                                                                                                                                                                                                                                                                                                                                                    |
| SENDS_DROPPED     | NUMBER   |      | Number of send messages that were dropped                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SEND_BUF_OR       | NUMBER   |      | Number of send buffer overruns experienced                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SEND_CARRIER_LOST | NUMBER   |      | Number of send errors due to carrier lost                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_DBID          | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID            | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.408 DBA\_HIST\_IM\_SEG\_STAT

DBA\_HIST\_IM\_SEG\_STAT displays information about historical in-memory segment statistics.

| Column                 | Datatype | NULL     | Description                                                                                                  |
|------------------------|----------|----------|--------------------------------------------------------------------------------------------------------------|
| SNAP_ID                | NUMBER   | NOT NULL | Unique snapshot ID                                                                                           |
| DBID                   | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                 |
| INSTANCE_NUMBER        | NUMBER   | NOT NULL | Instance number for the snapshot                                                                             |
| TS#                    | NUMBER   | NOT NULL | Tablespace number                                                                                            |
| OBJ#                   | NUMBER   | NOT NULL | Dictionary object number                                                                                     |
| DATAOBJ#               | NUMBER   | NOT NULL | Data object number                                                                                           |
| MEMBYTES               | NUMBER   |          | Size of in-memory version of the segment in bytes                                                            |
| SCANS                  | NUMBER   |          | Count of segment statistics                                                                                  |
| SCANS_DELTA            | NUMBER   |          | Delta values for in-memory scans                                                                             |
| DB_BLOCK_CHANGES       | NUMBER   |          | The total number of changes that were part of an update or delete operation that were made to segment blocks |
| DB_BLOCK_CHANGES_DELTA | NUMBER   |          | Delta value for database block changes                                                                       |
| POPULATE_CUS           | NUMBER   |          | Count of compression units (CUs) populated per segment                                                       |
| POPULATE_CUS_DELTA     | NUMBER   |          | Delta value for compression unit (CU) populate operations                                                    |
| REPOPULATE_CUS         | NUMBER   |          | Count of CUs repopulated per segment                                                                         |
| REPOPULATE_CUS_DELTA   | NUMBER   |          | Delta value for compression unit (CU) repopulate operations                                                  |

| Column   | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_DBID | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID   | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.409 DBA\_HIST\_IM\_SEG\_STAT\_OBJ

DBA\_HIST\_IM\_SEG\_STAT\_OBJ displays information about object metadata for historical in-memory segments.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 5.410 DBA\_HIST\_INST\_CACHE\_TRANSFER

DBA\_HIST\_INST\_CACHE\_TRANSFER displays the historical statistics on the cache blocks transferred among instances.

This view contains snapshots of V\$INSTANCE\_CACHE\_TRANSFER.

| Column  | Datatype | NULL     | Description        |
|---------|----------|----------|--------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID |

| Column                    | Datatype     | NULL     | Description                                                                                                                                                        |
|---------------------------|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID                      | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                       |
| INSTANCE_NUMBER           | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                   |
| INSTANCE                  | NUMBER       | NOT NULL | Instance from which the blocks are transferred                                                                                                                     |

## 5.411 DBA\_HIST\_INSTANCE\_RECOVERY

DBA\_HIST\_INSTANCE\_RECOVERY displays the historical monitoring of the mechanisms available to the user to limit recovery I/O.

This view contains snapshots of V\$INSTANCE\_RECOVERY.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |

| Column                         | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| RECOVERY_ESTIMATED_IOS         | NUMBER   |      | Number of dirty buffers in the buffer cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ACTUAL_REDO_BKLS               | NUMBER   |      | Current actual number of redo blocks required for recovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TARGET_REDO_BKLS               | NUMBER   |      | Current target number of redo blocks that must be processed for recovery. This value is the minimum value of the following 3 columns, and identifies which of the 3 user-defined limits determines checkpointing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LOG_FILE_SIZE_REDO_BKLS        | NUMBER   |      | Maximum number of redo blocks required to guarantee that a log switch does not occur before the checkpoint completes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LOG_CHKPT_TIMEOUT_REDO_BKLS    | NUMBER   |      | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_TIMEOUT parameter. The value displayed is not meaningful unless LOG_CHECKPOINT_TIMEOUT has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOG_CHKPT_INTERVAL_REDO_BKLS   | NUMBER   |      | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_INTERVAL parameter. The value displayed is not meaningful unless LOG_CHECKPOINT_INTERVAL has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FAST_START_IO_TARGET_REDO_BKLS | NUMBER   |      | This column is obsolete and maintained for backward compatibility. The value of this column is always null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TARGET_MTTR                    | NUMBER   |      | Effective MTTR (mean time to recover) target value in seconds. The TARGET_MTTR value is calculated based on the value of the FAST_START_MTTR_TARGET parameter (the TARGET_MTTR value is used internally), and is usually an approximation of the parameter's value. However, if the FAST_START_MTTR_TARGET parameter value is very small (for example, one second), or very large (for example, 3600 seconds), then the calculation will produce a target value dictated by system limitations.<br><br>In such cases, the TARGET_MTTR value will be the shortest calculated time, or the longest calculated time that recovery is expected to take. If FAST_START_MTTR_TARGET is not specified, then the value of this field is the current estimated MTTR. |
| ESTIMATED_MTTR                 | NUMBER   |      | Current estimated mean time to recover (MTTR) based on the number of dirty buffers and log blocks (0 if FAST_START_MTTR_TARGET is not specified). This value tells you how long you can expect recovery to take based on the work the system is doing right now.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CKPT_BLOCK_WRITES              | NUMBER   |      | Number of blocks written by checkpoint writes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OPTIMAL_LOGFILE_SIZE           | NUMBER   |      | Redo log file size (in megabytes) that is considered optimal based on the current setting of FAST_START_MTTR_TARGET. It is recommended that all online redo logs be configured to be at least this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTD_CLUSTER_AVAILABLE_TIME    | NUMBER   |      | Estimated time (in seconds) that the cluster would become partially available should the instance fail. This column is only meaningful in an Oracle Real Application Clusters (Oracle RAC) environment. In a non-Oracle RAC environment, the value of this column is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Column                         | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 5.412 DBA\_HIST\_INTERCONNECT\_PINGS

DBA\_HIST\_INTERCONNECT\_PINGS displays information about measured latency of interconnect messages (round-trip) from instance to instance.

In Oracle Database 11g and later releases, the PING process assesses the latencies associated with communications for each pair of instances.

Every few seconds, the process in one instance (INSTANCE\_NUMBER value) sends two messages to each instance (TARGET\_INSTANCE value). One message has a size of 500 bytes and the other has a size of 8 KB. The message is received by the PING process on the target instance and is immediately acknowledged. The time for the round-trip is measured and collected.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |
| TARGET_INSTANCE | NUMBER   | NOT NULL | Target instance number           |

| Column      | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CNT_500B    | NUMBER   |      | Number of pings of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER)                                                                                                                                                                                                                                                                                                             |
| WAIT_500B   | NUMBER   |      | Sum of round-trip times for messages of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). Dividing by CNT_500B gives the average latency.                                                                                                                                                                                                                                       |
| WAITSQ_500B | NUMBER   |      | Sum of squares (divided by 1000) of round-trip times for messages of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). When used with CNT_500B and WAIT_500B, the standard deviation of the latency can be calculated.                                                                                                                                                          |
| CNT_8K      | NUMBER   |      | Number of pings of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER)                                                                                                                                                                                                                                                                                                                  |
| WAIT_8K     | NUMBER   |      | Sum of round-trip times for messages of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). Dividing by CNT_8K gives the average latency.                                                                                                                                                                                                                                              |
| WAITSQ_8K   | NUMBER   |      | Sum of squares (divided by 1000) of round-trip times for messages of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). When used with CNT_8K and WAIT_8K, the standard deviation of the latency can be calculated.                                                                                                                                                                   |
| CON_DBID    | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID      | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.413 DBA\_HIST\_IOSTAT\_DETAIL

DBA\_HIST\_IOSTAT\_DETAIL displays I/O statistics aggregated by combination of file type and function (component).

This view contains snapshots of V\$IOSTAT\_FILE and V\$IOSTAT\_FUNCTION.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |
| FUNCTION_ID     | NUMBER   | NOT NULL | Function ID                      |

| Column                | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 5.414 DBA\_HIST\_IOSTAT\_FILETYPE

DBA\_HIST\_IOSTAT\_FILETYPE displays historical I/O statistics by file type.

This view contains snapshots of V\$IOSTAT\_FILE.

| Column          | Datatype | NULL     | Description                                                |
|-----------------|----------|----------|------------------------------------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID                                         |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot                               |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot                           |
| FILETYPE_ID     | NUMBER   | NOT NULL | Type of file (for example, log file, data file, and so on) |

| Column                  | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILETYPE_NAME           | VARCHAR2(30) | NOT NULL | Name of the file, in the case of a data file or temp file. For all other files, a corresponding string to be displayed (for example, ARCHIVELOG).                                                                                                                                                                                                                                                                                                   |

| SNAP_ID                     | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DBID                        | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE_NUMBER             | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                              |
| JAVA_POOL_SIZE_FOR_ESTIMATE | NUMBER   | NOT NULL | Java pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                |
| JAVA_POOL_SIZE_FACTOR       | NUMBER   |          | Size factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_LC_SIZE                | NUMBER   |          | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTD_LC_MEMORY_OBJECTS      | NUMBER   |          | Estimated number of library cache memory objects in the Java pool of the specified size                                                                                                                                                                                                                                                                                                                                                       |
| ESTD_LC_TIME_SAVED          | NUMBER   |          | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a Java pool of the specified size. This is the time that would have been spent in reloading the required objects in the Java pool had they been aged out due to insufficient amount of available free memory.                                                                                                                           |
| ESTD_LC_TIME_SAVED_FACTOR   | NUMBER   |          | Estimated parse time saved factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                  |
| ESTD_LC_LOAD_TIME           | NUMBER   |          | Estimated elapsed time (in seconds) for parsing in a Java pool of the specified size.                                                                                                                                                                                                                                                                                                                                                         |
| ESTD_LC_LOAD_TIME_FACTOR    | NUMBER   |          | Estimated load time factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                         |
| ESTD_LC_MEMORY_OBJECT_HITS  | NUMBER   |          | Estimated number of times a library cache memory object was found in a Java pool of the specified size                                                                                                                                                                                                                                                                                                                                        |
| CON_DBID                    | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                      | NUMBER   |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## Static Data Dictionary Views: DBA\_HIST\_LATCH to DBA\_STORED\_SETTINGS

This chapter contains the static data dictionary views DBA\_HIST\_LATCH through DBA\_STORED\_SETTINGS.

### 6.1 DBA\_HIST\_LATCH

DBA\_HIST\_LATCH displays historical aggregate latch statistics for both parent and child latches, grouped by latch name.

This view contains snapshots of V\$LATCH.

| Column               | Datatype     | NULL     | Description                                                                                                                                                                                  |
|----------------------|--------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID              | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                           |
| DBID                 | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                 |
| INSTANCE_NUMBER      | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                             |
| LATCH_HASH           | NUMBER       | NOT NULL | Latch hash                                                                                                                                                                                   |
| LATCH_NAME           | VARCHAR2(64) | NOT NULL | Latch name                                                                                                                                                                                   |
| LEVEL#               | NUMBER       |          | Latch level                                                                                                                                                                                  |
| GETS                 | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode                                                                                                                              |
| MISSES               | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode and the requester had to wait                                                                                                |
| SLEEPS               | NUMBER       |          | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch                                                                                   |
| IMMEDIATE_GETS       | NUMBER       |          | Number of times a latch was requested in no-wait mode                                                                                                                                        |
| IMMEDIATE_MISSES     | NUMBER       |          | Number of times a no-wait latch request did not succeed (that is, missed)                                                                                                                    |
| SPIN_GETS            | NUMBER       |          | Number of willing-to-wait latch requests which missed the first try but succeeded while spinning                                                                                             |
| SLEEP[1   2   3   4] | NUMBER       |          | These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero. |
| WAIT_TIME            | NUMBER       |          | Elapsed time spent waiting for the latch (in microseconds)                                                                                                                                   |
| CON_DBID             | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                           |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.2 DBA\_HIST\_LATCH\_CHILDREN

DBA\_HIST\_LATCH\_CHILDREN displays historical statistics about child latches.

This view includes all columns of DBA\_HIST\_LATCH plus the CHILD# column. Note that child latches have the same parent if their LATCH# columns match each other. This view contains snapshots of V\$LATCH\_CHILDREN.

| Column           | Datatype     | NULL     | Description                                                                                                |
|------------------|--------------|----------|------------------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER       | NOT NULL | Unique snapshot ID                                                                                         |
| DBID             | NUMBER       | NOT NULL | Database ID for the snapshot                                                                               |
| INSTANCE_NUMBER  | NUMBER       | NOT NULL | Instance number for the snapshot                                                                           |
| LATCH_HASH       | NUMBER       | NOT NULL | Latch hash                                                                                                 |
| LATCH_NAME       | VARCHAR2(64) | NOT NULL | Latch name                                                                                                 |
| CHILD#           | NUMBER       | NOT NULL | Child latch number (unique only to each parent latch)                                                      |
| GETS             | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode                                            |
| MISSES           | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode and the requester had to wait              |
| SLEEPS           | NUMBER       |          | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch |
| IMMEDIATE_GETS   | NUMBER       |          | Number of times a latch was requested in no-wait mode                                                      |
| IMMEDIATE_MISSES | NUMBER       |          | Number of times a no-wait latch request did not succeed (that is, missed)                                  |
| SPIN_GETS        | NUMBER       |          | Number of willing-to-wait latch requests which missed the first try but succeeded while spinning           |

| Column               | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLEEP[1   2   3   4] | NUMBER   |      | These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero.                                                                                                                                                                                                                                                  |
| WAIT_TIME            | NUMBER   |      | Elapsed time spent waiting for the latch (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_DBID             | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.3 DBA\_HIST\_LATCH\_MISSES\_SUMMARY

DBA\_HIST\_LATCH\_MISSES\_SUMMARY displays historical summary statistics about missed attempts to acquire a latch.

This view contains snapshots of V\$LATCH\_MISSES.

| Column          | Datatype     | NULL     | Description                                                  |
|-----------------|--------------|----------|--------------------------------------------------------------|
| SNAP_ID         | NUMBER       | NOT NULL | Unique snapshot ID                                           |
| DBID            | NUMBER       | NOT NULL | Database ID for the snapshot                                 |
| INSTANCE_NUMBER | NUMBER       | NOT NULL | Instance number for the snapshot                             |
| PARENT_NAME     | VARCHAR2(50) | NOT NULL | Latch name of a parent latch                                 |
| WHERE_IN_CODE   | VARCHAR2(64) | NOT NULL | Location that attempted to acquire the latch                 |
| NWFAIL_COUNT    | NUMBER       |          | Number of times that no-wait acquisition of the latch failed |
| SLEEP_COUNT     | NUMBER       |          | Number of times that acquisition attempts caused sleeps      |
| WTR_SLP_COUNT   | NUMBER       |          | Number of times a waiter slept                               |
| CON_DBID        | NUMBER       |          | The database ID of the PDB for the sampled session           |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. ## 6.5 DBA\_HIST\_LATCH\_PARENT

DBA\_HIST\_LATCH\_PARENT displays historical statistics about parent latches.

This view contains snapshots of V\$LATCH\_PARENT.

| Column               | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID              | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DBID                 | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE_NUMBER      | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                              |
| LATCH_HASH           | NUMBER       | NOT NULL | Latch hash                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LATCH_NAME           | VARCHAR2(64) | NOT NULL | Latch name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LEVEL#               | NUMBER       | NOT NULL | Latch level                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| GETS                 | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode                                                                                                                                                                                                                                                                                                                                                                               |
| MISSES               | NUMBER       |          | Number of times the latch was requested in willing-to-wait mode and the requester had to wait                                                                                                                                                                                                                                                                                                                                                 |
| SLEEPS               | NUMBER       |          | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch                                                                                                                                                                                                                                                                                                                                    |
| IMMEDIATE_GETS       | NUMBER       |          | Number of times a latch was requested in no-wait mode                                                                                                                                                                                                                                                                                                                                                                                         |
| IMMEDIATE_MISSES     | NUMBER       |          | Number of times a no-wait latch request did not succeed (that is, missed)                                                                                                                                                                                                                                                                                                                                                                     |
| SPIN_GETS            | NUMBER       |          | Number of willing-to-wait latch requests which missed the first try but succeeded while spinning                                                                                                                                                                                                                                                                                                                                              |
| SLEEP[1   2   3   4] | NUMBER       |          | These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero.                                                                                                                                                                                                                                                  |
| WAIT_TIME            | NUMBER       |          | Elapsed time spent waiting for the latch (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_DBID             | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER       |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.10 DBA\_HIST\_MEMORY\_TARGET\_ADVICE

DBA\_HIST\_MEMORY\_TARGET\_ADVICE displays memory target advice history.

This view contains snapshots of V\$MEMORY\_TARGET\_ADVICE.

| Column             | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                 |
|--------------------|----------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID            | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                          |
| DBID               | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER    | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                            |
| MEMORY_SIZE        | NUMBER   | NOT NULL | If the MEMORY_SIZE_FACTOR column has a value of 1, then this column shows the current size of memory, as set by the MEMORY_TARGET initialization parameter.<br>If the value of the MEMORY_SIZE_FACTOR column is less than or greater than 1, then this column shows a proposed memory size. |
| MEMORY_SIZE_FACTOR | NUMBER   |          | A multiplier for the current memory size. Possible values are 0.25, 0.5, 0.75, 1, 1.5, 1.75 and 2. This multiplier times the current memory size equals the value of the MEMORY_SIZE column.                                                                                                |
| ESTD_DB_TIME       | NUMBER   |          | For current memory size (MEMORY_SIZE_FACTOR = 1), the amount of database time required to complete the current workload. For a proposed memory size, the estimated amount of database time that would be required if the MEMORY_TARGET parameter were changed to the proposed size.         |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_DB_TIME_FACTOR | NUMBER   |      | For a proposed memory size, ratio of estimated database time to current database time                                                                                                                                                                                                                                                                                                                                                                  |
| VERSION             | NUMBER   |      | Version number of this recommendation                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_DBID            | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID              | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.12 DBA\_HIST\_MTTR\_TARGET\_ADVICE

DBA\_HIST\_MTTR\_TARGET\_ADVICE displays historical predictions of the number of physical I/O requests for the MTTR corresponding to each row.

The data also includes a physical I/O factor, which is the ratio of the number of estimated I/O requests to the number of I/O requests actually performed by the current MTTR setting during the measurement interval. This view contains snapshots of V\$MTTR\_TARGET\_ADVICE.

| Column                   | Datatype    | NULL     | Description                                                                                                                                                                                  |
|--------------------------|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                  | NUMBER      | NOT NULL | Unique snapshot ID                                                                                                                                                                           |
| DBID                     | NUMBER      | NOT NULL | Database ID for the snapshot                                                                                                                                                                 |
| INSTANCE_NUMBER          | NUMBER      | NOT NULL | Instance number for the snapshot                                                                                                                                                             |
| MTTR_TARGET_FOR_ESTIMATE | NUMBER      |          | MTTR setting being simulated (equal to the current MTTR setting if this is the first row of the view)                                                                                        |

| LOCATION        | VARCHAR2(40) | NOT NULL | The code location where the waiter slept for the mutex                                                                                                                                                                                                                                                                                                                                                                                                     |
| SLEEPS          | NUMBER       |          | Number of sleeps for this MUTEX_TYPE and LOCATION                                                                                                                                                                                                                                                                                                                                                                                                          |
| WAIT_TIME       | NUMBER       |          | Wait time in microseconds                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_DBID        | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID          | NUMBER       |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.14 DBA\_HIST\_OPTIMIZER\_ENV

DBA\_HIST\_OPTIMIZER\_ENV displays the optimizer environments that have been captured in the Workload Repository.

This view is used with the DBA\_HIST\_SQLSTAT view.

| Column                   | Datatype  | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 6.19 DBA\_HIST\_PDB\_IN\_SNAP

DBA\_HIST\_PDB\_IN\_SNAP captures a list of open pluggable databases (PDBs) at the time of the Automatic Workload Repository (AWR) snapshot. This view can be used with other DBA\_HIST\_ views to construct the number of opened PDBs at the time of the snapshot.

| Column          | Datatype                    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER                      | NOT NULL | AWR snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DBID            | NUMBER                      | NOT NULL | Database ID of the database that took this snapshot                                                                                                                                                                                                                                                                                                                                                                                             |
| INSTANCE_NUMBER | NUMBER                      | NOT NULL | Instance number of the instance that took this snapshot                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID        | NUMBER                      |          | DBID of an open PDB at the time of the snapshot                                                                                                                                                                                                                                                                                                                                                                                                 |
| FLAG            | NUMBER                      |          | Flag field in capture properties of the PDB. Not used at this time.                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID          | NUMBER                      |          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| OPEN_TIME_TZ    | TIMESTAMP(3) WITH TIME ZONE |          | Time the PDB was last opened                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 6.20 DBA\_HIST\_PDB\_INSTANCE

DBA\_HIST\_PDB\_INSTANCE displays the pluggable databases (PDBs) and instances in the Workload Repository.

| Column          | Datatype      | NULL     | Description                                        |
|-----------------|---------------|----------|----------------------------------------------------|
| DBID            | NUMBER        | NOT NULL | Database ID                                        |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number                                    |
| STARTUP_TIME    | TIMESTAMP(3)  | NOT NULL | Startup time of the instance                       |
| CON_DBID        | NUMBER        | NOT NULL | The database ID of the PDB for the sampled session |
| OPEN_TIME       | TIMESTAMP(3)  | NOT NULL | Time the PDB was last opened                       |
| OPEN_MODE       | VARCHAR2(16)  |          | Open mode of the database                          |
| PDB_NAME        | VARCHAR2(128) |          | PDB name                                           |

| Column          | Datatype                    | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-----------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID          | NUMBER                      |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SNAP_ID         | NUMBER                      |      | The unique snapshot identifier of the snapshot that flushed the corresponding row                                                                                                                                                                                                                                                                                                                                                                |
| STARTUP_TIME_TZ | TIMESTAMP(3) WITH TIME ZONE |      | Startup time of the instance                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 6.21 DBA\_HIST\_PERSISTENT\_QMN\_CACHE

DBA\_HIST\_PERSISTENT\_QMN\_CACHE displays the historical summary background queue table activity.

This view contains snapshots from V\$PERSISTENT\_QMN\_CACHE.

| Column              | Datatype     | NULL     | Description                                                                    |
|---------------------|--------------|----------|--------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER       | NOT NULL | Unique snapshot ID                                                             |
| DBID                | NUMBER       | NOT NULL | Database ID for the snapshot                                                   |
| INSTANCE_NUMBER     | NUMBER       | NOT NULL | Instance number for the snapshot                                               |
| QUEUE_TABLE_ID      | NUMBER       | NOT NULL | Queue table object ID                                                          |
| TYPE                | VARCHAR2(32) |          | Type of the queue table's queue monitor cache                                  |
| STATUS              | NUMBER       |          | Status of the queue table's queue monitor cache                                |
| NEXT_SERVICE_TIME   | TIMESTAMP(3) |          | Time when the queue table should be serviced by QMON servers                   |
| WINDOW_END_TIME     | TIMESTAMP(3) |          | Time manager activity period for non-owner queue table operations              |
| TOTAL_RUNS          | NUMBER       |          | Total number of times this queue table is served                               |
| TOTAL_LATENCY       | NUMBER       |          | Cumulative latency in serving the queue table (in hundredths of a second)      |
| TOTAL_ELAPSED_TIME  | NUMBER       |          | Total time spent in processing this queue table (in seconds)                   |
| TOTAL_CPU_TIME      | NUMBER       |          | Cumulative CPU time for serving the queue table (in hundredths of a second)    |
| TMGR_ROWS_PROCESSED | NUMBER       |          | Number of time manager entries processed                                       |
| TMGR_ELAPSED_TIME   | NUMBER       |          | Cumulative time for time management activities (in hundredths of a second)     |
| TMGR_CPU_TIME       | NUMBER       |          | Cumulative CPU time for time management activities (in hundredths of a second) |

| Column                         | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 6.22 DBA\_HIST\_PERSISTENT\_QUEUES

DBA\_HIST\_PERSISTENT\_QUEUES displays Oracle Database AQ persistent queues historical statistics information.

This view contains snapshots of V\$PERSISTENT\_QUEUES.

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column                       | Datatype      | NULL     | Description                                                                                                                                             |
|------------------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER              | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                        |
| QUEUE_SCHEMA                 | VARCHAR2(128) | NOT NULL | Owner of the queue                                                                                                                                      |
| QUEUE_NAME                   | VARCHAR2(128) | NOT NULL | Name of the queue                                                                                                                                       |
| QUEUE_ID                     | NUMBER        | NOT NULL | Identifier for the queue                                                                                                                                |
| FIRST_ACTIVITY_TIME          | TIMESTAMP(6)  |          | First queue activity time since database startup                                                                                                        |
| ENQUEUED_MSGS                | NUMBER        |          | Number of messages enqueued                                                                                                                             |
| DEQUEUED_MSGS                | NUMBER        |          | Number of messages dequeued                                                                                                                             |
|                              |               |          | <b>Note:</b> This column will not be incremented until all the subscribers of the message have dequeued the message and its retention time has elapsed. |
| BROWSED_MSGS                 | NUMBER        |          | Number of messages that have been browsed                                                                                                               |
| ELAPSED_ENQUEUE_TIME         | NUMBER        |          | Total time (in hundredths of a second) spent doing enqueue                                                                                              |
| ELAPSED_DEQUEUE_TIME         | NUMBER        |          | Total time (in hundredths of a second) spent doing dequeue                                                                                              |
| ENQUEUE_CPU_TIME             | NUMBER        |          | Total CPU time for enqueue (in hundredths of a second)                                                                                                  |
| DEQUEUE_CPU_TIME             | NUMBER        |          | Total CPU time for dequeue (in hundredths of a second)                                                                                                  |
| AVG_MSG_AGE                  | NUMBER        |          | Average age of messages in the queue                                                                                                                    |
| DEQUEUED_MSG_LATENCY         | NUMBER        |          | Last dequeued message latency (in seconds)                                                                                                              |
| ELAPSED_TRANSFORMATION_TIME  | NUMBER        |          | Total time (in hundredths of a second) spent doing transformation                                                                                       |
| ELAPSED_RULE_EVALUATION_TIME | NUMBER        |          | Total time (in hundredths of a second) spent doing rule evaluation                                                                                      |
| ENQUEUED_EXPIRY_MSGS         | NUMBER        |          | Number of messages enqueued with expiry                                                                                                                 |
| ENQUEUED_DELAY_MSGS          | NUMBER        |          | Number of messages enqueued with delay                                                                                                                  |
| MSGs_MADE_EXPIRED            | NUMBER        |          | Number of messages expired by time manager                                                                                                              |
| MSGs_MADE_READY              | NUMBER        |          | Number of messages made ready by time manager                                                                                                           |
| LAST_ENQUEUE_TIME            | TIMESTAMP(6)  |          | Last message enqueue time                                                                                                                               |
| LAST_DEQUEUE_TIME            | TIMESTAMP(6)  |          | Last message dequeue time                                                                                                                               |
| LAST_TM_EXPIRY_TIME          | TIMESTAMP(6)  |          | Last time message was expired by time manager                                                                                                           |
| LAST_TM_READY_TIME           | TIMESTAMP(6)  |          | Last time message was made ready by time manager                                                                                                        |
| ENQUEUE_TRANSACTIONS         | NUMBER        |          | Number of enqueue transactions                                                                                                                          |
| DEQUEUE_TRANSACTIONS         | NUMBER        |          | Number of dequeue transactions                                                                                                                          |
| EXECUTION_COUNT              | NUMBER        |          | Number of executions of the dequeue cursor                                                                                                              |
| CON_DBID                     | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                      |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.24 DBA\_HIST\_PGA\_TARGET\_ADVICE

DBA\_HIST\_PGA\_TARGET\_ADVICE displays historical predictions of how the cache hit percentage and over allocation count statistics displayed by the V\$PGASTAT performance view would be impacted if the value of the PGA\_AGGREGATE\_TARGET parameter is changed.

This view contains snapshots of V\$PGA\_TARGET\_ADVICE.

| Column                  | Datatype    | NULL     | Description                                                                                                             |
|-------------------------|-------------|----------|-------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER      | NOT NULL | Unique snapshot ID                                                                                                      |
| DBID                    | NUMBER      | NOT NULL | Database ID for the snapshot                                                                                            |
| INSTANCE_NUMBER         | NUMBER      | NOT NULL | Instance number for the snapshot                                                                                        |
| PGA_TARGET_FOR_ESTIMATE | NUMBER      | NOT NULL | Value of PGA_AGGREGATE_TARGET for the prediction (in bytes)                                                             |
| PGA_TARGET_FACTOR       | NUMBER      |          | PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter                                       |
| ADVICE_STATUS           | VARCHAR2(3) |          | Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter |
| BYTES_PROCESSED         | NUMBER      |          | Total bytes processed by all the work areas considered by this advice (in bytes)                                        |
| ESTD_TIME               | NUMBER      |          | Time (in seconds) required to process the bytes                                                                         |

| Column                        | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_EXTRA_BYTES_RW           | NUMBER   |      | Estimated number of extra bytes which would be read or written if PGA_AGGREGATE_TARGET was set to the value of the PGA_TARGET_FOR_ESTIMATE column. This number is derived from the estimated number and size of work areas which would run in one-pass (or multi-pass) for that value of PGA_AGGREGATE_TARGET.                                                                                                                                      |
| ESTD_PGA_CACHE_HIT_PERCENTAGE | NUMBER   |      | Estimated value of the cache hit percentage statistic when PGA_AGGREGATE_TARGET equals PGA_TARGET_FOR_ESTIMATE. This column is derived from the above two columns and is equal to $\text{BYTES\_PROCESSED} / (\text{BYTES\_PROCESSED} + \text{ESTD\_EXTRA\_BYTES\_RW})$                                                                                                                                                                             |
| ESTD_OVERALLOC_COUNT          | NUMBER   |      | Estimated number of PGA memory over-allocations if the value of PGA_AGGREGATE_TARGET is set to PGA_TARGET_FOR_ESTIMATE. A nonzero value means that PGA_TARGET_FOR_ESTIMATE is not large enough to run the work area workload. Hence, PGA_AGGREGATE_TARGET should not be set to PGA_TARGET_FOR_ESTIMATE since Oracle will not be able to honor that target.                                                                                          |
| CON_DBID                      | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID                        | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.25 DBA\_HIST\_PGASTAT

DBA\_HIST\_PGASTAT displays historical PGA memory usage statistics as well as statistics about the automatic PGA memory manager when it is enabled.

This view contains snapshots of V\$PGASTAT.

| Column          | Datatype | NULL     | Description                  |
|-----------------|----------|----------|------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Database instance number     |

| Column   | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 6.27 DBA\_HIST\_PLAN\_OPTION\_NAME

DBA\_HIST\_PLAN\_OPTION\_NAME displays historical information about SQL plan option names.

| Column      | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID        | NUMBER       | NOT NULL | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OPTION_ID   | NUMBER       | NOT NULL | Plan option identifier                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTION_NAME | VARCHAR2(64) |          | Plan option name. This value also appears in the SQL_PLAN_OPTIONS column of the DBA_HIST_ACTIVE_SESS_HISTORY view.                                                                                                                                                                                                                                                                                                                               |
| CON_DBID    | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID      | NUMBER       |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.28 DBA\_HIST\_PROCESS\_MEM\_SUMMARY

DBA\_HIST\_PROCESS\_MEM\_SUMMARY displays historical information about dynamic PGA memory usage by named component categories for each process.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |

| Column            | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CATEGORY          | VARCHAR2(15) | NOT NULL | Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories                                                                                                             |
| IS_INSTANCE_WIDE  | NUMBER       |          | This column shows whether the process memory detail is for only this container or for the whole instance. If the value is 1, the detail is for the whole instance. Any other value is the container ID for the container to which the detail pertains, as seen in the CON_ID column.                                                                                                                                                          |
| NUM_PROCESSES     | NUMBER       |          | Number of processes                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NON_ZERO_ALLOCS   | NUMBER       |          | Number of processes with nonzero allocations                                                                                                                                                                                                                                                                                                                                                                                                  |
| USED_TOTAL        | NUMBER       |          | Bytes of PGA memory used by the process for the category                                                                                                                                                                                                                                                                                                                                                                                      |
| ALLOCATED_TOTAL   | NUMBER       |          | Total number of bytes of PGA memory allocated by the process for the category.                                                                                                                                                                                                                                                                                                                                                                |
| ALLOCATED_AVG     | NUMBER       |          | Average number of bytes of PGA memory allocated by the process for the category                                                                                                                                                                                                                                                                                                                                                               |
| ALLOCATED_STDDEV  | NUMBER       |          | Standard deviation of the number of bytes of PGA memory allocated by the process for the category                                                                                                                                                                                                                                                                                                                                             |
| ALLOCATED_MAX     | NUMBER       |          | Maximum bytes of PGA memory ever allocated by the process for the category                                                                                                                                                                                                                                                                                                                                                                    |
| MAX_ALLOCATED_MAX | NUMBER       |          | Maximum bytes of PGA memory that can be allocated by the process for the category                                                                                                                                                                                                                                                                                                                                                             |
| CON_DBID          | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID            | NUMBER       |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.29 DBA\_HIST\_PROCESS\_WAITTIME

DBA\_HIST\_PROCESS\_WAITTIME displays CPU and wait time by process types.

| Column          | Datatype    | NULL     | Description                      |
|-----------------|-------------|----------|----------------------------------|
| SNAP_ID         | NUMBER      | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER      | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER      | NOT NULL | Instance number for the snapshot |
| PROCESS_TYPE    | VARCHAR2(5) | NOT NULL | Process type                     |

| Column          | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION     | VARCHAR2(64) | NOT NULL | Process description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| WAIT_CLASS_TYPE | VARCHAR2(64) | NOT NULL | Type of wait class                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| VALUE           | NUMBER       |          | Wait time or CPU used time in milliseconds                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_DBID        | NUMBER       |          | The database ID of the PDB for the process                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID          | NUMBER       |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.30 DBA\_HIST\_RECOVERY\_PROGRESS

DBA\_HIST\_RECOVERY\_PROGRESS displays database recovery progress information for an instance.

| Column          | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| CON_DBID  | NUMBER       |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID    | NUMBER       |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root.</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.31 DBA\_HIST\_REPLICATION\_TBL\_STATS

DBA\_HIST\_REPLICATION\_TBL\_STATS displays replication table statistics for Oracle GoldenGate and XStream sessions. This view is intended for use with Automatic Workload Repository (AWR).

| Column            | Datatype      | NULL     | Description                                                                                                 |
|-------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------|
| SNAP_ID           | NUMBER        | NOT NULL | Unique snapshot ID                                                                                          |
| DBID              | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                |
| INSTANCE_NUMBER   | NUMBER        | NOT NULL | Instance number for the snapshot                                                                            |
| APPLY_NAME        | VARCHAR2(128) | NOT NULL | Name of the apply process                                                                                   |
| TABLE_NAME        | VARCHAR2(128) | NOT NULL | Name of the table                                                                                           |
| TABLE_OWNER       | VARCHAR2(128) | NOT NULL | Owner of the table                                                                                          |
| SESSION_MODULE    | VARCHAR2(64)  | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>XStream</li> <li>GoldenGate</li> </ul> |
| TOTAL_INSERTS     | NUMBER        |          | Number of insert operations on this table processed by this apply server                                    |
| TOTAL_UPDATES     | NUMBER        |          | Number of update operations on this table processed by this apply server                                    |
| TOTAL_DELETES     | NUMBER        |          | Number of delete operations on this table processed by this apply server                                    |
| CDR_SUCCESSFUL    | NUMBER        |          | Number of successfully resolved conflicts                                                                   |
| CDR_FAILED        | NUMBER        |          | Number of conflicts that could not be resolved due to an error during resolution                            |
| REPERR_CNT        | NUMBER        |          | The total number of errors for the replication operation                                                    |
| HANDLE_COLLISIONS | NUMBER        |          | Number of collisions on this table handled by this apply server                                             |
| CON_DBID          | NUMBER        |          | The database ID of the PDB for the sampled session                                                          |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. | CON_DBID         | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID           | NUMBER        |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.33 DBA\_HIST\_REPORTS

DBA\_HIST\_REPORTS displays information about XML reports captured into Automatic Workload Repository (AWR).

The reports themselves belong to components such as SQL Monitor, DBOP, and Real-Time ADDM.

Each XML report contains details about some activity of a component. For example, a SQL Monitor report contains a detailed report about a particular execution of a SQL statement, or a Real-Time ADDM report contains system performance data analyzed by Real-Time ADDM.

| Column                  | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER         |      | ID of the first Automatic Workload Repository (AWR) snapshot that will be taken after this report is generated                                                                                                                                                                                                                                                                                                                                   |
| DBID                    | NUMBER         |      | Database ID of the current database for the report                                                                                                                                                                                                                                                                                                                                                                                               |
| INSTANCE_NUMBER         | NUMBER         |      | Instance number (for an Oracle RAC system)                                                                                                                                                                                                                                                                                                                                                                                                       |
| REPORT_ID               | NUMBER         |      | ID of the captured report                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COMPONENT_ID            | NUMBER         |      | ID of the component (for example, SQL Monitor) whose report is captured                                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID              | NUMBER         |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                             |
| SESSION_SERIAL#         | NUMBER         |      | Session serial number corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                         |
| PERIOD_START_TIME       | DATE           |      | Time when the activity period started                                                                                                                                                                                                                                                                                                                                                                                                            |
| PERIOD_END_TIME         | DATE           |      | Time when the activity period ended                                                                                                                                                                                                                                                                                                                                                                                                              |
| GENERATION_TIME         | DATE           |      | Time when this report was generated                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPONENT_NAME          | VARCHAR2(128)  |      | Name of the component whose report this is                                                                                                                                                                                                                                                                                                                                                                                                       |
| REPORT_NAME             | VARCHAR2(128)  |      | Name of this report                                                                                                                                                                                                                                                                                                                                                                                                                              |
| REPORT_PARAMETERS       | VARCHAR2(1024) |      | Parameters associated with this report                                                                                                                                                                                                                                                                                                                                                                                                           |
| KEY1                    | VARCHAR2(128)  |      | Key1 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |
| KEY2                    | VARCHAR2(128)  |      | Key2 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |
| KEY3                    | VARCHAR2(128)  |      | Key3 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |
| KEY4                    | VARCHAR2(256)  |      | Key4 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |
| GENERATION_COST_SECONDS | NUMBER         |      | Time taken to generate this report (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                  |
| REPORT_SUMMARY          | VARCHAR2(4000) |      | Summary of this report                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_DBID                | NUMBER         |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                  | NUMBER         |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.34 DBA\_HIST\_REPORTS\_CONTROL

DBA\_HIST\_REPORTS\_CONTROL contains control information about the report capture mechanism that automatically captures XML reports to Automatic Workload Repository (AWR).

Reports are captured automatically for components like SQL Monitor and Real-Time Automatic Database Diagnostic Monitor (Real-Time ADDM).

| Column         | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID           | NUMBER       |      | Database ID of the current database for the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| EXECUTION_MODE | VARCHAR2(12) |      | Mode of execution of automatic report capture.<br>Possible values: <ul style="list-style-type: none"><li>REGULAR: Regular per-minute report capture subject to DBTIME budget</li><li>FULL_CAPTURE: Report capture will be run per minute without the DBTIME budget constraints and is provided to capture a more comprehensive set of reports</li></ul> <b>NOTE:</b> The FULL_CAPTURE mode can be started and ended respectively by executing the START_REPORT_CAPTURE and FINISH_REPORT_CAPTURE APIs in the DBMS_AUTO_REPORT package. At all other times, the execution mode should be REGULAR. |

## 6.35 DBA\_HIST\_REPORTS\_DETAILS

DBA\_HIST\_REPORTS\_DETAILS displays details about each report captured in Automatic Workload Repository (AWR).

Metadata for each report appears in the DBA\_HIST\_REPORTS view while the actual report is available in the DBA\_HIST\_REPORTS\_DETAILS view.

| Column          | Datatype | NULL | Description                                                                                          |
|-----------------|----------|------|------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER   |      | ID of the first AWR snapshot that will be taken after this report is generated                       |
| DBID            | NUMBER   |      | Database ID of the current database for the report                                                   |
| INSTANCE_NUMBER | NUMBER   |      | Instance number (for an Oracle RAC system)                                                           |
| REPORT_ID       | NUMBER   |      | ID of the captured report                                                                            |
| SESSION_ID      | NUMBER   |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports) |
| SESSION_SERIAL# | NUMBER   |      | Session serial number relevant to this report (currently used only for SQL Monitor reports)          |
| GENERATION_TIME | DATE     |      | Time when this report was generated                                                                  |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPORT_COMPRESSED | BLOB     |      | Actual XML report in compressed form                                                                                                                                                                                                                                                                                                                                                                                                             |
| REPORT            | CLOB     |      | Full uncompressed report                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID          | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID            | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.36 DBA\_HIST\_REPORTS\_TIMEBANDS

DBA\_HIST\_REPORTS\_TIMEBANDS contains bands of time with a new row created every day corresponding to a band of time.

Each band of time represents a period of time, and has a row for every report captured automatically into Automatic Workload Repository (AWR) during that time. If the activity period of a report spans across two bands of time (for example, the activity started before midnight and ended after midnight), then the view contains two rows for that report, with one row for each band of time. The view is partitioned to provide fast access to all reports captured in a given time frame.

| Column                 | Datatype      | NULL | Description                                                             |
|------------------------|---------------|------|-------------------------------------------------------------------------|
| SNAP_ID                | NUMBER        |      | The AWR snapshot id corresponding to the report                         |
| DBID                   | NUMBER        |      | Database ID of the current database for the report                      |
| INSTANCE_NUMBER        | NUMBER        |      | Instance number (for an Oracle RAC system)                              |
| CON_DBID               | NUMBER        |      | CDB ID of the captured report                                           |
| COMPONENT_ID           | NUMBER        |      | ID of the component (for example, SQL Monitor) whose report is captured |
| COMPONENT_NAME         | VARCHAR2(128) |      | Name of the component whose report is captured                          |
| BAND_START_TIME        | DATE          |      | Starting time of the time band                                          |
| BAND_LENGTH            | NUMBER        |      | Length of time band in days (currently unused)                          |
| REPORT_ID              | NUMBER        |      | ID of the captured report                                               |
| REPORT_GENERATION_TIME | DATE          |      | Time when the report was generated                                      |
| PERIOD_START_TIME      | DATE          |      | Time when the activity period started                                   |
| PERIOD_END_TIME        | DATE          |      | Time when the activity period ended                                     |
| KEY1                   | VARCHAR2(128) |      | Key1 associated with the captured report                                |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| KEY4            | VARCHAR2(256) |      | Key4 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |
| SESSION_ID      | NUMBER        |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                             |
| SESSION_SERIAL# | NUMBER        |      | Session serial number corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                         |
| CON_ID          | NUMBER        |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.37 DBA\_HIST\_RESOURCE\_LIMIT

DBA\_HIST\_RESOURCE\_LIMIT displays historical information about global resource use for some of the system resource.

This view contains snapshots of V\$RESOURCE\_LIMIT.

If time is of interest, join this view with DBA\_HIST\_SNAPSHOT.END\_INTERVAL\_TIME.

| Column              | Datatype     | NULL     | Description                                                                                                                                              |
|---------------------|--------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                       |
| DBID                | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                             |
| INSTANCE_NUMBER     | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                         |
| RESOURCE_NAME       | VARCHAR2(30) | NOT NULL | Name of the resource                                                                                                                                     |
| CURRENT_UTILIZATION | NUMBER       |          | Number of (resources, locks, or processes) currently being used                                                                                          |
| MAX_UTILIZATION     | NUMBER       |          | Maximum consumption of the resource since the last instance start up                                                                                     |
| INITIAL_ALLOCATION  | VARCHAR2(10) |          | Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation). |
| LIMIT_VALUE         | VARCHAR2(10) |          | Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).                                 |
| CON_DBID            | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                       |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.38 DBA\_HIST\_ROWCACHE\_SUMMARY

DBA\_HIST\_ROWCACHE\_SUMMARY displays historical summary statistics for data dictionary activity.

This view contains snapshots of V\$ROWCACHE.

| Column          | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| SNAP_ID         | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DBID            | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INSTANCE_NUMBER | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PARAMETER       | VARCHAR2(32) | NOT NULL | Name of the initialization parameter that determines the number of entries in the data dictionary cache                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_USAGE     | NUMBER       |          | Sum of the total number of entries in the cache                                                                                                                                                                                                                                                                                                                                                                                                      |
| USAGE           | NUMBER       |          | Number of cache entries that contain valid data                                                                                                                                                                                                                                                                                                                                                                                                      |
| GETS            | NUMBER       |          | Total number of requests for information on the data object                                                                                                                                                                                                                                                                                                                                                                                          |
| GETMISSES       | NUMBER       |          | Number of data requests resulting in cache misses                                                                                                                                                                                                                                                                                                                                                                                                    |
| SCANS           | NUMBER       |          | Number of scan requests                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SCANMISSES      | NUMBER       |          | Number of times a scan failed to find the data in the cache                                                                                                                                                                                                                                                                                                                                                                                          |
| SCANCOMPLETES   | NUMBER       |          | For a list of subordinate entries, the number of times the list was scanned completely                                                                                                                                                                                                                                                                                                                                                               |
| MODIFICATIONS   | NUMBER       |          | Number of inserts, updates, and deletions                                                                                                                                                                                                                                                                                                                                                                                                            |
| FLUSHES         | NUMBER       |          | Number of times flushed to disk                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DLM_REQUESTS    | NUMBER       |          | Number of DLM requests                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DLM_CONFLICTS   | NUMBER       |          | Number of DLM conflicts                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DLM_RELEASES    | NUMBER       |          | Number of DLM releases                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID        | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID          | NUMBER       |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.39 DBA\_HIST\_RSRC\_CONSUMER\_GROUP

DBA\_HIST\_RSRC\_CONSUMER\_GROUP displays historical information about Resource Manager consumer groups.

This view contains snapshots of V\$RSRC\_CONS\_GROUP\_HISTORY.

| Column                | Datatype      | NULL     | Description                                                                                                                                                                                             |
|-----------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID               | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                      |
| DBID                  | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                            |
| INSTANCE_NUMBER       | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                        |
| SEQUENCE#             | NUMBER        | NOT NULL | A sequential counter that uniquely describes the DBA_HIST_RSRC_PLAN entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                  |
| CONSUMER_GROUP_ID     | NUMBER        | NOT NULL | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                           |
| CONSUMER_GROUP_NAME   | VARCHAR2(128) | NOT NULL | Name of the consumer group                                                                                                                                                                              |
| REQUESTS              | NUMBER        | NOT NULL | Cumulative number of requests that were executed in the consumer group                                                                                                                                  |
| CPU_WAIT_TIME         | NUMBER        | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.                            |
| CPU_WAITS             | NUMBER        | NOT NULL | Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. |
| CONSUMED_CPU_TIME     | NUMBER        | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                          |
| YIELDS                | NUMBER        | NOT NULL | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration                                                                         |
| ACTIVE_SESS_LIMIT_HIT | NUMBER        | NOT NULL | Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit                                                                             |
| UNDO_LIMIT_HIT        | NUMBER        | NOT NULL | Number of times that queries in the consumer group were cancelled because the consumer group reached its UNDO_POOL limit                                                                                |
| SWITCHES_IN_CPU_TIME  | NUMBER        | NOT NULL | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                     |
| SWITCHES_OUT_CPU_TIME | NUMBER        | NOT NULL | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                   |

| PQ_QUEUED_TIME        | NUMBER   |          | Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)                                                                                                                                                                                                                                                                                                                 |
| PQ_QUEUE_TIME_OUTS    | NUMBER   |          | Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit                                                                                                                                                                                                                                                             |
| PQS_COMPLETED         | NUMBER   |          | Total number of completed parallel statements in the consumer group                                                                                                                                                                                                                                                                                                                                                                           |
| PQ_SERVERS_USED       | NUMBER   |          | Total number of parallel servers used by completed parallel statements in the consumer group                                                                                                                                                                                                                                                                                                                                                  |
| PQ_ACTIVE_TIME        | NUMBER   |          | Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)                                                                                                                                                                                                                                                                                                                     |
| CON_DBID              | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                | NUMBER   |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.40 DBA\_HIST\_RSRC\_METRIC

DBA\_HIST\_RSRC\_METRIC displays information about historical Resource Manager metrics for the past hour.

| Column                      | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                 |
|-----------------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                     | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                          |
| DBID                        | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER             | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                            |
| BEGIN_TIME                  | TIMESTAMP(3) | NOT NULL | Begin time of the interval                                                                                                                                                                                                                                                  |
| END_TIME                    | TIMESTAMP(3) | NOT NULL | End time of the interval                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC                | NUMBER       | NOT NULL | Interval size (in hundredths of a second)                                                                                                                                                                                                                                   |
| SEQUENCE#                   | NUMBER       | NOT NULL | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                    |
| CONSUMER_GROUP_ID           | NUMBER       | NOT NULL | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                                                                                               |
| CPU_CONSUMED_TIME           | NUMBER       | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds                                                                                                                                                                               |
| CPU_WAIT_TIME               | NUMBER       | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| AVG_RUNNING_SESSIONS        | NUMBER       |          | Average number of sessions in the consumer group that are currently running                                                                                                                                                                                                 |
| AVG_WAITING_SESSIONS        | NUMBER       |          | Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                         |
| RUNNING_SESSION_LIMIT       | NUMBER       |          | Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.                                                 |
| AVG_CPU_UTILIZATION         | NUMBER       |          | Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system                                                                                                                                                            |
| IO_REQUESTS                 | NUMBER       | NOT NULL | I/O requests                                                                                                                                                                                                                                                                |
| IO_MEGABYTES                | NUMBER       | NOT NULL | I/O megabytes                                                                                                                                                                                                                                                               |
| IOPS                        | NUMBER       |          | I/O operations per second during the previous minute for this PDB                                                                                                                                                                                                           |
| IOMBPS                      | NUMBER       |          | I/O megabytes per second during the previous minute for this PDB                                                                                                                                                                                                            |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER       |          | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                               |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER       |          | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER       |          | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                         |

| Column                      | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER   |      | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                                    |
| CON_DBID                    | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                      | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.41 DBA\_HIST\_RSRC\_PDB\_METRIC

DBA\_HIST\_RSRC\_PDB\_METRIC displays information about historical Resource Manager metrics for the past hour by PDB.

| Column               | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                 |
|----------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID              | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                          |
| DBID                 | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER      | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                            |
| BEGIN_TIME           | TIMESTAMP(3) | NOT NULL | Begin time of the interval                                                                                                                                                                                                                                                  |
| END_TIME             | TIMESTAMP(3) | NOT NULL | End time of the interval                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC         | NUMBER       | NOT NULL | Interval size (in hundredths of a second)                                                                                                                                                                                                                                   |
| SEQUENCE#            | NUMBER       | NOT NULL | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.                                                                                               |
| CPU_CONSUMED_TIME    | NUMBER       | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds                                                                                                                                                                                          |
| CPU_WAIT_TIME        | NUMBER       | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| AVG_RUNNING_SESSIONS | NUMBER       |          | Average number of sessions in the PDB that are currently running                                                                                                                                                                                                            |
| AVG_WAITING_SESSIONS | NUMBER       |          | Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                                    |
| AVG_CPU_UTILIZATION  | NUMBER       |          | Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system                                                                                                                                                                       |
| IOPS                 | NUMBER       |          | I/O operations per second during the previous minute for this PDB                                                                                                                                                                                                           |

| Column                      | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|----------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IOMBPS                      | NUMBER   |          | I/O megabytes per second during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                                                              |
| IOPS_THROTTLE_EXEMPT        | NUMBER   |          | Indicates how much of the I/O per second in the current PDB was exempted from throttling.<br><br>For example, if the value in the IOPS column is 20 I/Os and the value in the IOPS_THROTTLE_EXEMPT column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling.<br><br>I/O throttling is defined by the MAX_IOPS database initialization parameter.                                                             |
| IOMBPS_THROTTLE_EXEMPT      | NUMBER   |          | Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling.<br><br>For example, if the value in the IOMBPS column is 200 megabytes and the value in the IOMBPS_THROTTLE_EXEMPT column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling.<br><br>I/O megabytes per second throttling is defined by the MAX_MBPS database initialization parameter.             |
| AVG_IO_THROTTLE             | NUMBER   |          | Average throttle time per I/O operation in milliseconds during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                               |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER   |          | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                 |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER   |          | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                  |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER   |          | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                                                                                                                                                                                           |
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER   |          | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                                    |
| SGA_BYTES                   | NUMBER   | NOT NULL | The current SGA usage for this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                   |
| BUFFER_CACHE_BYTES          | NUMBER   | NOT NULL | The current usage of the buffer cache by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                    |
| SHARED_POOL_BYTES           | NUMBER   | NOT NULL | The current usage of the shared pool by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                     |
| PGA_BYTES                   | NUMBER   | NOT NULL | The current PGA usage for this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_ID                     | NUMBER   | NOT NULL | Resource Manager plan identifier                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_DBID                    | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                      | NUMBER   |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column                   | Datatype | NULL     | Description                                                |
|--------------------------|----------|----------|------------------------------------------------------------|
| MAX_AVG_RUNNING_SESSIONS | NUMBER   | NOT NULL | Maximum value of AVG_RUNNING_SESSIONS during the last hour |

## 6.42 DBA\_HIST\_RSRC\_PLAN

DBA\_HIST\_RSRC\_PLAN displays historical information about resource plans.

This view contains snapshots of V\$RSRC\_PLAN\_HISTORY.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                         |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                  |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                        |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                    |
| SEQUENCE#       | NUMBER        | NOT NULL | A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.                                                                                                    |
| START_TIME      | DATE          | NOT NULL | Time that the resource plan was enabled                                                                                                                                                                             |
| END_TIME        | DATE          |          | Time that the resource plan was disabled; NULL if the row contains the current resource plan information                                                                                                            |
| PLAN_ID         | NUMBER        | NOT NULL | Resource plan ID; NULL if the Resource Manager was disabled                                                                                                                                                         |
| PLAN_NAME       | VARCHAR2(128) | NOT NULL | Resource plan name; NULL if the Resource Manager was disabled                                                                                                                                                       |
| CPU_MANAGED     | VARCHAR2(4)   | NOT NULL | Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF) |

| Column                     | Datatype    | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|-------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARALLEL_EXECUTION_MANAGED | VARCHAR2(4) |      | State of parallel statement queuing: <ul style="list-style-type: none"> <li>• OFF - Parallel statement queuing is disabled</li> <li>• STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes</li> <li>• FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue</li> <li>• FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled.</li> </ul> |
| INSTANCE_CAGING            | VARCHAR2(4) |      | Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_DBID                   | NUMBER      |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                     | NUMBER      |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                  |

## 6.43 DBA\_HIST\_RULE\_SET

DBA\_HIST\_RULE\_SET displays historical information about rule set statistics.

| Column          | Datatype      | NULL     | Description                      |
|-----------------|---------------|----------|----------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot |
| OWNER           | VARCHAR2(128) | NOT NULL | Owner of the rule set            |
| NAME            | VARCHAR2(128) | NOT NULL | Name of the rule set             |
| STARTUP_TIME    | DATE          | NOT NULL | Startup time of the instance     |

| Column               | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_TIME             | NUMBER   |      | Total CPU time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                                |
| ELAPSED_TIME         | NUMBER   |      | Total elapsed time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                            |
| EVALUATIONS          | NUMBER   |      | Number of evaluations on the rule set                                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_FREE_EVALUATIONS | NUMBER   |      | Number of evaluations on the rule set which did not internally issue SQL to evaluate rules                                                                                                                                                                                                                                                                                                                                                    |
| SQL_EXECUTIONS       | NUMBER   |      | Total number of SQL statements executed during evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                                     |
| RELOADS              | NUMBER   |      | Number of times the rule set object was reloaded in shared memory                                                                                                                                                                                                                                                                                                                                                                             |
| CON_DBID             | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.44 DBA\_HIST\_SEG\_STAT

DBA\_HIST\_SEG\_STAT displays historical information about segment-level statistics.

This view captures the top segments based on a set of criteria and captures information from V\$SEGSTAT. The total value is the value of the statistics since instance startup. The delta value is the value of the statistics from the BEGIN\_INTERVAL\_TIME to the END\_INTERVAL\_TIME in the DBA\_HIST\_SNAPSHOT view.

| Column                  | Datatype | NULL     | Description                                       |
|-------------------------|----------|----------|---------------------------------------------------|
| SNAP_ID                 | NUMBER   | NOT NULL | Unique snapshot ID                                |
| DBID                    | NUMBER   | NOT NULL | Database ID for the snapshot                      |
| INSTANCE_NUMBER         | NUMBER   | NOT NULL | Instance number for the snapshot                  |
| TS#                     | NUMBER   | NOT NULL | Tablespace number                                 |
| OBJ#                    | NUMBER   | NOT NULL | Dictionary object number                          |
| DATAOBJ#                | NUMBER   | NOT NULL | Data object number                                |
| LOGICAL_READS_TOTAL     | NUMBER   |          | Cumulative value for logical reads                |
| LOGICAL_READS_DELTA     | NUMBER   |          | Delta value for logical reads                     |
| BUFFER_BUSY_WAITS_TOTAL | NUMBER   |          | Cumulative value for buffer busy waits            |
| BUFFER_BUSY_WAITS_DELTA | NUMBER   |          | Delta value for buffer busy waits                 |
| DB_BLOCK_CHANGES_TOTAL  | NUMBER   |          | Cumulative value for db block changes (in blocks) |
| DB_BLOCK_CHANGES_DELTA  | NUMBER   |          | Delta value for db block changes (in blocks)      |
| PHYSICAL_READS_TOTAL    | NUMBER   |          | Cumulative value for physical reads (in blocks)   |

| Column                       | Datatype | NULL | Description                                                                                                                   |
|------------------------------|----------|------|-------------------------------------------------------------------------------------------------------------------------------|
| PHYSICAL_READS_DELTA         | NUMBER   |      | Delta value for physical reads (in blocks)                                                                                    |
| PHYSICAL_WRITES_TOTAL        | NUMBER   |      | Cumulative value for physical writes (in blocks)                                                                              |
| PHYSICAL_WRITES_DELTA        | NUMBER   |      | Delta value for physical writes (in blocks)                                                                                   |
| PHYSICAL_READS_DIRECT_TOTAL  | NUMBER   |      | Cumulative value for physical reads direct (in blocks)                                                                        |
| PHYSICAL_READS_DIRECT_DELTA  | NUMBER   |      | Delta value for physical reads direct (in blocks)                                                                             |
| PHYSICAL_WRITES_DIRECT_TOTAL | NUMBER   |      | Cumulative value for physical writes direct (in blocks)                                                                       |
| PHYSICAL_WRITES_DIRECT_DELTA | NUMBER   |      | Delta value for physical writes direct (in blocks)                                                                            |
| ITL_WAITS_TOTAL              | NUMBER   |      | Cumulative value for ITL waits                                                                                                |
| ITL_WAITS_DELTA              | NUMBER   |      | Delta value for ITL waits                                                                                                     |
| ROW_LOCK_WAITS_TOTAL         | NUMBER   |      | Cumulative value for row lock waits                                                                                           |
| ROW_LOCK_WAITS_DELTA         | NUMBER   |      | Delta value for row lock waits                                                                                                |
| GC_CR_BLOCKS_SERVED_TOTAL    | NUMBER   |      | Cumulative value for global cache CR blocks served                                                                            |
| GC_CR_BLOCKS_SERVED_DELTA    | NUMBER   |      | Delta value for global cache CR blocks served                                                                                 |
| GC_CU_BLOCKS_SERVED_TOTAL    | NUMBER   |      | Cumulative value for global cache current blocks served                                                                       |
| GC_CU_BLOCKS_SERVED_DELTA    | NUMBER   |      | Delta value for global cache current blocks served                                                                            |
| GC_BUFFER_BUSY_TOTAL         | NUMBER   |      | Cumulative value for global cache buffer busy                                                                                 |
| GC_BUFFER_BUSY_DELTA         | NUMBER   |      | Delta value for global cache buffer busy                                                                                      |
| GC_CR_BLOCKS_RECEIVED_TOTAL  | NUMBER   |      | Cumulative value for global cache CR blocks received                                                                          |
| GC_CR_BLOCKS_RECEIVED_DELTA  | NUMBER   |      | Delta value for global cache CR blocks received                                                                               |
| GC_CU_BLOCKS_RECEIVED_TOTAL  | NUMBER   |      | Cumulative value for global cache current blocks received                                                                     |
| GC_CU_BLOCKS_RECEIVED_DELTA  | NUMBER   |      | Delta value for global cache current blocks received                                                                          |
| SPACE_USED_TOTAL             | NUMBER   |      | Number of bytes used by user data                                                                                             |
| SPACE_USED_DELTA             | NUMBER   |      | Delta value for space used by user data (in bytes). A negative value indicates the number of bytes deleted in the segment.    |
| SPACE_ALLOCATED_TOTAL        | NUMBER   |      | The number of bytes that are allocated                                                                                        |
| SPACE_ALLOCATED_DELTA        | NUMBER   |      | Delta value for the space allocated (in bytes). A negative value indicates the number of bytes deallocated to the tablespace. |
| TABLE_SCANS_TOTAL            | NUMBER   |      | Cumulative value for table scans                                                                                              |
| TABLE_SCANS_DELTA            | NUMBER   |      | Delta value for table scans                                                                                                   |
| CHAIN_ROW_EXCESS_TOTAL       | NUMBER   |      | Cumulative value of number of chained row pieces that can be eliminated by table reorganization                               |

| Column                         | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.45 DBA\_HIST\_SEG\_STAT\_OBJ

DBA\_HIST\_SEG\_STAT\_OBJ displays all the names of the segments captured in the workload repository.

This view is used with the DBA\_HIST\_SEG\_STAT view.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 6.47 DBA\_HIST\_SERVICE\_STAT

DBA\_HIST\_SERVICE\_STAT displays the history of important service statistics tracked by the Workload Repository.

The call rate statistics in this view can be used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate.

The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the service name, this view provides historical data on the timing and work done for calls issued for the whole service. This view contains information from V\$SERVICE\_STATS.

| Column            | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 6.48 DBA\_HIST\_SERVICE\_WAIT\_CLASS

DBA\_HIST\_SERVICE\_WAIT\_CLASS displays the history of wait class information for services as tracked by the Workload Repository.

This view contains information from V\$SERVICE\_WAIT\_CLASS.

| Column            | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 6.49 DBA\_HIST\_SESS\_SGA\_STATS

DBA\_HIST\_SESS\_SGA\_STATS shows usage statistics for high utilization Oracle GoldenGate and XStream sessions.

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OBJECT_NAME     | VARCHAR2(128) | NOT NULL | Object name                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SESSION_TYPE    | VARCHAR2(64)  | NOT NULL | Type of session                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SESSION_MODULE  | VARCHAR2(64)  | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>• XStream</li> <li>• GoldenGate</li> </ul>                                                                                                                                                                                                                                                                                                                                     |
| SGA_USED        | NUMBER        |          | The total amount of shared memory (in bytes) currently used by the session out of the amount allocated (SGA_ALLOCATED)                                                                                                                                                                                                                                                                                                                              |
| SGA_ALLOCATED   | NUMBER        |          | The total amount of shared memory (in bytes) allocated from the pool for the session                                                                                                                                                                                                                                                                                                                                                                |
| CON_DBID        | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID          | NUMBER        |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.50 DBA\_HIST\_SESS\_TIME\_STATS

DBA\_HIST\_SESS\_TIME\_STATS displays information about CPU and I/O time for interesting Oracle GoldenGate and XStream sessions.

| Column           | Datatype     | NULL     | Description                                                                                                     |
|------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER       | NOT NULL | Unique snapshot ID                                                                                              |
| DBID             | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                    |
| INSTANCE_NUMBER  | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                |
| SESSION_TYPE     | VARCHAR2(64) | NOT NULL | Type of session                                                                                                 |
| MIN_LOGON_TIME   | DATE         |          | Minimum logon time                                                                                              |
| SUM_CPU_TIME     | NUMBER       |          | Total CPU time                                                                                                  |
| SUM_SYS_IO_WAIT  | NUMBER       |          | Total system I/O wait time                                                                                      |
| SUM_USER_IO_WAIT | NUMBER       |          | Total user I/O wait time                                                                                        |
| CON_DBID         | NUMBER       |          | The database ID of the PDB for the sampled session                                                              |
| SESSION_MODULE   | VARCHAR2(64) | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>• XStream</li> <li>• GoldenGate</li> </ul> |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.51 DBA\_HIST\_SESSMETRIC\_HISTORY

DBA\_HIST\_SESSMETRIC\_HISTORY displays the history of several important session metrics.

### Note

This view is populated only if a session metric exceeds a server metric threshold that was configured using the DBMS\_SERVER\_ALERT package.

| Column          | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.56 DBA\_HIST\_SHARED\_SERVER\_SUMMARY

DBA\_HIST\_SHARED\_SERVER\_SUMMARY displays historical information for shared servers.

This includes information about shared server activity, the servers, common queues, and dispatcher queues. This view obtains information from V\$SHARED\_SERVER, V\$DISPATCHER, V\$CIRCUIT, and V\$QUEUE, and is aggregated over all servers, dispatchers, queues, and circuits.

| Column              | Datatype | NULL     | Description                                                                                                                                                                                                                  |
|---------------------|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                           |
| DBID                | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                 |
| INSTANCE_NUMBER     | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                             |
| NUM_SAMPLES         | NUMBER   |          | Total number of samples                                                                                                                                                                                                      |
| SAMPLE_TIME         | NUMBER   |          | Last sample timestamp                                                                                                                                                                                                        |
| SAMPLED_TOTAL_CONN  | NUMBER   |          | Cumulative sum of total number of connections over all samples. To determine the average number of connections between two snapshots, divide the difference in SAMPLED_TOTAL_CONN by the difference in NUM_SAMPLES.          |
| SAMPLED_ACTIVE_CONN | NUMBER   |          | Cumulative sum of active number of connections over all samples. To determine the average number of active connections between two snapshots, divide the difference in SAMPLED_ACTIVE_CONN by the difference in NUM_SAMPLES. |
| SAMPLED_TOTAL_SRV   | NUMBER   |          | Cumulative sum of total number of servers over all samples. To determine the average number of servers between two snapshots, divide the difference in SAMPLED_TOTAL_SRV by the difference in NUM_SAMPLES.                   |
| SAMPLED_ACTIVE_SRV  | NUMBER   |          | Cumulative sum of active number of servers over all samples. To determine the average number of active servers between two snapshots, divide the difference in SAMPLED_ACTIVE_SRV by the difference in NUM_SAMPLES.          |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLED_TOTAL_DISP  | NUMBER   |      | Cumulative sum of total number of dispatchers over all samples. To determine the average number of dispatchers between two snapshots, divide the difference in SAMPLED_TOTAL_DISP by the difference in NUM_SAMPLES.                                                                                                                                                                                                                           |
| SAMPLED_ACTIVE_DISP | NUMBER   |      | Cumulative sum of active number of dispatchers over all samples. To determine the average number of active dispatchers between two snapshots, divide the difference in SAMPLED_ACTIVE_DISP by the difference in NUM_SAMPLES.                                                                                                                                                                                                                  |
| SRV_BUSY            | NUMBER   |      | Total shared server busy time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                     |
| SRV_IDLE            | NUMBER   |      | Total shared server idle time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                     |
| SRV_IN_NET          | NUMBER   |      | Total shared server incoming network wait time (in hundredths of a second). This includes waits for receives and resets. This time is also included in SRV_BUSY.                                                                                                                                                                                                                                                                              |
| SRV_OUT_NET         | NUMBER   |      | Total shared server outgoing network wait time (in hundredths of a second). This includes waits for sends and outbound connection requests. This time is also included in SRV_BUSY.                                                                                                                                                                                                                                                           |
| SRV_MESSAGES        | NUMBER   |      | Number of messages processed                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SRV_BYTES           | NUMBER   |      | Total number of bytes in all messages                                                                                                                                                                                                                                                                                                                                                                                                         |
| CQ_WAIT             | NUMBER   |      | Total time that all items in the common queue have waited (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                         |
| CQ_TOTALQ           | NUMBER   |      | Total number of items that have ever been in the common queue                                                                                                                                                                                                                                                                                                                                                                                 |
| DQ_TOTALQ           | NUMBER   |      | Total number of items that have ever been in a dispatcher queue                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID            | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID              | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                             |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TABLE_NAME      | VARCHAR2(128) | NOT NULL | Name of the table in which the error occurred                                                                                                                                                                                                                                                                                                                                                                                                            |
| ERROR_NUMBER    | NUMBER        | NOT NULL | Error number for the error encountered                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STEP_ID         | NUMBER        |          | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID          | NUMBER        |          | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.58 DBA\_HIST\_SNAPSHOT

DBA\_HIST\_SNAPSHOT displays information about the snapshots in the Workload Repository.

| Column              | Datatype                        | NULL     | Description                                                                      |
|---------------------|---------------------------------|----------|----------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER                          | NOT NULL | Unique snapshot ID                                                               |
| DBID                | NUMBER                          | NOT NULL | Database ID for the snapshot                                                     |
| INSTANCE_NUMBER     | NUMBER                          | NOT NULL | Instance number for the snapshot                                                 |
| STARTUP_TIME        | TIMESTAMP(3)                    | NOT NULL | Startup time of the instance                                                     |
| BEGIN_INTERVAL_TIME | TIMESTAMP(3)                    | NOT NULL | Time at the beginning of the snapshot interval                                   |
| END_INTERVAL_TIME   | TIMESTAMP(3)                    | NOT NULL | Time at the end of the snapshot interval; the actual time the snapshot was taken |
| FLUSH_ELAPSED       | INTERVAL DAY(5)<br>TO SECOND(1) |          | Amount of time to perform the snapshot                                           |
| SNAP_LEVEL          | NUMBER                          |          | Snapshot level                                                                   |
| ERROR_COUNT         | NUMBER                          |          | Number of errors occurring in the tables for the particular snapshot             |

| Column                 | Datatype                     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_FLAG              | NUMBER                       |      | Condition under which the snapshot was inserted.<br>Possible values are:<br>0 - Snapshot was taken automatically by the Manageability Monitor Process (MMON process)<br>1 - Manual snapshot created using a PL/SQL package<br>2 - Imported snapshot<br>4 - Snapshot taken while Diagnostic Pack or Tuning Pack was not enabled                                                                                                                     |
| SNAP_TIMEZONE          | INTERVAL DAY(0) TO SECOND(0) |      | Snapshot time zone expressed as offset from UTC (Coordinated Universal Time) time zone                                                                                                                                                                                                                                                                                                                                                             |
| BEGIN_INTERVAL_TIME_TZ | TIMESTAMP(3) WITH TIME ZONE  |      | Time at the beginning of the snapshot interval, with timezone                                                                                                                                                                                                                                                                                                                                                                                      |
| END_INTERVAL_TIME_TZ   | TIMESTAMP(3) WITH TIME ZONE  |      | Time at the end of the snapshot interval; the actual time the snapshot was taken, with timezone                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                 | NUMBER                       |      | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.59 DBA\_HIST\_SQL\_BIND\_METADATA

DBA\_HIST\_SQL\_BIND\_METADATA displays historical information on metadata for bind variables used by SQL cursors.

| Column       | Datatype      | NULL     | Description                                                                                                                                       |
|--------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID         | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                      |
| SQL_ID       | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                          |
| NAME         | VARCHAR2(128) |          | Name of the bind variable                                                                                                                         |
| POSITION     | NUMBER        | NOT NULL | Position of the bind variable in the SQL statement                                                                                                |
| DUP_POSITION | NUMBER        |          | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable         |
| DATATYPE     | NUMBER        |          | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column. |

| Column          | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATATYPE_STRING | VARCHAR2(15) |      | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.                                                                                                                                                                         |
| CHARACTER_SID   | NUMBER       |      | National character set identifier                                                                                                                                                                                                                                                                                                                                                                                                                |
| PRECISION       | NUMBER       |      | Precision (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SCALE           | NUMBER       |      | Scale (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_LENGTH      | NUMBER       |      | Maximum bind length                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_DBID        | NUMBER       |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER       |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.60 DBA\_HIST\_SQL\_PLAN

DBA\_HIST\_SQL\_PLAN displays the execution plan information for each child cursor in the workload repository.

This view captures information from V\$SQL\_PLAN and is used with the DBA\_HIST\_SQLSTAT view.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                     |
|-----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID            | NUMBER        | NOT NULL | Database ID                                                                                                                                                                                                     |
| SQL_ID          | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                        |
| PLAN_HASH_VALUE | NUMBER        | NOT NULL | Numerical representation of the SQL plan for the cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).   |
| ID              | NUMBER        | NOT NULL | A number assigned to each step in the execution plan                                                                                                                                                            |
| OPERATION       | VARCHAR2(30)  |          | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                               |
| OPTIONS         | VARCHAR2(30)  |          | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                              |
| OBJECT_NODE     | VARCHAR2(128) |          | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed. |
| OBJECT#         | NUMBER        |          | Object number of the table or the index                                                                                                                                                                         |
| OBJECT_OWNER    | VARCHAR2(128) |          | Name of the user who owns the schema containing the table or index                                                                                                                                              |
| OBJECT_NAME     | VARCHAR2(128) |          | Name of the table or index                                                                                                                                                                                      |
| OBJECT_ALIAS    | VARCHAR2(261) |          | Alias for the object                                                                                                                                                                                            |

| Column            | Datatype       | NULL | Description                                                                                                                                                                                                                                       |
|-------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_TYPE       | VARCHAR2(20)   |      | Type of the object                                                                                                                                                                                                                                |
| OPTIMIZER         | VARCHAR2(20)   |      | Current mode of the optimizer for the first row in the plan (statement line), for example, ALL_ROWS. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.            |
| PARENT_ID         | NUMBER         |      | ID of the next execution step that operates on the output of the current step                                                                                                                                                                     |
| DEPTH             | NUMBER         |      | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0. |
| POSITION          | NUMBER         |      | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                               |
| SEARCH_COLUMNS    | NUMBER         |      | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                        |
| COST              | NUMBER         |      | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                  |
| CARDINALITY       | NUMBER         |      | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                            |
| BYTES             | NUMBER         |      | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                           |
| OTHER_TAG         | VARCHAR2(35)   |      | Describes the contents of the OTHER column. See EXPLAIN PLAN for values.                                                                                                                                                                          |
| PARTITION_START   | VARCHAR2(64)   |      | Start partition of a range of accessed partitions                                                                                                                                                                                                 |
| PARTITION_STOP    | VARCHAR2(64)   |      | Stop partition of a range of accessed partitions                                                                                                                                                                                                  |
| PARTITION_ID      | NUMBER         |      | Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                                                                                           |
| OTHER             | VARCHAR2(4000) |      | Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.                                                                                                                                         |
| DISTRIBUTION      | VARCHAR2(20)   |      | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                   |
| CPU_COST          | NUMBER         |      | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| IO_COST           | NUMBER         |      | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| TEMP_SPACE        | NUMBER         |      | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                             |
| ACCESS_PREDICATES | VARCHAR2(4000) |      | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                             |
| FILTER_PREDICATES | VARCHAR2(4000) |      | Predicates used to filter rows before producing them                                                                                                                                                                                              |

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROJECTION  | VARCHAR2(4000) |      | Expressions produced by the operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TIME        | NUMBER         |      | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| QBLOCK_NAME | VARCHAR2(128)  |      | Name of the query block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| REMARKS     | VARCHAR2(4000) |      | Remarks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TIMESTAMP   | DATE           |      | Timestamp for when the plan was produced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OTHER_XML   | CLOB           |      | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> </ul> |
| CON_DBID    | NUMBER         |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID      | NUMBER         |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                             |

## 6.61 DBA\_HIST\_SQL\_SUMMARY

DBA\_HIST\_SQL\_SUMMARY displays historical SQL summary information.

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column             | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER    | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_SQL          | NUMBER   | NOT NULL | Total number of SQLs                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TOTAL_SQL_MEM      | NUMBER   | NOT NULL | Total sharable memory in bytes for SQLs                                                                                                                                                                                                                                                                                                                                                                                                                |
| SINGLE_USE_SQL     | NUMBER   | NOT NULL | Total number of single execution SQLs                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SINGLE_USE_SQL_MEM | NUMBER   | NOT NULL | Total sharable memory in bytes for single execution SQLs                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID           | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID             | NUMBER   |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.62 DBA\_HIST\_SQL\_WORKAREA\_HSTGRM

DBA\_HIST\_SQL\_WORKAREA\_HSTGRM displays the historical cumulative work area execution statistics (cumulated since instance startup) for different work area groups.

This view contains snapshots of V\$SQL\_WORKAREA\_HISTOGRAM.

| Column                 | Datatype | NULL     | Description                                                                                                                                                                         |
|------------------------|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                  |
| DBID                   | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                        |
| INSTANCE_NUMBER        | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                    |
| LOW_OPTIMAL_SIZE       | NUMBER   | NOT NULL | Lower bound for the optimal memory requirement of work areas included in the row (in bytes)                                                                                         |
| HIGH_OPTIMAL_SIZE      | NUMBER   | NOT NULL | Upper bound for the optimal memory requirement of work areas included in the row (in bytes)                                                                                         |
| OPTIMAL_EXECUTIONS     | NUMBER   |          | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup    |
| ONEPASS_EXECUTIONS     | NUMBER   |          | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup   |
| MULTIPASSES_EXECUTIONS | NUMBER   |          | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in multi-pass mode since instance startup |
| TOTAL_EXECUTIONS       | NUMBER   |          | Sum of OPTIMAL_EXECUTIONS, ONEPASS_EXECUTIONS, and MULTIPASSES_EXECUTIONS                                                                                                           |
| CON_DBID               | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                  |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.63 DBA\_HIST\_SQLBIND

DBA\_HIST\_SQLBIND displays historical information on bind variables used by SQL cursors.

This view contains snapshots of V\$SQL\_BIND\_CAPTURE.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                              |
|-----------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                       |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                             |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                         |
| SQL_ID          | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                 |
| NAME            | VARCHAR2(128) |          | Name of the bind variable                                                                                                                                                                                                                                                |
| POSITION        | NUMBER        | NOT NULL | Position of the bind variable in the SQL statement                                                                                                                                                                                                                       |
| DUP_POSITION    | NUMBER        |          | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.                                                                                                                               |
| DATATYPE        | NUMBER        |          | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                        |
| DATATYPE_STRING | VARCHAR2(15)  |          | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed. |
| CHARACTER_SID   | NUMBER        |          | National character set identifier                                                                                                                                                                                                                                        |
| PRECISION       | NUMBER        |          | Precision (for numeric binds)                                                                                                                                                                                                                                            |
| SCALE           | NUMBER        |          | Scale (for numeric binds)                                                                                                                                                                                                                                                |
| MAX_LENGTH      | NUMBER        |          | Maximum bind length                                                                                                                                                                                                                                                      |
| WAS_CAPTURED    | VARCHAR2(3)   |          | Indicates whether the bind value was captured (YES) or not (NO)                                                                                                                                                                                                          |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_CAPTURED | DATE           |      | Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.                                                                                                                                                                                                                                                             |
| VALUE_STRING  | VARCHAR2(4000) |      | Value of the bind represented as a string                                                                                                                                                                                                                                                                                                                                                                                                            |
| VALUE_ANYDATA | ANYDATA        |      | Value of the bind represented using the self-descriptive Sys.AnyData data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.                                                                                                                                                                                              |
| CON_DBID      | NUMBER         |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID        | NUMBER         |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.64 DBA\_HIST\_SQLCOMMAND\_NAME

DBA\_HIST\_SQLCOMMAND\_NAME displays the mapping between SQL opcodes and names.

| Column       | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID         | NUMBER       | NOT NULL | Database ID                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| COMMAND_TYPE | NUMBER       | NOT NULL | SQL command number                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| COMMAND_NAME | VARCHAR2(64) |          | SQL command name                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_DBID     | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                   |

## 6.65 DBA\_HIST\_SQLSTAT

DBA\_HIST\_SQLSTAT displays historical information about SQL statistics.

This view captures the top SQL statements based on a set of criteria and captures the statistics information from V\$SQL. The total value is the value of the statistics since instance startup. The delta value is the value of the statistics from the BEGIN\_INTERVAL\_TIME to the END\_INTERVAL\_TIME in the DBA\_HIST\_SNAPSHOT view.

This view is used with the DBA\_HIST\_OPTIMIZER\_ENV, DBA\_HIST\_SQLTEXT, and DBA\_HIST\_SQL\_PLAN views to provide a complete picture of historical SQL statistics.

| Column                   | Datatype      | NULL     | Description                                                                                                                                                                                                   |
|--------------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                  | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                            |
| DBID                     | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                  |
| INSTANCE_NUMBER          | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                              |
| SQL_ID                   | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                      |
| PLAN_HASH_VALUE          | NUMBER        | NOT NULL | Numerical representation of the SQL plan for the cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). |
| OPTIMIZER_COST           | NUMBER        |          | Cost of the query given by the optimizer                                                                                                                                                                      |
| OPTIMIZER_MODE           | VARCHAR2(10)  |          | Mode under which the SQL statement is executed                                                                                                                                                                |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER        |          | Hash Value for the optimizer environment                                                                                                                                                                      |
| SHARABLE_MEM             | NUMBER        |          | Amount of shared memory used by the child cursor (in bytes)                                                                                                                                                   |
| LOADED_VERSIONS          | NUMBER        |          | Indicates whether the context heap is loaded (1) or not (0)                                                                                                                                                   |
| VERSION_COUNT            | NUMBER        |          | Number of children associated with the cursor                                                                                                                                                                 |
| MODULE                   | VARCHAR2(64)  |          | Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE                                              |
| ACTION                   | VARCHAR2(64)  |          | Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION                                              |
| SQL_PROFILE              | VARCHAR2(64)  |          | Name of the applied SQL Profile                                                                                                                                                                               |
| FORCE_MATCHING_SIGNATURE | NUMBER        |          | The signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                                                                          |
| PARSING_SCHEMA_ID        | NUMBER        |          | Schema ID that was used to originally build the child cursor                                                                                                                                                  |
| PARSING_SCHEMA_NAME      | VARCHAR2(128) |          | Schema name that was used to originally build the child cursor                                                                                                                                                |

|--------------------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FETCHES_DELTA            | NUMBER   |      | Delta number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_OF_FETCH_COUNT_TOTAL | NUMBER   |      | Cumulative number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| END_OF_FETCH_COUNT_DELTA | NUMBER   |      | Delta number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed.                                                                                                                               |

## 6.66 DBA\_HIST\_SQLTEXT

DBA\_HIST\_SQLTEXT displays the text of SQL statements belonging to shared SQL cursors captured in the Workload Repository.

This view captures information from V\$SQL and is used with the DBA\_HIST\_SQLSTAT view.

| Column       | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.67 DBA\_HIST\_STAT\_NAME

DBA\_HIST\_STAT\_NAME displays decoded statistic names for the statistics captured in the Workload Repository.

This includes OLAP statistics and OLAP timed events. This view captures information from V\$STATNAME and is used with DBA\_HIST\_SYSSTAT and DBA\_HIST\_SYS\_TIME\_MODEL.

| Column    | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 6.68 DBA\_HIST\_STREAMS\_APPLY\_SUM

DBA\_HIST\_STREAMS\_APPLY\_SUM displays information about each apply process and its activities.

This view contains a snapshot of V\$STREAMS\_APPLY\_COORDINATOR, V\$STREAMS\_APPLY\_READER, and V\$STREAMS\_APPLY\_SERVER. This view is intended for use with Automatic Workload Repository (AWR).

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column                         | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |

For user enqueued messages, the delay between the message being enqueued in the local database and being received by the apply process.                                                                                                                                                                    |
| COORD_TOTAL_RECEIVED           | NUMBER        |          | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                                                                                                                                                     |
| COORD_TOTAL_APPLIED            | NUMBER        |          | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| COORD_TOTAL_ROLLBACKS          | NUMBER        |          | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                                                                                                                                                    |
| COORD_TOTAL_WAIT_DEPS          | NUMBER        |          | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                                                                                                                                                |
| COORD_TOTAL_WAIT_CMTS          | NUMBER        |          | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                                                                                                                                          |
| COORD_LWM_LAG                  | NUMBER        |          | For captured messages, the delay (in seconds) between the creation of the message corresponding to the low watermark and it being applied by the apply process. For user enqueued messages, the delay between the message being enqueued in the local database and being applied by the apply process.                                                                                                                                        |
| SERVER_TOTAL_MESSAGES_APPLIED  | NUMBER        |          | Total number of messages applied by all the apply servers since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| SERVER_ELAPSED_DEQUEUE_TIME    | NUMBER        |          | Time elapsed (in hundredths of a second) dequeuing messages by all the apply servers since the apply process was last started                                                                                                                                                                                                                                                                                                                 |
| SERVER_ELAPSED_APPLY_TIME      | NUMBER        |          | Time elapsed (in hundredths of a second) applying messages by all the apply servers since the apply process was last started                                                                                                                                                                                                                                                                                                                  |
| CON_DBID                       | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                         | NUMBER        |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.69 DBA\_HIST\_STREAMS\_CAPTURE

DBA\_HIST\_STREAMS\_CAPTURE displays information about each capture process.

This view is intended for use with Automatic Workload Repository (AWR).

| Column                  | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|---------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DBID                    | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                             |

| CON_DBID                | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                  | NUMBER        |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 6.70 DBA\_HIST\_STREAMS\_POOL\_ADVICE

DBA\_HIST\_STREAMS\_POOL\_ADVICE displays historical information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes.

This view is intended for use with Automatic Workload Repository (AWR).

| Column             | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| TABLESPACE_ID        | NUMBER       |          | Tablespace ID                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TABLESPACE_SIZE      | NUMBER       |          | Tablespace size (in database blocks)                                                                                                                                                                                                                                                                                                                                                                                                             |
| TABLESPACE_MAXSIZE   | NUMBER       |          | Maximum size of the tablespace (in database blocks)                                                                                                                                                                                                                                                                                                                                                                                              |
| TABLESPACE_USEDSPACE | NUMBER       |          | Used size of the tablespace (in database blocks)                                                                                                                                                                                                                                                                                                                                                                                                 |
| RTIME                | VARCHAR2(25) |          | Runtime                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_DBID             | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID               | NUMBER       |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.79 DBA\_HIST\_TEMPFILE

DBA\_HIST\_TEMPFILE displays a history of the temp file information from the control file. This view contains snapshots of V\$TEMPFILE.

| Column           | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 6.82 DBA\_HIST\_TOPLEVELCALL\_NAME

DBA\_HIST\_TOPLEVELCALL\_NAME displays the mapping between Oracle top level calls and names.

| Column              | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID                | NUMBER       | NOT NULL | Database ID                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TOP_LEVEL_CALL#     | NUMBER       | NOT NULL | Oracle top level call number                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TOP_LEVEL_CALL_NAME | VARCHAR2(64) |          | Oracle top level call name                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_DBID            | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID              | NUMBER       |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.83 DBA\_HIST\_UNDOSTAT

DBA\_HIST\_UNDOSTAT displays the history of histograms of statistical data to show how well the system is working.

The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. This view contains snapshots of V\$UNDOSTAT.

| Column          | Datatype | NULL     | Description                                   |
|-----------------|----------|----------|-----------------------------------------------|
| BEGIN_TIME      | DATE     | NOT NULL | Identifies the beginning of the time interval |
| END_TIME        | DATE     | NOT NULL | Identifies the end of the time interval       |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot                  |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot              |
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID                            |

| Column         | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UNDOTSN        | NUMBER       | NOT NULL | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                     |
| UNDOBLKS       | NUMBER       |          | Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.                                                                                                                                                                                                                   |
| TXNCOUNT       | NUMBER       |          | Identifies the total number of transactions executed within the period                                                                                                                                                                                                                                                                                                                                                                           |
| MAXQUERYLEN    | NUMBER       |          | Identifies the length of the longest query (in number of seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the UNDO_RETENTION initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/ executed during the period are reflected in the view. |
| MAXQUERYSQLID  | VARCHAR2(13) |          | SQL identifier of the longest running SQL statement in the period                                                                                                                                                                                                                                                                                                                                                                                |
| MAXCONCURRENCY | NUMBER       |          | Identifies the highest number of transactions executed concurrently within the period                                                                                                                                                                                                                                                                                                                                                            |
| UNXPSTEALCNT   | NUMBER       |          | Number of attempts to obtain undo space by stealing unexpired extents from other transactions                                                                                                                                                                                                                                                                                                                                                    |
| UNXPBLKRELCNT  | NUMBER       |          | Number of unexpired blocks removed from certain undo segments so they can be used by other transactions                                                                                                                                                                                                                                                                                                                                          |
| UNXPBLKREUCNT  | NUMBER       |          | Number of unexpired undo blocks reused by transactions                                                                                                                                                                                                                                                                                                                                                                                           |
| EXPSTEALCNT    | NUMBER       |          | Number of attempts to steal expired undo blocks from other undo segments                                                                                                                                                                                                                                                                                                                                                                         |
| EXPBLKRELCNT   | NUMBER       |          | Number of expired undo blocks stolen from other undo segments                                                                                                                                                                                                                                                                                                                                                                                    |
| EXPBLKREUCNT   | NUMBER       |          | Number of expired undo blocks reused within the same undo segments                                                                                                                                                                                                                                                                                                                                                                               |
| SSOLDERRCNT    | NUMBER       |          | Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.                                                                                                                                                     |
| NOSPACEERRCNT  | NUMBER       |          | Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.                                                                                                                                                                          |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| CON_ID | NUMBER   |      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.88 DBA\_HISTOGRAMS

DBA\_HISTOGRAMS is a synonym for DBA\_TAB\_HISTOGRAMS.

### ① See Also

["DBA\\_TAB\\_HISTOGRAMS"](#)

## 6.89 DBA\_HIVE\_COLUMNS

DBA\_HIVE\_COLUMNS describes all Hive columns in a Hive metastore. Its columns are the same as those in ALL\_HIVE\_COLUMNS.

### ① See Also

["ALL\\_HIVE\\_COLUMNS"](#)

## 6.90 DBA\_HIVE\_DATABASES

DBA\_HIVE\_DATABASES describes all the Hive schemas in a Hadoop cluster. Its columns are the same as those in ALL\_HIVE\_DATABASES.

### ① See Also

["ALL\\_HIVE\\_DATABASES"](#)

## 6.91 DBA\_HIVE\_PART\_KEY\_COLUMNS

DBA\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns in the database. Its columns are the same as those in ALL\_HIVE\_PART\_KEY\_COLUMNS.

 **See Also**  
["ALL\\_HIVE\\_PART\\_KEY\\_COLUMNS"](#)

## 6.92 DBA\_HIVE\_TAB\_PARTITIONS

DBA\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions in the database. Its columns are the same as those in ALL\_HIVE\_TAB\_PARTITIONS.

 **See Also**  
["ALL\\_HIVE\\_TAB\\_PARTITIONS"](#)

## 6.93 DBA\_HIVE\_TABLES

DBA\_HIVE\_TABLES provides information about all the Hive tables in the Hive metastore. Its columns are the same as those in ALL\_HIVE\_TABLES.

 **See Also**  
["ALL\\_HIVE\\_TABLES"](#)

## 6.94 DBA\_HOST\_ACES

DBA\_HOST\_ACES describes access control entries defined in host access control lists.

**Related View**

USER\_HOST\_ACES describes the status of access control entries for the current user to access network hosts through PL/SQL network utility packages. This view does not display the ACE\_ORDER, START\_DATE, END\_DATE, GRANT\_TYPE, INVERTED\_PRINCIPAL, PRINCIPAL, or PRINCIPAL\_TYPE columns.

| Column     | Datatype       | NULL     | Description                              |
|------------|----------------|----------|------------------------------------------|
| HOST       | VARCHAR2(1000) | NOT NULL | Network host                             |
| LOWER_PORT | NUMBER(5)      |          | Lower bound of the port range            |
| UPPER_PORT | NUMBER(5)      |          | Upper bound of the port range            |
| ACE_ORDER  | NUMBER         | NOT NULL | Order number of the access control entry |

| Column             | Datatype      | NULL | Description                                                               |
|--------------------|---------------|------|---------------------------------------------------------------------------|
| START_DATE         | TIMESTAMP(6)  |      | Start date of the access control entry                                    |
| END_DATE           | TIMESTAMP(6)  |      | End date of the access control entry                                      |
| GRANT_TYPE         | VARCHAR2(5)   |      | Indicates whether the access control entry grants or denies the privilege |
| INVERTED_PRINCIPAL | VARCHAR2(3)   |      | Indicates whether the principal is inverted or not                        |
| PRINCIPAL          | VARCHAR2(128) |      | Principal the privilege is applied to                                     |
| PRINCIPAL_TYPE     | VARCHAR2(16)  |      | Type of the principal                                                     |
| PRIVILEGE          | VARCHAR2(128) |      | Privilege                                                                 |

 **See Also**

["USER\\_HOST\\_ACES"](#)

## 6.95 DBA\_HOST\_ACLS

DBA\_HOST\_ACLS describes access control lists assigned to restrict access to network hosts through PL/SQL network utility packages.

| Column     | Datatype       | NULL     | Description                              |
|------------|----------------|----------|------------------------------------------|
| HOST       | VARCHAR2(1000) | NOT NULL | Network host                             |
| LOWER_PORT | NUMBER(5)      |          | Lower bound of the port range            |
| UPPER_PORT | NUMBER(5)      |          | Upper bound of the port range            |
| ACL        | VARCHAR2(4000) |          | The name of the access control list      |
| ACLID      | RAW(8)         |          | The object ID of the access control list |
| ACL_OWNER  | VARCHAR2(128)  |          | The owner of the access control list     |

## 6.96 DBA\_IDENTIFIERS

DBA\_IDENTIFIERS displays information about the identifiers in all stored objects in the database. Its columns are the same as those in ALL\_IDENTIFIERS.

 **See Also**

["ALL\\_IDENTIFIERS"](#)

## 6.97 DBA\_ILMDATAMOVEMENTPOLICIES

DBA\_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy in a database.

### Related View

USER\_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy for a user.

#### ① Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column            | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME       | VARCHAR2(128) | NOT NULL | The Automatic Data Optimization policy name is autogenerated                                                                                                                                                                                                                                                                                                                   |
| ACTION_TYPE       | VARCHAR2(11)  |          | Type of data movement action performed by the Automatic Data Optimization policy: <ul style="list-style-type: none"> <li>• ANNOTATE</li> <li>• COMPRESSION</li> <li>• EVICT</li> <li>• STORAGE</li> </ul>                                                                                                                                                                      |
| SCOPE             | VARCHAR2(7)   |          | Identifies the scope of the Automatic Data Optimization policy: <ul style="list-style-type: none"> <li>• ROW</li> <li>• GROUP</li> <li>• SEGMENT</li> </ul>                                                                                                                                                                                                                    |
| COMPRESSION_LEVEL | VARCHAR2(30)  |          | Compression level to move selected rows or the entire segment to, for a compression Automatic Data Optimization policy                                                                                                                                                                                                                                                         |
| TIER_TABLESPACE   | VARCHAR2(128) |          | Tablespace to move the object to, for a storage Automatic Data Optimization policy                                                                                                                                                                                                                                                                                             |
| TIER_STATUS       | VARCHAR2(9)   |          | This column is only valid for storage tiering policies, and indicates whether the storage tiering policy was specified with a READ ONLY clause. This column takes READ ONLY as a potential value. In all other cases, it is blank.<br><br>In other words, this column indicates whether the tablespace the object is being moved to will be made READ ONLY after the movement. |
| CONDITION_TYPE    | VARCHAR2(22)  |          | Column on which the condition for the policy is based. Possible values: <ul style="list-style-type: none"> <li>• LAST ACCESS TIME</li> <li>• LAST MODIFICATION TIME</li> <li>• CREATION TIME</li> <li>• USER DEFINED</li> <li>• LOW ACCESS</li> </ul>                                                                                                                          |
| CONDITION_DAYS    | NUMBER        |          | Number of days in the condition for the policy                                                                                                                                                                                                                                                                                                                                 |

| Column          | Datatype      | NULL | Description                                                        |
|-----------------|---------------|------|--------------------------------------------------------------------|
| CUSTOM_FUNCTION | VARCHAR2(128) |      | Optional function that evaluates the precondition on the policy    |
| POLICY_SUBTYPE  | VARCHAR2(10)  |      | Storage tier on which the policy is specified                      |
| ACTION_CLAUSE   | CLOB          |      | Text of the action executed by the policy                          |
| TIER_T0         | VARCHAR2(10)  |      | Storage tier where the data is placed after the policy is executed |

## 6.99 DBA\_ILMOBJECTS

DBA\_ILMOBJECTS displays all the Automatic Data Optimization policies and objects in the database.

Many objects inherit policies via their parent objects or because they were created in a particular tablespace. This view provides a mapping between the policies and objects and indicates whether a policy is inherited by an object or is directly specified on it.

### Related View

USER\_ILMOBJECTS displays all the Automatic Data Optimization policies and objects for a user.

### ① Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column      | Datatype      | NULL     | Description                   |
|-------------|---------------|----------|-------------------------------|
| POLICY_NAME | VARCHAR2(128) | NOT NULL | Policy name is auto-generated |

| Column             | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_OWNER       | VARCHAR2(128) | NOT NULL | Owner of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                            |
| OBJECT_NAME        | VARCHAR2(128) | NOT NULL | Name of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                             |
| SUBOBJECT_NAME     | VARCHAR2(128) |          | Name of the subobject associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                          |
| OBJECT_TYPE        | VARCHAR2(18)  |          | Object type. Valid values include: <ul style="list-style-type: none"> <li>• INDEX</li> <li>• INDEX PARTITION</li> <li>• LOB</li> <li>• LOB PARTITION</li> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTITION</li> </ul> Direct policies on Index, Index Partition, LOB, and LOB Partition are not supported in Oracle Database 12c. |
| INHERITED_FROM     | VARCHAR2(20)  |          | Indicates if the policy is inherited by the object or subobject, or directly specified on the object or subobject. If the policy is inherited, the level from which the policy is inherited (TABLE, TABLE PARTITION, TABLESPACE) is identified.                                                                                                       |
| TBS_INHERITED_FROM | VARCHAR2(30)  |          | The tablespace name, if the policy is inherited from a tablespace                                                                                                                                                                                                                                                                                     |
| ENABLED            | VARCHAR2(7)   |          | Indicates if the Automatic Data Optimization policy is enabled for the object (YES or NO)                                                                                                                                                                                                                                                             |
| DELETED            | VARCHAR2(7)   |          | Possible values: <ul style="list-style-type: none"> <li>• YES - Indicates that the policy is deleted for any objects that may be added in the future, but is active for those objects that are currently associated with that policy</li> <li>• NO - Indicates that the policy is active</li> </ul>                                                   |

## 6.100 DBA\_ILMPARAMETERS

DBA\_ILMPARAMETERS can be queried to provide information on the Automatic Data Optimization parameters in the database and their values.

### Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column | Datatype      | NULL | Description                                                                                                                             |
|--------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2(128) |      | Name of the Automatic Data Optimization environment parameter. The value is one of the constants defined in the DBMS_ILM_ADMIN package. |
| VALUE  | NUMBER        |      | Value of the parameter                                                                                                                  |

## 6.101 DBA\_ILMPOLICIES

DBA\_ILMPOLICIES displays details about Automatic Data Optimization policies in the database.

The view contains common details relevant to all types of Automatic Data Optimization policies, not just details relevant to the data movement-related Automatic Data Optimization policies.

#### Related View

USER\_ILMPOLICIES displays details about Automatic Data Optimization policies owned by the user.

#### ① Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column      | Datatype      | NULL | Description                                                                                                                                                                                                                 |
|-------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME | VARCHAR2(128) |      | The name of the Automatic Data Optimization policy is auto-generated                                                                                                                                                        |
| POLICY_TYPE | VARCHAR2(13)  |      | Type of the policy. Valid values include DATAMOVEMENT.                                                                                                                                                                      |
| TABLESPACE  | VARCHAR2(30)  |      | Tablespace name, in the case of a tablespace-level policy                                                                                                                                                                   |
| ENABLED     | VARCHAR2(6)   |      | Indicates whether the policy is enabled or not                                                                                                                                                                              |
| DELETED     | VARCHAR2(7)   |      | Possible values: <ul style="list-style-type: none"><li>• YES - Indicates that the policy associated has been deleted (but shall remain active for this object)</li><li>• NO - Indicates that the policy is active</li></ul> |

**Note**

Automatic Data Optimization policies cannot be set on tables with object types or materialized views.

# 6.102 DBA\_ILMRESULTS

DBA\_ILMRESULTS displays information on data movement-related Automatic Data Optimization jobs in the database.

**Related View**

USER\_ILMRESULTS displays information on data movement-related Automatic Data Optimization jobs for tasks created by the user.

**Note**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                  |
|-----------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASK_ID         | NUMBER         |      | Number that uniquely identifies a specific Automatic Data Optimization task                                                                                                                                                                                                  |
| JOB_NAME        | VARCHAR2(128)  |      | Name of the Automatic Data Optimization job                                                                                                                                                                                                                                  |
| JOB_STATE       | VARCHAR2(35)   |      | State of the job. Possible values: <ul style="list-style-type: none"><li>JOB CREATED</li><li>COMPLETED SUCCESSFULLY</li><li>FAILED</li><li>STOPPED</li><li>JOB CREATION FAILED</li><li>DEPENDENT OBJECTS BEING REBUILT</li><li>FAILED TO REBUILD DEPENDENT OBJECTS</li></ul> |
| START_TIME      | TIMESTAMP(6)   |      | Start time of the Automatic Data Optimization job                                                                                                                                                                                                                            |
| COMPLETION_TIME | TIMESTAMP(6)   |      | Completion time of the Automatic Data Optimization job                                                                                                                                                                                                                       |
| COMMENTS        | VARCHAR2(4000) |      | Additional information in cases where the Automatic Data Optimization job execution fails                                                                                                                                                                                    |
| STATISTICS      | CLOB           |      | Job specific statistics, such as space saved via compression. This column is in the form of comma separated name / value pairs, with each pair representing a particular statistic name and value.                                                                           |

## 6.104 DBA\_IM\_EXPRESSIONS

DBA\_IM\_EXPRESSIONS provides information about the list of expressions (SYS\_IME virtual columns) that are currently enabled for in-memory storage.

Typically, you can query this view after invoking the DBMS\_INMEMORY\_ADMIN.IME\_CAPTURE\_EXPRESSIONS PL/SQL procedure to see the list of hot expressions added to different tables across the database.

Based on this view, you can:

- Populate expressions on a particular table immediately
- Drop certain expressions that are marked for in-memory but not desired by users

#### Related View

USER\_IM\_EXPRESSIONS provides information about the list of expressions (SYS\_IME virtual columns) that are currently enabled for in-memory storage in schemas owned by the current user. This view does not display the OWNER column.

| Column         | Datatype      | NULL     | Description                                                            |
|----------------|---------------|----------|------------------------------------------------------------------------|
| OWNER          | VARCHAR2(129) |          | Table owner                                                            |
| TABLE_NAME     | VARCHAR2(129) |          | Table name                                                             |
| OBJECT_NUMBER  | NUMBER        |          | Object number of the table                                             |
| COLUMN_NAME    | VARCHAR2(128) | NOT NULL | Column name of the expression added to the table (with SYS_IME prefix) |
| SQL_EXPRESSION | LONG          |          | SQL representation of the expression                                   |

## 6.105 DBA\_IMMUTABLE\_TABLES

DBA\_IMMUTABLE\_TABLES describes all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_TABLES.

#### ① See Also

["ALL\\_IMMUTABLE\\_TABLES"](#)

## 6.106 DBA\_IND\_COLUMNS

DBA\_IND\_COLUMNS describes the columns of all the indexes on all tables and clusters in the database. Its columns are the same as those in ALL\_IND\_COLUMNS.

#### ① See Also

["ALL\\_IND\\_COLUMNS"](#)

## 6.107 DBA\_IND\_EXPRESSIONS

DBA\_IND\_EXPRESSIONS lists expressions of function-based indexes on all tables and clusters in the database. Its columns are the same as those in ALL\_IND\_EXPRESSIONS.

### ① See Also

["ALL\\_IND\\_EXPRESSIONS"](#)

## 6.108 DBA\_IND\_PARTITIONS

DBA\_IND\_PARTITIONS displays, for each index partition in the database, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics generated by the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_PARTITIONS.

### ① See Also

["ALL\\_IND\\_PARTITIONS"](#)

## 6.109 DBA\_IND\_PENDING\_STATS

DBA\_IND\_PENDING\_STATS describes pending statistics for all tables, partitions, and subpartitions in the database collected using the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_PENDING\_STATS.

### ① See Also

["ALL\\_IND\\_PENDING\\_STATS"](#)

## 6.110 DBA\_IND\_STATISTICS

DBA\_IND\_STATISTICS displays optimizer statistics for all indexes in the database collected using the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_STATISTICS.

### ① See Also

["ALL\\_IND\\_STATISTICS"](#)

# 6.111 DBA\_IND\_SUBPARTITIONS

DBA\_IND\_SUBPARTITIONS displays, for each index subpartition in the database, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_SUBPARTITIONS.

① **See Also**  
["ALL\\_IND\\_SUBPARTITIONS"](#)

# 6.112 DBA\_INDEX\_USAGE

DBA\_INDEX\_USAGE displays cumulative statistics for each index.

| Column                         | Datatype      | NULL     | Description                                                                                                                                                                                                                                      |
|--------------------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_ID                      | NUMBER        | NOT NULL | Object ID for the index                                                                                                                                                                                                                          |
| NAME                           | VARCHAR2(128) | NOT NULL | Index name                                                                                                                                                                                                                                       |
| OWNER                          | VARCHAR2(128) | NOT NULL | Index owner                                                                                                                                                                                                                                      |
| TOTAL_ACCESS_COUNT             | NUMBER        |          | Total number of times the index has been accessed                                                                                                                                                                                                |
| TOTAL_EXEC_COUNT               | NUMBER        |          | Total executions the index has participated in                                                                                                                                                                                                   |
| TOTAL_ROWS_RETURNED            | NUMBER        |          | Total rows returned by the index.                                                                                                                                                                                                                |
|                                |               |          | Index usage is categorized into buckets of different ranges. Each bucket has a range of values for access count and rows returned. An entry is placed into a bucket if the rows returned or access counts falls within the range of that bucket. |
| BUCKET_0_ACCESS_COUNT          | NUMBER        |          | The index has not been accessed                                                                                                                                                                                                                  |
| BUCKET_1_ACCESS_COUNT          | NUMBER        |          | The index has been accessed once                                                                                                                                                                                                                 |
| BUCKET_2_10_ACCESS_COUNT       | NUMBER        |          | The index has been accessed between 2 and 10 times                                                                                                                                                                                               |
| BUCKET_2_10_ROWS_RETURNED      | NUMBER        |          | The index has returned between 2 and 10 rows                                                                                                                                                                                                     |
| BUCKET_11_100_ACCESS_COUNT     | NUMBER        |          | The index has been accessed between 11 and 100 times                                                                                                                                                                                             |
| BUCKET_11_100_ROWS_RETURNED    | NUMBER        |          | The index has returned between 11 and 100 rows                                                                                                                                                                                                   |
| BUCKET_101_1000_ACCESS_COUNT   | NUMBER        |          | The index has been accessed between 101 and 1000 times                                                                                                                                                                                           |
| BUCKET_101_1000_ROWS_RETURNED  | NUMBER        |          | The index has returned between 101 and 1000 rows                                                                                                                                                                                                 |
| BUCKET_1000_PLUS_ACCESS_COUNT  | NUMBER        |          | The index has been accessed more than 1000 times                                                                                                                                                                                                 |
| BUCKET_1000_PLUS_ROWS_RETURNED | NUMBER        |          | The index has returned more than 1000 rows                                                                                                                                                                                                       |
| LAST_USED                      | DATE          |          | Time that the index was last used                                                                                                                                                                                                                |

**① See Also**

["V\\$INDEX\\_USAGE\\_INFO"](#)

## 6.113 DBA\_INDEXES

DBA\_INDEXES describes all indexes in the database. To gather statistics for this view, use the DBMS\_STATS package. This view supports parallel partitioned index scans. Its columns (except for TABLE\_TYPE) are the same as those in ALL\_INDEXES.

**① See Also**

["ALL\\_INDEXES"](#)

## 6.114 DBA\_INDEXTYPE\_ARRAYTYPES

DBA\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by all indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_ARRAYTYPES.

**① See Also**

["ALL\\_INDEXTYPE\\_ARRAYTYPES"](#)

## 6.115 DBA\_INDEXTYPE\_COMMENTS

DBA\_INDEXTYPE\_COMMENTS displays comments for all user-defined indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_COMMENTS.

**① See Also**

["ALL\\_INDEXTYPE\\_COMMENTS"](#)

## 6.116 DBA\_INDEXTYPE\_OPERATORS

DBA\_INDEXTYPE\_OPERATORS lists all the operators supported by indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_OPERATORS.

**① See Also**

["ALL\\_INDEXTYPE\\_OPERATORS"](#)

## 6.117 DBA\_INDEXTYPES

DBA\_INDEXTYPES describes all indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPES.

### See Also

["ALL\\_INDEXTYPES"](#)

## 6.118 DBA\_INMEMORY\_AIMTASKDETAILS

DBA\_INMEMORY\_AIMTASKDETAILS displays details for an Automatic In-Memory management task.

| Column         | Datatype      | NULL | Description                                                                          |
|----------------|---------------|------|--------------------------------------------------------------------------------------|
| TASK_ID        | NUMBER        |      | Number that uniquely identifies a specific automatic IM column store management task |
| OBJECT_OWNER   | VARCHAR2(128) |      | Owner of the object subject to automatic IM column store management task action      |
| OBJECT_NAME    | VARCHAR2(128) |      | Name of the object subject to automatic IM column store management task action       |
| SUBOBJECT_NAME | VARCHAR2(128) |      | Name of the subobject subject to automatic IM column store management task action    |
| ACTION         | VARCHAR2(16)  |      | Action taken on the object                                                           |
| STATE          | VARCHAR2(10)  |      | Status of the action on the object                                                   |

### See Also

## 6.119 DBA\_INMEMORY\_AIMTASKS

DBA\_INMEMORY\_AIMTASKS displays information about Automatic In-Memory management tasks.

| Column        | Datatype     | NULL | Description                                                                          |
|---------------|--------------|------|--------------------------------------------------------------------------------------|
| TASK_ID       | NUMBER       |      | Number that uniquely identifies a specific automatic IM column store management task |
| CREATION_TIME | TIMESTAMP(6) |      | Creation time of the task                                                            |
| STATE         | VARCHAR2(7)  |      | State of the task                                                                    |

### ① See Also

*Oracle Database In-Memory Guide* for more information about configuring the Automatic In-Memory feature

## 6.120 DBA\_INTERNAL\_TRIGGERS

DBA\_INTERNAL\_TRIGGERS describes internal triggers on all tables in the database. Its columns are the same as those in ALL\_INTERNAL\_TRIGGERS.

### ① See Also

["ALL\\_INTERNAL\\_TRIGGERS"](#)

## 6.121 DBA\_INVALID\_OBJECTS

DBA\_INVALID\_OBJECTS describes all invalid objects in the database. You can use this view to identify invalid objects before and after a database upgrade.

This view eliminates old versions of object types. It only includes the object type if it is the latest version.

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                |
|----------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2(128) |      | Owner of the object                                                                                                                                                                                                                                        |
| OBJECT_NAME    | VARCHAR2(128) |      | Name of the object                                                                                                                                                                                                                                         |
| SUBOBJECT_NAME | VARCHAR2(128) |      | Name of the subobject (for example, partition)                                                                                                                                                                                                             |
| OBJECT_ID      | NUMBER        |      | Dictionary object number of the object.                                                                                                                                                                                                                    |
| DATA_OBJECT_ID | NUMBER        |      | Dictionary object number of the segment that contains the object.                                                                                                                                                                                          |
|                |               |      | <b>Note:</b> OBJECT_ID and DATA_OBJECT_ID display data dictionary metadata. Do not confuse these numbers with the unique 16-byte object identifier ( <i>object ID</i> ) that Oracle Database assigns to row objects in object tables in the system.        |
| OBJECT_TYPE    | VARCHAR2(23)  |      | Type of the object (such as TABLE, INDEX).<br><br>The current version of the type is shown only if it is invalid. In other words, if prior versions of the type are invalid but the most recent version of the type is valid, it will not be in this list. |
| CREATED        | DATE          |      | Timestamp for the creation of the object                                                                                                                                                                                                                   |
| LAST_DDL_TIME  | DATE          |      | Timestamp for the last modification of the object and dependent objects resulting from a DDL statement (including grants and revokes)                                                                                                                      |
| TIMESTAMP      | VARCHAR2(19)  |      | Timestamp for the specification of the object (character data)                                                                                                                                                                                             |

| Column            | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS            | VARCHAR2(7)   |      | Status of the object: <ul style="list-style-type: none"> <li>• VALID</li> <li>• INVALID</li> <li>• N/A</li> </ul>                                                                                                                                                                                                                                                                                                           |
| TEMPORARY         | VARCHAR2(1)   |      | Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)                                                                                                                                                                                                                                                                                       |
| GENERATED         | VARCHAR2(1)   |      | Indicates whether the name of this object was system-generated (Y) or not (N)                                                                                                                                                                                                                                                                                                                                               |
| SECONDARY         | VARCHAR2(1)   |      | Indicates whether this is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge (Y) or not (N)                                                                                                                                                                                                                                                                                              |
| NAMESPACE         | NUMBER        |      | Namespace for the object                                                                                                                                                                                                                                                                                                                                                                                                    |
| EDITION_NAME      | VARCHAR2(128) |      | Name of the edition in which the object is actual                                                                                                                                                                                                                                                                                                                                                                           |
| SHARING           | VARCHAR2(18)  |      | Values: <ul style="list-style-type: none"> <li>• DATA LINK - If the object is data-linked or a data link to an object in the root</li> <li>• METADATA LINK - If the object is metadata-linked or a metadata link to an object in the root</li> <li>• EXTENDED DATA LINK - If the object is extended-data-linked or an extended data link to an object in the root</li> <li>• NONE - If none of the above applies</li> </ul> |
| EDITIONABLE       | VARCHAR2(1)   |      | Values: <ul style="list-style-type: none"> <li>• Y - For objects marked EDITIONABLE</li> <li>• N - For objects marked NONEDITIONABLE</li> <li>• NULL - For objects whose type is not editionable in the database</li> </ul>                                                                                                                                                                                                 |
| ORACLE_MAINTAINED | VARCHAR2(1)   |      | Denotes whether the object was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). An object for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.                                                                                                                                                                     |
| APPLICATION       | VARCHAR2(1)   |      | Indicates whether the object is an Application common object (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                 |
| DEFAULT_COLLATION | VARCHAR2(100) |      | Default collation for the object                                                                                                                                                                                                                                                                                                                                                                                            |
| DUPLICATED        | VARCHAR2(1)   |      | Indicates whether this object is duplicated on this shard (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                    |
| SHARDED           | VARCHAR2(1)   |      | Indicates whether this object is sharded (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                     |
| IMPORTED_OBJECT   | VARCHAR2(1)   |      | Indicates whether this object is imported (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                    |
| CREATED_APPID     | NUMBER        |      | ID of the Application that created the object                                                                                                                                                                                                                                                                                                                                                                               |
| CREATED_VSNID     | NUMBER        |      | ID of the Application Version that created the object                                                                                                                                                                                                                                                                                                                                                                       |
| MODIFIED_APPID    | NUMBER        |      | ID of the Application that last modified the object                                                                                                                                                                                                                                                                                                                                                                         |
| MODIFIED_VSNID    | NUMBER        |      | ID of the Application Version that last modified the object                                                                                                                                                                                                                                                                                                                                                                 |

## 6.122 DBA\_JAVA\_ARGUMENTS

DBA\_JAVA\_ARGUMENTS displays argument information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_ARGUMENTS.

### ① See Also

["ALL\\_JAVA\\_ARGUMENTS"](#)

## 6.123 DBA\_JAVA\_CLASSES

DBA\_JAVA\_CLASSES displays class level information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_CLASSES.

### ① See Also

["ALL\\_JAVA\\_CLASSES"](#)

## 6.124 DBA\_JAVA\_COMPILER\_OPTIONS

DBA\_JAVA\_COMPILER\_OPTIONS displays information about all native compiler options in the database. Its columns are the same as those in ALL\_JAVA\_COMPILER\_OPTIONS.

### ① See Also

["ALL\\_JAVA\\_COMPILER\\_OPTIONS"](#)

## 6.125 DBA\_JAVA\_DERIVATIONS

DBA\_JAVA\_DERIVATIONS displays mapping information about Java source objects and their derived Java class objects and Java resource objects for all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_DERIVATIONS.

### ① See Also

["ALL\\_JAVA\\_DERIVATIONS"](#)

## 6.126 DBA\_JAVA\_FIELDS

DBA\_JAVA\_FIELDS displays field information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_FIELDS.

### ① See Also

["ALL\\_JAVA\\_FIELDS"](#)

## 6.127 DBA\_JAVA\_IMPLEMENTES

DBA\_JAVA\_IMPLEMENTES describes interfaces implemented by all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_IMPLEMENTES.

### ① See Also

["ALL\\_JAVA\\_IMPLEMENTES"](#)

## 6.128 DBA\_JAVA\_INNERS

DBA\_JAVA\_INNERS displays information about inner classes referred to by all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_INNERS.

### ① See Also

["ALL\\_JAVA\\_INNERS"](#)

## 6.129 DBA\_JAVA\_LAYOUTS

DBA\_JAVA\_LAYOUTS displays class layout information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_LAYOUTS.

### ① See Also

["ALL\\_JAVA\\_LAYOUTS"](#)

## 6.130 DBA\_JAVA\_METHODS

DBA\_JAVA\_METHODS displays method information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_METHODS.

### ① See Also

["ALL\\_JAVA\\_METHODS"](#)

## 6.131 DBA\_JAVA\_NCOMPS

DBA\_JAVA\_NCOMPS displays ncomp-related information about all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_NCOMPS.

### ① See Also

["ALL\\_JAVA\\_NCOMPS"](#)

## 6.132 DBA\_JAVA\_POLICY

DBA\_JAVA\_POLICY describes Java security permissions for all users in the database.

### Related View

USER\_JAVA\_POLICY describes Java security permissions for the current user.

| Column      | Datatype       | NULL     | Description                                                                                                                         |
|-------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------|
| KIND        | VARCHAR2(8)    |          | Indicates whether the permission is a positive (GRANT) or a limitation (RESTRICT)                                                   |
| GRANTEE     | VARCHAR2(128)  | NOT NULL | Name of the user, schema, or role to which the permission object is assigned                                                        |
| TYPE_SCHEMA | VARCHAR2(128)  | NOT NULL | Schema in which the permission object is loaded                                                                                     |
| TYPE_NAME   | VARCHAR2(4000) |          | Permission class type, which is designated by a string containing the full class name, such as, <code>java.io.FilePermission</code> |
| NAME        | VARCHAR2(4000) |          | Target attribute (name) of the permission object. This name is used when defining the permission.                                   |
| ACTION      | VARCHAR2(4000) |          | Action attribute for this permission. Many permissions expect a null value if no action is appropriate for the permission.          |
| ENABLED     | VARCHAR2(8)    |          | Indicates whether the permission is enabled (ENABLED) or disabled (DISABLED)                                                        |
| SEQ         | NUMBER         |          | Sequence number used to identify this row. This number should be supplied when disabling, enabling, or deleting the permission.     |

① **See Also**  
["USER\\_JAVA\\_POLICY"](#)

## 6.133 DBA\_JAVA\_RESOLVERS

DBA\_JAVA\_RESOLVERS displays information about resolvers of all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_RESOLVERS.

① **See Also**  
["ALL\\_JAVA\\_RESOLVERS"](#)

## 6.134 DBA\_JAVA\_THROWS

DBA\_JAVA\_THROWS displays information about exceptions thrown from methods of all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_THROWSa.

① **See Also**  
["ALL\\_JAVA\\_THROWS"](#)

## 6.135 DBA\_JOBS

DBA\_JOBS describes all jobs in the database.

**Related View**

USER\_JOBS describes the jobs owned by the current user.

| Column      | Datatype      | NULL     | Description                                                                                                                                                                   |
|-------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB         | NUMBER        | NOT NULL | Identifier of job. Neither import/export nor repeated executions change this value.                                                                                           |
| LOG_USER    | VARCHAR2(128) | NOT NULL | Login user when the job was submitted                                                                                                                                         |
| PRIV_USER   | VARCHAR2(128) | NOT NULL | User whose default privileges apply to this job                                                                                                                               |
| SCHEMA_USER | VARCHAR2(128) | NOT NULL | Default schema used to parse the job<br>For example, if the SCHEMA_USER is SCOTT and you submit the procedure HIRE_EMP as a job, the Oracle Database looks for SCOTT.HIRE_EMP |
| LAST_DATE   | DATE          |          | Date on which this job last successfully executed                                                                                                                             |
| LAST_SEC    | VARCHAR2(8)   |          | Same as LAST_DATE. This is when the last successful execution started.                                                                                                        |
| THIS_DATE   | DATE          |          | Date that this job started executing (usually null if not executing)                                                                                                          |

| Column     | Datatype       | NULL     | Description                                                                                          |
|------------|----------------|----------|------------------------------------------------------------------------------------------------------|
| THIS_SEC   | VARCHAR2(8)    |          | Same as THIS_DATE. This is when the last successful execution started.                               |
| NEXT_DATE  | DATE           | NOT NULL | Date that this job will next be executed                                                             |
| NEXT_SEC   | VARCHAR2(8)    |          | Same as NEXT_DATE. The job becomes due for execution at this time.                                   |
| TOTAL_TIME | NUMBER         |          | Total wall clock time spent by the system on this job (in seconds) when it last executed             |
| BROKEN     | VARCHAR2(1)    |          | Y: no attempt is made to run this job<br>N: an attempt is made to run this job                       |
| INTERVAL   | VARCHAR2(200)  | NOT NULL | A date function, evaluated at the start of execution, becomes next NEXT_DATE                         |
| FAILURES   | NUMBER         |          | Number of times the job has started and failed since its last success                                |
| WHAT       | VARCHAR2(4000) |          | Body of the anonymous PL/SQL block that the job executes                                             |
| NLS_ENV    | VARCHAR2(4000) |          | Session parameters describing the NLS environment of the job                                         |
| MISC_ENV   | RAW(32)        |          | Other session parameters of the session that created the job. The job is run using these parameters. |
| INSTANCE   | NUMBER         |          | ID of the instance that can execute or is executing the job. The default is 0.                       |

① **See Also**  
["USER\\_JOBS"](#)

## 6.136 DBA\_JOBS\_RUNNING

DBA\_JOBS\_RUNNING lists all jobs that are currently running in the instance.

| Column    | Datatype    | NULL | Description                                                                      |
|-----------|-------------|------|----------------------------------------------------------------------------------|
| SID       | NUMBER      |      | Identifier of process that is executing the job. See <a href="#">"V\$LOCK"</a> . |
| JOB       | NUMBER      |      | Identifier of job. This job is currently executing.                              |
| FAILURES  | NUMBER      |      | Number of times this job started and failed since its last success.              |
| LAST_DATE | DATE        |      | Date that this job last successfully executed.                                   |
| LAST_SEC  | VARCHAR2(8) |      | Same as LAST_DATE. This is when the last successful execution started.           |
| THIS_DATE | DATE        |      | Date that this job started executing.                                            |
| THIS_SEC  | VARCHAR2(8) |      | Same as THIS_DATE. This is when the last successful execution started.           |
| INSTANCE  | NUMBER      |      | Indicates which instance can execute or is executing the job; the default is 0.  |

## 6.137 DBA\_JOIN\_IND\_COLUMNS

DBA\_JOIN\_IND\_COLUMNS describes all join conditions in the database. Its columns are the same as those in ALL\_JOIN\_IND\_COLUMNS.

 **See Also**  
["ALL\\_JOIN\\_IND\\_COLUMNS"](#)

## 6.138 DBA\_JOINGROUPS

DBA\_JOINGROUPS describes join groups in the database. A join group is a user-created object that consists of two or more columns that can be meaningfully joined. The maximum number of columns that can be included in a join group is 255.

In certain queries, join groups enable the database to eliminate the performance overhead of decompressing and hashing column values. Join groups require an In-Memory column store (IM column store).

**Related View**

USER\_JOINGROUPS describes join groups belonging to the user. This view does not display the JOINGROUP\_OWNER column.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|---------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOINGROUP_OWNER | VARCHAR2(128) | NOT NULL | Join group owner. This is the user that created the join group.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| JOINGROUP_NAME  | VARCHAR2(128) | NOT NULL | This is the user specified name of the join group. The join group name is specified when the join group is created as part of the CREATE INMEMORY JOIN GROUP statement.                                                                                                                                                                                                                                                                                                                              |
| TABLE_OWNER     | VARCHAR2(128) | NOT NULL | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TABLE_NAME      | VARCHAR2(128) | NOT NULL | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| COLUMN_NAME     | VARCHAR2(128) | NOT NULL | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| FLAGS           | VARCHAR2(6)   |          | Possible values: <ul style="list-style-type: none"><li>MASTER: Indicates which column in the join group is mastering the global dictionary. A join group is a group of columns sharing a global dictionary; the global dictionary is associated with one column and the other columns share the same dictionary. The column with which the global dictionary is associated is called the mastering column.</li><li>NULL: Indicates that the column is not mastering the global dictionary.</li></ul> |

| Column     | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GD_ADDRESS | RAW(8)   |      | The memory address of the global dictionary. Ideally, all the columns in one join group should have the same global dictionary address (that is, they share the same global structure). This might not always be the case (for example, a column might be added to a join group after it was populated into memory - in which case its GD_ADDRESS field will be NULL). In such cases, you should force re-populate the tables that are part of the join group and check the views after the repopulates complete. |

## 6.139 DBA\_JSON\_COLUMNS

DBA\_JSON\_COLUMNS provides information on all JavaScript Object Notation (JSON) columns in the database. Its columns are the same as those in ALL\_JSON\_COLUMNS.

#### ① See Also

- ["ALL\\_JSON\\_COLUMNS"](#)
- *Oracle Database JSON Developer's Guide* for more information about using JSON with Oracle Database

## 6.140 DBA\_JSON\_DATAGUIDE\_FIELDS

DBA\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from all the data guides in the database, which are the data guides returned by the DBA\_JSON\_DATAGUIDE view. Its columns are the same as those in ALL\_JSON\_DATAGUIDE\_FIELDS.

#### ① See Also

- ["ALL\\_JSON\\_DATAGUIDE\\_FIELDS"](#)

## 6.141 DBA\_JSON\_DATAGUIDES

DBA\_JSON\_DATAGUIDES provides information on all JavaScript Object Notation (JSON) columns in the database that have data guide enabled. Its columns are the same as those in ALL\_JSON\_DATAGUIDES.

### ① See Also

["ALL\\_JSON\\_DATAGUIDES"](#)

## 6.142 DBA\_KGLLOCK

DBA\_KGLLOCK lists all the locks and pins held on KGL objects (objects in the Kernel Generic Library cache).

| Column    | Datatype    | NULL | Description                                            |
|-----------|-------------|------|--------------------------------------------------------|
| kgllkuse  | RAW(4)      |      | Address of the user session that holds the lock or pin |
| kgllkhd1  | RAW(4)      |      | Address of the handle for the KGL object               |
| kgllkmod  | NUMBER      |      | Current mode of the lock or pin                        |
| kgllkreq  | NUMBER      |      | Mode in which the lock or pin was requested            |
| kgllktype | VARCHAR2(4) |      | Whether this is a lock or a pin                        |

## 6.143 DBA\_LIBRARIES

DBA\_LIBRARIES describes all libraries in the database. Its columns are the same as those in ALL\_LIBRARIES.

### ① See Also

["ALL\\_LIBRARIES"](#)

## 6.144 DBA\_LMT\_FREE\_SPACE

DBA\_LMT\_FREE\_SPACE describes the free extents in all locally managed tablespaces in the database.

| Column        | Datatype | NULL | Description                                               |
|---------------|----------|------|-----------------------------------------------------------|
| TABLESPACE_ID | NUMBER   |      | Identifier number of the tablespace containing the extent |
| FILE_ID       | NUMBER   |      | File identifier number of the file containing the extent  |
| BLOCK_ID      | NUMBER   |      | Starting block number of the extent                       |
| BLOCKS        | NUMBER   |      | Size of the extent (in Oracle blocks)                     |

## 6.145 DBA\_LMT\_USED\_EXTENTS

DBA\_LMT\_USED\_EXTENTS describes the extents comprising the segments in all locally managed tablespaces in the database.

| Column         | Datatype | NULL | Description                                               |
|----------------|----------|------|-----------------------------------------------------------|
| SEGMENT_FILEID | NUMBER   |      | File number of the segment header of the extent           |
| SEGMENT_BLOCK  | NUMBER   |      | Block number of the segment header of the extent          |
| TABLESPACE_ID  | NUMBER   |      | Identifier number of the tablespace containing the extent |
| EXTENT_ID      | NUMBER   |      | Extent number in the segment                              |
| FILEID         | NUMBER   |      | File identifier number of the file containing the extent  |
| BLOCK          | NUMBER   |      | Starting block number of the extent                       |
| LENGTH         | NUMBER   |      | Number of blocks in the extent                            |

## 6.146 DBA\_LOB\_PARTITIONS

DBA\_LOB\_PARTITIONS displays all LOB partitions in the database. Its columns are the same as those in ALL\_LOB\_PARTITIONS.

### ① See Also

["ALL\\_LOB\\_PARTITIONS"](#)

## 6.147 DBA\_LOB\_SUBPARTITIONS

DBA\_LOB\_SUBPARTITIONS displays partition-level attributes of all LOB data subpartitions in the database. Its columns are the same as those in ALL\_LOB\_SUBPARTITIONS.

### ① See Also

["ALL\\_LOB\\_SUBPARTITIONS"](#)

## 6.148 DBA\_LOB\_TEMPLATES

DBA\_LOB\_TEMPLATES describes all LOB subpartition templates in the database. Its columns are the same as those in ALL\_LOB\_TEMPLATES.

### ① See Also

["ALL\\_LOB\\_TEMPLATES"](#)

## 6.149 DBA\_LOBS

DBA\_LOBS displays the BLOBs and CLOBs contained in all tables in the database. BFILEs are stored outside the database, so they are not described by this view. This view's columns are the same as those in ALL\_LOBS.

### See Also

["ALL\\_LOBS"](#)

## 6.150 DBA\_LOCK

DBA\_LOCK lists all locks or latches held in the database, and all outstanding requests for a lock or latch.

| Column          | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|--------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID      | NUMBER       |      | Session holding or acquiring the lock                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOCK_TYPE       | VARCHAR2(26) |      | Lock type<br><b>See Also:</b> For a listing of lock types, see <a href="#">Oracle Enqueue Names</a>                                                                                                                                                                                                                                                                                                                                            |
| MODE_HELD       | VARCHAR2(40) |      | Lock mode                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MODE_REQUESTED  | VARCHAR2(40) |      | Lock mode requested                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LOCK_ID1        | VARCHAR2(40) |      | Type-specific lock identifier, part 1                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOCK_ID2        | VARCHAR2(40) |      | Type-specific lock identifier, part 2                                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_CONVERT    | NUMBER       |      | The last convert                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BLOCKING_OTHERS | VARCHAR2(40) |      | Whether the lock is currently blocking others                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID          | NUMBER       |      | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.151 DBA\_LOCK\_INTERNAL

DBA\_LOCK\_INTERNAL displays a row for each lock or latch that is being held, and one row for each outstanding request for a lock or latch.

| Column     | Datatype | NULL | Description                           |
|------------|----------|------|---------------------------------------|
| SESSION_ID | NUMBER   |      | Session holding or acquiring the lock |

| Column         | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOCK_TYPE      | VARCHAR2(56)   |      | Lock type<br><b>See Also:</b> For a listing of lock types, see <a href="#">Oracle Enqueue Names</a>                                                                                                                                                                                                                                                                                                                                                |
| MODE_HELD      | VARCHAR2(40)   |      | Lock mode                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MODE_REQUESTED | VARCHAR2(40)   |      | Lock mode requested                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LOCK_ID1       | VARCHAR2(1130) |      | Type-specific lock identifier, part 1                                                                                                                                                                                                                                                                                                                                                                                                              |
| LOCK_ID2       | VARCHAR2(40)   |      | Type-specific lock identifier, part 2                                                                                                                                                                                                                                                                                                                                                                                                              |

## 6.152 DBA\_LOCKDOWN\_PROFILES

DBA\_LOCKDOWN\_PROFILES provides information about lockdown profiles.

The PRIVATE\_DBAAS, PUBLIC\_DBAAS, and SAAS lockdown profiles are empty placeholder profiles for the lockdown profiles of their corresponding deployment type. You can modify and add restrictions to these profiles based on their deployment purpose. For example, if you have a Software as a Service (SAAS) application, you can modify the SAAS lockdown profile and use it. You can also delete and re-create these profiles.

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                      |
|---------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROFILE_NAME  | VARCHAR2(128)  | NOT NULL | Name of the lockdown profile                                                                                                                                                                                                                                     |
| RULE_TYPE     | VARCHAR2(128)  |          | Rule type. A lockdown profile is used to restrict operations that can be performed by users connected to a given PDB. It provides the ability to add or remove different types of rules like STATEMENT, FEATURES or OPTIONS which will be restricted in the PDB. |
| RULE          | VARCHAR2(128)  |          | Rule to be enabled or disabled                                                                                                                                                                                                                                   |
| CLAUSE        | VARCHAR2(128)  |          | Clause of the statement                                                                                                                                                                                                                                          |
| CLAUSE_OPTION | VARCHAR2(128)  |          | Option of the clause                                                                                                                                                                                                                                             |
| OPTION_VALUE  | VARCHAR2(4000) |          | Value of the option                                                                                                                                                                                                                                              |
| MIN_VALUE     | VARCHAR2(4000) |          | Minimum value allowed for the option                                                                                                                                                                                                                             |
| MAX_VALUE     | VARCHAR2(4000) |          | Maximum value allowed for the option                                                                                                                                                                                                                             |
| LIST          | VARCHAR2(4000) |          | List of allowed values for the option                                                                                                                                                                                                                            |
| STATUS        | VARCHAR2(7)    |          | Status of the lockdown profile: <ul style="list-style-type: none"> <li>ENABLE</li> <li>DISABLE</li> <li>EMPTY</li> </ul>                                                                                                                                         |

| Column       | Datatype    | NULL | Description                                                                                                        |
|--------------|-------------|------|--------------------------------------------------------------------------------------------------------------------|
| USERS        | VARCHAR2(6) |      | User type. Possible values: <ul style="list-style-type: none"><li>• COMMON</li><li>• LOCAL</li><li>• ALL</li></ul> |
| EXCEPT_USERS | CLOB        |      | For internal use only                                                                                              |

## 6.153 DBA\_LOCKS

DBA\_LOCKS is a synonym for DBA\_LOCK.

#### ① See Also

["DBA\\_LOCK"](#)

## 6.154 DBA\_LOG\_GROUP\_COLUMNS

DBA\_LOG\_GROUP\_COLUMNS describes all columns in the database that are specified in log groups. Its columns are the same as those in ALL\_LOG\_GROUP\_COLUMNS.

#### ① See Also

["ALL\\_LOG\\_GROUP\\_COLUMNS"](#)

## 6.155 DBA\_LOG\_GROUPS

DBA\_LOG\_GROUPS describes log group definitions on all tables in the database. Its columns are the same as those in ALL\_LOG\_GROUPS.

["ALL\\_LOG\\_GROUPS"](#)

## 6.156 DBA\_LOGMNR\_DICTIONARY\_BUILDLOG

DBA\_LOGMNR\_DICTIONARY\_BUILDLOG describes all successful LogMiner dictionary builds available for GoldenGate REGISTER EXTRACT.

When this view is queried from a PDB, it returns only LogMiner dictionary builds performed in that PDB.

| Column            | Datatype      | NULL | Description                                                                                                              |
|-------------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2(384) |      | User-supplied name of the LogMiner dictionary build                                                                      |
| DATE_OF_BUILD     | VARCHAR2(20)  |      | Date and time at which the LogMiner dictionary build was performed                                                       |
| START_SCN         | NUMBER        |      | Begin SCN of the LogMiner dictionary build operation                                                                     |
| END_SCN           | NUMBER        |      | End SCN of the LogMiner dictionary build operation                                                                       |
| BUILD_TYPE        | VARCHAR2(20)  |      | Internal string that identifies how the LogMiner dictionary build was initiated                                          |
| BUILD_OP          | NUMBER        |      | Internal number that identifies how the LogMiner dictionary build was initiated                                          |
| CONTAINER_ID      | NUMBER        |      | ID of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)                         |
| CONTAINER_UID     | NUMBER        |      | Unique number that identifies the container in which the LogMiner dictionary build was performed (the CDB root or a PDB) |
| CONTAINER_NAME    | VARCHAR2(384) |      | Name of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)                       |
| RESETLOGS_CHANGE# | NUMBER        |      | SCN that identifies the redo branch of the LogMiner dictionary build                                                     |

### Note

This view is available starting with Oracle Database 21c.

## 6.157 DBA\_LOGMNR\_LOG

DBA\_LOGMNR\_LOG displays all archived logs registered with active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

| Column            | Datatype      | NULL     | Description                                                                                                                   |
|-------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| LOGMNR_SESSION_ID | NUMBER        | NOT NULL | Unique identifier of the persistent session                                                                                   |
| NAME              | VARCHAR2(513) |          | Name of the archived log                                                                                                      |
| DBID              | NUMBER        | NOT NULL | Database identifier that produced the archived log                                                                            |
| RESETLOGS_SCN     | NUMBER        | NOT NULL | SCN at which resetlogs operation was performed at the source database generating the archived log                             |
| RESETLOGS_TIME    | NUMBER        | NOT NULL | Timestamp at which resetlogs operation was performed at the source database generating the archived log                       |
| MODIFIED_TIME     | DATE          |          | Time at which the archived log was registered with LogMiner                                                                   |
| THREAD#           | NUMBER        | NOT NULL | Redo thread at the source database that generated the archived log                                                            |
| SEQUENCE#         | NUMBER        | NOT NULL | Logfile sequence number                                                                                                       |
| FIRST_SCN         | NUMBER        | NOT NULL | Lowest SCN of the redo record contained in the logfile                                                                        |
| NEXT_SCN          | NUMBER        |          | Highest possible SCN of the redo record contained in the logfile                                                              |
| FIRST_TIME        | DATE          |          | Time of the first redo record contained in the logfile                                                                        |
| NEXT_TIME         | DATE          |          | Time of the last redo record contained in the logfile                                                                         |
| DICTIONARY_BEGIN  | VARCHAR2(3)   |          | Indicates whether the archived log contains the beginning of a LogMiner dictionary (YES) or not (NO)                          |
| DICTIONARY_END    | VARCHAR2(3)   |          | Indicates whether the archived log contains the end of a LogMiner dictionary (YES) or not (NO)                                |
| KEEP              | VARCHAR2(3)   |          | Indicates whether the logfile is still required for this LogMiner session (YES) or not (NO)                                   |
| SUSPECT           | VARCHAR2(3)   |          | Indicates whether the archived log content was deemed to be corrupt or the archived log is partially filled (YES) or not (NO) |

## 6.158 DBA\_LOGMNR\_PURGED\_LOG

DBA\_LOGMNR\_PURGED\_LOG displays archived redo log files that have been applied to the logical standby database and can be deleted because they are no longer needed.

Files in this view are refreshed as a result of executing the DBMS\_LOGSTDBY.PURGE\_SESSION PL/SQL procedure for Oracle Data Guard SQL Apply:

| Column    | Datatype      | NULL | Description                                                                                                                              |
|-----------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME | VARCHAR2(513) |      | Fully qualified names of the archived redo log files that are no longer needed by SQL Apply and can be deleted from the operating system |

**See Also**

## 6.159 DBA\_LOGMNR\_SESSION

DBA\_LOGMNR\_SESSION displays all active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

| Column                | Datatype      | NULL     | Description                                                                                                                                                                                   |
|-----------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                    | NUMBER        | NOT NULL | Unique session identifier                                                                                                                                                                     |
| NAME                  | VARCHAR2(128) | NOT NULL | Unique session name                                                                                                                                                                           |
| SOURCE_DATABASE       | VARCHAR2(128) |          | Global name of the source database whose archived logs are to be mined in this persistent LogMiner session                                                                                    |
| SOURCE_DBID           | NUMBER        |          | Database ID of the source database                                                                                                                                                            |
| SOURCE_RESETLOGS_SCN  | NUMBER        |          | Resetlogs SCN associated with the incarnation of the source database whose archived logs are mined                                                                                            |
| SOURCE_RESETLOGS_TIME | NUMBER        |          | Resetlogs time associated with the incarnation of the source database whose archived logs are mined                                                                                           |
| FIRST_SCN             | NUMBER        |          | Only modifications that occurred on or after this SCN can be mined using this persistent session                                                                                              |
| END_SCN               | NUMBER        |          | No modifications that occurred on or after this SCN can be mined using this persistent session                                                                                                |
| BRANCH_SCN            | NUMBER        |          | SCN at which a branch will be taken in terms of the incarnation corresponding to the source database. This implies a point-in-time recovery was performed at the source database at this SCN. |
| WAIT_FOR_LOG          | VARCHAR2(3)   |          | Indicates whether the persistent session waits for RFS to register new archived logs or to fill gaps (YES) or not (NO)                                                                        |
| HOT_MINE              | VARCHAR2(3)   |          | Indicates whether real-time mining is on (YES) or not (NO)                                                                                                                                    |
| SAFE_PURGE_SCN        | NUMBER        |          | Persistent session can safely be purged up to this SCN                                                                                                                                        |
| CHECKPOINT_SCN        | NUMBER        |          | SCN at which the latest checkpoint is taken by the persistent LogMiner session                                                                                                                |
| PURGE_SCN             | NUMBER        |          | The session has been purged up to this SCN                                                                                                                                                    |

## 6.160 DBA\_LOGSTDBY\_EVENTS

DBA\_LOGSTDBY\_EVENTS displays information about the activity of the logical standby database system.

It can be used to determine the cause of failures that occur when applying redo data to logical standby databases. This view is for logical standby databases only.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                           |
|-----------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT_TIME      | DATE           |          | Time when the event was logged                                                                                                                                                                                        |
| EVENT_TIMESTAMP | TIMESTAMP(6)   | NOT NULL | Timestamp when the event was logged                                                                                                                                                                                   |
| START_SCN       | NUMBER         |          | The SCN at which the associated transaction started at the primary database. This SCN refers to the system change number at the primary database.                                                                     |
| CURRENT_SCN     | NUMBER         |          | SCN associated with the change at the primary database. If a failure occurred, then examine this column to determine which archived log file contains the source of the failure (for example, an unsupported record). |
| COMMIT_SCN      | NUMBER         |          | SCN value on which the change was committed at the primary database                                                                                                                                                   |
| XIDUSN          | NUMBER         |          | Transaction ID undo segment number at the primary database of the associated transaction                                                                                                                              |
| XIDSLT          | NUMBER         |          | Transaction ID slot number at the primary database of the associated transaction                                                                                                                                      |
| XIDSQN          | NUMBER         |          | Transaction ID sequence number at the primary database of the associated transaction                                                                                                                                  |
| EVENT           | CLOB           |          | Statement that was being processed when the failure occurred                                                                                                                                                          |
| STATUS_CODE     | NUMBER         |          | Status (or Oracle error code) belonging to the STATUS message                                                                                                                                                         |
| STATUS          | VARCHAR2(2000) |          | Description of the current activity of the process or the reason why the apply operation stopped                                                                                                                      |
| SRC_CON_NAME    | VARCHAR2(30)   |          | Identifies the PDB name at the primary database where the transaction was executed                                                                                                                                    |
| SRC_CON_ID      | NUMBER         |          | Contains the PDB ID (the PDB_ID column from the DBA_PDBS view) of the primary database where the associated change was generated.                                                                                     |

### ① Note

In a CDB, this view shows data only when queried in the root.

## 6.161 DBA\_LOGSTDBY\_HISTORY

DBA\_LOGSTDBY\_HISTORY displays the history of switchovers and failovers in a Data Guard configuration.

It does this by showing the complete sequence of redo log streams processed or created on the local system, across all role transitions. (After a role transition, a new log stream is started and the log stream sequence number is incremented by the new primary database.). This view is for logical standby databases only.

| Column           | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STREAM_SEQUENCE# | NUMBER        |      | Lists the sequence numbers for all log streams created or applied on the local system.<br><br><b>Note:</b> A value of 0 indicates an unknown sequence order; this is reserved for future log streams.                                                                                                                                                                                                                                                                                                                 |
| STATUS           | VARCHAR2(16)  |      | Description of the log stream processing: <ul style="list-style-type: none"> <li>Past - The log stream has already been processed</li> <li>Immediate Past - This is the most recently processed log stream; its status is transitioning from Current to Past</li> <li>Current - The log stream is currently being processed</li> <li>Immediate Future - This is the next log stream to be processed; its status is transitioning from Future to Current</li> <li>Future - The log stream will be processed</li> </ul> |
| SOURCE           | VARCHAR2(5)   |      | Describes how the log stream was started: <ul style="list-style-type: none"> <li>RFS - The RFS process created the log stream</li> <li>User - A user registered the initial log file for the log stream</li> <li>Synch - A user issued the ALTER DATABASE START LOGICAL STANDBY APPLY NEW PRIMARY DDL statement</li> <li>Redo - The log stream information was recorded in the redo log</li> </ul>                                                                                                                    |
| DBID             | NUMBER        |      | Database identifier of the primary database that created the log stream                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FIRST_CHANGE#    | NUMBER        |      | Lowest system change number (SCN) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_CHANGE#     | NUMBER        |      | Highest system change number (SCN) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FIRST_TIME       | DATE          |      | Time of the first SCN entry (FIRST_CHANGE#) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LAST_TIME        | DATE          |      | Time of the last SCN entry (LAST_CHANGE#) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DGNAME           | VARCHAR2(255) |      | Unique database name (DB_UNIQUE_NAME) of the primary database that produced the log stream. See V\$DATAGUARD_CONFIG to display all database DB_UNIQUE_NAME values defined in the Data Guard configuration.                                                                                                                                                                                                                                                                                                            |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MERGE_CHANGE#     | NUMBER   |      | SCN that should be used to flashback a failed primary (that created the log stream) or to flashback a bystander logical standby database following a failover, in the context of the associated redo log stream. It is the SCN up to which redo for the associated log stream can be merged safely in all databases using local copies of archived logs received from the primary database. In order to apply changes beyond this following a failover, you will need to fetch and mine the redo logs from the failover target. |
| PROCESSED_CHANGE# | NUMBER   |      | Strict upper bound on the SCN up to which SQL Apply has applied redo records before it switched to a new log stream (either because it was activated and became the primary database, or in the case of a bystander logical standby database where it switched to a new log stream to accommodate a new primary database).                                                                                                                                                                                                      |

**Note**

In a CDB, this view shows data only when queried in the root.

## 6.162 DBA\_LOGSTDBY\_LOG

DBA\_LOGSTDBY\_LOG displays information about the logs registered for a logical standby database.

This view is for logical standby databases only.

| Column            | Datatype      | NULL     | Description                                                                                                                                            |
|-------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| THREAD#           | NUMBER        | NOT NULL | Thread ID of the archive log. The THREAD number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers. |
| RESETLOGS_CHANGE# | NUMBER        | NOT NULL | Start SCN of the branch                                                                                                                                |
| RESETLOGS_ID      | NUMBER        | NOT NULL | Resetlogs identifier (a numeric form of the timestamp of the branch)                                                                                   |
| SEQUENCE#         | NUMBER        | NOT NULL | Sequence number of the archive log file                                                                                                                |
| FIRST_CHANGE#     | NUMBER        | NOT NULL | System change number (SCN) of the current archive log                                                                                                  |
| NEXT_CHANGE#      | NUMBER        |          | SCN of the next archive log                                                                                                                            |
| FIRST_TIME        | DATE          |          | Date of the current archive log                                                                                                                        |
| NEXT_TIME         | DATE          |          | Date of the next archive log                                                                                                                           |
| FILE_NAME         | VARCHAR2(513) |          | Name of the archive log                                                                                                                                |
| TIMESTAMP         | DATE          |          | Time when the archive log was registered                                                                                                               |
| DICT_BEGIN        | VARCHAR2(3)   |          | Indicates whether the beginning of the dictionary build is in this archive log (YES) or not (NO)                                                       |

**Note**

The SCN values in this view correlate to the SCN values shown in the DBA\_LOGSTDBY\_PROGRESS view.

**Note**

In a CDB, this view shows data only when queried in the root.

## 6.163 DBA\_LOGSTDBY\_NOT\_UNIQUE

DBA\_LOGSTDBY\_NOT\_UNIQUE displays all tables that have no primary and no non-null unique indexes.

Most of the tables displayed by this view are supported because their columns contain enough information to be maintained in a logical standby database. Some tables, however, cannot be supported because their columns do not contain the necessary information. Unsupported tables usually contain a column defined using an unsupported data type.

In a CDB, the data displayed pertains to the container in which the view is queried.

| Column     | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| BAD_COLUMN | VARCHAR2(1)   |      | <ul style="list-style-type: none"><li>Y - Table column is defined using an unbounded data type, such as LONG or BLOB. If two rows in the table match except in their LOB columns, then the table cannot be maintained properly. Log apply services will attempt to maintain these tables, but you must ensure the application does not allow uniqueness only in the unbounded columns.</li><li>N - Enough column information is present to maintain the table in the logical standby database but the log transport services and log apply services would run more efficiently if you added a primary key. You should consider adding a disabled RELY constraint to these tables.</li></ul> |

## 6.164 DBA\_LOGSTDBY\_PARAMETERS

DBA\_LOGSTDBY\_PARAMETERS displays the list of parameters used by SQL apply for logical standby databases.

This view is for logical standby databases only.

| Column  | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| NAME    | VARCHAR2(64)   |      | <p>Name of the parameter:</p> <ul style="list-style-type: none"> <li>• MAX_SGA - System global area (SGA) allocated for the log apply services cache (in megabytes)</li> <li>• MAX_SERVERS - Number of processes used by SQL Apply services</li> <li>• PREPARE_SERVERS - Controls the number of parallel execution servers used to prepare changes</li> <li>• APPLY_SERVERS - Controls the number of parallel execution servers used to apply changes</li> <li>• MAX_EVENTS_RECORDED - Number of events stored in the DBA_LOGSTDBY_EVENTS view</li> <li>• RECORD_SKIP_ERRORS - Indicates records that are skipped</li> <li>• RECORD_SKIP_DDL - Indicates skipped DDL statements</li> <li>• RECORD_APPLIED_DDL - Indicates applied DDL statements</li> <li>• RECORD_UNSUPPORTED_OPERATIONS - Shows whether SQL Apply will capture information about transactions that did unsupported operations at the primary database in the DBA_LOGSTDBY_EVENTS view</li> <li>• EVENT_LOG_DEST - Indicates where SQL Apply records the occurrence of an interesting event</li> <li>• LOG_AUTO_DELETE - Shows whether SQL Apply will automatically delete remote archived logs received from the primary database, once the contents of the logs are applied at the logical standby database.</li> <li>• LOG_AUTO_DEL_RETENTION_TARGET - How many minutes a remote archived log received from the primary database will be retained at the logical standby database, once the contents of the log are applied by SQL Apply.</li> <li>• PRESERVE_COMMIT_ORDER - Shows whether transactions are committed at the logical standby database in the same order that they were committed at the primary database</li> </ul> |
| VALUE   | VARCHAR2(2000) |      | Value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| UNIT    | VARCHAR2(64)   |      | Unit of the value, if applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SETTING | VARCHAR2(64)   |      | <p>Possible values are as follows:</p> <ul style="list-style-type: none"> <li>• SYSTEM - Parameter value was not explicitly set by the user. However, the user can change it with an appropriate call to the APPLY_SET procedure.</li> <li>• USER - Parameter value was explicitly set by the user</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DYNAMIC | VARCHAR2(64)   |      | <p>YES if the parameter can be set dynamically (that is, without having to stop SQL Apply)</p> <p>NO if setting the parameter requires that SQL Apply be stopped</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Note**

In a CDB, this view shows data when queried in the root.

## 6.165 DBA\_LOGSTDBY\_PLSQL\_MAP

DBA\_LOGSTDBY\_PLSQL\_MAP shows the mapping between a supported user invokable (/external) PL/SQL procedure to the corresponding replicated internal PL/SQL procedure.

| Column             | Datatype      | NULL     | Description                                    |
|--------------------|---------------|----------|------------------------------------------------|
| OWNER              | VARCHAR2(128) | NOT NULL | Owner name of the procedure                    |
| PKG_NAME           | VARCHAR2(128) |          | Package name of the user invokable procedure   |
| PROC_NAME          | VARCHAR2(128) |          | Procedure name of the user invokable procedure |
| INTERNAL_PKG_NAME  | VARCHAR2(128) |          | Package name of the internal procedure         |
| INTERNAL_PROC_NAME | VARCHAR2(128) |          | Procedure name of the internal procedure       |

**Note**

In a CDB, this view shows data when queried in the root or a PDB.

## 6.166 DBA\_LOGSTDBY\_PLSQL\_SUPPORT

DBA\_LOGSTDBY\_PLSQL\_SUPPORT shows the PL/SQL packages that are only supported during rolling operations.

| Column        | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER         | VARCHAR2(128) | NOT NULL | Owner name of the package                                                                                                                                                                                                                                                                                                                         |
| PKG_NAME      | VARCHAR2(128) |          | Package name of the user invokable procedure                                                                                                                                                                                                                                                                                                      |
| SUPPORT_LEVEL | VARCHAR2(12)  |          | Logical standby PL/SQL support level for the package: <ul style="list-style-type: none"> <li>• ALWAYS - PL/SQL replication is always supported for this package, whether it is called inside or outside of DBMS_ROLLING</li> <li>• DBMS_ROLLING: PL/SQL replication is supported only when the procedure is called inside DBMS_ROLLING</li> </ul> |

**Note**

In a CDB, this view shows data when queried in the root or a PDB.

# 6.168 DBA\_LOGSTDBY\_SKIP

DBA\_LOGSTDBY\_SKIP displays the skip rules that are used by SQL Apply.

This view is for logical standby databases only.

| Column        | Datatype      | NULL | Description                                                                                                                                                                            |
|---------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR         | VARCHAR2(1)   |      | Indicates how the skip rule was created: <ul style="list-style-type: none"><li>• Y - For rules from DBMS_LOGSTDBY.SKIP_ERROR</li><li>• N - For rules from DBMS_LOGSTDBY.SKIP</li></ul> |
| STATEMENT_OPT | VARCHAR2(128) |      | Specifies the type of statement that should be skipped                                                                                                                                 |
| OWNER         | VARCHAR2(128) |      | Name of the schema under which the skip option should be used                                                                                                                          |
| NAME          | VARCHAR2(261) |      | Name of the object that is being skipped                                                                                                                                               |
| USE_LIKE      | VARCHAR2(1)   |      | Indicates whether the statement should use a SQL wildcard search when matching names (Y) or not (N)                                                                                    |
| ESC           | VARCHAR2(1)   |      | Escape character used when performing wildcard matches                                                                                                                                 |
| PROC          | VARCHAR2(392) |      | Name of a stored procedure that will be executed when processing the skip option                                                                                                       |

## 6.169 DBA\_LOGSTDBY\_SKIP\_TRANSACTION

DBA\_LOGSTDBY\_SKIP\_TRANSACTION displays the skip settings chosen. This view is for logical standby databases only.

| Column   | Datatype      | NULL | Description                        |
|----------|---------------|------|------------------------------------|
| XIDUSN   | NUMBER        |      | Transaction ID undo segment number |
| XIDSLT   | NUMBER        |      | Transaction ID slot number         |
| XIDSQN   | NUMBER        |      | Transaction ID sequence number     |
| CON_NAME | VARCHAR2(384) |      | Container name                     |

## 6.170 DBA\_LOGSTDBY\_SUPPORT\_MODE

DBA\_LOGSTDBY\_SUPPORT\_MODE displays information about whether tables in the database are supported for logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database *is* undergoing such an upgrade, then this view displays information about whether tables in the database are supported for transient logical standby. If the database *is not* undergoing such an upgrade, then this view displays information about whether tables in the database are supported for logical standby.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|-------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPLANATION | VARCHAR2(4000) |      | Reason the table is not fully supported for transient logical standby<br>This column is populated only when all of the following conditions are met: <ul style="list-style-type: none"> <li>The database is currently undergoing a manual rolling upgrade using transient logical standby databases</li> <li>The value of the COMPATIBLE initialization parameter is 20.0 or higher</li> <li>The value of the SUPPORT_MODE column is INTERNAL or UNSUPPORTED</li> </ul> |

**Note**

This view is available starting with Oracle Database 21c.

## 6.171 DBA\_LOGSTDBY\_UNSUPPORTED

DBA\_LOGSTDBY\_UNSUPPORTED displays the schemas, tables, and columns in those tables that contain data types that are unsupported by logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database is undergoing such an upgrade, then this view displays information about tables in the database that are unsupported for transient logical standby. If the database *is not* undergoing such an upgrade, then this view displays information about tables in the database are unsupported for logical standby.

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                                                  |
|-------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2(128)  |      | Owner of the unsupported table                                                                                                                                                                                                                                               |
| TABLE_NAME  | VARCHAR2(128)  |      | Name of the unsupported table                                                                                                                                                                                                                                                |
| COLUMN_NAME | VARCHAR2(128)  |      | Name of the unsupported column                                                                                                                                                                                                                                               |
| ATTRIBUTES  | VARCHAR2(4000) |      | If the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases and the value of the COMPATIBLE initialization parameter is 20.0 or higher, then this column displays the reason the table is unsupported by SQL Apply. |
| DATA_TYPE   | VARCHAR2(106)  |      | Data type of the unsupported column                                                                                                                                                                                                                                          |

**Note**

When the value of the COMPATIBLE initialization parameter is 20.0 or higher, this view displays all columns in unsupported tables. Otherwise, this view displays only the unsupported columns in unsupported tables.

**Note**

A rolling upgrade performed using the DBMS\_ROLLING PL/SQL package supports more object types than a manual rolling upgrade performed using transient logical standby databases.

# 6.172 DBA\_LOGSTDBY\_UNSUPPORTED\_TABLE

DBA\_LOGSTDBY\_UNSUPPORTED\_TABLE displays the data tables that are unsupported by logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database is undergoing such an upgrade, then this view displays information about tables in the database that are unsupported for transient logical standby. If the database *is not* undergoing such an upgrade, then this view displays information about tables in the database are unsupported for logical standby.

The data displayed pertains to the container in which the view is queried.

| Column                   | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |

| OWNER                    | VARCHAR2(128)  |      | Owner of the unsupported table                                                                                                                                                                                                                                                                                                                                                                                                |
| TABLE_NAME               | VARCHAR2(128)  |      | Name of the unsupported table                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXPLANATION <sup>1</sup> | VARCHAR2(4000) |      | If the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases, then this column displays the reason the table is unsupported for transient logical standby. Otherwise, this column displays the reason the table is unsupported for logical standby.<br><br>This column is populated only when the value of the COMPATIBLE initialization parameter is 20.0 or higher. |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 6.173 DBA\_MEASURE\_FOLDER\_CONTENTS

DBA\_MEASURE\_FOLDER\_CONTENTS describes the contents of all OLAP measure folders in the database. Its columns are the same as those in ALL\_MEASURE\_FOLDER\_CONTENTS.

### ① See Also

["ALL\\_MEASURE\\_FOLDER\\_CONTENTS"](#)

## 6.174 DBA\_MEASURE\_FOLDER\_SUBFOLDERS

DBA\_MEASURE\_FOLDER\_SUBFOLDERS describes the OLAP measure folders contained within the database OLAP measure folders. Its columns are the same as those in ALL\_MEASURE\_FOLDER\_SUBFOLDERS.

### ① See Also

["ALL\\_MEASURE\\_FOLDER\\_SUBFOLDERS"](#)

## 6.175 DBA\_MEASURE\_FOLDERS

DBA\_MEASURE\_FOLDERS describes all OLAP measure folders in the database. Its columns are the same as those in ALL\_MEASURE\_FOLDERS.

### ① See Also

["ALL\\_MEASURE\\_FOLDERS"](#)

## 6.176 DBA\_METADATA\_PROPERTIES

DBA\_METADATA\_PROPERTIES describes OLAP metadata properties in the database. Its columns are the same as those in ALL\_METADATA\_PROPERTIES.

### ① See Also

["ALL\\_METADATA\\_PROPERTIES"](#)

## 6.177 DBA\_METHOD\_PARAMS

DBA\_METHOD\_PARAMS describes the method parameters of all object types in the database. Its columns are the same as those in ALL\_METHOD\_PARAMS.

**① See Also**

["ALL\\_METHOD\\_PARAMS"](#)

## 6.178 DBA\_METHOD\_RESULTS

DBA\_METHOD\_RESULTS describes the method results of all object types in the database. Its columns are the same as those in ALL\_METHOD\_RESULTS.

**① See Also**

["ALL\\_METHOD\\_RESULTS"](#)

## 6.179 DBA\_MINING\_MODEL\_ATTRIBUTES

DBA\_MINING\_MODEL\_ATTRIBUTES describes all machine learning model attributes in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_ATTRIBUTES.

**① See Also**

["ALL\\_MINING\\_MODEL\\_ATTRIBUTES"](#)

## 6.180 DBA\_MINING\_MODEL\_PARTITIONS

DBA\_MINING\_MODEL\_PARTITIONS describes all the model partitions accessible to the system. Its columns are the same as those in ALL\_MINING\_MODEL\_PARTITIONS.

**① See Also**

["ALL\\_MINING\\_MODEL\\_PARTITIONS"](#)

## 6.181 DBA\_MINING\_MODEL\_SETTINGS

DBA\_MINING\_MODEL\_SETTINGS describes all machine learning model settings in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_SETTINGS.

### 📘 See Also

["ALL\\_MINING\\_MODEL\\_SETTINGS"](#)

## 6.182 DBA\_MINING\_MODEL\_TABLES

DBA\_MINING\_MODEL\_TABLES describes the tables that contain metadata about the machine learning models in the database.

Machine learning models are schema objects created by Oracle Machine Learning for SQL (OML4SQL).

Model tables reside in the schema of the machine learning model owner. The metadata stored in the tables is controlled by OML4SQL APIs. The tables are read-only. They should not be modified by users.

| Column     | Datatype      | NULL     | Description                              |
|------------|---------------|----------|------------------------------------------|
| OWNER      | VARCHAR2(128) | NOT NULL | Owner of the machine learning model      |
| MODEL_NAME | VARCHAR2(128) | NOT NULL | Name of the machine learning model       |
| TABLE_NAME | VARCHAR2(128) | NOT NULL | Name of the table                        |
| TABLE_TYPE | VARCHAR2(21)  |          | The type of metadata stored in the table |

## 6.183 DBA\_MINING\_MODEL\_VIEWS

DBA\_MINING\_MODEL\_VIEWS describes all model views in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_VIEWS.

### 📘 See Also

["ALL\\_MINING\\_MODEL\\_VIEWS"](#)

## 6.184 DBA\_MINING\_MODEL\_XFORMS

DBA\_MINING\_MODEL\_XFORMS describes the user-specified transformations embedded in all models accessible in the system. Its columns are the same as those in ALL\_MINING\_MODEL\_XFORMS.

### ① See Also

["ALL\\_MINING\\_MODEL\\_XFORMS"](#)

## 6.185 DBA\_MINING\_MODELS

DBA\_MINING\_MODELS describes all machine learning models in the database. Its columns are the same as those in ALL\_MINING\_MODELS.

### ① See Also

["ALL\\_MINING\\_MODELS"](#)

## 6.186 DBA\_MVIEW\_AGGREGATES

DBA\_MVIEW\_AGGREGATES describes the grouping functions (aggregated measures) that appear in the SELECT list of all aggregated materialized view in the database. Its columns are the same as those in ALL\_MVIEW\_AGGREGATES.

### ① See Also

["ALL\\_MVIEW\\_AGGREGATES"](#)

## 6.187 DBA\_MVIEW\_ANALYSIS

DBA\_MVIEW\_ANALYSIS describes all materialized views in the database that potentially support query rewrite and that provide additional information for analysis by applications. Its columns are the same as those in ALL\_MVIEW\_ANALYSIS.

### ① Note

This view excludes materialized views that reference remote tables or that include references to non-static values such as SYSDATE or USER. This view also excludes materialized views that were created as snapshots before Oracle8i and that were never altered to enable query rewrite.

**① See Also**

["ALL\\_MVIEW\\_ANALYSIS"](#)

## 6.188 DBA\_MVIEW\_COMMENTS

DBA\_MVIEW\_COMMENTS displays comments on all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_COMMENTS.

**① See Also**

["ALL\\_MVIEW\\_COMMENTS"](#)

## 6.189 DBA\_MVIEW\_DETAIL\_PARTITION

DBA\_MVIEW\_DETAIL\_PARTITION displays freshness information, with respect to partition change tracking (PCT) detail partitions, for all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_PARTITION.

**① See Also**

["ALL\\_MVIEW\\_DETAIL\\_PARTITION"](#).

## 6.190 DBA\_MVIEW\_DETAIL\_RELATIONS

DBA\_MVIEW\_DETAIL\_RELATIONS represents the named detail relations that are either in the FROM list of a materialized view, or that are indirectly referenced through views in the FROM list. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_RELATIONS.

**① See Also**

["ALL\\_MVIEW\\_DETAIL\\_RELATIONS"](#)

## 6.191 DBA\_MVIEW\_DETAIL\_SUBPARTITION

DBA\_MVIEW\_DETAIL\_SUBPARTITION displays freshness information, with respect to partition change tracking (PCT) detail subpartitions, for all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_SUBPARTITION.

### ① See Also

["ALL\\_MVIEW\\_DETAIL\\_SUBPARTITION"](#)

## 6.192 DBA\_MVIEW\_JOINS

DBA\_MVIEW\_JOINS describes a join between two columns in the WHERE clause of a subquery that defines a materialized view. Its columns are the same as those in ALL\_MVIEW\_JOINS.

### ① See Also

["ALL\\_MVIEW\\_JOINS"](#)

## 6.193 DBA\_MVIEW\_KEYS

DBA\_MVIEW\_KEYS describes the columns or expressions in the SELECT list upon which materialized views in the database are based. Its columns are the same as those in ALL\_MVIEW\_KEYS.

### ① See Also

["ALL\\_MVIEW\\_KEYS"](#)

## 6.194 DBA\_MVIEW\_LOG\_FILTER\_COLS

DBA\_MVIEW\_LOG\_FILTER\_COLS displays all columns (excluding primary key columns) being logged in the materialized view logs.

| Column      | Datatype      | NULL | Description                            |
|-------------|---------------|------|----------------------------------------|
| OWNER       | VARCHAR2(128) |      | Owner of the master table being logged |
| NAME        | VARCHAR2(128) |      | Name of the master table being logged  |
| COLUMN_NAME | VARCHAR2(128) |      | Column being logged                    |

## 6.195 DBA\_MVIEW\_LOGS

DBA\_MVIEW\_LOGS describes all materialized view logs in the database. Its columns are the same as those in ALL\_MVIEW\_LOGS.

### ① See Also

["ALL\\_MVIEW\\_LOGS"](#)

## 6.196 DBA\_MVIEW\_REFRESH\_TIMES

DBA\_MVIEW\_REFRESH\_TIMES describes refresh times of all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_REFRESH\_TIMES.

### ① See Also

["ALL\\_MVIEW\\_REFRESH\\_TIMES"](#)

## 6.197 DBA\_MVIEWS

DBA\_MVIEWS describes all materialized views in the database. Its columns are the same as those in ALL\_MVIEWS.

### ① See Also

["ALL\\_MVIEWS"](#)

## 6.198 DBA\_MVREF\_CHANGE\_STATS

DBA\_MVREF\_CHANGE\_STATS displays the change data load information on the base tables associated with a refresh run for all the materialized views for the database.

### Related View

USER\_MVREF\_CHANGE\_STATS displays the change data load information on the master tables associated with a refresh run for all the materialized views in the database that are accessible to the current user.

| Column    | Datatype      | NULL     | Description                                         |
|-----------|---------------|----------|-----------------------------------------------------|
| TBL_OWNER | VARCHAR2(128) | NOT NULL | Owner of the master table for the materialized view |
| TBL_NAME  | VARCHAR2(128) | NOT NULL | Name of the master table for the materialized view  |
| MV_OWNER  | VARCHAR2(128) | NOT NULL | Owner of the materialized view                      |
| MV_NAME   | VARCHAR2(128) | NOT NULL | Name of the materialized view                       |

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                          |
|-----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REFRESH_ID      | NUMBER         | NOT NULL | The refresh ID of the refresh run                                                                                                                                                                    |
| NUM_ROWS_INS    | NUMBER         |          | The number of inserts in the materialized view log of the table (applicable only if the table has a materialized view log)                                                                           |
| NUM_ROWS_UPD    | NUMBER         |          | The number of updates in the materialized view log of the table (applicable only if the table has a materialized view log)                                                                           |
| NUM_ROWS_DEL    | NUMBER         |          | The number of deletes in the materialized view log of the table (applicable only if the table has a materialized view log)                                                                           |
| NUM_ROWS_DL_INS | NUMBER         |          | The number of direct load inserts on the table                                                                                                                                                       |
| PMOPS_OCCURRED  | CHAR(1)        |          | Indicates whether a partition-maintenance operation (PMOP) occurred. Possible values: <ul style="list-style-type: none"> <li>• Y</li> <li>• N</li> <li>• NULL: Indicates an unknown value</li> </ul> |
| PMOP_DETAILS    | VARCHAR2(4000) |          | Details of the PMOPs in the following format: <ul style="list-style-type: none"> <li>• TRUNCATE (low_bound, high_bound)</li> <li>• EXCHANGE (low_bound, high_bound)</li> </ul>                       |
| NUM_ROWS        | NUMBER         |          | The number of rows in the table at the start of the refresh operation                                                                                                                                |

## 6.199 DBA\_MVREF\_RUN\_STATS

DBA\_MVREF\_RUN\_STATS has information about each refresh run for all the materialized views for the database, with each run being identified by the REFRESH\_ID. The information includes timing statistics related to the run and the parameters specified in that run.

### Related View

USER\_MVREF\_RUN\_STATS has information about each refresh run for the materialized views accessible for the current database user, with each run being identified by the REFRESH\_ID. The information includes timing statistics related to the run and the parameters specified in that run. This view does not display the RUN\_OWNER column.

| Column     | Datatype      | NULL     | Description                                                          |
|------------|---------------|----------|----------------------------------------------------------------------|
| RUN_OWNER  | VARCHAR2(128) | NOT NULL | Owner of the refresh operation (the user who launched the operation) |
| REFRESH_ID | NUMBER        | NOT NULL | The refresh ID of the refresh run                                    |
| NUM_MVS    | NUMBER        | NOT NULL | The number of materialized views being refreshed in the run          |

| Column                   | Datatype       | NULL | Description                                                                                                                                                                                                              |
|--------------------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MVIEWS                   | VARCHAR2(4000) |      | Shows the list of comma separated parameters specified in the API for the materialized view refresh operation                                                                                                            |
| BASE_TABLES              | VARCHAR2(4000) |      | For internal use only                                                                                                                                                                                                    |
| METHOD                   | VARCHAR2(4000) |      | The METHOD parameter specified by the API                                                                                                                                                                                |
| ROLLBACK_SEG             | VARCHAR2(4000) |      | The ROLLBACK_SEG parameter specified by the API                                                                                                                                                                          |
| PUSH_DEFERRED_RPC        | CHAR(1)        |      | The PUSH_DEFERRED_RPC parameter specified by the API                                                                                                                                                                     |
| REFRESH_AFTER_ERRORS     | CHAR(1)        |      | The REFRESH_AFTER_ERRORS parameter specified by the API                                                                                                                                                                  |
| PURGE_OPTION             | NUMBER         |      | The PURGE_OPTION parameter specified by the API                                                                                                                                                                          |
| PARALLELISM              | NUMBER         |      | The PARALLELISM parameter specified by the API                                                                                                                                                                           |
| HEAP_SIZE                | NUMBER         |      | The HEAP_SIZE parameter specified by the API                                                                                                                                                                             |
| ATOMIC_REFRESH           | CHAR(1)        |      | The ATOMIC_REFRESH parameter specified by the API                                                                                                                                                                        |
| NESTED                   | CHAR(1)        |      | The NESTED parameter specified by the API                                                                                                                                                                                |
| OUT_OF_PLACE             | CHAR(1)        |      | The OUT_OF_PLACE parameter specified by the API                                                                                                                                                                          |
| NUMBER_OF_FAILURES       | NUMBER         |      | The number of failures that occurred in processing the API                                                                                                                                                               |
| START_TIME               | TIMESTAMP(6)   |      | Start time of the refresh run                                                                                                                                                                                            |
| END_TIME                 | TIMESTAMP(6)   |      | End time of the refresh run                                                                                                                                                                                              |
| ELAPSED_TIME             | NUMBER         |      | The length of time for the refresh run, in seconds                                                                                                                                                                       |
| LOG_SETUP_TIME           | NUMBER         |      | Log setup time (in seconds) for the materialized view for a non-atomic refresh; NULL for an atomic refresh                                                                                                               |
| LOG_PURGE_TIME           | NUMBER         |      | Log purge time (in seconds) for the materialized view in the case of atomic refresh; NULL in the case of non-atomic refresh                                                                                              |
| COMPLETE_STATS_AVAILABLE | CHAR(1)        |      | Indicates whether all the complete refresh statistics are available for this run: <ul style="list-style-type: none"> <li>Y: All the statistics are available</li> <li>N: All the statistics are not available</li> </ul> |

## 6.200 DBA\_MVREF\_STATS

DBA\_MVREF\_STATS shows the REFRESH\_ID associated with each refresh run of each materialized view for the database. It also provides some basic timing statistics related to that materialized view's refresh in that run.

### Related View

USER\_MVREF\_STATS shows the REFRESH\_ID associated with each refresh run of each materialized view for the database that is accessible to the current user. It also provides some

basic timing statistics related to that materialized view's refresh in that run. This view does not display the MV\_OWNER column.

| Column                | Datatype       | NULL     | Description                                                                                                                                                                                                                                     |
|-----------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MV_OWNER              | VARCHAR2(128)  | NOT NULL | Owner of the materialized view                                                                                                                                                                                                                  |
| MV_NAME               | VARCHAR2(128)  | NOT NULL | Name of the materialized view                                                                                                                                                                                                                   |
| REFRESH_ID            | NUMBER         | NOT NULL | The refresh ID of the refresh run                                                                                                                                                                                                               |
| REFRESH_METHOD        | VARCHAR2(30)   |          | The refresh method used to refresh the materialized view: <ul style="list-style-type: none"> <li>• FAST</li> <li>• PCT</li> <li>• COMPLETE</li> <li>• OUT OF PLACE FAST</li> <li>• OUT OF PLACE PCT</li> <li>• OUT OF PLACE COMPLETE</li> </ul> |
| REFRESH_OPTIMIZATIONS | VARCHAR2(4000) |          | The refresh optimization, for example, a null refresh, or a primary key/foreign key that is applied during refresh of the materialize view                                                                                                      |
| ADDITIONAL_EXECUTIONS | VARCHAR2(4000) |          | The additional executions, for example, an index rebuild, or log operations involved during refresh of the materialized view                                                                                                                    |
| START_TIME            | TIMESTAMP(6)   |          | Start time of the refresh run                                                                                                                                                                                                                   |
| END_TIME              | TIMESTAMP(6)   |          | End time of the refresh run                                                                                                                                                                                                                     |
| ELAPSED_TIME          | NUMBER         |          | The length of time for the refresh run, in seconds                                                                                                                                                                                              |
| LOG_SETUP_TIME        | NUMBER         |          | Log setup time (in seconds) for the materialized view for a non-atomic refresh; NULL for an atomic refresh                                                                                                                                      |
| LOG_PURGE_TIME        | NUMBER         |          | Log purge time (in seconds) for the materialized view in the case of atomic refresh; NULL in the case of non-atomic refresh                                                                                                                     |
| INITIAL_NUM_ROWS      | NUMBER         |          | Initial number of rows in the materialized view (at the start of the refresh)                                                                                                                                                                   |
| FINAL_NUM_ROWS        | NUMBER         |          | Final number of rows in the materialized view (at the end of the refresh)                                                                                                                                                                       |

## 6.201 DBA\_MVREF\_STATS\_PARAMS

DBA\_MVREF\_STATS\_PARAMS displays the refresh statistics properties associated with each materialized view. These properties can be modified with the DBMS\_MVIEW\_STATS.SET\_MVREF\_STATS\_PARAMS procedure.

### Related View

USER\_MVREF\_STATS\_PARAMS displays the refresh statistics properties associated with each materialized view accessible to the current user. These properties can be modified with the DBMS\_MVIEW\_STATS.SET\_MVREF\_STATS\_PARAMS procedure.

| Column           | Datatype      | NULL     | Description                                    |
|------------------|---------------|----------|------------------------------------------------|
| MV_OWNER         | VARCHAR2(128) | NOT NULL | Owner of the materialized view                 |
| MV_NAME          | VARCHAR2(128) | NOT NULL | Name of the materialized view                  |
| COLLECTION_LEVEL | VARCHAR2(8)   |          | The collection level for the materialized view |
| RETENTION_PERIOD | NUMBER        |          | The retention period for the materialize view  |

## 6.202 DBA\_MVREF\_STATS\_SYS\_DEFAULTS

DBA\_MVREF\_STATS\_SYS\_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views. These values can be altered with the SET\_SYSTEM\_DEFAULTS procedure by a database administrator.

This view contains exactly two rows corresponding to the collection-level and retention-period properties; their initial values are TYPICAL and 31 respectively.

### Related View

USER\_MVREF\_STATS\_SYS\_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views accessible to the current user. These values can be altered with the SET\_SYSTEM\_DEFAULTS procedure by a database administrator.

| Column         | Datatype     | NULL | Description                                                                                                                             |
|----------------|--------------|------|-----------------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER_NAME | CHAR(16)     |      | Value of the parameter_name parameter: <ul style="list-style-type: none"> <li>• COLLECTION_LEVEL</li> <li>• RETENTION_PERIOD</li> </ul> |
| VALUE          | VARCHAR2(40) |      | The system-wide default value for the parameter                                                                                         |

## 6.203 DBA\_MVREF\_STMT\_STATS

DBA\_MVREF\_STMT\_STATS shows information associated with each refresh statement of a materialized view in a refresh run.

### Related View

USER\_MVREF\_STMT\_STATS shows information associated with each refresh statement of a materialized view accessible to the current user in a refresh run.

| Column         | Datatype               | NULL     | Description                                                                                                                                                       |
|----------------|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MV_OWNER       | VARCHAR2(128)          | NOT NULL | Owner of the materialized view                                                                                                                                    |
| MV_NAME        | VARCHAR2(128)          | NOT NULL | Name of the materialized view                                                                                                                                     |
| REFRESH_ID     | NUMBER                 | NOT NULL | The refresh ID of the refresh run                                                                                                                                 |
| STEP           | NUMBER                 | NOT NULL | A number indicating the step in the refresh process in which the statement is executed for the materialized view. Steps are numbered consecutively starting at 1. |
| SQLID          | VARCHAR2(14)           | NOT NULL | The SQL ID of the statement                                                                                                                                       |
| STMT           | CLOB                   | NOT NULL | The text of the SQL statement                                                                                                                                     |
| EXECUTION_TIME | NUMBER                 | NOT NULL | The time it took to execute the statement (in seconds)                                                                                                            |
| EXECUTION_PLAN | XMLTYPE STORAGE BINARY |          | For internal use only                                                                                                                                             |

## 6.204 DBA\_NESTED\_TABLE\_COLS

DBA\_NESTED\_TABLE\_COLS describes the columns of all nested tables in the database. Its columns are the same as those in ALL\_NESTED\_TABLE\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

① **See Also**

["ALL\\_NESTED\\_TABLE\\_COLS"](#)

## 6.205 DBA\_NESTED\_TABLES

DBA\_NESTED\_TABLES describes all nested tables contained in all tables in the database. Its columns are the same as those in ALL\_NESTED\_TABLES.

① **See Also**

["ALL\\_NESTED\\_TABLES"](#)

## 6.206 DBA\_NETWORK\_ACL\_PRIVILEGES

DBA\_NETWORK\_ACL\_PRIVILEGES describes the network privileges defined in all access control lists that are currently assigned to network hosts.

### Note

This DBA\_NETWORK\_ACL\_PRIVILEGES view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA\_HOST\_ACES view, instead.

| Column     | Datatype       | NULL     | Description                                                                                |
|------------|----------------|----------|--------------------------------------------------------------------------------------------|
| ACL        | VARCHAR2(4000) |          | Path of the access control list                                                            |
| ACLID      | RAW(8)         | NOT NULL | Object ID of the access control list                                                       |
| PRINCIPAL  | VARCHAR2(128)  |          | Principal (database user or role) whom the privilege is granted to or denied from          |
| PRIVILEGE  | VARCHAR2(128)  |          | Network privilege                                                                          |
| IS_GRANT   | VARCHAR2(5)    |          | Indicates whether the privilege is granted (true) or denied (false)                        |
| INVERT     | VARCHAR2(5)    |          | Indicates whether the access control entry contains invert principal (true) or not (false) |
| START_DATE | TIMESTAMP(6)   |          | Start date of the access control entry                                                     |
| END_DATE   | TIMESTAMP(6)   |          | End date of the access control entry                                                       |
| ACL_OWNER  | VARCHAR2(128)  |          | Owner of the access control list                                                           |

### See Also

["DBA\\_HOST\\_ACES"](#)

## 6.207 DBA\_NETWORK\_ACLS

DBA\_NETWORK\_ACLS describes the access control list assignments to network hosts.

### Note

This DBA\_NETWORK\_ACLS view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA\_HOST\_ACLS view, instead.

| Column     | Datatype       | NULL     | Description                   |
|------------|----------------|----------|-------------------------------|
| HOST       | VARCHAR2(1000) | NOT NULL | Network host                  |
| LOWER_PORT | NUMBER(5)      |          | Lower bound of the port range |
| UPPER_PORT | NUMBER(5)      |          | Upper bound of the port range |

| Column    | Datatype       | NULL | Description                          |
|-----------|----------------|------|--------------------------------------|
| ACL       | VARCHAR2(4000) |      | Path of the access control list      |
| ACLID     | RAW(8)         |      | Object ID of the access control list |
| ACL_OWNER | VARCHAR2(128)  |      | Owner of the access control list     |

## 6.208 DBA\_OBJ\_AUDIT\_OPTS

DBA\_OBJ\_AUDIT\_OPTS describes auditing options on all objects.

**Note**

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

### Related View

USER\_OBJ\_AUDIT\_OPTS describes auditing options on all objects owned by the current user. This view does not display the OWNER column.

| Column      | Datatype      | NULL | Description                                         |
|-------------|---------------|------|-----------------------------------------------------|
| OWNER       | VARCHAR2(128) |      | Owner of the object                                 |
| OBJECT_NAME | VARCHAR2(128) |      | Name of the object                                  |
| OBJECT_TYPE | VARCHAR2(23)  |      | Type of the object                                  |
| ALT         | VARCHAR2(3)   |      | Auditing ALTER WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| AUD         | VARCHAR2(3)   |      | Auditing AUDIT WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| COM         | VARCHAR2(3)   |      | Auditing COMMENT WHENEVER SUCCESSFUL / UNSUCCESSFUL |
| DEL         | VARCHAR2(3)   |      | Auditing DELETE WHENEVER SUCCESSFUL / UNSUCCESSFUL  |
| GRA         | VARCHAR2(3)   |      | Auditing GRANT WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| IND         | VARCHAR2(3)   |      | Auditing INDEX WHENEVER SUCCESSFUL / UNSUCCESSFUL   |

| Column | Datatype    | NULL | Description                                           |
|--------|-------------|------|-------------------------------------------------------|
| INS    | VARCHAR2(3) |      | Auditing INSERT WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| LOC    | VARCHAR2(3) |      | Auditing LOCK WHENEVER SUCCESSFUL / UNSUCCESSFUL      |
| REN    | VARCHAR2(3) |      | Auditing RENAME WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| SEL    | VARCHAR2(3) |      | Auditing SELECT WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| UPD    | VARCHAR2(3) |      | Auditing UPDATE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| EXE    | VARCHAR2(3) |      | Auditing EXECUTE WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| CRE    | VARCHAR2(3) |      | Auditing CREATE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| REA    | VARCHAR2(3) |      | Auditing READ WHENEVER SUCCESSFUL / UNSUCCESSFUL      |
| WRI    | VARCHAR2(3) |      | Auditing WRITE WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| FBK    | VARCHAR2(3) |      | Auditing FLASHBACK WHENEVER SUCCESSFUL / UNSUCCESSFUL |

## 6.209 DBA\_OBJ\_COLATTRS

DBA\_OBJ\_COLATTRS describes object columns and attributes contained in all tables in the database. Its columns are the same as those in ALL\_OBJ\_COLATTRS.

#### ① See Also

["ALL\\_OBJ\\_COLATTRS"](#)

## 6.210 DBA\_OBJECT\_SIZE

DBA\_OBJECT\_SIZE lists the sizes, in bytes, of various PL/SQL objects.

### Related View

- USER\_OBJECT\_SIZE lists the size of PL/SQL objects owned by the current user.

| Column      | Datatype      | NULL     | Description                                                                                                                                               |
|-------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2(128) | NOT NULL | Owner of the object                                                                                                                                       |
| NAME        | VARCHAR2(128) | NOT NULL | Name of the object                                                                                                                                        |
| TYPE        | VARCHAR2(18)  |          | Type of the object: TYPE, TYPE BODY, TABLE, VIEW, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, JAVA SOURCE, JAVA CLASS or JAVA RESOURCE |
| SOURCE_SIZE | NUMBER        |          | Size of the source in bytes. Must be in memory during compilation, or dynamic recompilation.                                                              |
| PARSED_SIZE | NUMBER        |          | Size of the parsed form of the object, in bytes. Must be in memory when an object is being compiled that references this object.                          |
| CODE_SIZE   | NUMBER        |          | Code size, in bytes. Must be in memory when this object is executing.                                                                                     |
| ERROR_SIZE  | NUMBER        |          | Size of error messages, in bytes. In memory during the compilation of the object when there are compilation errors.                                       |

## 6.211 DBA\_OBJECT\_TABLES

DBA\_OBJECT\_TABLES describes all object tables in the database. Its columns are the same as those in ALL\_OBJECT\_TABLES.

### ① See Also

["ALL\\_OBJECT\\_TABLES"](#)

## 6.212 DBA\_OBJECT\_USAGE

DBA\_OBJECT\_USAGE displays statistics about index usage gathered from the database for all the indexes in the database.

You can use this view to monitor index usage. All indexes that have been used at least once can be monitored and displayed in this view.

**Related View**

- USER\_OBJECT\_USAGE displays statistics about index usage gathered from the database for the indexes owned by the current user.

| Column           | Datatype      | NULL     | Description                                                                                                                                      |
|------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER            | VARCHAR2(128) | NOT NULL | Index owner                                                                                                                                      |
| INDEX_NAME       | VARCHAR2(128) | NOT NULL | Index name in sys.obj\$.name                                                                                                                     |
| TABLE_NAME       | VARCHAR2(128) | NOT NULL | Table name in sys.obj\$.name                                                                                                                     |
| MONITORING       | VARCHAR2(3)   |          | Indicates whether the monitoring feature is turned on.<br>Possible values: <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul> |
| USED             | VARCHAR2(3)   |          | Indicates whether the index has been accessed.<br>Possible values: <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>         |
| START_MONITORING | VARCHAR2(19)  |          | Start monitoring time in<br>sys.object_stats.start_monitoring                                                                                    |
| END_MONITORING   | VARCHAR2(19)  |          | End monitoring time in<br>sys.object_stats.end_monitoring                                                                                        |

## 6.215 DBA\_OGG\_AUTO\_CAPTURED\_TABLES

DBA\_OGG\_AUTO\_CAPTURED\_TABLES describes all tables in the database that are enabled for Oracle GoldenGate automatic capture.

### Related View

USER\_OGG\_AUTO\_CAPTURED\_TABLES describes the tables owned by the current user that are enabled for Oracle GoldenGate automatic capture. This view does not display the OWNER column.

| Column              | Datatype      | NULL     | Description                                                                                                                      |
|---------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2(128) | NOT NULL | Owner of the table                                                                                                               |
| NAME                | VARCHAR2(128) | NOT NULL | Name of the table                                                                                                                |
| ALLOW_NOVALIDATE_PK | VARCHAR2(3)   |          | Indicates whether a primary key constraint in NOVALIDATE mode can be used as a unique identifier for the table (YES) or not (NO) |

#### Note

This view is available starting with Oracle Database 21c.

## 6.216 DBA\_OPANCILLARY

DBA\_OPANCILLARY provides ancillary information for all operator bindings in the database. Its columns are the same as those in ALL\_OPANCILLARY.

#### See Also

["ALL\\_OPANCILLARY"](#)

## 6.217 DBA\_OPARGUMENTS

DBA\_OPARGUMENTS provides argument information for all operator bindings in the database. Its columns are the same as those in ALL\_OPARGUMENTS.

### ① See Also

["ALL\\_OPARGUMENTS"](#)

## 6.218 DBA\_OPBINDINGS

DBA\_OPBINDINGS describes the binding functions and methods on all operators in the database. Its columns are the same as those in ALL\_OPBINDINGS.

### ① See Also

["ALL\\_OPBINDINGS"](#)

## 6.219 DBA\_OPERATOR\_COMMENTS

DBA\_OPERATOR\_COMMENTS displays comments for all user-defined operators in the database. Its columns are the same as those in ALL\_OPERATOR\_COMMENTS.

### ① See Also

["ALL\\_OPERATOR\\_COMMENTS"](#)

## 6.220 DBA\_OPERATORS

DBA\_OPERATORS describes all operators in the database. Its columns are the same as those in ALL\_OPERATORS.

### ① See Also

["ALL\\_OPERATORS"](#)

## 6.221 DBA\_OPTSTAT\_OPERATION\_TASKS

DBA\_OPTSTAT\_OPERATION\_TASKS displays the history of tasks that are performed as part of statistics operations (recorded in DBA\_OPTSTAT\_OPERATIONS). Each task represents a target object to be processed in the corresponding parent operation.

| Column         | Datatype                    | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPID           | NUMBER                      |      | Internal identifier for the statistics operation that the task belongs to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TARGET         | VARCHAR2(100)               |      | Name of the object that this task operates on                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TARGET_OBJN    | NUMBER                      |      | Object number of the target object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TARGET_TYPE    | VARCHAR2(40)                |      | Type of the target object. Possible values are: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• TABLE (GLOBAL STATS ONLY):<br/>Task is created to gather only global statistics of a partitioned table</li> <li>• TABLE (COORDINATOR JOB):<br/>Coordinator task for a partitioned table when concurrency is on</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTITION</li> <li>• INDEX</li> <li>• INDEX PARTITION</li> <li>• INDEX SUBPARTITION</li> </ul>                                                                                                    |
| TARGET_SIZE    | NUMBER                      |      | Target size (in number of blocks) when the task started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| START_TIME     | TIMESTAMP(6) WITH TIME ZONE |      | Task start time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| END_TIME       | TIMESTAMP(6) WITH TIME ZONE |      | Task end time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STATUS         | VARCHAR2(49)                |      | Current task status. Possible values are: <ul style="list-style-type: none"> <li>• PENDING: Task is queued for processing</li> <li>• IN PROGRESS: Task is currently running</li> <li>• COMPLETED: Task has completed successfully</li> <li>• FAILED: Task has failed</li> <li>• SKIPPED: Task has been skipped, as it does not exist any more, or its stats are not stale (applies only to only automatic statistics gathering)</li> <li>• TIMED OUT: Maintenance window was not enough to complete this task (applies only to automatic statistics gathering)</li> </ul> |
| JOB_NAME       | VARCHAR2(50)                |      | Name of the scheduler job that executes this task (for example, when concurrency is on)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTIMATED_COST | NUMBER                      |      | Estimated cost of the task (measured as elapsed time in seconds). This column is populated only when concurrency is on.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| BATCHING_COEFF | NUMBER                      |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ACTIONS        | NUMBER                      |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PRIORITY       | NUMBER                      |      | Rank of the task among all target objects for the parent operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FLAGS          | NUMBER                      |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NOTES          | VARCHAR2(4000)              |      | Notes about the underlying task, such as the failure message for tasks with status FAILED.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 6.223 DBA\_ORPHAN\_KEY\_TABLE

DBA\_ORPHAN\_KEY\_TABLE reports key values from indexes where the underlying base table has block corruptions.

To create the view, run the DBMS\_REPAIR.ADMIN\_TABLES procedure. To populate the orphan key table for an index, run the DBMS\_REPAIR.DUMP\_ORPHAN\_KEYS procedure on the index. For each key in the index that points to a corrupt data block, Oracle inserts a row into the orphan key table.

| Column         | Datatype      | NULL     | Description                                                 |
|----------------|---------------|----------|-------------------------------------------------------------|
| SCHEMA_NAME    | VARCHAR2(128) | NOT NULL | Schema name of the index                                    |
| INDEX_NAME     | VARCHAR2(128) | NOT NULL | Name of the index                                           |
| IPART_NAME     | VARCHAR2(128) | NULL     | Name of the index partition or subpartition                 |
| INDEX_ID       | NUMBER        | NOT NULL | Dictionary object ID of the index                           |
| TABLE_NAME     | VARCHAR2(128) | NOT NULL | Name of the base table of the index                         |
| PART_NAME      | VARCHAR2(128) | NULL     | Name of the base table partition or subpartition            |
| TABLE_ID       | NUMBER        | NOT NULL | Dictionary object ID of the base table                      |
| KEYROWID       | ROWID         | NOT NULL | Physical rowid of the corrupt data row                      |
| KEY            | ROWID         | NOT NULL | Key values for the index entry                              |
| DUMP_TIMESTAMP | DATE          | NOT NULL | Timestamp when the entry was made into the orphan key table |

## 6.224 DBA\_OUTLINE\_HINTS

DBA\_OUTLINE\_HINTS describes the set of hints stored in all outlines in the database.

### Related View

USER\_OUTLINE\_HINTS describes the set of hints stored in the outlines owned by the current user. This view does not display the OWNER column.

| Column   | Datatype      | NULL | Description                                                                                                                                                             |
|----------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | VARCHAR2(128) |      | Name of the outline                                                                                                                                                     |
| OWNER    | VARCHAR2(128) |      | Name of the user who created the outline                                                                                                                                |
| NODE     | NUMBER        |      | ID of the query or subquery to which the hint applies. The top-level query is labeled 1. Subqueries are assigned sequentially numbered labels, starting with 2.         |
| STAGE    | NUMBER        |      | Outline hints can be applied at three different stages during the compilation process. This column indicates the stage at which this hint was applied.                  |
| JOIN_POS | NUMBER        |      | Position of the table in the join order. The value is 0 for all hints except access method hints, which identify a table to which the hint and the join position apply. |
| HINT     | CLOB          |      | Text of the hint                                                                                                                                                        |

# 6.225 DBA\_OUTLINES

DBA\_OUTLINES describes all stored outlines in the database.

## Related View

USER\_OUTLINES describes the stored outlines owned by the current user. This view does not display the OWNER column.

| Column     | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(128) |      | User-specified or generated name of the stored outline. The name must be of a form that can be expressed in SQL.                                                                                                                                                                                                                                                                                               |
| OWNER      | VARCHAR2(128) |      | Name of the user who created the outline                                                                                                                                                                                                                                                                                                                                                                       |
| CATEGORY   | VARCHAR2(128) |      | User-defined name of the category to which the outline belongs                                                                                                                                                                                                                                                                                                                                                 |
| USED       | VARCHAR2(6)   |      | Indicates whether the outline has ever been used (USED) or not (UNUSED)                                                                                                                                                                                                                                                                                                                                        |
| TIMESTAMP  | DATE          |      | Timestamp of outline creation                                                                                                                                                                                                                                                                                                                                                                                  |
| VERSION    | VARCHAR2(64)  |      | Oracle version that created the outline                                                                                                                                                                                                                                                                                                                                                                        |
| SQL_TEXT   | LONG          |      | SQL text of the query, including any hints that were a part of the original statement. If bind variables are included, the variable names are stored as SQL text, not the values that are assigned to the variables.<br><b>Note:</b> This field may contain sensitive information about your database or application. Therefore, use discretion when granting SELECT or VIEW object privileges on these views. |
| SIGNATURE  | RAW(16)       |      | Signature uniquely identifying the outline SQL text                                                                                                                                                                                                                                                                                                                                                            |
| COMPATIBLE | VARCHAR2(12)  |      | Indicates whether the outline hints were compatible across a migration (COMPATIBLE) or not (INCOMPATIBLE)                                                                                                                                                                                                                                                                                                      |
| ENABLED    | VARCHAR2(8)   |      | Indicates whether the outline is enabled (ENABLED) or disabled (DISABLED)                                                                                                                                                                                                                                                                                                                                      |
| FORMAT     | VARCHAR2(6)   |      | Hint format: <ul style="list-style-type: none"><li>• NORMAL</li><li>• LOCAL</li></ul>                                                                                                                                                                                                                                                                                                                          |
| MIGRATED   | VARCHAR2(12)  |      | Indicates whether the outline has been migrated to a SQL plan baseline (MIGRATED) or not (NOT-MIGRATED)                                                                                                                                                                                                                                                                                                        |

## 6.226 DBA\_OUTSTANDING\_ALERTS

DBA\_OUTSTANDING\_ALERTS describes alerts which the server considers to be outstanding.

| Column                  | Datatype                    | NULL     | Description                                                                                   |
|-------------------------|-----------------------------|----------|-----------------------------------------------------------------------------------------------|
| SEQUENCE_ID             | NUMBER                      |          | Alert sequence number                                                                         |
| REASON_ID               | NUMBER                      | NOT NULL | ID of the alert reason                                                                        |
| OWNER                   | VARCHAR2(128)               |          | Owner of the object on which the alert was issued                                             |
| OBJECT_NAME             | VARCHAR2(513)               |          | Name of the object                                                                            |
| SUBOBJECT_NAME          | VARCHAR2(128)               |          | Name of the subobject (for example: partition)                                                |
| OBJECT_TYPE             | VARCHAR2(64)                |          | Object type (for example: table, tablespace)                                                  |
| REASON                  | VARCHAR2(4000)              |          | Reason for the alert                                                                          |
| TIME_SUGGESTED          | TIMESTAMP(6) WITH TIME ZONE |          | Time when the alert was last updated                                                          |
| CREATION_TIME           | TIMESTAMP(6) WITH TIME ZONE |          | Time when the alert was first created                                                         |
| SUGGESTED_ACTION        | VARCHAR2(4000)              |          | Advice of the recommended action                                                              |
| ADVISOR_NAME            | VARCHAR2(128)               |          | Name of the advisor to be invoked for more information                                        |
| METRIC_VALUE            | NUMBER                      |          | Value of the related metrics                                                                  |
| MESSAGE_TYPE            | VARCHAR2(12)                |          | Message type: <ul style="list-style-type: none"> <li>Notification</li> <li>Warning</li> </ul> |
| MESSAGE_GROUP           | VARCHAR2(64)                |          | Name of the message group to which the alert belongs                                          |
| MESSAGE_LEVEL           | NUMBER                      |          | Message severity level (1 to 32)                                                              |
| HOSTING_CLIENT_ID       | VARCHAR2(64)                |          | ID of the client or security group to which the alert relates                                 |
| MODULE_ID               | VARCHAR2(64)                |          | ID of the module that originated the alert                                                    |
| PROCESS_ID              | VARCHAR2(128)               |          | Process ID                                                                                    |
| HOST_ID                 | VARCHAR2(256)               |          | DNS host name of the originating host                                                         |
| HOST_NW_ADDR            | VARCHAR2(256)               |          | IP or other network address of the originating host                                           |
| INSTANCE_NAME           | VARCHAR2(16)                |          | Originating instance name                                                                     |
| INSTANCE_NUMBER         | NUMBER                      |          | Originating instance number                                                                   |
| USER_ID                 | VARCHAR2(128)               |          | User ID                                                                                       |
| EXECUTION_CONTEXT_ID    | VARCHAR2(128)               |          | Execution Context ID                                                                          |
| ERROR_INSTANCE_ID       | VARCHAR2(142)               |          | ID of an error instance plus a sequence number                                                |
| STATE_TRANSITION_NUMBER | NUMBER                      |          | Sequence number of the state transition for the alert                                         |
| PDB_NAME                | VARCHAR2(128)               |          | PDB name                                                                                      |

| Column | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | NOT NULL | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.227 DBA\_PARALLEL\_EXECUTE\_CHUNKS

DBA\_PARALLEL\_EXECUTE\_CHUNKS displays the chunks for all tasks in the database.

### Related View

USER\_PARALLEL\_EXECUTE\_CHUNKS displays the chunks for tasks created by the current user. This view does not display the TASK\_OWNER column.

| Column        | Datatype       | NULL     | Description                                                                                                                                          |
|---------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHUNK_ID      | NUMBER         | NOT NULL | Unique ID for the chunk                                                                                                                              |
| TASK_OWNER    | VARCHAR2(128)  | NOT NULL | Owner of the task                                                                                                                                    |
| TASK_NAME     | VARCHAR2(128)  | NOT NULL | Name of the task                                                                                                                                     |
| STATUS        | VARCHAR2(20)   |          | Status of the chunk: <ul style="list-style-type: none"> <li>UNASSIGNED</li> <li>ASSIGNED</li> <li>PROCESSED</li> <li>PROCESSED_WITH_ERROR</li> </ul> |
| START_ROWID   | ROWID          |          | Rowid for the first row in the chunk                                                                                                                 |
| END_ROWID     | ROWID          |          | Rowid for the last row in the chunk                                                                                                                  |
| START_ID      | NUMBER         |          | Number column value of the first row in the chunk                                                                                                    |
| END_ID        | NUMBER         |          | Number column value of the last row in the chunk                                                                                                     |
| JOB_NAME      | VARCHAR2(128)  |          | Name of the job which processed this chunk                                                                                                           |
| START_TS      | TIMESTAMP(6)   |          | Processing start time for the chunk                                                                                                                  |
| END_TS        | TIMESTAMP(6)   |          | Processing end time for the chunk                                                                                                                    |
| ERROR_CODE    | NUMBER         |          | Error code returned during the execution of the chunk if the STATUS column is PROCESSED_WITH_ERROR                                                   |
| ERROR_MESSAGE | VARCHAR2(4000) |          | Error message returned during the execution of the chunk if the STATUS column is PROCESSED_WITH_ERROR                                                |

## 6.229 DBA\_PART\_COL\_STATISTICS

DBA\_PART\_COL\_STATISTICS displays column statistics and histogram information for all table partitions in the database. Its columns are the same as those in ALL\_PART\_COL\_STATISTICS.

**① See Also**

["ALL\\_PART\\_COL\\_STATISTICS"](#)

## 6.230 DBA\_PART\_HISTOGRAMS

DBA\_PART\_HISTOGRAMS displays the histogram data (endpoints per histogram) for the histograms on all table partitions in the database. Its columns are the same as those in ALL\_PART\_HISTOGRAMS.

**① See Also**

["ALL\\_PART\\_HISTOGRAMS"](#)

## 6.231 DBA\_PART\_INDEXES

DBA\_PART\_INDEXES displays the object-level partitioning information for all partitioned indexes in the database. Its columns are the same as those in ALL\_PART\_INDEXES.

**① See Also**

["ALL\\_PART\\_INDEXES"](#)

## 6.232 DBA\_PART\_KEY\_COLUMNS

DBA\_PART\_KEY\_COLUMNS describes the partitioning key columns for all partitioned objects in the database. Its columns are the same as those in ALL\_PART\_KEY\_COLUMNS.

### ① See Also

["ALL\\_PART\\_KEY\\_COLUMNS"](#)

## 6.233 DBA\_PART\_LOBS

DBA\_PART\_LOBS displays table-level information for all partitioned LOBs in the database, including default attributes for LOB data partitions. Its columns are the same as those in ALL\_PART\_LOBS.

### ① See Also

["ALL\\_PART\\_LOBS"](#)

## 6.234 DBA\_PART\_TABLES

DBA\_PART\_TABLES displays the object-level partitioning information for all partitioned tables in the database. Its columns are the same as those in ALL\_PART\_TABLES.

### ① See Also

["ALL\\_PART\\_TABLES"](#)

## 6.235 DBA\_PARTIAL\_DROP\_TABS

DBA\_PARTIAL\_DROP\_TABS describes all tables in the database that have partially completed DROP COLUMN operations. Its columns are the same as those in ALL\_PARTIAL\_DROP\_TABS.

### ① See Also

["ALL\\_PARTIAL\\_DROP\\_TABS"](#)

## 6.236 DBA\_PDB\_HISTORY

DBA\_PDB\_HISTORY describes the lineage of the PDB to which it belongs.

| Column               | Datatype      | NULL     | Description                                                                           |
|----------------------|---------------|----------|---------------------------------------------------------------------------------------|
| PDB_NAME             | VARCHAR2(128) | NOT NULL | Name of this PDB in one of its incarnations                                           |
| PDB_ID               | NUMBER        | NOT NULL | Container ID of this PDB in one of its incarnations.                                  |
| PDB_DBID             | NUMBER        | NOT NULL | Database ID of this PDB in one of its incarnations                                    |
| PDB_GUID             | RAW(16)       | NOT NULL | Globally unique ID of this PDB in one of its incarnations                             |
| OP_SCNBAS            | NUMBER        | NOT NULL | SCN base when an operation was performed on one of the incarnations of this PDB       |
| OP_SCNWRP            | NUMBER        | NOT NULL | SCN wrap when an operation was performed on one of incarnations of this PDB           |
| OP_TIMESTAMP         | DATE          | NOT NULL | Timestamp of an operation performed on one of the incarnations of this PDB            |
| OPERATION            | VARCHAR2(16)  | NOT NULL | Operation that was performed on one of the incarnations of this PDB                   |
| DB_VERSION           | NUMBER        | NOT NULL | Database version                                                                      |
| CLONED_FROM_PDB_NAME | VARCHAR2(128) |          | Name of a PDB from which one of the incarnations of this PDB was cloned               |
| CLONED_FROM_PDB_DBID | NUMBER        |          | Database ID of a PDB from which one of the incarnations of this PDB was cloned        |
| CLONED_FROM_PDB_GUID | RAW(16)       |          | Globally unique ID of a PDB from which one of the incarnations of this PDB was cloned |
| DB_NAME              | VARCHAR2(128) |          | Name of a CDB in which one of the incarnations of this PDB was created                |
| DB_UNIQUE_NAME       | VARCHAR2(128) |          | Unique name of a CDB in which one of the incarnations of this PDB was created         |
| DB_DBID              | NUMBER        |          | Database ID of a CDB in which one of the incarnations of this PDB was created         |
| CLONETAG             | VARCHAR2(128) |          | Clone tag name for the PDB if the PDB was cloned using the snapshot copy mechanism    |
| DB_VERSION_STRING    | VARCHAR2(204) |          | Database version string                                                               |

## 6.237 DBA\_PDB\_SAVED\_STATES

DBA\_PDB\_SAVED\_STATES shows information about the current saved PDB states in the CDB.

This view is a data link, so the data is also available within the PDB.

| Column        | Datatype      | NULL     | Description                                                       |
|---------------|---------------|----------|-------------------------------------------------------------------|
| CON_ID        | NUMBER        | NOT NULL | The ID of the PDB                                                 |
| CON_NAME      | VARCHAR2(128) | NOT NULL | Name of the PDB                                                   |
| INSTANCE_NAME | VARCHAR2(128) | NOT NULL | Name of the instance for which the state is saved                 |
| CON_UID       | NUMBER        | NOT NULL | Unique ID assigned to the PDB at creation time                    |
| GUID          | RAW(16)       |          | Globally unique immutable ID assigned to the PDB at creation time |
| STATE         | VARCHAR2(14)  |          | Open state of the PDB                                             |
| RESTRICTED    | VARCHAR2(3)   |          | Restricted mode of the PDB                                        |

**See Also**

*Oracle Database SQL Language Reference* for more information about preserving a PDB's open mode across an instance restart

## 6.238 DBA\_PDB\_SNAPSHOTFILE

DBA\_PDB\_SNAPSHOTFILE displays the files associated with snapshots taken of pluggable databases (PDBs).

You can use this view in conjunction with the DBA\_PDB\_SNAPSHOT view. Join the SNAPSHOT\_SCN column in this view with the SNAPSHOT\_SCN column in DBA\_PDB\_SNAPSHOT to determine the files associated with a particular PDB snapshot. A PDB snapshot consists of an archive log file, one or more data files, and one or more XML files. A row is added to this view for each file associated with a PDB snapshot.

| Column            | Datatype      | NULL     | Description                                                                                                                                                   |
|-------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID            | NUMBER        | NOT NULL | The ID of the PDB                                                                                                                                             |
| SNAPSHOT_SCN      | NUMBER        | NOT NULL | SCN at which the snapshot was taken                                                                                                                           |
| SNAPSHOT_FILENAME | VARCHAR2(513) | NOT NULL | Snapshot file name                                                                                                                                            |
| SNAPSHOT_FILETYPE | VARCHAR2(8)   | NOT NULL | Snapshot file type. Possible values: <ul style="list-style-type: none"> <li>ARCH: Archive log file</li> <li>DATA: Data file</li> <li>XML: XML file</li> </ul> |

**See Also**

["DBA\\_PDB\\_SNAPSHOTS"](#)

## 6.239 DBA\_PDB\_SNAPSHOTS

DBA\_PDB\_SNAPSHOTS describes the snapshots taken of pluggable databases (PDBs).

Rows are added to this view when a snapshot of a PDB is taken by using the ALTER PLUGGABLE DATABASE SNAPSHOT SQL statement.

| Column                | Datatype      | NULL     | Description                                              |
|-----------------------|---------------|----------|----------------------------------------------------------|
| CON_ID                | NUMBER        | NOT NULL | The ID of the PDB                                        |
| CON_UID               | NUMBER        | NOT NULL | Unique ID assigned to the PDB at creation time           |
| CON_NAME              | VARCHAR2(128) | NOT NULL | Name of the PDB                                          |
| SNAPSHOT_NAME         | VARCHAR2(128) | NOT NULL | Snapshot name of the PDB                                 |
| SNAPSHOT_SCN          | NUMBER        | NOT NULL | SCN at which the snapshot was taken                      |
| PREVIOUS_SNAPSHOT_SCN | NUMBER        | NOT NULL | SCN at which the previous snapshot for the PDB was taken |
| SNAPSHOT_TIME         | NUMBER        | NOT NULL | Timestamp at which the snapshot was taken                |

| Column                 | Datatype       | NULL     | Description                                     |
|------------------------|----------------|----------|-------------------------------------------------|
| PREVIOUS_SNAPSHOT_TIME | NUMBER         | NOT NULL | Timestamp of the previous snapshot for this PDB |
| FULL_SNAPSHOT_PATH     | VARCHAR2(4000) | NOT NULL | Full path for the snapshot                      |

 **Note**

This view does not display snapshot copy PDBs, which are created by using the CREATE PLUGGABLE DATABASE ... SNAPSHOT COPY SQL statement.

 **See Also**

"[DBA\\_PDB\\_SNAPSHOTFILE](#)" for information about the files associated with a particular PDB snapshot

## 6.240 DBA\_PDBS

DBA\_PDBS describes PDBs belonging to a given CDB.

When queried from a CDB root, this view describes all PDBs that belong to the CDB. When queried from an application root, it describes all PDBs that belong to the application container. When queried from a regular PDB or from an application PDB, it describes the regular PDB or the application PDB.

| Column   | Datatype      | NULL     | Description                                                                                              |
|----------|---------------|----------|----------------------------------------------------------------------------------------------------------|
| PDB_ID   | NUMBER        | NOT NULL | Container ID of the PDB                                                                                  |
| PDB_NAME | VARCHAR2(128) | NOT NULL | Name of the PDB                                                                                          |
| DBID     | NUMBER        | NOT NULL | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB |
| CON_UID  | NUMBER        | NOT NULL | Unique identifier associated with the container                                                          |
| GUID     | RAW(16)       |          | Globally unique immutable ID assigned to the PDB at creation time                                        |

| Column                  | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|--------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                  | VARCHAR2(10) |      | <p>State of the PDB. Possible values:</p> <ul style="list-style-type: none"> <li>NEW - The PDB has never been opened since it was created. It must be opened in READ WRITE mode for Oracle to perform processing needed to complete the integration of the PDB into the CDB and mark it NORMAL. An error will be thrown if an attempt is made to open the PDB read only.</li> <li>NORMAL - The PDB is ready to be used.</li> <li>UNPLUGGED - The PDB has been unplugged. The only operation that can be performed on it is DROP PLUGGABLE DATABASE.</li> <li>RELOCATING: The PDB is in the process of being relocated to a different CDB.</li> <li>RELOCATED: The PDB has been relocated to a different CDB.</li> <li>REFRESHING: The PDB is a refresh PDB.</li> <li>STANDBY: The PDB is a Data Guard standby PDB.</li> <li>UNDEFINED: The PDB is in an undefined state.</li> <li>UNUSABLE - The PDB is being created or an unrecoverable error was encountered during its creation. The PDB cannot be opened while its state is set to UNUSABLE. If the PDB remains in this state because of an error encountered during its creation, it can only be dropped. The alert log can be checked to determine if there was an error during PDB creation.</li> </ul> |

| CLOUD_IDENTITY <sup>1</sup>    | VARCHAR2(4000) |          | Cloud identifier for the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SOURCE_PDB_NAME <sup>1</sup>   | VARCHAR2(128)  |          | Name of the source PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SOURCE_DB_LINK <sup>1</sup>    | VARCHAR2(128)  |          | Name of the source database link                                                                                                                                                                                                                                                                                                                                                                                                                                               |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 6.241 DBA\_PENDING\_CONV\_TABLES

DBA\_PENDING\_CONV\_TABLES describes all pending conversion tables in the database. Its columns are the same as those in ALL\_PENDING\_CONV\_TABLES.

### ① See Also

["ALL\\_PENDING\\_CONV\\_TABLES"](#)

## 6.242 DBA\_PENDING\_TRANSACTIONS

DBA\_PENDING\_TRANSACTIONS describes unresolved transactions (either due to failure or if the coordinator has not sent a commit/rollback).

| Column   | Datatype | NULL | Description                                                |
|----------|----------|------|------------------------------------------------------------|
| FORMATID | NUMBER   |      | The format identifier of the transaction identifier        |
| GLOBALID | RAW(64)  |      | The global part (gtrid) of the transaction identifier      |
| BRANCHID | RAW(64)  |      | The branch qualifier (bqual) of the transaction identifier |

## 6.243 DBA\_PLSQL\_COLL\_TYPES

DBA\_PLSQL\_COLL\_TYPES describes all named PL/SQL collection types in the database. Its columns (except for CHAR\_USED) are the same as those in ALL\_PLSQL\_COLL\_TYPES.

### ① See Also

["ALL\\_PLSQL\\_COLL\\_TYPES"](#)

## 6.244 DBA\_PLSQL\_OBJECT\_SETTINGS

DBA\_PLSQL\_OBJECT\_SETTINGS displays information about the compiler settings for all stored objects in the database. Its columns are the same as those in ALL\_PLSQL\_OBJECT\_SETTINGS.

### ① See Also

["ALL\\_PLSQL\\_OBJECT\\_SETTINGS"](#)

## 6.245 DBA\_PLSQL\_TYPE\_ATTRS

DBA\_PLSQL\_TYPE\_ATTRS describes the attributes of all PL/SQL types in the database. Its columns are the same as those in ALL\_PLSQL\_TYPE\_ATTRS.

### ① See Also

["ALL\\_PLSQL\\_TYPE\\_ATTRS"](#)

## 6.246 DBA\_PLSQL\_TYPES

DBA\_PLSQL\_TYPES describes all PL/SQL types in the database. Its columns are the same as those in ALL\_PLSQL\_TYPES.

### ① See Also

["ALL\\_PLSQL\\_TYPES"](#)

## 6.247 DBA\_POLICIES

DBA\_POLICIES describes all Oracle Virtual Private Database (VPD) security policies in the database. Its columns are the same as those in ALL\_POLICIES.

A security policy is a list of security requirements and rules that regulate row level access to database objects.

### ① See Also

["ALL\\_POLICIES"](#)

## 6.248 DBA\_POLICY\_ATTRIBUTES

DBA\_POLICY\_ATTRIBUTES lists the attribute associations {Namespaces, Attributes} of all context-sensitive and shared context-sensitive Oracle Virtual Private Database (VPD) policies in the database. Its columns are the same as those in ALL\_POLICY\_ATTRIBUTES.

### ① See Also

["ALL\\_POLICY\\_ATTRIBUTES"](#)

## 6.249 DBA\_POLICY\_CONTEXTS

DBA\_POLICY\_CONTEXTS describes all driving contexts in the database. Its columns are the same as those in ALL\_POLICY\_CONTEXTS.

### ① See Also

["ALL\\_POLICY\\_CONTEXTS"](#)

## 6.250 DBA\_POLICY\_GROUPS

DBA\_POLICY\_GROUPS describes all policy groups in the database. Its columns are the same as those in ALL\_POLICY\_GROUPS.

### ① See Also

["ALL\\_POLICY\\_GROUPS"](#)

## 6.251 DBA\_PRIV\_AUDIT\_OPTS

DBA\_PRIV\_AUDIT\_OPTS describes current system privileges being audited across the system and by user.

### ① Note

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

| Column     | Datatype      | NULL     | Description                                                                                                                         |
|------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------|
| USER_NAME  | VARCHAR2(128) |          | User name if by user auditing; ANY CLIENT if access by a proxy on behalf of a client is being audited; NULL for systemwide auditing |
| PROXY_NAME | VARCHAR2(128) |          | Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly     |
| PRIVILEGE  | VARCHAR2(40)  | NOT NULL | Name of the system privilege being audited                                                                                          |

| Column  | Datatype     | NULL | Description                                      |
|---------|--------------|------|--------------------------------------------------|
| SUCCESS | VARCHAR2(10) |      | Mode for WHENEVER SUCCESSFUL system auditing     |
| FAILURE | VARCHAR2(10) |      | Mode for WHENEVER NOT SUCCESSFUL system auditing |

## 6.252 DBA\_PRIV\_CAPTURES

DBA\_PRIV\_CAPTURES lists the privilege analysis policies in the database.

| Column      | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                        |
|-------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2(128)  | NOT NULL | Name of the privilege analysis policy                                                                                                                                                                                                                                                                              |
| DESCRIPTION | VARCHAR2(1024) |          | Description of the privilege analysis                                                                                                                                                                                                                                                                              |
| TYPE        | VARCHAR2(16)   |          | Type of the privilege analysis policy.<br>Possible values: <ul style="list-style-type: none"> <li>G_DATABASE: Database wide privilege analysis</li> <li>G_ROLE: Role privilege analysis</li> <li>G_CONTEXT: Context privilege analysis</li> <li>G_ROLE_AND_CONTEXT: Role and context privilege analysis</li> </ul> |
| ENABLED     | VARCHAR2(1)    |          | Enabling status of the privilege analysis                                                                                                                                                                                                                                                                          |
| ROLES       | ROLE_ID_LIST   |          | List of roles whose privileges to analyze if the privilege analysis type is G_ROLE or G_ROLE_AND_CONTEXT                                                                                                                                                                                                           |
| CONTEXT     | VARCHAR2(4000) |          | Context condition if the privilege analysis type is G_CONTEXT or G_ROLE_AND_CONTEXT                                                                                                                                                                                                                                |
| RUN_NAME    | VARCHAR2(128)  |          | Displays run name information for each run                                                                                                                                                                                                                                                                         |

## 6.253 DBA\_PRIVATE\_TEMP\_TABLES

DBA\_PRIVATE\_TEMP\_TABLES describes all of the private temporary tables in the database.

### Related View

USER\_PRIVATE\_TEMP\_TABLES describes the private temporary tables in the current session. This view does not display the INST\_ID column.

| Column  | Datatype | NULL | Description                                                                   |
|---------|----------|------|-------------------------------------------------------------------------------|
| SID     | NUMBER   |      | Session ID of the session that created the private temporary table            |
| SERIAL# | NUMBER   |      | Session serial number of the session that created the private temporary table |

| Column          | Datatype      | NULL | Description                                                              |
|-----------------|---------------|------|--------------------------------------------------------------------------|
| INST_ID         | NUMBER        |      | Instance ID of the session that created the private temporary table      |
| OWNER           | VARCHAR2(128) |      | Owner name of the private temporary table                                |
| TABLE_NAME      | VARCHAR2(128) |      | Private temporary table name                                             |
| TABLESPACE_NAME | VARCHAR2(128) |      | Private temporary table's tablespace name                                |
| DURATION        | VARCHAR2(128) |      | Private temporary table's duration (for example, SESSION or TRANSACTION) |
| NUM_ROWS        | NUMBER        |      | Number of rows in the private temporary table when analyzed              |
| BLOCKS          | NUMBER        |      | Number of blocks used by private temporary table                         |
| AVG_ROW_LEN     | NUMBER        |      | Average row length                                                       |
| LAST_ANALYZED   | DATE          |      | Timestamp of last analyze                                                |
| TXN_ID          | RAW(8)        |      | Transaction ID of the transaction duration private temporary table       |
| SAVE_POINT_NUM  | NUMBER        |      | Save point number of the transaction duration private temporary table    |

## 6.254 DBA\_PROCEEDURES

DBA\_PROCEEDURES lists all functions and procedures that are available in the database, along with their associated properties. Its columns are the same as those in ALL\_PROCEEDURES.

#### ① See Also

- ["ALL\\_PROCEEDURES"](#)
- ["DBA\\_ARGUMENTS"](#) for information about the arguments of all of the functions and procedures that are available in the database

## 6.255 DBA\_PROFILES

DBA\_PROFILES displays all profiles and their limits.

| Column  | Datatype      | NULL     | Description  |
|---------|---------------|----------|--------------|
| PROFILE | VARCHAR2(128) | NOT NULL | Profile name |

| Column                         | Datatype      | NULL     | Description                                                                                                                                                                                                                                               |
|--------------------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESOURCE_NAME                  | VARCHAR2(32)  | NOT NULL | Resource name                                                                                                                                                                                                                                             |
| RESOURCE_TYPE                  | VARCHAR2(8)   |          | Indicates whether the resource profile is a KERNEL or a PASSWORD parameter                                                                                                                                                                                |
| LIMIT                          | VARCHAR2(128) |          | Limit placed on this resource for the profile                                                                                                                                                                                                             |
| COMMON                         | VARCHAR2(3)   |          | Indicates whether the profile is common. Possible values: <ul style="list-style-type: none"> <li>• YES if a profile is common</li> <li>• NO if a profile is local (not common)</li> </ul>                                                                 |
| INHERITED                      | VARCHAR2(3)   |          | Indicates whether the profile definition was inherited from another container (YES) or not (NO)                                                                                                                                                           |
| IMPLICIT                       | VARCHAR2(3)   |          | Indicates whether the profile was created by an implicit application (YES) or not (NO)                                                                                                                                                                    |
| ORACLE_MAINTAINED <sup>1</sup> | VARCHAR2(3)   |          | Indicates whether the profile was created by Oracle-supplied scripts (YES) or not (NO)<br>Note that a profile created by Oracle-supplied scripts is local to all PDBs and can be changed inside a PDB to accommodate individual application requirements. |
| MANDATORY <sup>1</sup>         | VARCHAR2(3)   |          | Indicates whether the profile is a mandatory user profile (YES) or not (NO)<br><b>See Also:</b> The <a href="#">MANDATORY_USER_PROFILE</a> initialization parameter                                                                                       |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 6.256 DBA\_PROPAGATION

DBA\_PROPAGATION displays information about all propagations in the database. Its columns are the same as those in ALL\_PROPAGATION.

### ① See Also

["ALL\\_PROPAGATION"](#)

## 6.257 DBA\_PROXIES

DBA\_PROXIES displays information about all proxy connections in the database.

### Related View

USER\_PROXIES displays information about connections the current user is allowed to proxy. This view does not display the PROXY or PROXY\_AUTHORITY columns.

| Column | Datatype      | NULL     | Description                                                     |
|--------|---------------|----------|-----------------------------------------------------------------|
| PROXY  | VARCHAR2(128) |          | Name of the proxy user                                          |
| CLIENT | VARCHAR2(128) | NOT NULL | Name of the client user who the proxy user can act on behalf of |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                             |
|--------------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTHENTICATION           | VARCHAR2(3)   |      | Indicates whether the proxy is required to supply the client's authentication credentials (YES) or not (NO)                                                                                                                                                                             |
| AUTHORIZATION_CONSTRAINT | VARCHAR2(35)  |      | Indicates the proxy's authority to exercise roles on the client's behalf: <ul style="list-style-type: none"> <li>• NO CLIENT ROLES MAY BE ACTIVATED</li> <li>• PROXY MAY ACTIVATE ROLE</li> <li>• PROXY MAY ACTIVATE ALL CLIENT ROLES</li> <li>• PROXY MAY NOT ACTIVATE ROLE</li> </ul> |
| ROLE                     | VARCHAR2(128) |      | Name of the role referenced in AUTHORIZATION_CONSTRAINT                                                                                                                                                                                                                                 |
| PROXY_AUTHORITY          | VARCHAR2(9)   |      | Value is either: <ul style="list-style-type: none"> <li>• DIRECTORY if an EUS proxy is enabled for the database user</li> <li>• DATABASE if this row describes a local proxy permission</li> </ul>                                                                                      |

#### ① See Also

- ["USER\\_PROXIES"](#)
- ["PROXY\\_USERS"](#) for a list of proxy users and the clients on whose behalf they can act

## 6.258 DBA\_QUEUE\_EVENT\_STREAMS

DBA\_QUEUE\_EVENT\_STREAMS describes all Transactional Event Queue (TEQ) event streams in the database. Its columns are the same as those in ALL\_QUEUE\_EVENT\_STREAMS.

#### ① Note

This view is available starting with Oracle Database 21c.

#### ① See Also

["ALL\\_QUEUE\\_EVENT\\_STREAMS"](#)

## 6.259 DBA\_QUEUE\_SCHEDULES

DBA\_QUEUE\_SCHEDULES describes all propagation schedules in the database. Its columns are the same as those in ALL\_QUEUE\_SCHEDULES.

### ① See Also

["ALL\\_QUEUE\\_SCHEDULES"](#)

## 6.260 DBA\_QUEUE\_SUBSCRIBERS

DBA\_QUEUE\_SUBSCRIBERS displays all subscribers on all queues in the database. Its columns are the same as those in ALL\_QUEUE\_SUBSCRIBERS.

### ① See Also

["ALL\\_QUEUE\\_SUBSCRIBERS"](#)

## 6.261 DBA\_QUEUE\_TABLES

DBA\_QUEUE\_TABLES contains information about the owner instance for a queue table.

A queue table can contain multiple queues. In this case, each queue in a queue table has the same owner instance as the queue table. Its columns are the same as those in ALL\_QUEUE\_TABLES.

### ① See Also

["ALL\\_QUEUE\\_TABLES"](#)

## 6.262 DBA\_QUEUES

DBA\_QUEUES describes the operational characteristics of every queue in a database. Its columns are the same as those in ALL\_QUEUES.

### ① See Also

- ["ALL\\_QUEUES"](#)

## 6.263 DBA\_RAT\_CAPTURE\_SCHEMA\_INFO

DBA\_RAT\_CAPTURE\_SCHEMA\_INFO displays the login schema and current schema that were in effect when SQL statements were recorded in a workload capture.

This view is useful when you perform a workload replay in extended PL/SQL mode. This type of replay may include SQL statements that perform table operations such as SELECT, UPDATE, and DELETE. If the current schema was different from the login schema at the time of the workload capture, then those table operations may have been performed with the privileges of the current user, not the login user. During workload replay, all operations are performed with the privileges of the login user. Therefore, errors can occur during replay if the login user does not have the necessary privileges to perform the table operations.

To resolve this issue, you can use this view in conjunction with the DBA\_WORKLOAD\_CAPTURE\_SQLTEXT view. Join the CAPTURE\_ID column in this view with the CAPTURE\_ID column in DBA\_WORKLOAD\_CAPTURE\_SQLTEXT to determine the login schema and current schema that were in effect when each SQL statement in DBA\_WORKLOAD\_CAPTURE\_SQLTEXT was captured. Examine the SQL\_TEXT column in DBA\_WORKLOAD\_CAPTURE\_SQLTEXT to determine whether the SQL statement involved any table operations, and whether those table operations were performed with the privileges of the current user or the login user. You can then grant to the login user the necessary privileges for performing those table operations before performing a workload replay.

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                           |
|----------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAPTURE_ID     | NUMBER(38)    |      | Internal key for the workload capture                                                                                                                                                                                                                                                                                 |
| SQL_ID         | VARCHAR2(13)  |      | SQL identifier for the parent cursor in the library cache                                                                                                                                                                                                                                                             |
| LOGIN_SCHEMA   | VARCHAR2(128) |      | The schema of the user who logged on to the session in which the SQL statement was recorded in the workload capture. This value does not change during a session.                                                                                                                                                     |
| CURRENT_SCHEMA | VARCHAR2(128) |      | The currently active default schema for the session when the SQL statement was recorded in the workload capture. This value may change during a session through use of an ALTER SESSION SET CURRENT_SCHEMA statement. It may also change during a session to reflect the owner of any active definer's rights object. |

## 6.264 DBA\_RCHILD

DBA\_RCHILD displays all the children in any refresh group.

| Column   | Datatype      | NULL     | Description                              |
|----------|---------------|----------|------------------------------------------|
| REFGROUP | NUMBER        |          | Internal identifier of the refresh group |
| OWNER    | VARCHAR2(128) | NOT NULL | Owner of the object in the refresh group |

| Column | Datatype      | NULL     | Description                             |
|--------|---------------|----------|-----------------------------------------|
| NAME   | VARCHAR2(128) | NOT NULL | Name of the object in the refresh group |
| TYPE#  | VARCHAR2(128) |          | Type of the object in the refresh group |

## 6.265 DBA\_RECOVERABLE\_SCRIPT

DBA\_RECOVERABLE\_SCRIPT provides details about recoverable operations.

| Column                 | Datatype       | NULL | Description                                                                              |
|------------------------|----------------|------|------------------------------------------------------------------------------------------|
| SCRIPT_ID              | RAW(16)        |      | Unique ID of the operation                                                               |
| CREATION_TIME          | DATE           |      | Time the operation was invoked                                                           |
| INVOKING_PACKAGE_OWNER | VARCHAR2(128)  |      | Invoking package owner of the operation                                                  |
| INVOKING_PACKAGE       | VARCHAR2(128)  |      | Invoking package of the operation                                                        |
| INVOKING_PROCEDURE     | VARCHAR2(128)  |      | Invoking procedure of the operation                                                      |
| INVOKING_USER          | VARCHAR2(128)  |      | Script owner                                                                             |
| STATUS                 | VARCHAR2(12)   |      | State of the recoverable script: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR |
| TOTAL_BLOCKS           | NUMBER         |      | Total number of blocks for the recoverable script to be executed                         |
| DONE_BLOCK_NUM         | NUMBER         |      | Last block executed, thus far                                                            |
| SCRIPT_COMMENT         | VARCHAR2(4000) |      | Comment for the recoverable script                                                       |

## 6.266 DBA\_RECOVERABLE\_SCRIPT\_BLOCKS

DBA\_RECOVERABLE\_SCRIPT\_BLOCKS provides details about recoverable script blocks.

| Column               | Datatype       | NULL | Description                                                                            |
|----------------------|----------------|------|----------------------------------------------------------------------------------------|
| SCRIPT_ID            | RAW(16)        |      | Global unique ID of the recoverable script to which this block belongs                 |
| BLOCK_NUM            | NUMBER         |      | The <i>n</i> th block in the recoverable script to be executed                         |
| FORWARD_BLOCK        | CLOB           |      | Forward block to be executed                                                           |
| FORWARD_BLOCK_DBLINK | VARCHAR2(128)  |      | Database where the forward block is executed                                           |
| UNDO_BLOCK           | CLOB           |      | Block to roll back the forward operation                                               |
| UNDO_BLOCK_DBLINK    | VARCHAR2(128)  |      | Database where the undo block is executed                                              |
| STATUS               | VARCHAR2(12)   |      | Status of the block execution: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR |
| BLOCK_COMMENT        | VARCHAR2(4000) |      | Comment for the block                                                                  |

## 6.267 DBA\_RECOVERABLE\_SCRIPT\_ERRORS

DBA\_RECOVERABLE\_SCRIPT\_ERRORS provides details about errors that occurred during script execution.

| Column              | Datatype       | NULL | Description                                               |
|---------------------|----------------|------|-----------------------------------------------------------|
| SCRIPT_ID           | RAW(16)        |      | Global unique ID of the recoverable script                |
| BLOCK_NUM           | NUMBER         |      | The <i>n</i> th block that failed                         |
| ERROR_NUMBER        | NUMBER         |      | Number of the error encountered while executing the block |
| ERROR_MESSAGE       | VARCHAR2(4000) |      | Error message encountered while executing the block       |
| ERROR_CREATION_TIME | DATE           |      | Time that the error was created                           |

## 6.268 DBA\_RECOVERABLE\_SCRIPT\_HIST

DBA\_RECOVERABLE\_SCRIPT\_HIST displays details about executed or purged recoverable operations.

| Column                 | Datatype       | NULL | Description                                                      |
|------------------------|----------------|------|------------------------------------------------------------------|
| SCRIPT_ID              | RAW(16)        |      | Unique id of the operation                                       |
| CREATION_TIME          | DATE           |      | Time the operation was invoked                                   |
| INVOKING_PACKAGE_OWNER | VARCHAR2(128)  |      | Invoking package owner of the operation                          |
| INVOKING_PACKAGE       | VARCHAR2(128)  |      | Invoking package of the operation                                |
| INVOKING_PROCEDURE     | VARCHAR2(128)  |      | Invoking procedure of the operation                              |
| INVOKING_USER          | VARCHAR2(128)  |      | Script owner                                                     |
| STATUS                 | VARCHAR2(8)    |      | state of the recoverable script: EXECUTED, PURGED                |
| TOTAL_BLOCKS           | NUMBER         |      | total number of blocks for the recoverable script to be executed |
| DONE_BLOCK_NUM         | NUMBER         |      | last block so far executed                                       |
| SCRIPT_COMMENT         | VARCHAR2(4000) |      | comment for the recoverable script                               |

## 6.269 DBA\_RECOVERABLE\_SCRIPT\_PARAMS

DBA\_RECOVERABLE\_SCRIPT\_PARAMS provides details about recoverable operation parameters.

| Column      | Datatype       | NULL | Description                      |
|-------------|----------------|------|----------------------------------|
| SCRIPT_ID   | RAW(16)        |      | Unique ID of the operation       |
| PARAMETER   | VARCHAR2(128)  |      | Name of the parameter            |
| PARAM_INDEX | NUMBER         |      | Index for multi-valued parameter |
| VALUE       | VARCHAR2(4000) |      | Value of the parameter           |

## 6.270 DBA\_RECYCLEBIN

DBA\_RECYCLEBIN displays information about all recycle bins in the database.

### Related View

USER\_RECYCLEBIN displays information about the recycle bin owned by the current user. This view does not display the OWNER column.

| Column         | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 6.271 DBA\_REDEFINITION\_ERRORS

DBA\_REDEFINITION\_ERRORS is an online redefinition view. It displays the dependent objects for which errors were raised while attempting to create similar objects on the interim table of the redefinition.

| Column           | Datatype       | NULL     | Description                                                                                                                                                                                                         |
|------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_TYPE      | VARCHAR2(12)   |          | Type of the redefinition object: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• INDEX</li> <li>• CONSTRAINT</li> <li>• TRIGGER</li> <li>• NESTED TABLE</li> <li>• PARTITION</li> <li>• MV LOG</li> </ul> |
| OBJECT_OWNER     | VARCHAR2(4000) |          | Owner of the redefinition object                                                                                                                                                                                    |
| OBJECT_NAME      | VARCHAR2(128)  | NOT NULL | Name of the redefinition object                                                                                                                                                                                     |
| BASE_TABLE_OWNER | VARCHAR2(128)  |          | Owner of the base table of the redefinition object                                                                                                                                                                  |
| BASE_TABLE_NAME  | VARCHAR2(128)  |          | Name of the base table of the redefinition object                                                                                                                                                                   |
| DDL_TXT          | CLOB           |          | DDL used to create the corresponding interim redefinition object                                                                                                                                                    |
| EDITION_NAME     | VARCHAR2(128)  |          | Reserved for future use                                                                                                                                                                                             |
| ERR_NO           | NUMBER(38)     |          | Oracle error number corresponding to this error                                                                                                                                                                     |
| ERR_TXT          | VARCHAR2(1000) |          | Oracle error text corresponding to this error                                                                                                                                                                       |

## 6.272 DBA\_REDEFINITION\_OBJECTS

DBA\_REDEFINITION\_OBJECTS is an online redefinition view. It displays the objects involved in the current redefinitions.

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                                         |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_TYPE          | VARCHAR2(12)   |          | Type of the redefinition object: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• INDEX</li> <li>• CONSTRAINT</li> <li>• TRIGGER</li> <li>• NESTED TABLE</li> <li>• PARTITION</li> <li>• MV LOG</li> </ul> |
| OBJECT_OWNER         | VARCHAR2(4000) |          | Owner of the redefinition object                                                                                                                                                                                    |
| OBJECT_NAME          | VARCHAR2(128)  | NOT NULL | Name of the redefinition object                                                                                                                                                                                     |
| BASE_TABLE_OWNER     | VARCHAR2(128)  |          | Owner of the base table of the redefinition object                                                                                                                                                                  |
| BASE_TABLE_NAME      | VARCHAR2(128)  |          | Name of the base table of the redefinition object                                                                                                                                                                   |
| INTERIM_OBJECT_OWNER | VARCHAR2(4000) |          | Owner of the corresponding interim redefinition object                                                                                                                                                              |
| INTERIM_OBJECT_NAME  | VARCHAR2(128)  |          | Name of the corresponding interim redefinition object                                                                                                                                                               |
| EDITION_NAME         | VARCHAR2(128)  |          | Reserved for future use                                                                                                                                                                                             |

## 6.273 DBA\_REDEFINITION\_STATUS

DBA\_REDEFINITION\_STATUS is an online redefinition view. It provides information about the online redefinition status.

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                            |
|----------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REDEFINITION_ID      | NUMBER(38)    | NOT NULL | ID for the redefinition object                                                                                                                                                                         |
| BASE_TABLE_OWNER     | VARCHAR2(128) |          | Owner of the base table of the redefinition object                                                                                                                                                     |
| BASE_TABLE_NAME      | VARCHAR2(128) |          | Name of the base table of the redefinition object                                                                                                                                                      |
| BASE_OBJECT_NAME     | VARCHAR2(128) | NOT NULL | Name of the base object of the redefinition object                                                                                                                                                     |
| BASE_OBJECT_TYPE     | VARCHAR2(9)   |          | Type of the base object of the redefinition object                                                                                                                                                     |
| INTERIM_OBJECT_OWNER | VARCHAR2(128) |          | Owner of the interim object of the redefinition object                                                                                                                                                 |
| INTERIM_OBJECT_NAME  | VARCHAR2(128) |          | Name of the interim object of the redefinition object                                                                                                                                                  |
| OPERATION            | VARCHAR2(128) | NOT NULL | The current redefinition operation: <ul style="list-style-type: none"> <li>• START_REDEF_TABLE</li> <li>• SYNC_INTERIM_TABLE</li> <li>• COPY_TABLE_DEPENDENTS</li> <li>• FINISH_REDEF_TABLE</li> </ul> |
| STATUS               | VARCHAR2(128) | NOT NULL | Status of the previous redefinition operation: <ul style="list-style-type: none"> <li>• FAILURE</li> <li>• SUCCESS</li> </ul>                                                                          |
| RESTARTABLE          | VARCHAR2(1)   | NOT NULL | Indicates whether the previous operation can be restarted                                                                                                                                              |

| Column             | Datatype       | NULL | Description                                                                                                                            |
|--------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------|
| ERR_TXT            | VARCHAR2(1000) |      | The error message raised from the previous operation                                                                                   |
| ACTION             | VARCHAR2(400)  |      | The suggested action                                                                                                                   |
| REFRESH_DEP_MVIEWS | VARCHAR2(1)    |      | Indicates whether the online redefinition will also refresh dependent materialized views when syncing the interim table (Y) or not (N) |

## 6.274 DBA\_REFRESH

DBA\_REFRESH describes all refresh groups in the database. Its columns are the same as those in ALL\_REFRESH.

① **See Also**

["ALL\\_REFRESH"](#)

## 6.275 DBA\_REFRESH\_CHILDREN

DBA\_REFRESH\_CHILDREN lists all of the objects in all refresh groups in the database. Its columns are the same as those in ALL\_REFRESH\_CHILDREN.

① **See Also**

["ALL\\_REFRESH\\_CHILDREN"](#)

## 6.276 DBA\_REFS

DBA\_REFS describes the REF columns and REF attributes in object type columns of all the objects in the database. Its columns are the same as those in ALL\_REFS.

① **See Also**

["ALL\\_REFS"](#)

## 6.277 DBA\_REGISTERED\_ARCHIVED\_LOG

DBA\_REGISTERED\_ARCHIVED\_LOG displays information about all registered archived logfiles in the database.

| Column             | Datatype      | NULL     | Description                                                                                                                                                      |
|--------------------|---------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONSUMER_NAME      | VARCHAR2(128) | NOT NULL | Consumer name of the archived logs                                                                                                                               |
| SOURCE_DATABASE    | VARCHAR2(128) |          | Name of the database which generated the redo logs                                                                                                               |
| THREAD#            | NUMBER        | NOT NULL | Thread number of the archived redo log. The thread number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers. |
| SEQUENCE#          | NUMBER        | NOT NULL | Sequence number of the archived redo log file                                                                                                                    |
| FIRST_SCN          | NUMBER        | NOT NULL | System change number (SCN) of the current archived redo log                                                                                                      |
| NEXT_SCN           | NUMBER        |          | System change number (SCN) of the next archived redo log                                                                                                         |
| FIRST_TIME         | DATE          |          | Date and time of the current archived redo log                                                                                                                   |
| NEXT_TIME          | DATE          |          | Date and time of the next archived redo log                                                                                                                      |
| NAME               | VARCHAR2(513) |          | Name of the archived redo log                                                                                                                                    |
| MODIFIED_TIME      | DATE          |          | Time when the archived redo log was registered                                                                                                                   |
| DICTIONARY_BEGIN   | VARCHAR2(3)   |          | Indicates whether the beginning of the dictionary build is in the archived redo log (YES) or not (NO)                                                            |
| DICTIONARY_END     | VARCHAR2(3)   |          | Indicates whether the end of the dictionary build is in the archived redo log (YES) or not (NO)                                                                  |
| PURGEABLE          | VARCHAR2(3)   |          | Indicates whether the redo log can be permanently removed (YES) or not (NO)                                                                                      |
| RESET_LOGS_CHANGE# | NUMBER        | NOT NULL | Resetlogs change number of the database when the log was written                                                                                                 |
| RESET_TIMESTAMP    | NUMBER        | NOT NULL | Resetlogs time of the database when the log was written                                                                                                          |

## 6.278 DBA\_REGISTERED\_MVIEWS

DBA\_REGISTERED\_MVIEWS describes all registered materialized views (registered at a master site or a master materialized view site) in the database. Its columns are the same as those in ALL\_REGISTERED\_MVIEWS.

### ① See Also

"[ALL\\_REGISTERED\\_MVIEWS](#)"

## 6.279 DBA\_REGISTRY

DBA\_REGISTRY displays information about all components in the database that are loaded into the component registry.

The component registry tracks components that can be separately loaded into the Oracle Database. When a SQL script loads the PL/SQL packages and other database objects for a component into the database, the script records the component name, status, and version. If scripts are used to upgrade/downgrade the dictionary elements for the component, then those scripts also record status and version information.

### Related View

USER\_REGISTRY displays information about the components owned by the current user that are loaded into the component registry.

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                      |

## 6.280 DBA\_REGISTRY\_BACKPORTS

DBA\_REGISTRY\_BACKPORTS displays backported bug fixes that were applied to the database. This view displays only bug fixes that changed the data dictionary of the database.

| Column        | Datatype     | NULL     | Description                                                                                                                                                |
|---------------|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUGNO         | NUMBER       | NOT NULL | Bug number                                                                                                                                                 |
| VERSION_FULL  | VARCHAR2(30) | NOT NULL | Component full version                                                                                                                                     |
| COMP_ID       | VARCHAR2(30) | NOT NULL | Component identifier                                                                                                                                       |
| NAMESPACE     | VARCHAR2(30) | NOT NULL | Component namespace                                                                                                                                        |
| BACKPORT_TYPE | VARCHAR2(30) | NOT NULL | Type of backported bug fix<br>The value of this columns is always DICTONARY, which indicates that the bug fix changed the data dictionary of the database. |
| BACKPORT_TIME | TIMESTAMP(6) | NOT NULL | Date and time at which the backported bug fix was applied                                                                                                  |

## 6.281 DBA\_REGISTRY\_HIERARCHY

DBA\_REGISTRY\_HIERARCHY displays information about the components loaded into the database, grouped by owner and organized in the component hierarchy.

| Column       | Datatype       | NULL     | Description                                                                                                                                                                                                                                                      |
|--------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAMESPACE    | VARCHAR2(30)   | NOT NULL | Component namespace                                                                                                                                                                                                                                              |
| COMP_ID      | VARCHAR2(4000) |          | Component identifier                                                                                                                                                                                                                                             |
| VERSION      | VARCHAR2(30)   |          | Component version loaded                                                                                                                                                                                                                                         |
| VERSION_FULL | VARCHAR2(30)   |          | Component full version                                                                                                                                                                                                                                           |
| STATUS       | VARCHAR2(11)   |          | Component status: <ul style="list-style-type: none"> <li>• INVALID</li> <li>• VALID</li> <li>• LOADING</li> <li>• LOADED</li> <li>• UPGRADING</li> <li>• UPGRADED</li> <li>• DOWNGRADING</li> <li>• DOWNGRADED</li> <li>• REMOVING</li> <li>• REMOVED</li> </ul> |
| MODIFIED     | VARCHAR2(20)   |          | Time when the component was last modified                                                                                                                                                                                                                        |

## 6.282 DBA\_REGISTRY\_HISTORY

DBA\_REGISTRY\_HISTORY provides information about upgrades, downgrades, and critical patch updates that have been performed on the database.

| Column        | Datatype      | NULL | Description                                                    |
|---------------|---------------|------|----------------------------------------------------------------|
| ACTION_TIME   | TIMESTAMP(6)  |      | The time the upgrade, downgrade, or patch action was completed |
| ACTION        | VARCHAR2(30)  |      | The specific action (for example, UPGRADE or DOWNGRADE)        |
| NAMESPACE     | VARCHAR2(30)  |      | The namespace of the components affected (for example, SERVER) |
| VERSION       | VARCHAR2(30)  |      | The version number of the server (for example, 10.2.0.1.0)     |
| ID            | NUMBER        |      | Bundle ID                                                      |
| COMMENTS      | VARCHAR2(255) |      | Additional comments about the action taken                     |
| BUNDLE_SERIES | VARCHAR2(30)  |      | If a bundle patch, the series (for example, PSU or DBBP)       |

## 6.283 DBA\_REGISTRY\_LOG

DBA\_REGISTRY\_LOG displays operating information about components loaded into the database.

| Column    | Datatype       | NULL | Description          |
|-----------|----------------|------|----------------------|
| OPTIME    | VARCHAR2(20)   |      | Operation time       |
| NAMESPACE | VARCHAR2(30)   |      | Component namespace  |
| COMP_ID   | VARCHAR2(30)   |      | Component identifier |
| OPERATION | VARCHAR2(11)   |      | Operation name       |
| MESSAGE   | VARCHAR2(1000) |      | Message              |

## 6.284 DBA\_REGISTRY\_SCHEMAS

DBA\_REGISTRY\_SCHEMAS lists the primary and ancillary schemas included in the component registry. The ancillary schemas that are listed in this view are the same schemas that would be included in the OTHER\_SCHEMAS column of the DBA\_REGISTRY view.

| Column    | Datatype      | NULL | Description                                      |
|-----------|---------------|------|--------------------------------------------------|
| NAMESPACE | VARCHAR2(30)  |      | Component namespace                              |
| COMP_ID   | VARCHAR2(30)  |      | Component identifier                             |
| SCHEMA    | VARCHAR2(128) |      | User that contains the objects for the component |

## 6.285 DBA\_REGISTRY\_SQLPATCH

DBA\_REGISTRY\_SQLPATCH contains information about the SQL patches that have been installed in the database.

A SQL patch is a patch that contains SQL scripts which need to be run after OPatch completes. DBA\_REGISTRY\_SQLPATCH is updated by the datapatch utility. Each row contains information about an installation attempt (apply or roll back) for a given patch.

| Column                   | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                   |
|--------------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTALL_ID               | NUMBER        | NOT NULL | Unique numeric identifier for this datapatch session. All patches installed in the same invocation of datapatch will have the same value for INSTALL_ID.                                                                                                                                                      |
| PATCH_ID                 | NUMBER        | NOT NULL | ID associated with the patch                                                                                                                                                                                                                                                                                  |
| PATCH_UID                | NUMBER        | NOT NULL | UPI (Universal Patch ID) associated with the patch                                                                                                                                                                                                                                                            |
| PATCH_TYPE               | VARCHAR2(10)  | NOT NULL | Type of the patch. Possible values: <ul style="list-style-type: none"> <li>• INTERIM: Interim patch</li> <li>• RU: Release Update</li> <li>• RUI: Release Update Increment</li> <li>• RUR: Release Update Revision</li> <li>• CU: Cumulative Update</li> </ul>                                                |
| ACTION                   | VARCHAR2(15)  | NOT NULL | APPLY or ROLLBACK                                                                                                                                                                                                                                                                                             |
| STATUS                   | VARCHAR2(25)  | NOT NULL | Possible values: <ul style="list-style-type: none"> <li>• SUCCESS: Patch application has completed with no errors</li> <li>• WITH ERRORS: Patch application finished with errors</li> </ul>                                                                                                                   |
| ACTION_TIME              | TIMESTAMP(6)  | NOT NULL | Timestamp when the install was performed                                                                                                                                                                                                                                                                      |
| DESCRIPTION              | VARCHAR2(100) |          | Description of this patch from OPatch metadata                                                                                                                                                                                                                                                                |
| LOGFILE                  | VARCHAR2(500) | NOT NULL | Location of the logfile for this apply or rollback attempt                                                                                                                                                                                                                                                    |
| RU_LOGFILE               | VARCHAR2(500) |          | Logfile location for RU specific commands                                                                                                                                                                                                                                                                     |
| FLAGS                    | VARCHAR2(10)  |          | One or more of the following: <ul style="list-style-type: none"> <li>• J: Patch is a JVM patch</li> <li>• M: Patch installation was merged with another patch</li> <li>• N: Patch requires normal mode</li> <li>• R: Patch installation has been retried</li> <li>• U: Patch requires upgrade mode</li> </ul> |
| PATCH_DESCRIPTOR         | XMLTYPE       |          | Contents of the XML descriptor for the patch                                                                                                                                                                                                                                                                  |
| PATCH_DIRECTORY          | BLOB          |          | Contents of the patch directory under ORACLE_HOME/sqlpatch                                                                                                                                                                                                                                                    |
| SOURCE_VERSION           | VARCHAR2(15)  |          | 5 digit version (for example, 18.3.2.0.0) for the version on which the patch was applied                                                                                                                                                                                                                      |
| SOURCE_BUILD_DESCRIPTION | VARCHAR2(80)  |          | Build description (for example, Release_Update or Release_Update_Revision) for the version on which the patch was applied                                                                                                                                                                                     |
| SOURCE_BUILD_TIMESTAMP   | TIMESTAMP(6)  |          | Build timestamp for the version on which the patch was applied                                                                                                                                                                                                                                                |

| Column                   | Datatype     | NULL | Description                                                                                                |
|--------------------------|--------------|------|------------------------------------------------------------------------------------------------------------|
| TARGET_VERSION           | VARCHAR2(15) |      | 5 digit version (for example, 18.4.0.0.0) for the version to be installed                                  |
| TARGET_BUILD_DESCRIPTION | VARCHAR2(80) |      | Build description (for example, Release_Update or Release_Update_Revision) for the version to be installed |
| TARGET_BUILD_TIMESTAMP   | TIMESTAMP(6) |      | Build timestamp for the version to be installed                                                            |

## 6.286 DBA\_REPAIR\_TABLE

DBA\_REPAIR\_TABLE describes any corruptions found by the DBMS\_REPAIR.CHECK\_OBJECT procedure.

This information is used by the DBMS\_REPAIR.FIX\_CORRUPT\_BLOCKS procedure on execution. To create this view, first run the DBMS\_REPAIR.ADMIN\_TABLES procedure. To populate the resulting repair table for an object, run the DBMS\_REPAIR.CHECK\_OBJECT procedure on the object.

### Note

The table created by the DBMS\_REPAIR.ADMIN\_TABLES procedure is called REPAIR\_TABLE by default. If you specify a different name, this view will have the name you specify, preceded by "DBA\_REPAIR\_".

| Column              | Datatype       | NULL     | Description                                                |
|---------------------|----------------|----------|------------------------------------------------------------|
| OBJECT_ID           | NUMBER         | NOT NULL | Dictionary object number of the object with the corruption |
| TABLESPACE_ID       | NUMBER         | NOT NULL | Tablespace number of the corrupt object                    |
| RELATIVE_FILE_ID    | NUMBER)        | NOT NULL | Relative file number of the corrupt object                 |
| BLOCK_ID            | NUMBER         | NOT NULL | Block number of the corruption                             |
| CORRUPT_TYPE        | NUMBER         | NOT NULL | Type of corruption encountered                             |
| SCHEMA_NAME         | VARCHAR2(128)  | NOT NULL | Schema of the corrupt object                               |
| OBJECT_NAME         | VARCHAR2(128)  | NOT NULL | Name of the corrupt object                                 |
| BASEOBJECT_NAME     | VARCHAR2(128)  | NULL     | If the object is an index, the name of its base table      |
| PARTITION_NAME      | VARCHAR2(128)  | NULL     | Partition or subpartition name, if applicable              |
| CORRUPT_DESCRIPTION | VARCHAR2(2000) | NULL     | Description of corruption                                  |

| Column             | Datatype      | NULL     | Description                                                                                  |
|--------------------|---------------|----------|----------------------------------------------------------------------------------------------|
| REPAIR_DESCRIPTION | VARCHAR2(200) | NULL     | Description of repair action                                                                 |
| MARKED_CORRUPT     | VARCHAR2(10)  | NOT NULL | Whether the block is marked corrupt (TRUE   FALSE)                                           |
| CHECK_TIMESTAMP    | DATE          | NOT NULL | Date and time when this row was inserted into the repair table                               |
| FIX_TIMESTAMP      | DATE          | NULL     | Date and time when the block was modified by the FIX_CORRUPT_BLOCKS procedure, if applicable |
| REFORMAT_TIMESTAMP | DATE          | NULL     | Reserved for future use                                                                      |

#### ① See Also

## 6.287 DBA\_REPL\_DBNAME\_MAPPING

DBA\_REPL\_DBNAME\_MAPPING provides details about the database name mapping in replication. Its columns are the same as those in ALL\_REPL\_DBNAME\_MAPPING.

#### ① See Also

"[ALL\\_REPL\\_DBNAME\\_MAPPING](#)"

## 6.288 DBA\_REPLICATION\_PROCESS\_EVENTS

DBA\_REPLICATION\_PROCESS\_EVENTS provides information about the replication processes events in the database. Its columns are the same as those in ALL\_REPLICATION\_PROCESS\_EVENTS.

#### ① See Also

"[ALL\\_REPLICATION\\_PROCESS\\_EVENTS](#)"

## 6.289 DBA\_RESOURCE\_INCARNATIONS

DBA\_RESOURCE\_INCARNATIONS lists all resource incarnations that are running or eligible for HA status notification.

| Column        | Datatype      | NULL     | Description      |
|---------------|---------------|----------|------------------|
| RESOURCE_TYPE | VARCHAR2(30)  | NOT NULL | Type of resource |
| RESOURCE_NAME | VARCHAR2(256) |          | Name of resource |

| Column         | Datatype                    | NULL     | Description                                   |
|----------------|-----------------------------|----------|-----------------------------------------------|
| DB_UNIQUE_NAME | VARCHAR2(30)                | NOT NULL | Database unique name                          |
| DB_DOMAIN      | VARCHAR2(128)               | NOT NULL | Database domain                               |
| INSTANCE_NAME  | VARCHAR2(30)                | NOT NULL | Name of instance at which resource is located |
| HOST_NAME      | VARCHAR2(512)               |          | Name of host at which resource is located     |
| STARTUP_TIME   | TIMESTAMP(9) WITH TIME ZONE |          | Resource startup date and time                |

## 6.290 DBA\_RESUMABLE

DBA\_RESUMABLE displays all resumable statements executed in the system.

### Related View

USER\_RESUMABLE displays the resumable statements executed by the current user. This view does not display the USER\_ID column.

| Column            | Datatype       | NULL | Description                                                                                                                                                                |
|-------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER_ID           | NUMBER         |      | User ID Number of the Resumable Statement Owner                                                                                                                            |
| SESSION_ID        | NUMBER         |      | Session Identifier of the Resumable Statement                                                                                                                              |
| INSTANCE_ID       | NUMBER         |      | Instance Number of the Resumable Statement                                                                                                                                 |
| COORD_INSTANCE_ID | NUMBER         |      | Instance Number on which the Parallel Coordinator is Running                                                                                                               |
| COORD_SESSION_ID  | NUMBER         |      | Session Identifier of the Parallel Coordinator                                                                                                                             |
| STATUS            | VARCHAR2(9)    |      | Status of the resumable statement: <ul style="list-style-type: none"> <li>• RUNNING</li> <li>• SUSPENDED</li> <li>• TIMEOUT</li> <li>• ERROR</li> <li>• ABORTED</li> </ul> |
| TIMEOUT           | NUMBER         |      | Timeout of the resumable statement                                                                                                                                         |
| START_TIME        | VARCHAR2(20)   |      | Start time of the resumable statement                                                                                                                                      |
| SUSPEND_TIME      | VARCHAR2(20)   |      | Last time the resumable statement was suspended (initialized to NULL)                                                                                                      |
| RESUME_TIME       | VARCHAR2(20)   |      | Last time the suspended resumable statement was resumed (initialized to NULL)                                                                                              |
| NAME              | VARCHAR2(4000) |      | Name given in the resumable clause of the resumable statement                                                                                                              |
| SQL_TEXT          | VARCHAR2(1000) |      | Resumable statement, selected from the V\$SQL view                                                                                                                         |
| ERROR_NUMBER      | NUMBER         |      | Error code of the last correctable error. When STATUS is set to RUNNING, its value will be 0.                                                                              |
| ERROR_PARAMETER1  | VARCHAR2(80)   |      | First parameter for the error message (NULL if no error)                                                                                                                   |
| ERROR_PARAMETER2  | VARCHAR2(80)   |      | Second parameter for the error message (NULL if no error)                                                                                                                  |
| ERROR_PARAMETER3  | VARCHAR2(80)   |      | Third parameter for the error message (NULL if no error)                                                                                                                   |

| Column           | Datatype       | NULL | Description                                                                          |
|------------------|----------------|------|--------------------------------------------------------------------------------------|
| ERROR_PARAMETER4 | VARCHAR2(80)   |      | Fourth parameter for the error message (NULL if no error)                            |
| ERROR_PARAMETER5 | VARCHAR2(80)   |      | Fifth parameter for the error message (NULL if no error)                             |
| ERROR_MSG        | VARCHAR2(4000) |      | Error message corresponding to ERROR_NUMBER. It will be NULL when ERROR_NUMBER is 0. |

## 6.291 DBA\_REWRITE\_EQUIVALENCES

DBA\_REWRITE\_EQUIVALENCES describes all rewrite equivalences in the database. Its columns are the same as those in ALL\_REWRITE\_EQUIVALENCES.

 **See Also**

["ALL\\_REWRITE\\_EQUIVALENCES"](#)

## 6.292 DBA\_RGROUP

DBA\_RGROUP displays all refresh groups.

| Column               | Datatype      | NULL     | Description                                                                                                                |
|----------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------|
| REFGROUP             | NUMBER        |          | Internal identifier of the refresh group                                                                                   |
| OWNER                | VARCHAR2(128) | NOT NULL | Owner of the object in the refresh group                                                                                   |
| NAME                 | VARCHAR2(128) | NOT NULL | Name of the object in the refresh group                                                                                    |
| IMPLICIT_DESTROY     | VARCHAR2(1)   |          | Indicates whether the refresh group is destroyed when its last item is removed (Y) or not (N)                              |
| PUSH_DEFERRED_RPC    | VARCHAR2(1)   |          | Indicates whether changes are pushed from the snapshot to the master before refresh (Y) or not (N)                         |
| REFRESH_AFTER_ERRORS | VARCHAR2(1)   |          | Indicates whether to proceed with refresh despite errors when pushing deferred RPCs (Y) or not (N)                         |
| ROLLBACK_SEG         | VARCHAR2(128) |          | Name of the rollback segment to use while refreshing                                                                       |
| JOB                  | NUMBER        | NOT NULL | Identifier of the job used to refresh the group automatically                                                              |
| PURGE_OPTION         | NUMBER(38)    |          | Method for purging the transaction queue after each push. 1 indicates quick purge option; 2 indicates precise purge option |
| PARALLELISM          | NUMBER(38)    |          | Level of parallelism for transaction propagation                                                                           |
| HEAP_SIZE            | NUMBER(38)    |          | Size of the heap                                                                                                           |

| Column   | Datatype      | NULL | Description                                                 |
|----------|---------------|------|-------------------------------------------------------------|
| JOB_NAME | VARCHAR2(128) |      | The name of the job used to automatically refresh the group |

## 6.293 DBA\_ROLE\_PRIVS

DBA\_ROLE\_PRIVS describes the roles granted to all users and roles in the database.

### Related View

USER\_ROLE\_PRIVS describes the roles granted to the current user.

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                  |
|-----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE         | VARCHAR2(128) |      | Name of the user or role receiving the grant                                                                                                                                                                                                 |
| GRANTED_ROLE    | VARCHAR2(128) |      | Granted role name                                                                                                                                                                                                                            |
| ADMIN_OPTION    | VARCHAR2(3)   |      | Indicates whether the grant was with the ADMIN OPTION (YES) or not (NO)                                                                                                                                                                      |
| DELEGATE_OPTION | VARCHAR2(3)   |      | Indicates whether the grant was with the DELEGATE OPTION (YES) or not (NO)                                                                                                                                                                   |
| DEFAULT_ROLE    | VARCHAR2(3)   |      | Indicates whether the role is designated as a DEFAULT ROLE for the user (YES) or not (NO)                                                                                                                                                    |
| COMMON          | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the role was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the role was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED       | VARCHAR2(3)   |      | Indicates whether the role grant was inherited from another container (YES) or not (NO)                                                                                                                                                      |

## 6.294 DBA\_ROLES

DBA\_ROLES describes all roles in the database.

| Column            | Datatype      | NULL     | Description                                                          |
|-------------------|---------------|----------|----------------------------------------------------------------------|
| ROLE              | VARCHAR2(128) | NOT NULL | Name of the role                                                     |
| ROLE_ID           | NUMBER        | NOT NULL | ID number of the role                                                |
| PASSWORD_REQUIRED | VARCHAR2(8)   |          | This column is deprecated in favor of the AUTHENTICATION_TYPE column |

| Column              | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTHENTICATION_TYPE | VARCHAR2(11)   |      | Indicates the authentication mechanism for the role: <ul style="list-style-type: none"> <li>NONE - CREATE ROLE <i>role1</i>;</li> <li>EXTERNAL - CREATE ROLE <i>role2</i> IDENTIFIED EXTERNALLY;</li> <li>GLOBAL - CREATE ROLE <i>role3</i> IDENTIFIED GLOBALLY;</li> <li>APPLICATION - CREATE ROLE <i>role4</i> IDENTIFIED USING <i>schema.package</i>;</li> <li>PASSWORD - CREATE ROLE <i>role5</i> IDENTIFIED BY <i>role5</i>;</li> </ul> |
| COMMON              | VARCHAR2(3)    |      | Indicates whether a given role is common. Possible values: <ul style="list-style-type: none"> <li>YES if the role is common</li> <li>NO if the role is local (not common)</li> </ul>                                                                                                                                                                                                                                                         |
| ORACLE_MAINTAINED   | VARCHAR2(1)    |      | Denotes whether the role was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A role for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.                                                                                                                                                                                           |
| INHERITED           | VARCHAR2(3)    |      | Indicates whether the role was inherited from another container (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                            |
| IMPLICIT            | VARCHAR2(3)    |      | Indicates whether the role is a common role created by an implicit application (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                             |
| EXTERNAL_NAME       | VARCHAR2(4000) |      | For a global role, the external name refers to the DN of a group from a directory service that is mapped to the global role. This is not applicable to a local role.                                                                                                                                                                                                                                                                         |

## 6.295 DBA\_ROLLBACK\_SEGS

DBA\_ROLLBACK\_SEGS describes rollback segments.

| Column          | Datatype     | NULL     | Description                                                                                          |
|-----------------|--------------|----------|------------------------------------------------------------------------------------------------------|
| SEGMENT_NAME    | VARCHAR2(30) | NOT NULL | Name of the rollback segment                                                                         |
| OWNER           | VARCHAR2(6)  |          | Owner of the rollback segment: <ul style="list-style-type: none"> <li>PUBLIC</li> <li>SYS</li> </ul> |
| TABLESPACE_NAME | VARCHAR2(30) | NOT NULL | Name of the tablespace containing the rollback segment                                               |
| SEGMENT_ID      | NUMBER       | NOT NULL | ID number of the rollback segment                                                                    |
| FILE_ID         | NUMBER       | NOT NULL | Absolute file number of the data file containing the segment header                                  |
| BLOCK_ID        | NUMBER       | NOT NULL | ID number of the block containing the segment header                                                 |
| INITIAL_EXTENT  | NUMBER       |          | Initial extent size in bytes                                                                         |
| NEXT_EXTENT     | NUMBER       |          | Secondary extent size in bytes                                                                       |
| MIN_EXTENTS     | NUMBER       | NOT NULL | Minimum number of extents                                                                            |
| MAX_EXTENTS     | NUMBER       | NOT NULL | Maximum number of extent                                                                             |
| PCT_INCREASE    | NUMBER       |          | Percent increase for extent size                                                                     |

| Column       | Datatype     | NULL     | Description                                                                                                                                                                       |
|--------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS       | VARCHAR2(16) |          | Rollback segment status: <ul style="list-style-type: none"> <li>• OFFLINE</li> <li>• ONLINE</li> <li>• NEEDS RECOVERY</li> <li>• PARTLY AVAILABLE</li> <li>• UNDEFINED</li> </ul> |
| INSTANCE_NUM | VARCHAR2(40) |          | Rollback segment owning Oracle Real Application Clusters instance number                                                                                                          |
| RELATIVE_FNO | NUMBER       | NOT NULL | Relative file number of the segment header                                                                                                                                        |

## 6.296 DBA\_ROLLING\_DATABASES

DBA\_ROLLING\_DATABASES lists all the databases eligible for configuration with rolling operations.

| Column          | Datatype      | NULL | Description                                                                                 |
|-----------------|---------------|------|---------------------------------------------------------------------------------------------|
| RDBID           | NUMBER        |      | Rolling operation database identifier                                                       |
| DBID            | NUMBER        |      | Oracle database identifier                                                                  |
| DBUN            | VARCHAR2(128) |      | Database unique name                                                                        |
| ROLE            | VARCHAR2(8)   |      | Database role                                                                               |
| OPEN_MODE       | VARCHAR2(15)  |      | Open mode information                                                                       |
| PARTICIPANT     | VARCHAR2(3)   |      | Indicates whether the database is participating in the rolling operation (YES) or not (NO)  |
| VERSION         | VARCHAR2(128) |      | RDBMS version number                                                                        |
| ENGINE_STATUS   | VARCHAR2(14)  |      | Running status of the MRP-recovery or LSP-apply process                                     |
| RAC             | VARCHAR2(3)   |      | Indicates whether the database is an Oracle Real Application Clusters (Oracle RAC) database |
| UPDATE_PROGRESS | VARCHAR2(11)  |      | Upgrade status of the system catalog                                                        |
| PROD_RSCN       | VARCHAR(40)   |      | Resetlogs SCN at which redo is currently being produced                                     |
| PROD_RID        | VARCHAR(40)   |      | Resetlogs ID at which redo is currently being produced                                      |
| PROD_SCN        | VARCHAR(40)   |      | Last SCN at which redo was produced                                                         |
| REDO_SOURCE     | VARCHAR2(128) |      | Database unique name of the producer of redo being consumed                                 |
| CONS_RSCN       | VARCHAR(40)   |      | Resetlogs SCN at which redo is currently being consumed                                     |
| CONS_RID        | VARCHAR(40)   |      | Resetlogs ID at which redo is currently being consumed                                      |
| CONS_SCN        | VARCHAR(40)   |      | Last SCN at which redo was consumed                                                         |
| UPDATE_TIME     | TIMESTAMP(6)  |      | Time of the last record update                                                              |

## 6.297 DBA\_ROLLING\_EVENTS

DBA\_ROLLING\_EVENTS lists all the events reported from the DBMS\_ROLLING PL/SQL package.

| Column     | Datatype      | NULL | Description                                    |
|------------|---------------|------|------------------------------------------------|
| EVENTID    | NUMBER        |      | Event identifier which identifies event order  |
| EVENT_TIME | TIMESTAMP(6)  |      | Time associated with the event                 |
| TYPE       | VARCHAR2(7)   |      | Type of event: INFO, NOTICE, WARNING, or ERROR |
| MESSAGE    | VARCHAR2(256) |      | Text describing the event details              |
| STATUS     | NUMBER        |      | Status code associated with an event           |
| INSTID     | NUMBER        |      | Instruction ID associated with an event        |
| REVISION   | NUMBER        |      | Plan revision number associated with an event  |

## 6.298 DBA\_ROLLING\_PARAMETERS

DBA\_ROLLING\_PARAMETERS lists the available parameters of the DBMS\_ROLLING PL/SQL package.

| Column      | Datatype      | NULL | Description                                      |
|-------------|---------------|------|--------------------------------------------------|
| SCOPE       | VARCHAR2(128) |      | Database unique name associated with a parameter |
| TYPE        | VARCHAR2(7)   |      | Type of parameter                                |
| NAME        | VARCHAR2(32)  |      | Name of the parameter                            |
| DESCRIPTION | VARCHAR2(256) |      | Description of the parameter                     |
| CURVAL      | VARCHAR2(256) |      | Current value of the parameter                   |
| LSTVAL      | VARCHAR2(256) |      | Prior value of the parameter                     |
| DEFVAL      | VARCHAR2(256) |      | Default value of the parameter                   |
| MINVAL      | NUMBER        |      | Minimum value of the parameter                   |
| MAXVAL      | NUMBER        |      | Maximum value of the parameter                   |

## 6.299 DBA\_ROLLING\_PLAN

DBA\_ROLLING\_PLAN displays the instructions which constitute the active upgrade plan.

Each row in DBA\_ROLLING\_PLAN identifies a specific instruction scheduled to execute at a specific database. Instructions are created as a result of successful calls to the DBMS\_ROLLING.BUILD\_PLAN procedure.

During execution, groups of instructions are scheduled in batches to execute at remote databases. Groups of instructions are guaranteed to complete in BATCHID order.

| Column      | Datatype      | NULL | Description                                                         |
|-------------|---------------|------|---------------------------------------------------------------------|
| REVISION    | NUMBER        |      | Plan revision number associated with an instruction                 |
| BATCHID     | NUMBER        |      | Identifier for a batch of instructions which are requested together |
| INSTID      | NUMBER        |      | Identifier for a single instruction                                 |
| SOURCE      | VARCHAR2(128) |      | Database unique name where an instruction executes                  |
| TARGET      | VARCHAR2(128) |      | The site where a given instruction will execute                     |
| PHASE       | VARCHAR2(14)  |      | rolling operation phase in which an instruction executes            |
| STATUS      | VARCHAR2(7)   |      | Scheduling status of the instruction                                |
| PROGRESS    | VARCHAR2(10)  |      | Execution progress of the instruction                               |
| DESCRIPTION | VARCHAR2(256) |      | Description of the instruction                                      |
| EXEC_STATUS | NUMBER        |      | Status code returned from instruction execution                     |
| EXEC_INFO   | VARCHAR2(256) |      | Supplemental information obtained during instruction execution      |
| EXEC_TIME   | TIMESTAMP(6)  |      | Time of instruction execution                                       |
| FINISH_TIME | TIMESTAMP(6)  |      | Time of instruction completion                                      |

## 6.300 DBA\_ROLLING\_STATISTICS

DBA\_ROLLING\_STATISTICS provides a list of rolling operation statistics.

| Column      | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2(256) |      | Name of the statistic. Possible values: <ul style="list-style-type: none"> <li>• DBMS_ROLLING execution time</li> <li>• logical to primary switchover finish time</li> <li>• primary services offline for</li> <li>• primary to logical switchover start time</li> <li>• rolling upgrade finish time</li> <li>• rolling upgrade start time</li> <li>• time for former primary to fully recover upgrade redo</li> <li>• time for former primary to start upgrade redo recovery</li> <li>• total time former primary in physical role</li> <li>• transient logical creation finish time</li> <li>• transient logical creation start time</li> <li>• transient logical protection finish time</li> <li>• transient logical protection start time</li> <li>• user upgrade time</li> </ul> |
| VALUE       | VARCHAR2(256) |      | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| UPDATE_TIME | TIMESTAMP(6)  |      | Time of last update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 6.301 DBA\_ROLLING\_STATUS

DBA\_ROLLING\_STATUS displays the overall status of the rolling operation.

| Column                 | Datatype     | NULL | Description                                                           |
|------------------------|--------------|------|-----------------------------------------------------------------------|
| REVISION               | NUMBER       |      | Revision number of the current upgrade plan                           |
| STATUS                 | VARCHAR2(12) |      | Readiness of the facility to begin or resume the rolling operation    |
| PHASE                  | VARCHAR2(14) |      | Current phase of the plan                                             |
| NEXT_INSTRUCTION       | NUMBER       |      | Instruction ID of the next pending instruction                        |
| REMAINING_INSTRUCTIONS | NUMBER       |      | Number of remaining instructions to execute in the plan               |
| COORDINATOR_INSTANCE   | NUMBER       |      | Instance number from which the rolling operation is being coordinated |
| COORDINATOR_PID        | NUMBER       |      | Process PID in which the rolling operation is being coordinated       |

| Column                  | Datatype      | NULL | Description                                                                |
|-------------------------|---------------|------|----------------------------------------------------------------------------|
| ORIGINAL_PRIMARY        | VARCHAR2(128) |      | Database unique name of the original primary                               |
| FUTURE_PRIMARY          | VARCHAR2(128) |      | Database unique name of the future primary                                 |
| TOTAL_DATABASES         | NUMBER        |      | Number of total databases eligible to participate in the rolling operation |
| PARTICIPATING_DATABASES | NUMBER        |      | Number of databases configured to participate in the rolling operation     |
| INIT_TIME               | TIMESTAMP(6)  |      | Time of the last call to DBMS_ROLLING.INIT_PLAN                            |
| BUILD_TIME              | TIMESTAMP(6)  |      | Time of the last call to DBMS_ROLLING.BUILD                                |
| START_TIME              | TIMESTAMP(6)  |      | Time of the last call to DBMS_ROLLING.START_UPGRADE                        |
| SWITCH_TIME             | TIMESTAMP(6)  |      | Time of the last call to DBMS_ROLLING.SWITCHOVER                           |
| FINISH_TIME             | TIMESTAMP(6)  |      | Time of the last call to DBMS_ROLLING.FINISH                               |

## 6.302 DBA\_ROLLING\_SUPPORT\_MODE

DBA\_ROLLING\_SUPPORT\_MODE displays information about whether tables in the database are supported for rolling upgrades performed using the DBMS\_ROLLING package.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER        | VARCHAR2(128) |      | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TABLE_NAME   | VARCHAR2(128) |      | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SUPPORT_MODE | VARCHAR2(11)  |      | Indicates whether the table is supported<br>Possible values: <ul style="list-style-type: none"> <li>• SUPPORTED - The table is fully supported</li> <li>• INTERNAL - The table is not supported because it contains data that should not be replicated. Such tables include mapping tables for index-organized tables, storage tables for nested tables, materialized view logs, secondary objects associated with domain indexes, and temporary tables.</li> <li>• UNSUPPORTED - The table is not supported because it contains a data type that is not supported or uses a feature that is not supported</li> </ul> |

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                   |
|-------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPLANATION | VARCHAR2(4000) |      | Reason why the table is not fully supported<br>This column is populated only when both of the following conditions are met: <ul style="list-style-type: none"> <li>The value of the COMPATIBLE initialization parameter is 20.0 or higher</li> <li>The value of the SUPPORT_MODE column is INTERNAL or UNSUPPORTED</li> </ul> |

**Note**

This view is available starting with Oracle Database 21c.

## 6.303 DBA\_ROLLING\_UNSUPPORTED

DBA\_ROLLING\_UNSUPPORTED displays the schemas, tables, and columns in those tables that contain unsupported data types for a rolling upgrade operation for a logical standby database using the DBMS\_ROLLING PL/SQL package.

Use this view before you perform a rolling upgrade using DBMS\_ROLLING to determine what is unsupported.

The data pertains to the container in which the view is queried.

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                                |
|-------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2(128)  |      | Schema name of the unsupported column                                                                                                                                                                                                                      |
| TABLE_NAME  | VARCHAR2(128)  |      | Name of the table that the unsupported column belongs to                                                                                                                                                                                                   |
| COLUMN_NAME | VARCHAR2(128)  |      | Name of the unsupported column                                                                                                                                                                                                                             |
| ATTRIBUTES  | VARCHAR2(4000) |      | When the value of the COMPATIBLE initialization parameter is 20.0 or higher, this column displays the reason the table is unsupported.<br>Otherwise, this column displays the reason the table is unsupported only if the reason is not a data type issue. |
| DATA_TYPE   | VARCHAR2(106)  |      | Data type of the unsupported column                                                                                                                                                                                                                        |

**Note**

When the value of the COMPATIBLE initialization parameter is 20.0 or higher, this view displays all columns in unsupported tables. Otherwise, this view displays only the unsupported columns in unsupported tables.

**Note**

A rolling upgrade using DBMS\_ROLLING supports more object types than a manual rolling upgrade using transient logical standby databases

## 6.304 DBA\_RSRC\_CATEGORIES

DBA\_RSRC\_CATEGORIES displays all resource consumer group categories.

| Column    | Datatype       | NULL | Description                                                                                       |
|-----------|----------------|------|---------------------------------------------------------------------------------------------------|
| NAME      | VARCHAR2(128)  |      | Name of the consumer group category                                                               |
| COMMENTS  | VARCHAR2(2000) |      | Text comment on the consumer group category                                                       |
| STATUS    | VARCHAR2(128)  |      | Indicates whether the consumer group category is part of the pending area (PENDING) or not (NULL) |
| MANDATORY | VARCHAR2(3)    |      | Indicates whether the consumer group category is mandatory (YES) or not (NO)                      |

## 6.305 DBA\_RSRC\_CONSUMER\_GROUP\_PRIVS

DBA\_RSRC\_CONSUMER\_GROUP\_PRIVS displays information about all resource consumer groups and the users and roles assigned to them.

The grant referred to in this view and the related view is the grant of the SWITCH\_CONSUMER\_GROUP object privilege, which is granted using the DBMS\_RESOURCE\_MANAGER\_PRIVS package. This privilege is not granted through the GRANT SQL statement.

**Related View**

USER\_RSRC\_CONSUMER\_GROUP\_PRIVS displays information about the resource consumer groups to which the current user is assigned. This view does not display the GRANTEE column.

| Column  | Datatype      | NULL     | Description                      |
|---------|---------------|----------|----------------------------------|
| GRANTEE | VARCHAR2(128) | NOT NULL | User or role receiving the grant |

| Column        | Datatype      | NULL | Description                                                                                               |
|---------------|---------------|------|-----------------------------------------------------------------------------------------------------------|
| GRANTED_GROUP | VARCHAR2(128) |      | Granted consumer group name                                                                               |
| GRANT_OPTION  | VARCHAR2(3)   |      | Indicates whether the grant was with the GRANT option (YES) or not (NO)                                   |
| INITIAL_GROUP | VARCHAR2(3)   |      | Indicates whether the consumer group is designated as the default for this user or role (YES) or not (NO) |

## 6.306 DBA\_RSRC\_CONSUMER\_GROUPS

DBA\_RSRC\_CONSUMER\_GROUPS displays information about all resource consumer groups in the database.

| Column            | Datatype       | NULL     | Description                                                                              |
|-------------------|----------------|----------|------------------------------------------------------------------------------------------|
| CONSUMER_GROUP_ID | NUMBER         | NOT NULL | ID of the consumer group                                                                 |
| CONSUMER_GROUP    | VARCHAR2(128)  |          | Name of the consumer group                                                               |
| CPU_METHOD        | VARCHAR2(128)  |          | CPU resource allocation method for the consumer group                                    |
| MGMT_METHOD       | VARCHAR2(128)  |          | Resource allocation method for the consumer group                                        |
| INTERNAL_USE      | VARCHAR2(3)    |          | Indicates whether the consumer group is for internal use only (YES) or not (NO)          |
| COMMENTS          | VARCHAR2(2000) |          | Text comment on the consumer group                                                       |
| CATEGORY          | VARCHAR2(128)  |          | Category of the consumer group                                                           |
| STATUS            | VARCHAR2(128)  |          | Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL) |
| MANDATORY         | VARCHAR2(3)    |          | Indicates whether the consumer group is mandatory (YES) or not (NO)                      |

## 6.307 DBA\_RSRC\_GROUP\_MAPPINGS

DBA\_RSRC\_GROUP\_MAPPINGS displays the mapping between session attributes and consumer groups in the database.

| Column         | Datatype      | NULL | Description                |
|----------------|---------------|------|----------------------------|
| ATTRIBUTE      | VARCHAR2(128) |      | Session attribute to match |
| VALUE          | VARCHAR2(128) |      | Attribute value            |
| CONSUMER_GROUP | VARCHAR2(128) |      | Target consumer group name |

| Column | Datatype      | NULL | Description                                                                              |
|--------|---------------|------|------------------------------------------------------------------------------------------|
| STATUS | VARCHAR2(128) |      | Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL) |

## 6.308 DBA\_RSRC\_IO\_CALIBRATE

DBA\_RSRC\_IO\_CALIBRATE displays I/O calibration results for the latest calibration run.

| Column             | Datatype       | NULL | Description                                                                                  |
|--------------------|----------------|------|----------------------------------------------------------------------------------------------|
| START_TIME         | TIMESTAMP(6)   |      | Start time of the most recent I/O calibration                                                |
| END_TIME           | TIMESTAMP(6)   |      | End time of the most recent I/O calibration                                                  |
| MAX_IOPS           | NUMBER         |      | Maximum number of data block read requests that can be sustained per second                  |
| MAX_MBPS           | NUMBER         |      | Maximum megabytes per second of maximum-sized read requests that can be sustained            |
| MAX_PMBPS          | NUMBER         |      | Maximum megabytes per second of large I/O requests that can be sustained by a single process |
| LATENCY            | NUMBER         |      | Latency for data block read requests                                                         |
| NUM_PHYSICAL_DISKS | NUMBER         |      | Number of physical disks in the storage subsystem (as specified by the user)                 |
| ADDITIONAL_INFO    | VARCHAR2(1024) |      | Additional information about the most recent calibration run                                 |

## 6.309 DBA\_RSRC\_MANAGER\_SYSTEM\_PRIVS

DBA\_RSRC\_MANAGER\_SYSTEM\_PRIVS displays information about all the users and roles that have been granted the ADMINISTER\_RESOURCE\_MANAGER system privilege, which is granted using the DBMS\_RESOURCE\_MANAGER\_PRIVS package.

This privilege is not granted through the GRANT SQL statement.

### Related View

USER\_RSRC\_MANAGER\_SYSTEM\_PRIVS displays information about the users who are granted system privileges for the DBMS\_RESOURCE\_MANAGER package. This view does not display the GRANTEE column.

| Column       | Datatype      | NULL     | Description                                                             |
|--------------|---------------|----------|-------------------------------------------------------------------------|
| GRANTEE      | VARCHAR2(128) | NOT NULL | User or role receiving the grant                                        |
| PRIVILEGE    | VARCHAR2(40)  | NOT NULL | Name of the system privilege                                            |
| ADMIN_OPTION | VARCHAR2(3)   |          | Indicates whether the grant was with the ADMIN option (YES) or not (NO) |

## 6.310 DBA\_RSRC\_MAPPING\_PRIORITY

DBA\_RSRC\_MAPPING\_PRIORITY displays information about all consumer group mapping attribute priorities.

| Column    | Datatype      | NULL | Description                                                                              |
|-----------|---------------|------|------------------------------------------------------------------------------------------|
| ATTRIBUTE | VARCHAR2(128) |      | Session attribute                                                                        |
| PRIORITY  | NUMBER        |      | Priority (1 is the highest)                                                              |
| STATUS    | VARCHAR2(128) |      | Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL) |

## 6.311 DBA\_RSRC\_PLAN\_DIRECTIVES

DBA\_RSRC\_PLAN\_DIRECTIVES displays information about all resource plan directives in the database.

| Column           | Datatype      | NULL | Description                                                                                     |
|------------------|---------------|------|-------------------------------------------------------------------------------------------------|
| PLAN             | VARCHAR2(128) |      | Name of the plan to which the directive belongs                                                 |
| GROUP_OR_SUBPLAN | VARCHAR2(128) |      | Name of the consumer group or subplan referred to                                               |
| TYPE             | VARCHAR2(14)  |      | Indicates whether GROUP_OR_SUBPLAN refers to a consumer group (CONSUMER_GROUP) or a plan (PLAN) |
| CPU_P1           | NUMBER        |      | This column is deprecated. Use the MGMT_P1 column instead.                                      |
| CPU_P2           | NUMBER        |      | This column is deprecated. Use the MGMT_P2 column instead.                                      |
| CPU_P3           | NUMBER        |      | This column is deprecated. Use the MGMT_P3 column instead.                                      |
| CPU_P4           | NUMBER        |      | This column is deprecated. Use the MGMT_P4 column instead.                                      |
| CPU_P5           | NUMBER        |      | This column is deprecated. Use the MGMT_P5 column instead.                                      |
| CPU_P6           | NUMBER        |      | This column is deprecated. Use the MGMT_P6 column instead.                                      |
| CPU_P7           | NUMBER        |      | This column is deprecated. Use the MGMT_P7 column instead.                                      |
| CPU_P8           | NUMBER        |      | This column is deprecated. Use the MGMT_P8 column instead.                                      |
| MGMT_P1          | NUMBER        |      | Resource allocation at level 1. For share-based plans, indicates the number of shares.          |

| Column                     | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                  |
|----------------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MGMT_P2                    | NUMBER        |      | Resource allocation at level 2.                                                                                                                                                                                                                                                                                              |
| MGMT_P3                    | NUMBER        |      | Resource allocation at level 3.                                                                                                                                                                                                                                                                                              |
| MGMT_P4                    | NUMBER        |      | Resource allocation at level 4.                                                                                                                                                                                                                                                                                              |
| MGMT_P5                    | NUMBER        |      | Resource allocation at level 5.                                                                                                                                                                                                                                                                                              |
| MGMT_P6                    | NUMBER        |      | Resource allocation at level 6.                                                                                                                                                                                                                                                                                              |
| MGMT_P7                    | NUMBER        |      | Resource allocation at level 7.                                                                                                                                                                                                                                                                                              |
| MGMT_P8                    | NUMBER        |      | Resource allocation at level 8.                                                                                                                                                                                                                                                                                              |
| ACTIVE_SESS_POOL_P1        | NUMBER        |      | Maximum number of calls this consumer group can run concurrently                                                                                                                                                                                                                                                             |
| QUEUEING_P1                | NUMBER        |      | Timeout in seconds for waits in the Active Session Limit queue                                                                                                                                                                                                                                                               |
| PARALLEL_TARGET_PERCENTAGE | NUMBER        |      | This column is deprecated. Use the PARALLEL_SERVER_LIMIT column instead.                                                                                                                                                                                                                                                     |
| PARALLEL_DEGREE_LIMIT_P1   | NUMBER        |      | Sessions in this consumer group are limited to this maximum degree of parallelism for all parallel operations                                                                                                                                                                                                                |
| SWITCH_GROUP               | VARCHAR2(128) |      | Group to switch to once the switch time is reached                                                                                                                                                                                                                                                                           |
| SWITCH_FOR_CALL            | VARCHAR2(5)   |      | Indicates whether to switch back to the initial consumer group once the top call has completed (TRUE) or not (FALSE)                                                                                                                                                                                                         |
| SWITCH_TIME                | NUMBER        |      | Amount of run time (in seconds) within a group before the session is automatically switched. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the run time is accumulated from the start of a call. Otherwise, the run time is accumulated for the length of the session.                                        |
| SWITCH_IO_MEGABYTES        | NUMBER        |      | The maximum megabytes of I/O within a group that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the maximum megabytes of I/O is accumulated from the start of a call. Otherwise, the maximum megabytes of I/O is accumulated for the length of the session. |
| SWITCH_IO_REQS             | NUMBER        |      | The maximum I/O requests within a group that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the maximum I/O requests is accumulated from the start of a call. Otherwise, the maximum I/O requests is accumulated for the length of the session.             |
| SWITCH_ESTIMATE            | VARCHAR2(5)   |      | Indicates whether estimated execution time should be used for switch criteria (TRUE) or not (FALSE)                                                                                                                                                                                                                          |
| MAX_EST_EXEC_TIME          | NUMBER        |      | Maximum estimated execution time                                                                                                                                                                                                                                                                                             |
| UNDO_POOL                  | NUMBER        |      | Undo pool size for the consumer group                                                                                                                                                                                                                                                                                        |
| MAX_IDLE_TIME              | NUMBER        |      | Maximum idle time for the session                                                                                                                                                                                                                                                                                            |
| MAX_IDLE_BLOCKER_TIME      | NUMBER        |      | Maximum idle time for the session when blocking other sessions                                                                                                                                                                                                                                                               |
| MAX_UTILIZATION_LIMIT      | NUMBER        |      | This column is deprecated. Use UTILIZATION_LIMIT instead.                                                                                                                                                                                                                                                                    |

| Column                 | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|--------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARALLEL_QUEUE_TIMEOUT | NUMBER       |      | Time (in seconds) that a query can remain in the parallel statement queue for the consumer group before it is removed from the queue.<br><br>The PQ_TIMEOUT_ACTION directive in a Resource Manager plan can be used in conjunction with the PARALLEL_QUEUE_TIMEOUT directive to either cancel or run the removed query. If the PQ_TIMEOUT_ACTION directive is not specified, the default behavior is to cancel the query with ORA-07454.                                                                                                                                                                                           |
| SWITCH_TIME_IN_CALL    | NUMBER       |      | This column is deprecated. Specify the time in the SWITCH_TIME directive and set SWITCH_FOR_CALL to TRUE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SWITCH_IO_LOGICAL      | NUMBER       |      | The number of logical I/Os that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the number of logical I/Os is accumulated from the start of a call. Otherwise, the number of logical I/Os is accumulated for the length of the session.                                                                                                                                                                                                                                                                                                                            |
| SWITCH_ELAPSED_TIME    | NUMBER       |      | The elapsed time that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.                                                                                                                                                                                                                                                                                                                                                          |
| PARALLEL_SERVER_LIMIT  | NUMBER       |      | Maximum percentage of the parallel target used before queuing subsequent parallel queries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| UTILIZATION_LIMIT      | NUMBER       |      | Maximum resource utilization allowed, expressed in percentage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARALLEL_STMT_CRITICAL | VARCHAR2(12) |      | Indicates whether parallel statements from this consumer group are eligible for queuing in the parallel statement queue: <ul style="list-style-type: none"> <li>• BYPASS_QUEUE - Parallel statements in this consumer group are critical and should never be queued.</li> <li>• QUEUE - All parallel statements in this consumer group, irrespective of the PARALLEL_DEGREE_POLICY initialization parameter value, are eligible for being queued.</li> <li>• FALSE - Certain parallel statements are eligible for queuing, depending on the PARALLEL_DEGREE_POLICY initialization parameter value. This is the default.</li> </ul> |
| SESSION_PGA_LIMIT      | NUMBER       |      | The maximum amount of untunable PGA in MB that sessions in this consumer group can allocate before being terminated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PQ_TIMEOUT_ACTION      | VARCHAR2(6)  |      | Indicates the action to be taken on a parallel query in the parallel queue when its queue time exceeds the limit set by the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT directive: <ul style="list-style-type: none"> <li>• CANCEL - The statement terminates with error ORA-07454</li> <li>• RUN - The statement runs immediately, and may get downgraded if parallel servers are unavailable</li> </ul>                                                                                                                                                                                                                       |

| Column    | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMENTS  | VARCHAR2(2000) |      | Text comment on the plan directive                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| STATUS    | VARCHAR2(128)  |      | Indicates whether the plan directive is part of the pending area (PENDING) or not (NULL).<br><br><b>Note:</b> PDB resource plans must be single-level, they cannot contain subplans, and they must have 8 or fewer consumer groups. If a resource plan is imported into a PDB and it violates any of these PDB requirements, then the import will automatically convert the resource plan to a compliant version. The original, unmodified resource plan will be stored with a STATUS of LEGACY. |
| MANDATORY | VARCHAR2(3)    |      | Indicates whether the plan directive is mandatory (YES) or not (NO). Mandatory plans cannot be deleted.                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.312 DBA\_RSRC\_PLANS

DBA\_RSRC\_PLANS displays information about all resource plans in the database.

For a list of currently active plans, see "[V\\$RSRC\\_PLAN](#)".

| Column                    | Datatype       | NULL     | Description                                                                    |
|---------------------------|----------------|----------|--------------------------------------------------------------------------------|
| PLAN_ID                   | NUMBER         | NOT NULL | ID number of the resource plan                                                 |
| PLAN                      | VARCHAR2(128)  |          | Name of the resource plan                                                      |
| NUM_PLAN_DIRECTIVES       | NUMBER         |          | Number of plan directives for the plan                                         |
| CPU_METHOD                | VARCHAR2(128)  |          | CPU resource allocation method for the plan                                    |
| MGMT_METHOD               | VARCHAR2(128)  |          | Resource allocation method for the plan                                        |
| ACTIVE_SESS_POOL_MTH      | VARCHAR2(128)  |          | Active session pool resource allocation method for the plan                    |
| PARALLEL_DEGREE_LIMIT_MTH | VARCHAR2(128)  |          | Parallel degree limit resource allocation method for the plan                  |
| QUEUING_MTH               | VARCHAR2(128)  |          | Queuing resource allocation method for the plan                                |
| SUB_PLAN                  | VARCHAR2(3)    |          | Indicates whether the plan is a subplan (YES) or not (NO)                      |
| COMMENTS                  | VARCHAR2(2000) |          | Text comment on the plan                                                       |
| STATUS                    | VARCHAR2(128)  |          | Indicates whether the plan is part of the pending area (PENDING) or not (NULL) |

| Column    | Datatype    | NULL | Description                                                                                   |
|-----------|-------------|------|-----------------------------------------------------------------------------------------------|
| MANDATORY | VARCHAR2(3) |      | Indicates whether the plan is mandatory (YES) or not (NO). Mandatory plans cannot be deleted. |

## 6.313 DBA\_RULE\_SET\_RULES

DBA\_RULE\_SET\_RULES describes the rules in all rule sets in the database. Its columns are the same as those in ALL\_RULE\_SET\_RULES.

#### ① See Also

["ALL\\_RULE\\_SET\\_RULES"](#)

## 6.314 DBA\_RULE\_SETS

DBA\_RULE\_SETS describes all rule sets in the database. Its columns are the same as those in ALL\_RULE\_SETS.

#### ① See Also

["ALL\\_RULE\\_SETS"](#)

## 6.315 DBA\_RULES

DBA\_RULES describes all rules in the database. Its columns are the same as those in ALL\_RULES.

#### ① See Also

["ALL\\_RULES"](#)

## 6.316 DBA\_SCHEDULER\_CHAIN\_RULES

DBA\_SCHEDULER\_CHAIN\_RULES displays information about the rules for all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAIN\_RULES.

### ① See Also

["ALL\\_SCHEDULER\\_CHAIN\\_RULES"](#)

## 6.317 DBA\_SCHEDULER\_CHAIN\_STEPS

DBA\_SCHEDULER\_CHAIN\_STEPS displays information about the defined steps of all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAIN\_STEPS.

### ① See Also

["ALL\\_SCHEDULER\\_CHAIN\\_STEPS"](#)

## 6.318 DBA\_SCHEDULER\_CHAINS

DBA\_SCHEDULER\_CHAINS displays information about all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAINS.

### ① See Also

["ALL\\_SCHEDULER\\_CHAINS"](#)

## 6.319 DBA\_SCHEDULER\_CREDENTIALS

DBA\_SCHEDULER\_CREDENTIALS displays information about all credentials in the database. Its columns are the same as those in ALL\_SCHEDULER\_CREDENTIALS.

### ① Note

This view is deprecated in favor of the DBA\_CREDENTIALS view. Oracle recommends that you use DBA\_CREDENTIALS instead. DBA\_SCHEDULER\_CREDENTIALS is retained for backward compatibility only.

**① See Also**

- ["DBA\\_CREDENTIALS"](#)
- ["ALL\\_SCHEDULER\\_CREDENTIALS"](#)

## 6.320 DBA\_SCHEDULER\_DB\_DESTS

DBA\_SCHEDULER\_DB\_DESTS displays information about all destination objects in the database pointing to remote databases. Its columns are the same as those in ALL\_SCHEDULER\_DB\_DESTS.

**① See Also**

["ALL\\_SCHEDULER\\_DB\\_DESTS"](#)

## 6.321 DBA\_SCHEDULER\_DESTS

DBA\_SCHEDULER\_DESTS displays information about all destination objects for jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_DESTS.

**① See Also**

["ALL\\_SCHEDULER\\_DESTS"](#)

## 6.322 DBA\_SCHEDULER\_EXTERNAL\_DESTS

DBA\_SCHEDULER\_EXTERNAL\_DESTS displays information about all destination objects in the database pointing to remote agents. Its columns are the same as those in ALL\_SCHEDULER\_EXTERNAL\_DESTS.

**① See Also**

["ALL\\_SCHEDULER\\_EXTERNAL\\_DESTS"](#)

## 6.323 DBA\_SCHEDULER\_FILE\_WATCHERS

DBA\_SCHEDULER\_FILE\_WATCHERS displays information about all scheduler file watch requests in the database. Its columns are the same as those in ALL\_SCHEDULER\_FILE\_WATCHERS.

**① See Also**

["ALL\\_SCHEDULER\\_FILE\\_WATCHERS"](#)

## 6.324 DBA\_SCHEDULER\_GLOBAL\_ATTRIBUTE

DBA\_SCHEDULER\_GLOBAL\_ATTRIBUTE displays the values of all scheduler attributes in the database (for example, DEFAULT\_TIMEZONE and CURRENT\_OPEN\_WINDOW). Its columns are the same as those in ALL\_SCHEDULER\_GLOBAL\_ATTRIBUTE.

### ① See Also

["ALL\\_SCHEDULER\\_GLOBAL\\_ATTRIBUTE"](#)

## 6.325 DBA\_SCHEDULER\_GROUP\_MEMBERS

DBA\_SCHEDULER\_GROUP\_MEMBERS displays information about the members of all Scheduler object groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_GROUP\_MEMBERS.

### ① See Also

["ALL\\_SCHEDULER\\_GROUP\\_MEMBERS"](#)

## 6.326 DBA\_SCHEDULER\_GROUPS

DBA\_SCHEDULER\_GROUPS displays information about all Scheduler object groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_GROUPS.

### ① See Also

["ALL\\_SCHEDULER\\_GROUPS"](#)

## 6.327 DBA\_SCHEDULER\_INCOMPAT\_MEMBER

DBA\_SCHEDULER\_INCOMPAT\_MEMBER displays all Scheduler incompatibility resource objects members in the database. Its columns are the same as those in ALL\_SCHEDULER\_INCOMPAT\_MEMBER.

### ① See Also

["ALL\\_SCHEDULER\\_INCOMPAT\\_MEMBER"](#)

## 6.328 DBA\_SCHEDULER\_INCOMPATS

DBA\_SCHEDULER\_INCOMPATS displays all Scheduler incompatibility resource objects in the database. Its columns are the same as those in ALL\_SCHEDULER\_INCOMPATS.

### ① See Also

["ALL\\_SCHEDULER\\_INCOMPATS"](#)

## 6.329 DBA\_SCHEDULER\_JOB\_ARGS

DBA\_SCHEDULER\_JOB\_ARGS displays information about the arguments of all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_ARGS.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_ARGS"](#)

## 6.330 DBA\_SCHEDULER\_JOB\_CLASSES

DBA\_SCHEDULER\_JOB\_CLASSES displays information about all Scheduler job classes in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_CLASSES.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_CLASSES"](#)

## 6.331 DBA\_SCHEDULER\_JOB\_DESTS

DBA\_SCHEDULER\_JOB\_DESTS displays information about the state of all jobs in the database at each of their destinations. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_DESTS.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_DESTS"](#)

## 6.332 DBA\_SCHEDULER\_JOB\_LOG

DBA\_SCHEDULER\_JOB\_LOG displays log information for all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_LOG.

### See Also

["ALL\\_SCHEDULER\\_JOB\\_LOG"](#)

## 6.333 DBA\_SCHEDULER\_JOB\_ROLES

DBA\_SCHEDULER\_JOB\_ROLES displays information about all Scheduler jobs in the database by database role.

| Column         | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2(128)  | NOT NULL | Owner of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| JOB_NAME       | VARCHAR2(128)  | NOT NULL | Name of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| JOB_SUBNAME    | VARCHAR2(128)  |          | Subname of the Scheduler job (for a job running a chain step)                                                                                                                                                                                                                                                                                                                                                                                                                                |
| JOB_CREATOR    | VARCHAR2(128)  |          | Creator of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATABASE_ROLE  | VARCHAR2(16)   |          | Name of the database role                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| COMMENTS        | VARCHAR2(4000)              |      | Comments on the job                                                                                                                                                                                                                                                                |

## 6.334 DBA\_SCHEDULER\_JOB\_RUN\_DETAILS

DBA\_SCHEDULER\_JOB\_RUN\_DETAILS displays log run details for all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_RUN\_DETAILS.

### ① See Also

"[ALL\\_SCHEDULER\\_JOB\\_RUN\\_DETAILS](#)"

## 6.335 DBA\_SCHEDULER\_JOBS

DBA\_SCHEDULER\_JOBS displays information about all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOBS.

### ① See Also

"[ALL\\_SCHEDULER\\_JOBS](#)"

## 6.336 DBA\_SCHEDULER\_NOTIFICATIONS

DBA\_SCHEDULER\_NOTIFICATIONS displays information about the E-mail notifications for all jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_NOTIFICATIONS.

### ① See Also

["ALL\\_SCHEDULER\\_NOTIFICATIONS"](#)

## 6.337 DBA\_SCHEDULER\_PROGRAM\_ARGS

DBA\_SCHEDULER\_PROGRAM\_ARGS displays information about the arguments of all Scheduler programs in the database. Its columns are the same as those in ALL\_SCHEDULER\_PROGRAM\_ARGS.

### ① See Also

["ALL\\_SCHEDULER\\_PROGRAM\\_ARGS"](#)

## 6.338 DBA\_SCHEDULER\_PROGRAMS

DBA\_SCHEDULER\_PROGRAMS displays information about all Scheduler programs in the database. Its columns are the same as those in ALL\_SCHEDULER\_PROGRAMS.

### ① See Also

["ALL\\_SCHEDULER\\_PROGRAMS"](#)

## 6.339 DBA\_SCHEDULER\_REMOTE\_DATABASES

DBA\_SCHEDULER\_REMOTE\_DATABASES displays information about all remote databases that have been registered as sources and destinations for remote database jobs. Its columns are the same as those in ALL\_SCHEDULER\_REMOTE\_DATABASES.

### ① See Also

["ALL\\_SCHEDULER\\_REMOTE\\_DATABASES"](#)

## 6.340 DBA\_SCHEDULER\_REMOTE\_JOBSTATE

DBA\_SCHEDULER\_REMOTE\_JOBSTATE displays information about the state of all jobs at remote databases. Its columns are the same as those in ALL\_SCHEDULER\_REMOTE\_JOBSTATE.

### ① See Also

["ALL\\_SCHEDULER\\_REMOTE\\_JOBSTATE"](#)

## 6.341 DBA\_SCHEDULER\_RESOURCES

DBA\_SCHEDULER\_RESOURCES displays all scheduler resource objects in the database. Its columns are the same as those in ALL\_SCHEDULER\_RESOURCES.

### ① See Also

["ALL\\_SCHEDULER\\_RESOURCES"](#)

## 6.342 DBA\_SCHEDULER\_RSC\_CONSTRAINTS

DBA\_SCHEDULER\_RSC\_CONSTRAINTS lists all Oracle Scheduler resource constraint members in the database. Its columns are the same as those in ALL\_SCHEDULER\_RSC\_CONSTRAINTS.

### ① See Also

["ALL\\_SCHEDULER\\_RSC\\_CONSTRAINTS"](#)

## 6.343 DBA\_SCHEDULER\_RUNNING\_CHAINS

DBA\_SCHEDULER\_RUNNING\_CHAINS displays information about the chain steps of all running chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_RUNNING\_CHAINS.

### ① See Also

["ALL\\_SCHEDULER\\_RUNNING\\_CHAINS"](#)

## 6.344 DBA\_SCHEDULER\_RUNNING\_JOBS

DBA\_SCHEDULER\_RUNNING\_JOBS displays information about all running Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_RUNNING\_JOBS.

### ① See Also

["ALL\\_SCHEDULER\\_RUNNING\\_JOBS"](#)

## 6.345 DBA\_SCHEDULER\_SCHEDULES

DBA\_SCHEDULER\_SCHEDULES displays information about all Scheduler schedules in the database. Its columns are the same as those in ALL\_SCHEDULER\_SCHEDULES.

### ① See Also

["ALL\\_SCHEDULER\\_SCHEDULES"](#)

## 6.346 DBA\_SCHEDULER\_WINDOW\_DETAILS

DBA\_SCHEDULER\_WINDOW\_DETAILS displays log details for all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_DETAILS.

### ① See Also

["ALL\\_SCHEDULER\\_WINDOW\\_DETAILS"](#)

## 6.347 DBA\_SCHEDULER\_WINDOW\_GROUPS

DBA\_SCHEDULER\_WINDOW\_GROUPS displays information about all Scheduler window groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_GROUPS.

### ① See Also

["ALL\\_SCHEDULER\\_WINDOW\\_GROUPS"](#)

## 6.348 DBA\_SCHEDULER\_WINDOW\_LOG

DBA\_SCHEDULER\_WINDOW\_LOG displays log information for all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_LOG.

### ① See Also

["ALL\\_SCHEDULER\\_WINDOW\\_LOG"](#)

## 6.349 DBA\_SCHEDULER\_WINDOWS

DBA\_SCHEDULER\_WINDOWS displays information about all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOWS.

### ① See Also

["ALL\\_SCHEDULER\\_WINDOWS"](#)

## 6.350 DBA\_SCHEDULER\_WINGROUP\_MEMBERS

DBA\_SCHEDULER\_WINGROUP\_MEMBERS displays the members of all Scheduler window groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINGROUP\_MEMBERS.

### ① See Also

["ALL\\_SCHEDULER\\_WINGROUP\\_MEMBERS"](#)

## 6.351 DBA\_SEC\_RELEVANT\_COLS

DBA\_SEC\_RELEVANT\_COLS describes the security relevant columns of all security policies in the database. Its columns are the same as those in ALL\_SEC\_RELEVANT\_COLS.

### ① See Also

["ALL\\_SEC\\_RELEVANT\\_COLS"](#)

## 6.352 DBA\_SECONDARY\_OBJECTS

DBA\_SECONDARY\_OBJECTS provides information about all secondary objects that are associated with domain indexes in the database.

This view is only relevant in the context of domain indexes. Its columns are the same as those in "[ALL\\_SECONDARY\\_OBJECTS](#)".

## 6.353 DBA\_SEGMENTS

DBA\_SEGMENTS describes the storage allocated for all segments in the database.

### Related View

USER\_SEGMENTS describes the storage allocated for the segments owned by the current user's objects. This view does not display the OWNER, HEADER\_FILE, HEADER\_BLOCK, or RELATIVE\_FNO columns.

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2(128) |      | Username of the segment owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SEGMENT_NAME    | VARCHAR2(128) |      | Name, if any, of the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| SEGMENT_SUBTYPE | VARCHAR2(10)  |      | Subtype of LOB segment: SECUREFILE, ASSM, MSSM, and NULL                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TABLESPACE_NAME | VARCHAR2(30)  |      | Name of the tablespace containing the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HEADER_FILE     | NUMBER        |      | Absolute file number of the data file containing the segment header                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| HEADER_BLOCK    | NUMBER        |      | ID of the block containing the segment header                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BYTES           | NUMBER        |      | Size, in bytes, of the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column            | Datatype    | NULL | Description                                                                                                                                                                                                                                 |
|-------------------|-------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BLOCKS            | NUMBER      |      | Size, in Oracle blocks, of the segment                                                                                                                                                                                                      |
| EXTENTS           | NUMBER      |      | Number of extents allocated to the segment                                                                                                                                                                                                  |
| INITIAL_EXTENT    | NUMBER      |      | Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.)                                                      |
| NEXT_EXTENT       | NUMBER      |      | Size in bytes of the next extent to be allocated to the segment                                                                                                                                                                             |
| MIN_EXTENTS       | NUMBER      |      | Minimum number of extents allowed in the segment                                                                                                                                                                                            |
| MAX_EXTENTS       | NUMBER      |      | Maximum number of extents allowed in the segment                                                                                                                                                                                            |
| MAX_SIZE          | NUMBER      |      | Maximum number of blocks allowed in the segment                                                                                                                                                                                             |
| RETENTION         | VARCHAR2(7) |      | Retention option for SECUREFILE segment                                                                                                                                                                                                     |
| MINRETENTION      | NUMBER      |      | Minimum retention duration for SECUREFILE segment                                                                                                                                                                                           |
| PCT_INCREASE      | NUMBER      |      | Percent by which to increase the size of the next extent to be allocated                                                                                                                                                                    |
| FREELISTS         | NUMBER      |      | Number of process freelists allocated to this segment                                                                                                                                                                                       |
| FREELIST_GROUPS   | NUMBER      |      | Number of freelist groups allocated to this segment                                                                                                                                                                                         |
| RELATIVE_FNO      | NUMBER      |      | Relative file number of the segment header                                                                                                                                                                                                  |
| BUFFER_POOL       | VARCHAR2(7) |      | Buffer pool to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> </ul>                                                                                                   |
| FLASH_CACHE       | VARCHAR2(7) |      | Database Smart Flash Cache hint to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                     |
| CELL_FLASH_CACHE  | VARCHAR2(7) |      | Cell flash cache hint to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| INMEMORY          | VARCHAR2(8) |      | Indicates whether the In-Memory Column Store (IM column store) is enabled (ENABLED) or disabled (DISABLED) for this segment                                                                                                                 |
| INMEMORY_PRIORITY | VARCHAR2(8) |      | Indicates the priority for In-Memory Column Store (IM column store) population: <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> <li>• NULL</li> </ul>               |

| Column                   | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|--------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_DISTRIBUTE      | VARCHAR2(15) |      | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>AUTO</li> <li>BY ROWID RANGE</li> <li>BY PARTITION</li> <li>BY SUBPARTITION</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                  |
| INMEMORY_DUPLICATE       | VARCHAR2(13) |      | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> <li>NO DUPLICATE</li> <li>DUPLICATE</li> <li>DUPLICATE ALL</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION     | VARCHAR2(17) |      | Indicates the compression level for the IM column store: <ul style="list-style-type: none"> <li>NO MEMCOMPRESS</li> <li>FOR DML</li> <li>FOR QUERY [ LOW   HIGH ]</li> <li>FOR CAPACITY [ LOW   HIGH ]</li> <li>AUTO</li> <li>NULL</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| CELLMEMORY <sup>11</sup> | VARCHAR2(24) |      | The value for columnar compression in the storage cell flash cache. Possible values: <ul style="list-style-type: none"> <li>ENABLED: Oracle Exadata Storage will decide automatically whether to cache in columnar form</li> <li>DISABLED: Oracle Exadata Storage is prevented from caching in columnar form</li> <li>NO CACHECOMPRESS: Oracle Exadata Storage will cache in HCC format (no recompression)</li> <li>FOR QUERY: Oracle Exadata Storage will recompress and cache in INMEMORY query high format</li> <li>FOR CAPACITY: Oracle Exadata Storage will recompress and cache in INMEMORY capacity low format</li> </ul> |

<sup>11</sup> This column is intended for use with Oracle Exadata

## 6.354 DBA\_SEGMENTS\_OLD

DBA\_SEGMENTS\_OLD lists information about storage allocated for all database segments.

| Column       | Datatype      | NULL | Description                   |
|--------------|---------------|------|-------------------------------|
| OWNER        | VARCHAR2(128) |      | Username of the segment owner |
| SEGMENT_NAME | VARCHAR2(128) |      | Name, if any, of the segment  |

| Column          | Datatype      | NULL | Description                                                                                                                                                                            |
|-----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARTITION_NAME  | VARCHAR2(128) |      | Name of the partition                                                                                                                                                                  |
| SEGMENT_TYPE    | VARCHAR2(18)  |      | Type of segment: INDEX PARTITION, TABLE PARTITION, TABLE, CLUSTER, INDEX, ROLLBACK, DEFERRED ROLLBACK, TEMPORARY, CACHE, LOBSEGMENT and LOBINDEX                                       |
| TABLESPACE_NAME | VARCHAR2(30)  |      | Name of the tablespace containing the segment                                                                                                                                          |
| HEADER_FILE     | NUMBER        |      | ID of the file containing the segment header                                                                                                                                           |
| HEADER_BLOCK    | NUMBER        |      | ID of the block containing the segment header                                                                                                                                          |
| BYTES           | NUMBER        |      | Size, in bytes, of the segment                                                                                                                                                         |
| BLOCKS          | NUMBER        |      | Size, in Oracle blocks, of the segment                                                                                                                                                 |
| EXTENTS         | NUMBER        |      | Number of extents allocated to the segment                                                                                                                                             |
| INITIAL_EXTENT  | NUMBER        |      | Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.) |
| NEXT_EXTENT     | NUMBER        |      | Size in bytes of the next extent to be allocated to the segment                                                                                                                        |
| MIN_EXTENTS     | NUMBER        |      | Minimum number of extents allowed in the segment                                                                                                                                       |
| MAX_EXTENTS     | NUMBER        |      | Maximum number of extents allowed in the segment                                                                                                                                       |
| PCT_INCREASE    | NUMBER        |      | Percent by which to increase the size of the next extent to be allocated                                                                                                               |
| FREELISTS       | NUMBER        |      | Number of process freelists allocated to the segment                                                                                                                                   |
| FREELIST_GROUPS | NUMBER        |      | Number of freelist groups allocated to this segment                                                                                                                                    |
| RELATIVE_FNO    | NUMBER        |      | Relative file number of the segment header                                                                                                                                             |
| BUFFER_POOL     | VARCHAR2(7)   |      | Buffer pool for the object                                                                                                                                                             |

## 6.355 DBA\_SENSITIVE\_COLUMN\_TYPES

DBA\_SENSITIVE\_COLUMN\_TYPES describes sensitive column types in the database.

| Column       | Datatype       | NULL | Description                                                                                                                                         |
|--------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME         | VARCHAR2(128)  |      | The name of the sensitive column type                                                                                                               |
| USER_COMMENT | VARCHAR2(4000) |      | User comment on the sensitive column type                                                                                                           |
| SOURCE_NAME  | VARCHAR2(128)  |      | The name of the discovery source for the sensitive column type                                                                                      |
| SOURCE_TYPE  | VARCHAR2(3)    |      | The type of the discovery source: <ul style="list-style-type: none"> <li>• ADM: import from ADM</li> <li>• DB: added within the database</li> </ul> |

## 6.356 DBA\_SENSITIVE\_DATA

DBA\_SENSITIVE\_DATA describes the sensitive columns in the database.

| Column         | Datatype       | NULL     | Description                                                        |
|----------------|----------------|----------|--------------------------------------------------------------------|
| SENSITIVE#     | NUMBER         | NOT NULL | Dictionary ID for the sensitive data                               |
| SCHEMA_NAME    | VARCHAR2(128)  | NOT NULL | The schema containing the sensitive data                           |
| TABLE_NAME     | VARCHAR2(128)  | NOT NULL | The table containing the sensitive data                            |
| COLUMN_NAME    | VARCHAR2(128)  | NOT NULL | The name of the column identified as sensitive                     |
| SENSITIVE_TYPE | VARCHAR2(128)  |          | The sensitive column type of the data                              |
| SOURCE_NAME    | VARCHAR2(128)  |          | The name of the discovery source for the sensitive data            |
| USER_COMMENT   | VARCHAR2(4000) |          | User comment on the sensitive data                                 |
| TS             | TIMESTAMP(6)   |          | The time when the data was identified as sensitive in the database |

## 6.357 DBA\_SEQUENCES

DBA\_SEQUENCES describes all sequences in the database. Its columns are the same as those in ALL\_SEQUENCES.

### ① See Also

["ALL\\_SEQUENCES"](#)

## 6.358 DBA\_SERVER\_REGISTRY

DBA\_SERVER\_REGISTRY displays information about all server components in the database that are loaded into the component registry.

| Column       | Datatype      | NULL     | Description              |
|--------------|---------------|----------|--------------------------|
| COMP_ID      | VARCHAR2(30)  | NOT NULL | Component identifier     |
| COMP_NAME    | VARCHAR2(255) |          | Component name           |
| VERSION      | VARCHAR2(30)  |          | Component version loaded |
| VERSION_FULL | VARCHAR2(30)  |          | Component full version   |

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                      |
|---------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS        | VARCHAR2(11)   |          | Component status: <ul style="list-style-type: none"> <li>• INVALID</li> <li>• VALID</li> <li>• LOADING</li> <li>• LOADED</li> <li>• UPGRADING</li> <li>• UPGRADED</li> <li>• DOWNGRADING</li> <li>• DOWNGRADED</li> <li>• REMOVING</li> <li>• REMOVED</li> </ul> |
| MODIFIED      | VARCHAR2(20)   |          | Time when the component was last modified                                                                                                                                                                                                                        |
| CONTROL       | VARCHAR2(128)  | NOT NULL | User that created the component entry                                                                                                                                                                                                                            |
| SCHEMA        | VARCHAR2(128)  | NOT NULL | User that contains the objects for the component                                                                                                                                                                                                                 |
| PROCEDURE     | VARCHAR2(61)   |          | Validation procedure                                                                                                                                                                                                                                             |
| STARTUP       | VARCHAR2(8)    |          | Indicates whether the component requires a startup after the upgrade (REQUIRED) or not                                                                                                                                                                           |
| PARENT_ID     | VARCHAR2(30)   |          | Parent component identifier                                                                                                                                                                                                                                      |
| OTHER_SCHEMAS | VARCHAR2(4000) |          | A list of ancillary schema names associated with the component                                                                                                                                                                                                   |

## 6.359 DBA\_SERVICES

DBA\_SERVICES displays all services in the database. The view excludes rows marked for deletion. Its columns are the same as those in ALL\_SERVICES.

["ALL\\_SERVICES"](#)

## 6.360 DBA\_SODA\_COLLECTIONS

DBA\_SODA\_COLLECTIONS describes all Simple Oracle Document Access (SODA) collections in the database.

### Related View

USER\_SODA\_COLLECTIONS describes the SODA collections owned by the current user. This view does not display the OWNER column.

| Column      | Datatype       | NULL     | Description                                                                  |
|-------------|----------------|----------|------------------------------------------------------------------------------|
| URI_NAME    | NVARCHAR2(255) | NOT NULL | Collection name                                                              |
| OWNER       | VARCHAR2(128)  | NOT NULL | Owner of the collection                                                      |
| OBJECT_TYPE | VARCHAR2(10)   | NOT NULL | Indicates whether the collection is table-based (TABLE) or view-based (VIEW) |

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_SCHEMA   | VARCHAR2(128)  | NOT NULL | Name of the schema that includes the table or view on which the collection is based                                                                                                                                                                                                                                                                                                                                                        |
| OBJECT_NAME     | VARCHAR2(128)  | NOT NULL | Name of the table or view on which the collection is based                                                                                                                                                                                                                                                                                                                                                                                 |
| CREATED_ON      | TIMESTAMP(6)   | NOT NULL | Collection creation time                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CREATE_MODE     | VARCHAR2(10)   | NOT NULL | Creation mode. Possible values: <ul style="list-style-type: none"> <li>DDL: A new table was created at collection creation time</li> <li>MAP: The collection was created by mapping a preexisting table or view</li> </ul> <b>Note:</b> For view-based collections, the value of this column is always MAP. New views are not created for view-based collections. A view-based collection is always created by mapping a preexisting view. |
| JSON_DESCRIPTOR | VARCHAR2(4000) | NOT NULL | Collection metadata, expressed in JavaScript Object Notation (JSON)                                                                                                                                                                                                                                                                                                                                                                        |

### ① Note

The DBA\_SODA\_COLLECTIONS view is available only in Oracle Autonomous Database. However, the USER\_SODA\_COLLECTIONS view is available in on-premises Oracle databases and Oracle Autonomous Database.

## 6.361 DBA\_SOURCE

DBA\_SOURCE describes the text source of all stored objects in the database. Its columns are the same as those in ALL\_SOURCE.

### ① See Also

"[ALL\\_SOURCE](#)"

## 6.362 DBA\_SOURCE\_AE

DBA\_SOURCE\_AE describes the text source of all stored objects (across all editions) in the database. Its columns are the same as those in ALL\_SOURCE\_AE.

### See Also

["ALL\\_SOURCE\\_AE"](#)

## 6.363 DBA\_SQL\_MANAGEMENT\_CONFIG

DBA\_SQL\_MANAGEMENT\_CONFIG displays the configuration parameters of the SQL management base.

You must have the DBA role in order to change the configuration parameter values.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                  |
|-----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER_NAME  | VARCHAR2(128)  | NOT NULL | Name of the configuration parameter: <ul style="list-style-type: none"> <li>AUTO_CAPTURE_ACTION</li> <li>AUTO_CAPTURE_MODULE</li> <li>AUTO_CAPTURE_PARSING_SCHEMA_NAME</li> <li>AUTO_CAPTURE_SQL_TEXT</li> <li>PLAN_RETENTION_WEEKS</li> <li>SPACE_BUDGET_PERCENT</li> </ul> |
| PARAMETER_VALUE | VARCHAR2(4000) |          | Value of the configuration parameter                                                                                                                                                                                                                                         |
| LAST_MODIFIED   | TIMESTAMP(6)   |          | Time the parameter value was last updated                                                                                                                                                                                                                                    |
| MODIFIED_BY     | VARCHAR2(128)  |          | User who last updated the parameter value                                                                                                                                                                                                                                    |

## 6.364 DBA\_SQL\_QUARANTINE

DBA\_SQL\_QUARANTINE displays information about SQL Quarantine configurations.

Each row in this view represents a quarantine configuration for a SQL plan.

| Column          | Datatype       | NULL     | Description                                              |
|-----------------|----------------|----------|----------------------------------------------------------|
| SIGNATURE       | NUMBER         | NOT NULL | Unique SQL identifier generated from normalized SQL text |
| NAME            | VARCHAR2(128)  | NOT NULL | Unique plan identifier in string form as a search key    |
| SQL_TEXT        | CLOB           | NOT NULL | Un-normalized SQL text                                   |
| PLAN_HASH_VALUE | NUMBER         |          | Unique plan identifier in numeric form as a search key   |
| CPU_TIME        | VARCHAR2(4000) |          | CPU time threshold (in seconds)                          |
| IO_MEGABYTES    | VARCHAR2(4000) |          | I/O threshold (in megabytes)                             |
| IO_REQUESTS     | VARCHAR2(4000) |          | Physical I/O threshold (number of physical I/O requests) |
| ELAPSED_TIME    | VARCHAR2(4000) |          | Elapsed time threshold (in seconds)                      |

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                   |
|---------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IO_LOGICAL    | VARCHAR2(4000) |          | Logical I/O threshold (number of logical I/O requests)                                                                                                                                        |
| CREATOR       | VARCHAR2(128)  |          | User who created the quarantine configuration                                                                                                                                                 |
| ORIGIN        | VARCHAR2(16)   |          | Method by which the quarantine configuration was created. The only possible value is RESOURCE-MANAGER, which indicates that the quarantine configuration was created by the Resource Manager. |
| DESCRIPTION   | VARCHAR2(500)  |          | Text description                                                                                                                                                                              |
| CREATED       | TIMESTAMP(6)   | NOT NULL | Time at which the quarantine configuration was created                                                                                                                                        |
| LAST_EXECUTED | TIMESTAMP(6)   |          | Time at which the quarantine configuration was last used                                                                                                                                      |
| ENABLED       | VARCHAR2(3)    |          | Indicates whether the quarantine configuration is enabled (YES) or disabled (NO)                                                                                                              |

## 6.365 DBA\_SQL\_PATCHES

DBA\_SQL\_PATCHES displays the set of SQL patches.

| Column         | Datatype      | NULL     | Description                                                                                              |
|----------------|---------------|----------|----------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2(128) | NOT NULL | Name of the SQL patch                                                                                    |
| CATEGORY       | VARCHAR2(128) | NOT NULL | Category of the SQL patch                                                                                |
| SIGNATURE      | NUMBER        | NOT NULL | Unique identifier generated from normalized SQL text                                                     |
| SQL_TEXT       | CLOB          | NOT NULL | Un-normalized SQL text                                                                                   |
| CREATED        | TIMESTAMP(6)  | NOT NULL | Timestamp when the SQL patch was created                                                                 |
| LAST_MODIFIED  | TIMESTAMP(6)  |          | Timestamp when the SQL patch was last modified                                                           |
| DESCRIPTION    | VARCHAR2(500) |          | Text description provided for the SQL patch                                                              |
| STATUS         | VARCHAR2(8)   |          | Status of the SQL patch: <ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> </ul> |
| FORCE_MATCHING | VARCHAR2(3)   |          | Indicates whether the signature is force matching (YES) or exact matching (NO)                           |
| TASK_ID        | NUMBER        |          | Advisor task ID that generated the SQL patch                                                             |
| TASK_EXEC_NAME | VARCHAR2(128) |          | Advisor execution name for the SQL patch                                                                 |
| TASK_OBJ_ID    | NUMBER        |          | Advisor object ID for the SQL patch                                                                      |
| TASK_FND_ID    | NUMBER        |          | Advisor finding ID for the SQL patch                                                                     |

| Column      | Datatype | NULL | Description                                 |
|-------------|----------|------|---------------------------------------------|
| TASK_REC_ID | NUMBER   |      | Advisor recommendation ID for the SQL patch |

## 6.366 DBA\_SQL\_PLAN\_BASELINES

DBA\_SQL\_PLAN\_BASELINES displays information about the SQL plan baselines currently created for specific SQL statements.

| Column              | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIGNATURE           | NUMBER        | NOT NULL | Unique SQL identifier generated from normalized SQL text                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_HANDLE          | VARCHAR2(30)  | NOT NULL | Unique SQL identifier in string form as a search key                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SQL_TEXT            | CLOB          | NOT NULL | Un-normalized SQL text                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PLAN_NAME           | VARCHAR2(128) | NOT NULL | Unique plan identifier in string form as a search key                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATOR             | VARCHAR2(128) |          | User who created the plan baseline                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| REPRODUCED                      | VARCHAR2(3)  |      | Indicates whether the optimizer was able to reproduce the plan (YES) or not (NO). The value of this column is set to YES when a plan is initially added to the plan baseline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AUTOPURGE                       | VARCHAR2(3)  |      | Indicates whether the plan baseline is auto-purged (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ADAPTIVE                        | VARCHAR2(3)  |      | Indicates whether a plan that is automatically captured by SQL plan management is marked adaptive or not.<br><br>When a new adaptive plan is found for a SQL statement that has an existing SQL plan baseline, that new plan will be added to the SQL plan baseline as an unaccepted plan, and the ADAPTIVE column will be marked YES. When this new plan is verified (either manually or via the auto evolve task), the plan will be test executed and the final plan determined at execution will become an accepted plan if its performance is better than the existing plan baseline. At this point, the value of the ADAPTIVE column is set to NO since the plan is no longer adaptive, but resolved. |
| OPTIMIZER_COST                  | NUMBER       |      | Optimizer cost at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 6.367 DBA\_SQL\_PLAN\_DIR\_OBJECTS

DBA\_SQL\_PLAN\_DIR\_OBJECTS displays the objects created in the SQL plan directive.

| Column         | Datatype      | NULL | Description                                                               |
|----------------|---------------|------|---------------------------------------------------------------------------|
| DIRECTIVE_ID   | NUMBER        |      | The identifier of the SQL plan directive                                  |
| OWNER          | VARCHAR2(128) |      | The username of the owner of the object in the SQL plan directive         |
| OBJECT_NAME    | VARCHAR2(128) |      | The name of the object in the SQL plan directive                          |
| SUBOBJECT_NAME | VARCHAR2(128) |      | The name of the subobject (for example, column) in the SQL plan directive |
| OBJECT_TYPE    | VARCHAR2(6)   |      | The type of the subobject in the SQL plan directive                       |
| NUM_ROWS       | NUMBER        |      | The number of rows in the object when the directive is created            |
| NOTES          | XMLTYPE       |      | Other notes about the object                                              |

## 6.368 DBA\_SQL\_PLAN\_DIRECTIVES

DBA\_SQL\_PLAN\_DIRECTIVES displays information about the SQL plan directives in the system.

| Column       | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                      |
|--------------|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIRECTIVE_ID | NUMBER       | NOT NULL | The identifier of the SQL plan directive                                                                                                                                                                                                                                                                         |
| TYPE         | VARCHAR2(16) |          | The type of the SQL plan directive: <ul style="list-style-type: none"><li>• DYNAMIC SAMPLING: SQL plan directive</li><li>• DYNAMIC SAMPLING RESULT: Dynamic sampling query results. This value appears only in Oracle Database 12c Release 2 (12.2.0.1) and later releases.</li><li>• UNKNOWN: Unknown</li></ul> |

| Column        | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENABLED       | VARCHAR2(3)  |      | Indicates whether the SQL plan directive is enabled.<br>Possible values: <ul style="list-style-type: none"> <li>• YES: The SQL plan directive is enabled.</li> <li>• NO: The SQL plan directive is not enabled.</li> </ul>                                                                                                                                                                                |
| STATE         | VARCHAR2(10) |      | The state of the SQL plan directive. Possible values include: <ul style="list-style-type: none"> <li>• SUPERSEDED: This value indicates that the corresponding column or groups have an extension or histogram, or that another SQL plan directive exists that can be used for the directive.</li> <li>• USABLE: This value indicates that the SQL plan directive is usable for the optimizer.</li> </ul> |
| AUTO_DROP     | VARCHAR2(3)  |      | If YES, the SQL plan directive gets dropped when unused beyond SPD_RETENTION_WEEKS                                                                                                                                                                                                                                                                                                                        |
| REASON        | VARCHAR2(36) |      | The reason for creating the SQL plan directive                                                                                                                                                                                                                                                                                                                                                            |
| CREATED       | TIMESTAMP(6) |      | The creation timestamp of the SQL plan directive                                                                                                                                                                                                                                                                                                                                                          |
| LAST_MODIFIED | TIMESTAMP(6) |      | The timestamp of most recent modification of the SQL plan directive                                                                                                                                                                                                                                                                                                                                       |
| LAST_USED     | TIMESTAMP(9) |      | The timestamp of most recent usage of the SQL plan directive                                                                                                                                                                                                                                                                                                                                              |
| NOTES         | XMLTYPE      |      | Extra information about the SQL plan directive                                                                                                                                                                                                                                                                                                                                                            |

## 6.369 DBA\_SQL\_PROFILES

DBA\_SQL\_PROFILES displays information about SQL profiles currently created for specific SQL statements.

| Column        | Datatype      | NULL     | Description                                                                                                              |
|---------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------|
| NAME          | VARCHAR2(128) | NOT NULL | Name of the SQL profile                                                                                                  |
| CATEGORY      | VARCHAR2(128) | NOT NULL | Category of the SQL profile                                                                                              |
| SIGNATURE     | NUMBER        | NOT NULL | Unique identifier generated from normalized SQL text                                                                     |
| SQL_TEXT      | CLOB          | NOT NULL | Un-normalized SQL text                                                                                                   |
| CREATED       | TIMESTAMP(6)  | NOT NULL | Timestamp when the SQL profile was created                                                                               |
| LAST_MODIFIED | TIMESTAMP(6)  |          | Timestamp when the SQL profile was last modified                                                                         |
| DESCRIPTION   | VARCHAR2(500) |          | Text description provided for the SQL profile                                                                            |
| TYPE          | VARCHAR2(7)   |          | Type of the SQL profile (how it was created): <ul style="list-style-type: none"> <li>• MANUAL</li> <li>• AUTO</li> </ul> |

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS         | VARCHAR2(8)   |      | Status of the SQL profile: <ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> <li>• VOID</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                               |
| FORCE_MATCHING | VARCHAR2(3)   |      | If YES, this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values to bind variables. If a combination of literal values and bind variables is used in the same SQL text, then no transformation occurs. This is analogous to the matching algorithm use by the FORCE option of the CURSOR_SHARING parameter.<br><br>If NO, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter. |
| TASK_ID        | NUMBER        |      | Advisor task ID that generated the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TASK_EXEC_NAME | VARCHAR2(128) |      | Advisor execution name for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TASK_OBJ_ID    | NUMBER        |      | Advisor object ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TASK_FND_ID    | NUMBER        |      | Advisor finding ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TASK_REC_ID    | NUMBER        |      | Advisor recommendation ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TASK_CON_DBID  | NUMBER        |      | Database ID for the PDB tuning task generating the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The DBMS\_SQLTUNE package in *Oracle Database PL/SQL Packages and Types Reference*

## 6.370 DBA\_SQL\_TRANSLATION\_PROFILES

DBA\_SQL\_TRANSLATION\_PROFILES describes all SQL translation profiles in the database. Its columns are the same as those in ALL\_SQL\_TRANSLATION\_PROFILES.

#### ① See Also

"[ALL\\_SQL\\_TRANSLATION\\_PROFILES](#)"

## 6.371 DBA\_SQL\_TRANSLATIONS

DBA\_SQL\_TRANSLATIONS describes all SQL translations in the database. Its columns are the same as those in ALL\_SQL\_TRANSLATIONS.

① **See Also**

["ALL\\_SQL\\_TRANSLATIONS"](#)

## 6.372 DBA\_SQLJ\_TYPE\_ATTRS

DBA\_SQLJ\_TYPE\_ATTRS describes the attributes of all SQLJ object types in the database. Its columns are the same as those in ALL\_SQLJ\_TYPE\_ATTRS.

① **See Also**

["ALL\\_SQLJ\\_TYPE\\_ATTRS"](#)

## 6.373 DBA\_SQLJ\_TYPE\_METHODS

DBA\_SQLJ\_TYPE\_METHODS describes the methods of all SQLJ object types in the database. Its columns are the same as those in ALL\_SQLJ\_TYPE\_METHODS.

① **See Also**

["ALL\\_SQLJ\\_TYPE\\_METHODS"](#)

## 6.374 DBA\_SQLJ\_TYPES

DBA\_SQLJ\_TYPES describes all SQLJ object types in the database. Its columns are the same as those in ALL\_SQLJ\_TYPES.

① **See Also**

["ALL\\_SQLJ\\_TYPES"](#)

## 6.375 DBA\_SQLSET

DBA\_SQLSET displays information about all SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET.

### ① See Also

["ALL\\_SQLSET"](#)

## 6.376 DBA\_SQLSET\_BINDS

DBA\_SQLSET\_BINDS displays the bind values associated with all SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET\_BINDS.

### ① See Also

["ALL\\_SQLSET\\_BINDS"](#)

## 6.377 DBA\_SQLSET\_PLANS

DBA\_SQLSET\_PLANS describes captured plans in the SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET\_PLANS.

### ① See Also

["ALL\\_SQLSET\\_PLANS"](#)

## 6.378 DBA\_SQLSET\_REFERENCES

DBA\_SQLSET\_REFERENCES describes whether or not all SQL tuning sets in the database are active. A SQL tuning set cannot be dropped if it is referenced. Its columns are the same as those in ALL\_SQLSET\_REFERENCES.

### ① See Also

["ALL\\_SQLSET\\_REFERENCES"](#)

## 6.379 DBA\_SQLSET\_STATEMENTS

DBA\_SQLSET\_STATEMENTS displays information about the SQL statements, along with their statistics, that form all SQL tuning sets in the database. Its columns, except for PARSING\_SCHEMA\_ID, are the same as those in ALL\_SQLSET\_STATEMENTS.

| Column                   | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQLSET_NAME              | VARCHAR2(128) | NOT NULL | Name of the SQL tuning set for the statement                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SQLSET_OWNER             | VARCHAR2(128) |          | User name of the SQL tuning set owner                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SQLSET_ID                | NUMBER        | NOT NULL | ID of the SQL tuning set for the statement                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_DBID                 | NUMBER        | NOT NULL | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_ID                   | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| FORCE_MATCHING_SIGNATURE | NUMBER        | NOT NULL | The signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SQL_TEXT                 | CLOB          |          | Full text for the SQL statement exposed as a CLOB column.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PARSING_SCHEMA_NAME      | VARCHAR2(128) |          | Name of the user in whose schema the statement was parsed                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PARSING_SCHEMA_ID        | NUMBER        |          | ID of the schema in which the statement was parsed                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PLAN_HASH_VALUE          | NUMBER        | NOT NULL | Hash value for the plan corresponding to statistics in this record                                                                                                                                                                                                                                                                                                                                                                                                                         |
| BIND_DATA                | RAW(2000)     |          | Bind data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BINDS_CAPTURED           | CHAR(1)       |          | Binds captured                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MODULE                   | VARCHAR2(64)  |          | Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE                                                                                                                                                                                                                                                                                                                           |
| ACTION                   | VARCHAR2(64)  |          | Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_TIME             | NUMBER        |          | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                                    |
| CPU_TIME                 | NUMBER        |          | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                                        |
| BUFFER_GETS              | NUMBER        |          | Number of buffer gets for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK_READS               | NUMBER        |          | Number of disk reads for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DIRECT_WRITES            | NUMBER        |          | Number of direct writes for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ROWS_PROCESSED           | NUMBER        |          | Total number of rows that the parsed SQL statement returns                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| FETCHES                  | NUMBER        |          | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EXECUTIONS               | NUMBER        |          | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                            |
| END_OF_FETCH_COUNT       | NUMBER        |          | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less than, or equal to, the value of the EXECUTIONS column. |
| OPTIMIZER_COST           | NUMBER        |          | Cost of this query, given by the optimizer                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OPTIMIZER_ENV            | RAW(2000)     |          | Optimizer environment                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column               | Datatype     | NULL     | Description                                                                                                  |
|----------------------|--------------|----------|--------------------------------------------------------------------------------------------------------------|
| PRIORITY             | NUMBER       |          | User-defined priority                                                                                        |
| COMMAND_TYPE         | NUMBER       |          | Oracle command type definition                                                                               |
| FIRST_LOAD_TIME      | VARCHAR2(19) |          | Timestamp of the parent creation time                                                                        |
| STAT_PERIOD          | NUMBER       |          | Period of time (in seconds) during which the statistics of the SQL statement were collected                  |
| ACTIVE_STAT_PERIOD   | NUMBER       |          | Effective period of time (in seconds) during which the SQL statement was active                              |
| OTHER                | CLOB         |          | Client data, specified by the user, for this statement                                                       |
| PLAN_TIMESTAMP       | DATE         |          | Timestamp for the plan corresponding to the statistics in this record                                        |
| SQL_SEQ              | NUMBER       | NOT NULL | SQL sequence                                                                                                 |
| LAST_EXEC_START_TIME | VARCHAR2(19) |          | For SQLs captured from the cursor cache, this is the time when the most recent execution of this SQL started |

## 6.380 DBA\_SQLTUNE\_BINDS

DBA\_SQLTUNE\_BINDS displays the bind values associated with all tuned SQL statements in the database.

#### Related View

USER\_SQLTUNE\_BINDS displays the bind values associated with the tuned SQL statements owned by the current user.

| Column    | Datatype   | NULL     | Description                                            |
|-----------|------------|----------|--------------------------------------------------------|
| TASK_ID   | NUMBER(38) | NOT NULL | Tuning task identifier                                 |
| OBJECT_ID | NUMBER(38) | NOT NULL | Advisor framework object identifier                    |
| POSITION  | NUMBER(38) | NOT NULL | Bind position                                          |
| VALUE     | ANYDATA    |          | Bind value. This column is NULL for PL/SQL bind types. |

## 6.381 DBA\_SQLTUNE\_PLANS

DBA\_SQLTUNE\_PLANS displays information about the execution plans generated for all SQL statements in the database during a SQL tuning session.

### Related View

USER\_SQLTUNE\_PLANS displays information about the execution plans generated for the SQL statements owned by the current user during a SQL tuning session.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASK_ID         | NUMBER(38)     | NOT NULL | Advisor task ID                                                                                                                                                                                                                                                                                                                                          |
| EXECUTION_NAME  | VARCHAR2(128)  | NOT NULL | Advisor task execution                                                                                                                                                                                                                                                                                                                                   |
| OBJECT_ID       | NUMBER(38)     | NOT NULL | Advisor object ID                                                                                                                                                                                                                                                                                                                                        |
| ATTRIBUTE       | VARCHAR2(34)   |          | Text string identifying the type of the execution plan: <ul style="list-style-type: none"> <li>• Original - Original plan of the query</li> <li>• Original with adjusted cost - Same as Original but with adjusted cost</li> <li>• Using SQL profile - Plan with SQL profile applied</li> <li>• Using new indices - Plan with indexes applied</li> </ul> |
| STATEMENT_ID    | VARCHAR2(30)   |          | Optional statement identifier specified in the EXPLAIN PLAN statement                                                                                                                                                                                                                                                                                    |
| PLAN_HASH_VALUE | NUMBER         | NOT NULL | Numerical representation of the execution plan                                                                                                                                                                                                                                                                                                           |
| PLAN_ID         | NUMBER         |          | Plan identifier                                                                                                                                                                                                                                                                                                                                          |
| TIMESTAMP       | DATE           |          | Date and time when the EXPLAIN PLAN statement was issued                                                                                                                                                                                                                                                                                                 |
| REMARKS         | VARCHAR2(4000) |          | Place for comments that can be added to the steps of the execution plan                                                                                                                                                                                                                                                                                  |
| OPERATION       | VARCHAR2(30)   |          | Name of the operation performed at this step                                                                                                                                                                                                                                                                                                             |
| OPTIONS         | VARCHAR2(255)  |          | Options used for the operation performed at this step                                                                                                                                                                                                                                                                                                    |
| OBJECT_NODE     | VARCHAR2(128)  |          | Name of the database link used to reference the object                                                                                                                                                                                                                                                                                                   |
| OBJECT_OWNER    | VARCHAR2(128)  |          | Owner of the object                                                                                                                                                                                                                                                                                                                                      |
| OBJECT_NAME     | VARCHAR2(128)  |          | Name of the object                                                                                                                                                                                                                                                                                                                                       |
| OBJECT_ALIAS    | VARCHAR2(261)  |          | Object alias                                                                                                                                                                                                                                                                                                                                             |
| OBJECT_INSTANCE | NUMBER(38)     |          | Numbered position of the object name in the original SQL statement                                                                                                                                                                                                                                                                                       |
| OBJECT_TYPE     | VARCHAR2(30)   |          | Descriptive modifier that further describes the type of object                                                                                                                                                                                                                                                                                           |
| OPTIMIZER       | VARCHAR2(255)  |          | Current mode of the optimizer                                                                                                                                                                                                                                                                                                                            |
| SEARCH_COLUMNS  | NUMBER         |          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                                                                                                                               |
| ID              | NUMBER(38)     | NOT NULL | Identification number for this step in the execution plan                                                                                                                                                                                                                                                                                                |
| PARENT_ID       | NUMBER(38)     |          | ID of the next step that operates on the results of this step                                                                                                                                                                                                                                                                                            |

# 6.383 DBA\_SQLTUNE\_STATISTICS

DBA\_SQLTUNE\_STATISTICS displays statistics associated with all SQL statements in the database.

**Related View**

USER\_SQLTUNE\_STATISTICS displays statistics associated with the SQL statements owned by the current user.

| Column             | Datatype     | NULL     | Description                                  |
|--------------------|--------------|----------|----------------------------------------------|
| TASK_ID            | NUMBER(38)   | NOT NULL | Tuning task identifier                       |
| OBJECT_ID          | NUMBER(38)   | NOT NULL | Advisor framework object identifier          |
| PARSING_SCHEMA_ID  | NUMBER       |          | Schema under which the SQL is parsed         |
| MODULE             | VARCHAR2(64) |          | Last application module recorded for the SQL |
| ACTION             | VARCHAR2(64) |          | Last application action recorded for the SQL |
| ELAPSED_TIME       | NUMBER       |          | Elapsed time for the SQL statement           |
| CPU_TIME           | NUMBER       |          | CPU time for the SQL                         |
| BUFFER_GETS        | NUMBER       |          | Number of buffer gets                        |
| DISK_READS         | NUMBER       |          | Number of disk reads                         |
| DIRECT_WRITES      | NUMBER       |          | Number of disk writes                        |
| ROWS_PROCESSED     | NUMBER       |          | Number of rows processed by the SQL          |
| FETCHES            | NUMBER       |          | Number of fetches                            |
| EXECUTIONS         | NUMBER       |          | Number of executions                         |
| END_OF_FETCH_COUNT | NUMBER       |          | End of fetch count                           |
| OPTIMIZER_COST     | NUMBER       |          | Optimizer cost for the SQL                   |
| OPTIMIZER_ENV      | RAW(2000)    |          | Optimizer environment                        |
| COMMAND_TYPE       | NUMBER       |          | Command type                                 |

# 6.384 DBA\_SR\_GRP\_STATUS

DBA\_SR\_GRP\_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database. It has the same columns as the DBA\_SR\_GRP\_STATUS\_ALL view.

Refresh operations are controlled using the DBMS\_SYNC\_REFRESH package.

**Related View**

USER\_SR\_GRP\_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS.

| Column                | Datatype       | NULL     | Description                                                                                                                                                                                                                   |
|-----------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                 | VARCHAR2(128)  | NOT NULL | Owner of the refresh operation, which is the user who launched the operation                                                                                                                                                  |
| GROUP_ID              | NUMBER         | NOT NULL | Group ID of the synchronous refresh group                                                                                                                                                                                     |
| OPERATION             | VARCHAR2(7)    |          | The phase of the refresh operation performed: <ul style="list-style-type: none"> <li>• PREPARE</li> <li>• EXECUTE</li> </ul>                                                                                                  |
| STATUS                | VARCHAR2(10)   |          | The status of the refresh operation: <ul style="list-style-type: none"> <li>• RUNNING</li> <li>• NOT PROCESSED</li> <li>• COMPLETE</li> <li>• ERROR-SOFT</li> <li>• ERROR-HARD</li> <li>• ABORT</li> <li>• PARTIAL</li> </ul> |
| NUM_TBLS              | NUMBER         | NOT NULL | The number of tables in the synchronous refresh group                                                                                                                                                                         |
| NUM_MVS               | NUMBER         | NOT NULL | The number of materialized views in the synchronous refresh group                                                                                                                                                             |
| BASE_TBLS_REFR_STATUS | VARCHAR2(13)   |          | Indicates the refresh status of base tables in the synchronous refresh group. The possible values are: <ul style="list-style-type: none"> <li>• NOT PROCESSED</li> <li>• COMPLETE</li> <li>• ABORT</li> </ul>                 |
| NUM_MVS_COMPLETED     | NUMBER         |          | The number of materialized views which have completed refresh in the synchronous refresh group                                                                                                                                |
| NUM_MVS_ABORTED       | NUMBER         |          | The number of materialized views which have terminated refresh in the synchronous refresh group                                                                                                                               |
| ERROR_NUMBER          | NUMBER         |          | Error number of the run (if any)                                                                                                                                                                                              |
| ERROR_MESSAGE         | VARCHAR2(4000) |          | Error message of the run (if any)                                                                                                                                                                                             |
| PREPARE_START_TIME    | DATE           |          | Time that the PREPARE_REFRESH phase of the run started                                                                                                                                                                        |
| PREPARE_END_TIME      | DATE           |          | Time that the PREPARE_REFRESH phase of the run ended                                                                                                                                                                          |
| EXECUTE_START_TIME    | DATE           |          | Time that the EXECUTE_REFRESH phase of the run started                                                                                                                                                                        |
| EXECUTE_END_TIME      | DATE           |          | Time that the EXECUTE_REFRESH phase of the run ended                                                                                                                                                                          |

## 6.385 DBA\_SR\_GRP\_STATUS\_ALL

DBA\_SR\_GRP\_STATUS\_ALL provides information on the refresh operations on the synchronous refresh groups in the database.

A refresh operation is also called a run, and it has two phases: PREPARE\_REFRESH and EXECUTE\_REFRESH. These phases are controlled using the DBMS\_SYNC\_REFRESH package.

Each row in this view provides information on a run of a group, identified by its GROUP\_ID. The view contains information on the status of the objects of both current and past runs of both current and defunct synchronous refresh groups. Therefore, this view can be used to examine the history of synchronous refresh operations.

The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To view the status of refresh operations for the most recent runs of only the current groups, use the DBA\_SR\_GRP\_STATUS view.

### Related View

USER\_SR\_GRP\_STATUS\_ALL provides information on the refresh operations on the synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS\_ALL.

| Column    | Datatype      | NULL     | Description                                                                                                                                                                                                           |

## 6.389 DBA\_SR\_OBJ\_STATUS\_ALL

DBA\_SR\_OBJ\_STATUS\_ALL provides information on the status of objects registered for synchronous refresh.

The view contains information on the status of the objects of both the current and past runs of both current and defunct groups. Therefore, this view can be used to examine the history of synchronous refresh operations. The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To see information on the status of refresh operations for the most recent runs of only the current groups, use the DBA\_SR\_OBJ\_STATUS view.

### Related View

USER\_SR\_OBJ\_STATUS\_ALL provides information on the status of objects registered for synchronous refresh in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_OBJ\_STATUS\_ALL.

| Column             | Datatype       | NULL     | Description                                                                                                                                                       |

## 6.390 DBA\_SR\_PARTN\_OPS

DBA\_SR\_PARTN\_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh.

These rows last only as long as the registrations are active; that is, they disappear after EXECUTE\_REFRESH or ABORT\_REFRESH of the base table by the DBMS\_SYNC\_REFRESH package.

### Related View

USER\_SR\_PARTN\_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh belonging to the current user. Its columns are the same as those in DBA\_SR\_PARTN\_OPS.

| Column               | Datatype      | NULL     | Description                                                                                                                   |
|----------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2(128) | NOT NULL | Owner of the base table registered for synchronous refresh                                                                    |
| TABLE_NAME           | VARCHAR2(128) | NOT NULL | Name of the table                                                                                                             |

|------------------|----------------|----------|---------------------------------------------------------------------------------------------|
| TABLE_NAME       | VARCHAR2(128)  | NOT NULL | Name of the base table registered for synchronous refresh                                   |
| STAGING_LOG_NAME | VARCHAR2(128)  | NOT NULL | Name of the staging log for tables. This column has a value of NULL for materialized views. |
| BAD_ROWID        | ROWID          | NOT NULL | Row ID of the staging log row causing the exception for the synchronous refresh             |
| ERROR_NUMBER     | NUMBER         |          | Error number of the exception for the synchronous refresh                                   |
| ERROR_MESSAGE    | VARCHAR2(4000) |          | Error message associated with the ERROR_NUMBER for the synchronous refresh                  |

## 6.392 DBA\_SR\_STLOG\_STATS

DBA\_SR\_STLOG\_STATS provides information on the statistics in the staging logs for the tables processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG.

These three statistics columns in the staging log are filled in PREPARE\_STAGING\_LOG:

- The number of inserts (NUM\_INSERTS)
- The number of deletes (NUM\_DELETES)
- The number of updates (NUM\_UPDATES)

After the data in the staging logs of a synchronous refresh group have been processed by PREPARE\_REFRESH and EXECUTE\_REFRESH, the statistics columns for the tables in the group are cleared and appear as NULL.

### Related View

USER\_SR\_STLOG\_STATS provides information on the statistics in the staging logs for the tables belonging to the current user processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG.

| Column           | Datatype      | NULL     | Description                                                     |
|------------------|---------------|----------|-----------------------------------------------------------------|
| OWNER            | VARCHAR2(128) | NOT NULL | Owner of the base table registered for synchronous refresh      |
| TABLE_NAME       | VARCHAR2(128) | NOT NULL | Name of the table                                               |
| STAGING_LOG_NAME | VARCHAR2(128) | NOT NULL | Name of the staging log for tables. NULL for materialized views |
| NUM_INSERTS      | NUMBER        | NOT NULL | The number of inserts in the staging log                        |
| NUM_DELETES      | NUMBER        | NOT NULL | The number of deletes in the staging log                        |
| NUM_UPDATES      | NUMBER        | NOT NULL | The number of updates in the staging log                        |

| Column   | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                   |

## 6.393 DBA\_SSCR\_CAPTURE

DBA\_SSCR\_CAPTURE displays session state capture statistics.

| Column          | Datatype       | NULL     | Description                               |
|-----------------|----------------|----------|-------------------------------------------|
| DB_NAME         | VARCHAR2(4000) |          | Database name of captured session         |
| INST_NAME       | VARCHAR2(4000) |          | Instance name of captured session         |
| INST_ID         | NUMBER         |          | Instance ID of captured session           |
| SESSION_ID      | NUMBER         |          | Session ID of captured session            |
| SESSION_SERIAL# | NUMBER         |          | Session serial number of captured session |
| USER_NAME       | VARCHAR2(128)  | NOT NULL | User name of captured session             |
| SCHEMA_NAME     | VARCHAR2(128)  | NOT NULL | Schema name of captured session           |
| SEQUENCE#       | NUMBER         |          | Sequence number of captured session       |
| CAPTURE_MODE    | VARCHAR2(7)    |          | Mode of capture operation                 |
| CAPTURE_SCOPE   | VARCHAR2(7)    |          | Scope of capture operation                |
| CAPTURE_FORMAT  | VARCHAR2(9)    |          | Format of capture files                   |
| CAPTURE_DIR     | VARCHAR2(128)  |          | Directory object of capture files         |
| CAPTURE_LOCATOR | RAW(64)        |          | Locator of primary capture file           |
| CAPTURE_TIME    | TIMESTAMP(6)   |          | Timestamp of capture operation            |

## 6.394 DBA\_SSCR\_RESTORE

DBA\_SSCR\_RESTORE displays session state restore statistics.

| Column          | Datatype       | NULL     | Description                               |
|-----------------|----------------|----------|-------------------------------------------|
| DB_NAME         | VARCHAR2(4000) |          | Database name of restored session         |
| INST_NAME       | VARCHAR2(4000) |          | Instance name of restored session         |
| INST_ID         | NUMBER         |          | Instance ID of restored session           |
| SESSION_ID      | NUMBER         |          | Session ID of restored session            |
| SESSION_SERIAL# | NUMBER         |          | Session serial number of restored session |
| USER_NAME       | VARCHAR2(128)  | NOT NULL | User name of restored session             |
| SCHEMA_NAME     | VARCHAR2(128)  | NOT NULL | Schema name of restored session           |
| SEQUENCE#       | NUMBER         |          | Sequence number of restore operation      |
| RESTORE_MODE    | VARCHAR2(7)    |          | Mode of restore operation                 |
| RESTORE_SCOPE   | VARCHAR2(7)    |          | Scope of restore operation                |
| RESTORE_FORMAT  | VARCHAR2(9)    |          | Format of restore files                   |
| RESTORE_DIR     | VARCHAR2(128)  |          | Directory object of restore files         |
| RESTORE_LOCATOR | RAW(64)        |          | Locator of primary restore file           |
| RESTORE_TIME    | TIMESTAMP(6)   |          | Timestamp of restore operation            |

## 6.395 DBA\_STAT\_EXTENSIONS

DBA\_STAT\_EXTENSIONS displays information about all optimizer statistics extensions in the database.

### ① See Also

"[ALL\\_STAT\\_EXTENSIONS](#)"

## 6.396 DBA\_STATEMENTS

DBA\_STATEMENTS Statements in stored objects accessible to sys. Its columns are the same as those in ALL\_STATEMENTS.

### ① See Also

"[ALL\\_STATEMENTS](#)"

## 6.397 DBA\_STMT\_AUDIT\_OPTS

DBA\_STMT\_AUDIT\_OPTS describes current system auditing options across the system and by user.

### Note

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

| Column       | Datatype      | NULL     | Description                                                                                                                          |
|--------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| USER_NAME    | VARCHAR2(128) |          | User name if by user auditing; ANY CLIENT if access by a proxy on behalf of a client is being audited; NULL for system-wide auditing |
| PROXY_NAME   | VARCHAR2(128) |          | Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly      |
| AUDIT_OPTION | VARCHAR2(40)  | NOT NULL | Name of the system auditing option                                                                                                   |
| SUCCESS      | VARCHAR2(10)  |          | Mode for WHENEVER SUCCESSFUL system auditing                                                                                         |
| FAILURE      | VARCHAR2(10)  |          | Mode for WHENEVER NOT SUCCESSFUL system auditing                                                                                     |

## 6.398 DBA\_STORED\_SETTINGS

DBA\_STORED\_SETTINGS lists information about the persistent parameter settings for stored PL/SQL units for which the current user has execute privileges.

It also returns parameter information for all objects in the database and is accessible only to users with the SELECT\_CATALOG\_ROLE privilege. Its columns are the same as those in ALL\_STORED\_SETTINGS.

## Static Data Dictionary Views: DBA\_STREAMS\_ADD\_COLUMN to USER\_ZONEMAPS

This chapter contains the static data dictionary views DBA\_STREAMS\_ADD\_COLUMN through USER\_ZONEMAPS.

### 7.1 DBA\_STREAMS\_ADD\_COLUMN

DBA\_STREAMS\_ADD\_COLUMN displays information about declarative rule-based transformations that add a column to a row logical change record (LCR).

| Column          | Datatype       | NULL | Description                                                                                                                  |
|-----------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER      | VARCHAR2(128)  |      | Owner of the rule                                                                                                            |
| RULE_NAME       | VARCHAR2(128)  |      | Name of the rule                                                                                                             |
| SCHEMA_NAME     | VARCHAR2(128)  |      | Schema of the column to be added                                                                                             |
| TABLE_NAME      | VARCHAR2(128)  |      | Table of the column to be added                                                                                              |
| COLUMN_NAME     | VARCHAR2(4000) |      | Name of the column to be added                                                                                               |
| COLUMN_VALUE    | ANYDATA        |      | Value of the column to be added                                                                                              |
| COLUMN_TYPE     | VARCHAR2(4000) |      | Type of the column to be added                                                                                               |
| COLUMN_FUNCTION | VARCHAR2(128)  |      | Name of the default function used to add a column                                                                            |
| VALUE_TYPE      | VARCHAR2(3)    |      | Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR                                          |
| PRECEDENCE      | NUMBER         |      | 3 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER     | NUMBER         |      | Order in which this transformation should be executed                                                                        |

### 7.2 DBA\_STREAMS\_DELETE\_COLUMN

DBA\_STREAMS\_DELETE\_COLUMN displays information about declarative rule-based transformations that delete a column from a row logical change record (LCR).

| Column      | Datatype       | NULL | Description                        |
|-------------|----------------|------|------------------------------------|
| RULE_OWNER  | VARCHAR2(128)  |      | Owner of the rule                  |
| RULE_NAME   | VARCHAR2(128)  |      | Name of the rule                   |
| SCHEMA_NAME | VARCHAR2(128)  |      | Schema of the column to be deleted |
| TABLE_NAME  | VARCHAR2(128)  |      | Table of the column to be deleted  |
| COLUMN_NAME | VARCHAR2(4000) |      | Name of the column to delete       |

| Column      | Datatype    | NULL | Description                                                                                                                  |
|-------------|-------------|------|------------------------------------------------------------------------------------------------------------------------------|
| VALUE_TYPE  | VARCHAR2(3) |      | Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR                                          |
| PRECEDENCE  | NUMBER      |      | 1 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER | NUMBER      |      | Order in which this transformation should be executed                                                                        |

## 7.3 DBA\_STREAMS\_GLOBAL\_RULES

DBA\_STREAMS\_GLOBAL\_RULES displays information about the global rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_GLOBAL\_RULES.

### ① See Also

["ALL\\_STREAMS\\_GLOBAL\\_RULES"](#)

## 7.4 DBA\_STREAMS\_KEEP\_COLUMNS

DBA\_STREAMS\_KEEP\_COLUMNS displays information about declarative rule-based transformations that keep a list of columns in a row logical change record (LCR).

| Column      | Datatype       | NULL | Description                                                                                                                  |
|-------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER  | VARCHAR2(128)  |      | Owner of the rule which has an associated transformation                                                                     |
| RULE_NAME   | VARCHAR2(128)  |      | Name of the rule which has an associated transformation                                                                      |
| SCHEMA_NAME | VARCHAR2(128)  |      | Schema of the column to be kept                                                                                              |
| TABLE_NAME  | VARCHAR2(128)  |      | Table of the column to be kept                                                                                               |
| COLUMN_NAME | VARCHAR2(4000) |      | Column to keep                                                                                                               |
| VALUE_TYPE  | VARCHAR2(3)    |      | Indicates whether to keep the old (OLD), new (NEW), or both (*) value of the LCR                                             |
| PRECEDENCE  | NUMBER         |      | 0 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER | NUMBER         |      | Order in which this transformation should be executed                                                                        |

## 7.5 DBA\_STREAMS\_MESSAGE\_CONSUMERS

DBA\_STREAMS\_MESSAGE\_CONSUMERS displays information about all Streams messaging clients in the database. Its columns are the same as those in ALL\_STREAMS\_MESSAGE\_CONSUMERS.

### ① See Also

["ALL\\_STREAMS\\_MESSAGE\\_CONSUMERS"](#)

## 7.6 DBA\_STREAMS\_NEWLY\_SUPPORTED

DBA\_STREAMS\_NEWLY\_SUPPORTED displays information about all tables in the database that are newly supported by capture processes. Its columns are the same as those in ALL\_STREAMS\_NEWLY\_SUPPORTED.

### ① See Also

["ALL\\_STREAMS\\_NEWLY\\_SUPPORTED"](#)

## 7.7 DBA\_STREAMS\_RENAME\_COLUMN

DBA\_STREAMS\_RENAME\_COLUMN displays information about declarative rule-based transformations that rename a column in a row logical change record (LCR).

| Column           | Datatype       | NULL | Description                                                                                                                  |
|------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2(128)  |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2(128)  |      | Name of the rule                                                                                                             |
| SCHEMA_NAME      | VARCHAR2(128)  |      | Schema of the column to be renamed                                                                                           |
| TABLE_NAME       | VARCHAR2(128)  |      | Table of the column to be renamed                                                                                            |
| FROM_COLUMN_NAME | VARCHAR2(4000) |      | Column to rename                                                                                                             |
| TO_COLUMN_NAME   | VARCHAR2(4000) |      | New column name                                                                                                              |
| VALUE_TYPE       | VARCHAR2(3)    |      | Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR                                          |
| PRECEDENCE       | NUMBER         |      | 2 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER         |      | Order in which this transformation should be executed                                                                        |

## 7.8 DBA\_STREAMS\_RENAME\_SCHEMA

DBA\_STREAMS\_RENAME\_SCHEMA displays information about declarative rule-based transformations that rename a schema in a row logical change record (LCR).

| Column           | Datatype      | NULL | Description                                                                                                                  |
|------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2(128) |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2(128) |      | Name of the rule                                                                                                             |
| FROM_SCHEMA_NAME | VARCHAR2(128) |      | Schema to be renamed                                                                                                         |
| TO_SCHEMA_NAME   | VARCHAR2(128) |      | New schema name                                                                                                              |
| PRECEDENCE       | NUMBER        |      | 5 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER        |      | Order in which this transformation should be executed                                                                        |

## 7.9 DBA\_STREAMS\_RENAME\_TABLE

DBA\_STREAMS\_RENAME\_TABLE displays information about declarative rule-based transformations that rename a table in a row logical change record (LCR).

| Column           | Datatype      | NULL | Description                                                                                                                  |
|------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2(128) |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2(128) |      | Name of the rule                                                                                                             |
| FROM_SCHEMA_NAME | VARCHAR2(128) |      | Schema to be renamed                                                                                                         |
| TO_SCHEMA_NAME   | VARCHAR2(128) |      | New schema name                                                                                                              |
| FROM_TABLE_NAME  | VARCHAR2(128) |      | Table to be renamed                                                                                                          |
| TO_TABLE_NAME    | VARCHAR2(128) |      | New table name                                                                                                               |
| PRECEDENCE       | NUMBER        |      | 4 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER        |      | Order in which this transformation should be executed                                                                        |

## 7.10 DBA\_STREAMS\_SCHEMA\_RULES

DBA\_STREAMS\_SCHEMA\_RULES displays information about the schema rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_SCHEMA\_RULES.

### ① See Also

["ALL\\_STREAMS\\_SCHEMA\\_RULES"](#)

## 7.11 DBA\_STREAMS\_TABLE\_RULES

DBA\_STREAMS\_TABLE\_RULES displays information about the table rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_TABLE\_RULES.

### See Also

["ALL\\_STREAMS\\_TABLE\\_RULES"](#)

## 7.12 DBA\_STREAMS\_TP\_COMPONENT

DBA\_STREAMS\_TP\_COMPONENT displays information about each Replication component at each database.

| Column                 | Datatype       | NULL     | Description                                                                                                                                                                                    |
|------------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID           | NUMBER         | NOT NULL | ID of the Replication component                                                                                                                                                                |
| COMPONENT_NAME         | VARCHAR2(4000) |          | Name of the Replication component                                                                                                                                                              |
| COMPONENT_DB           | VARCHAR2(128)  |          | Database where the Replication component resides                                                                                                                                               |
| COMPONENT_TYPE         | VARCHAR2(20)   |          | Type of the Replication component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |
| COMPONENT_CHANGED_TIME | DATE           |          | Time that the Replication component was last changed                                                                                                                                           |

## 7.13 DBA\_STREAMS\_TP\_COMPONENT\_LINK

DBA\_STREAMS\_TP\_COMPONENT\_LINK displays information about how messages flow between Replication components.

| Column                | Datatype       | NULL     | Description                                                                                                                                                                                           |
|-----------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE_COMPONENT_ID   | NUMBER         | NOT NULL | ID of the source Replication component                                                                                                                                                                |
| SOURCE_COMPONENT_NAME | VARCHAR2(4000) |          | Name of the source Replication component                                                                                                                                                              |
| SOURCE_COMPONENT_DB   | VARCHAR2(128)  |          | Database where the source Replication component resides                                                                                                                                               |
| SOURCE_COMPONENT_TYPE | VARCHAR2(20)   |          | Type of the source Replication component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |

| Column                     | Datatype       | NULL     | Description                                                                                                                                                                                                |
|----------------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESTINATION_COMPONENT_ID   | NUMBER         | NOT NULL | ID of the destination Replication component                                                                                                                                                                |
| DESTINATION_COMPONENT_NAME | VARCHAR2(4000) |          | Name of the destination Replication component                                                                                                                                                              |
| DESTINATION_COMPONENT_DB   | VARCHAR2(128)  |          | Database where the destination Replication component resides                                                                                                                                               |
| DESTINATION_COMPONENT_TYPE | VARCHAR2(20)   |          | Type of the destination Replication component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |
| PATH_ID                    | NUMBER         | NOT NULL | ID of the stream path                                                                                                                                                                                      |
| POSITION                   | NUMBER         |          | Position of the link within the stream path                                                                                                                                                                |

## 7.14 DBA\_STREAMS\_TP\_COMPONENT\_STAT

DBA\_STREAMS\_TP\_COMPONENT\_STAT displays temporary performance statistics and session statistics about each Replication component.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                       |
|--------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID       | NUMBER         | NOT NULL | ID of the Replication component                                                                                                                                                                                                                                                                                   |
| COMPONENT_NAME     | VARCHAR2(4000) |          | Name of the Replication component                                                                                                                                                                                                                                                                                 |
| COMPONENT_DB       | VARCHAR2(128)  |          | Database where the Replication component resides                                                                                                                                                                                                                                                                  |
| COMPONENT_TYPE     | VARCHAR2(20)   |          | Type of the Replication component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul>                                                                                                                    |

| SESSION_ID         | NUMBER         |          | ID of the Replication session for the Replication component                                                                                                                                                                                                                                                       |
| SESSION_SERIAL#    | NUMBER         |          | Serial number of the Replication session for the Replication component                                                                                                                                                                                                                                            |
| STATISTIC_TIME     | DATE           |          | Time that the statistic was taken                                                                                                                                                                                                                                                                                 |
| STATISTIC_NAME     | VARCHAR2(64)   |          | Name of the statistic                                                                                                                                                                                                                                                                                             |
| STATISTIC_VALUE    | VARCHAR2(4000) |          | Value of the statistic                                                                                                                                                                                                                                                                                            |

| Column           | Datatype     | NULL | Description                                 |
|------------------|--------------|------|---------------------------------------------|
| STATISTIC_UNIT   | VARCHAR2(64) |      | Unit of the statistic                       |
| ADVISOR_RUN_ID   | NUMBER       |      | Logical number (1-based) of the Advisor run |
| ADVISOR_RUN_TIME | DATE         |      | Time that the Advisor was run               |

## 7.15 DBA\_STREAMS\_TP\_DATABASE

DBA\_STREAMS\_TP\_DATABASE displays information about each database that contains Replication components.

| Column                 | Datatype      | NULL     | Description                             |
|------------------------|---------------|----------|-----------------------------------------|
| GLOBAL_NAME            | VARCHAR2(128) | NOT NULL | Global name of the database             |
| LAST_QUERIED           | DATE          | NOT NULL | Time that the database was last queried |
| VERSION                | VARCHAR2(128) |          | Database version of the database        |
| COMPATIBILITY          | VARCHAR2(128) |          | Compatible setting of the database      |
| MANAGEMENT_PACK_ACCESS | VARCHAR2(128) |          | Management pack access of the database  |

## 7.16 DBA\_STREAMS\_TP\_PATH\_BOTTLENECK

DBA\_STREAMS\_TP\_PATH\_BOTTLENECK displays temporary information about Replication components that might be slowing down the flow of messages in a stream path.

| Column                | Datatype       | NULL | Description                                                                                                                                                                                   |
|-----------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH_ID               | NUMBER         |      | ID of the stream path                                                                                                                                                                         |
| COMPONENT_ID          | NUMBER         |      | ID of the bottleneck component                                                                                                                                                                |
| COMPONENT_NAME        | VARCHAR2(4000) |      | Name of the bottleneck component                                                                                                                                                              |
| COMPONENT_DB          | VARCHAR2(128)  |      | Database where the bottleneck component resides                                                                                                                                               |
| COMPONENT_TYPE        | VARCHAR2(20)   |      | Type of the bottleneck component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION_SENDER</li> <li>• PROPAGATION_RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |
| TOP_SESSION_ID        | NUMBER         |      | ID of the top session for the bottleneck component                                                                                                                                            |
| TOP_SESSION_SERIAL#   | NUMBER         |      | Serial number of the top session for the bottleneck component                                                                                                                                 |
| ACTION_NAME           | VARCHAR2(64)   |      | Action name for the bottleneck process                                                                                                                                                        |
| BOTTLENECK_IDENTIFIED | VARCHAR2(30)   |      | Indicates whether the bottleneck was identified (YES) or not (NO)                                                                                                                             |
| ADVISOR_RUN_ID        | NUMBER         |      | Logical number (1-based) of the Advisor run                                                                                                                                                   |
| ADVISOR_RUN_TIME      | DATE           |      | Time that the Advisor was run                                                                                                                                                                 |

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADVISOR_RUN_REASON | VARCHAR2(4000) |      | Reason for the bottleneck analysis result.: <ul style="list-style-type: none"> <li>• NULL - Bottleneck is identified</li> <li>• PRE-11.1 DATABASE EXISTS - A pre-release 11.1 database exists in the stream path</li> <li>• DIAGNOSTIC PACK REQUIRED - A database in the stream path does not have the diagnostic package installed</li> <li>• NO BOTTLENECK IDENTIFIED</li> </ul> |

## 7.17 DBA\_STREAMS\_TP\_PATH\_STAT

DBA\_STREAMS\_TP\_PATH\_STAT displays temporary performance statistics about each stream path that exists in the Replication topology.

| Column           | Datatype     | NULL | Description                                 |
|------------------|--------------|------|---------------------------------------------|
| PATH_ID          | NUMBER       |      | ID of the stream path                       |
| STATISTIC_TIME   | DATE         |      | Time that the statistic was taken           |
| STATISTIC_NAME   | VARCHAR2(64) |      | Name of the statistic                       |
| STATISTIC_VALUE  | NUMBER       |      | Value of the statistic                      |
| STATISTIC_UNIT   | VARCHAR2(64) |      | Unit of the statistic                       |
| ADVISOR_RUN_ID   | NUMBER       |      | Logical number (1-based) of the Advisor run |
| ADVISOR_RUN_TIME | DATE         |      | Time that the Advisor was run               |

## 7.18 DBA\_STREAMS\_TRANSFORM\_FUNCTION

DBA\_STREAMS\_TRANSFORM\_FUNCTION displays information about all rule-based transformation functions in the database. Its columns are the same as those in ALL\_STREAMS\_TRANSFORM\_FUNCTION.

### ① See Also

"[ALL\\_STREAMS\\_TRANSFORM\\_FUNCTION](#)"

## 7.19 DBA\_SUBPART\_COL\_STATISTICS

DBA\_SUBPART\_COL\_STATISTICS provides column statistics and histogram information for all subpartitions in the database. Its columns are the same as those in ALL\_SUBPART\_COL\_STATISTICS.

### ① See Also

"[ALL\\_SUBPART\\_COL\\_STATISTICS](#)"

## 7.20 DBA\_SUBPART\_HISTOGRAMS

DBA\_SUBPART\_HISTOGRAMS lists actual histogram data (end-points per histogram) for histograms on all table subpartitions in the database. Its columns are the same as those in ALL\_SUBPART\_HISTOGRAMS.

### ① See Also

["ALL\\_SUBPART\\_HISTOGRAMS"](#)

## 7.21 DBA\_SUBPART\_KEY\_COLUMNS

DBA\_SUBPART\_KEY\_COLUMNS lists subpartitioning key columns for all composite-partitioned tables (and local indexes on composite-partitioned tables) in the database. Its columns are the same as those in ALL\_SUBPART\_KEY\_COLUMNS.

### ① See Also

["ALL\\_SUBPART\\_KEY\\_COLUMNS"](#)

## 7.22 DBA\_SUBPARTITION\_TEMPLATES

DBA\_SUBPARTITION\_TEMPLATES describes all subpartition templates in the database. Its columns are the same as those in ALL\_SUBPARTITION\_TEMPLATES.

### ① See Also

["ALL\\_SUBPARTITION\\_TEMPLATES"](#)

## 7.23 DBA\_SUBSCR\_REGISTRATIONS

DBA\_SUBSCR\_REGISTRATIONS displays information about all subscription registrations in the database.

### Related View

USER\_SUBSCR\_REGISTRATIONS displays information about the subscription registrations owned by the current user.

| Column | Datatype | NULL | Description     |
|--------|----------|------|-----------------|
| REG_ID | NUMBER   |      | Registration ID |

| Column                   | Datatype                    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-----------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUBSCRIPTION_NAME        | VARCHAR2(128)               | NOT NULL | Name of the subscription registration. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queue.                                                                                                                                                                                                         |
| LOCATION_NAME            | VARCHAR2(256)               | NOT NULL | Location endpoint of the registration                                                                                                                                                                                                                                                                                                                                                                                                             |

## 7.24 DBA\_SUPPLEMENTAL\_LOGGING

DBA\_SUPPLEMENTAL\_LOGGING provides information about supplemental logging for a pluggable database (PDB) in a multitenant container database (CDB).

| Column       | Datatype    | NULL | Description                                                                          |
|--------------|-------------|------|--------------------------------------------------------------------------------------|
| MINIMAL      | VARCHAR2(3) |      | Identifies whether minimal supplemental logging is on (YES or NO)                    |
| PRIMARY_KEY  | VARCHAR2(3) |      | Identifies whether primary key supplemental logging is on (YES or NO)                |
| UNIQUE_INDEX | VARCHAR2(3) |      | Identifies whether unique column supplemental logging is on (YES or NO)              |
| FOREIGN_KEY  | VARCHAR2(3) |      | Identifies whether foreign key supplemental logging is on (YES or NO)                |
| ALL_COLUMN   | VARCHAR2(3) |      | Identifies whether all column supplemental logging is on (YES or NO)                 |
| PROCEDURAL   | VARCHAR2(3) |      | Identifies whether supplemental logging for procedural replication is on (YES or NO) |
| SUBSET_REP   | VARCHAR2(3) |      | Indicates whether subset database replication is on (YES or NO)                      |

## 7.25 DBA\_SYNC\_CAPTURE

DBA\_SYNC\_CAPTURE displays information about all synchronous capture processes in the database. Its columns are the same as those in ALL\_SYNC\_CAPTURE.

**See Also**

["ALL\\_SYNC\\_CAPTURE"](#)

## 7.26 DBA\_SYNC\_CAPTURE\_PREPARED\_TABS

DBA\_SYNC\_CAPTURE\_PREPARED\_TABS displays information about all tables in the database that are prepared for synchronous capture instantiation. Its columns are the same as those in ALL\_SYNC\_CAPTURE\_PREPARED\_TABS.

### ① See Also

["ALL\\_SYNC\\_CAPTURE\\_PREPARED\\_TABS"](#)

## 7.27 DBA\_SYNC\_CAPTURE\_TABLES

DBA\_SYNC\_CAPTURE\_TABLES displays information about all tables in the database that are captured by synchronous captures. Its columns are the same as those in ALL\_SYNC\_CAPTURE\_TABLES.

### ① See Also

["ALL\\_SYNC\\_CAPTURE\\_TABLES"](#)

## 7.28 DBA\_SYNONYMS

DBA\_SYNONYMS describes all synonyms in the database. Its columns are the same as those in ALL\_SYNONYMS.

### ① See Also

["ALL\\_SYNONYMS"](#)

## 7.29 DBA\_SYS\_PRIVS

DBA\_SYS\_PRIVS describes system privileges granted to users and roles.

| Column       | Datatype      | NULL | Description                                                             |
|--------------|---------------|------|-------------------------------------------------------------------------|
| GRANTEE      | VARCHAR2(128) |      | Grantee name, user, or role receiving the grant                         |
| PRIVILEGE    | VARCHAR2(40)  |      | System privilege                                                        |
| ADMIN_OPTION | VARCHAR2(3)   |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO) |

| Column    | Datatype    | NULL | Description                                                                                                                                                                                                                                            |
|-----------|-------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMON    | VARCHAR2(3) |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED | VARCHAR2(3) |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                     |

#### ① See Also

["USER\\_SYS\\_PRIVS"](#)

## 7.30 DBA\_TAB\_COL\_STAT\_MODELS

DBA\_TAB\_COL\_STAT\_MODELS describes real-time statistics models for all tables in the database. Its columns are the same as those in ALL\_TAB\_COL\_STAT\_MODELS.

Real-time statistics models use machine learning algorithms to predict the number of distinct values (NDV) for table columns.

#### ① Note

This view is available starting with Oracle Database 21c.

#### ① See Also

["ALL\\_TAB\\_COL\\_STAT\\_MODELS"](#)

## 7.31 DBA\_TAB\_COL\_STATISTICS

DBA\_TAB\_COL\_STATISTICS contains column statistics and histogram information extracted from DBA\_TAB\_COLUMNS. Its columns are the same as those in ALL\_TAB\_COL\_STATISTICS.

#### ① See Also

- ["DBA\\_TAB\\_COLUMNS"](#)
- ["ALL\\_TAB\\_COL\\_STATISTICS"](#)

## 7.32 DBA\_TAB\_COLS

DBA\_TAB\_COLS describes the columns of all tables, views, and clusters in the database.

Its columns (except for SENSITIVE\_COLUMN) are the same as those in ALL\_TAB\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

This view differs from DBA\_TAB\_COLUMNS in that system-generated hidden columns are not filtered out.

Columns marked with an asterisk (\*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]\_COL\_STATISTICS views.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2(128) | NOT NULL | Owner of the table, view, or cluster                                                                                                                                                                                                                                                                                                        |
| TABLE_NAME      | VARCHAR2(128) | NOT NULL | Name of the table, view, or cluster                                                                                                                                                                                                                                                                                                         |
| COLUMN_NAME     | VARCHAR2(128) | NOT NULL | Column name                                                                                                                                                                                                                                                                                                                                 |
| DATA_TYPE       | VARCHAR2(128) |          | Data type of the column                                                                                                                                                                                                                                                                                                                     |
| DATA_TYPE_MOD   | VARCHAR2(3)   |          | Data type modifier of the column                                                                                                                                                                                                                                                                                                            |
| DATA_TYPE_OWNER | VARCHAR2(128) |          | Owner of the data type of the column                                                                                                                                                                                                                                                                                                        |
| DATA_LENGTH     | NUMBER        | NOT NULL | Length of the column (in bytes)                                                                                                                                                                                                                                                                                                             |
| DATA_PRECISION  | NUMBER        |          | Decimal precision for NUMBER data type; binary precision for FLOAT data type; NULL for all other data types                                                                                                                                                                                                                                 |
| DATA_SCALE      | NUMBER        |          | Digits to the right of the decimal point in a number                                                                                                                                                                                                                                                                                        |
| NULLABLE        | VARCHAR2(1)   |          | Indicates whether a column allows NULLs. The value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY.                                                                                                                                                                                          |
| COLUMN_ID       | NUMBER        |          | Sequence number of the column as created                                                                                                                                                                                                                                                                                                    |
| DEFAULT_LENGTH  | NUMBER        |          | Length of the default value for the column                                                                                                                                                                                                                                                                                                  |
| DATA_DEFAULT    | LONG          |          | Default value for the column                                                                                                                                                                                                                                                                                                                |
| NUM_DISTINCT*   | NUMBER        |          | Number of distinct values in the column                                                                                                                                                                                                                                                                                                     |
| LOW_VALUE*      | RAW(1000)     |          | Low value in the column                                                                                                                                                                                                                                                                                                                     |
| HIGH_VALUE*     | RAW(1000)     |          | High value in the column                                                                                                                                                                                                                                                                                                                    |
| DENSITY*        | NUMBER        |          | If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram. It does not represent the selectivity of values that span 2 or more endpoints.<br><br>If a histogram is not available on COLUMN_NAME, then the value of this column is 1/NUM_DISTINCT. |
| NUM_NULLS       | NUMBER        |          | Number of NULLs in the column                                                                                                                                                                                                                                                                                                               |

| Column               | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_BUCKETS          | NUMBER       |          | Number of buckets in the histogram for the column<br><b>Note:</b> The number of buckets in a histogram is specified in the SIZE parameter of the ANALYZE SQL statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm. |
| LAST_ANALYZED        | DATE         |          | Date on which this column was most recently analyzed                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SAMPLE_SIZE          | NUMBER       |          | Sample size used in analyzing this column                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CHARACTER_SET_NAME   | VARCHAR2(44) |          | Name of the character set: <ul style="list-style-type: none"> <li>CHAR_CS</li> <li>NCHAR_CS</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                |
| CHAR_COL_DECL_LENGTH | NUMBER       |          | Declaration length of the character type column                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| GLOBAL_STATS         | VARCHAR2(3)  |          | GLOBAL_STATS will be YES if statistics are gathered or incrementally maintained, otherwise it will be NO                                                                                                                                                                                                                                                                                                                                                                                                              |
| USER_STATS           | VARCHAR2(3)  |          | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AVG_COL_LEN          | NUMBER       |          | Average length of the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CHAR_LENGTH          | NUMBER       |          | Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none"> <li>CHAR</li> <li>VARCHAR2</li> <li>NCHAR</li> <li>NVARCHAR2</li> </ul>                                                                                                                                                                                                                                                                                                      |
| CHAR_USED            | VARCHAR2(1)  |          | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none"> <li>CHAR</li> <li>VARCHAR2</li> <li>NCHAR</li> <li>NVARCHAR2</li> </ul>                                                                                                                                                                                                                                                        |
| V80_FMT_IMAGE        | VARCHAR2(3)  |          | Indicates whether the column data is in release 8.0 image format (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DATA_UPGRADED        | VARCHAR2(3)  |          | Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                               |
| HIDDEN_COLUMN        | VARCHAR2(3)  |          | Indicates whether the column is a hidden column (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VIRTUAL_COLUMN       | VARCHAR2(3)  |          | Indicates whether the column is a virtual column (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SEGMENT_COLUMN_ID    | NUMBER       |          | Sequence number of the column in the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| INTERNAL_COLUMN_ID   | NUMBER       | NOT NULL | Internal sequence number of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column             | Datatype       | NULL | Description                                                                                                                                                                      |
|--------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HISTOGRAM          | VARCHAR2(15)   |      | Indicates existence/type of histogram: <ul style="list-style-type: none"> <li>NONE</li> <li>FREQUENCY</li> <li>TOP-FREQUENCY</li> <li>HEIGHT BALANCED</li> <li>HYBRID</li> </ul> |
| QUALIFIED_COL_NAME | VARCHAR2(4000) |      | Qualified column name                                                                                                                                                            |
| USER_GENERATED     | VARCHAR2(3)    |      | Indicates whether the column is a user-generated column (YES) or a system-generated column (NO)                                                                                  |
| DEFAULT_ON_NULL    | VARCHAR2(3)    |      | Indicates whether the column has DEFAULT ON NULL semantics (YES) or not (NO)                                                                                                     |
| IDENTITY_COLUMN    | VARCHAR2(3)    |      | Indicates whether this is an identity column (YES) or not (NO)                                                                                                                   |
| SENSITIVE_COLUMN   | VARCHAR2(3)    |      | Indicates whether this is a sensitive column (YES) or not (NO)                                                                                                                   |
| EVALUATION_EDITION | VARCHAR2(128)  |      | Name of the edition in which editioned objects referenced in an expression column are resolved                                                                                   |
| UNUSABLE_BEFORE    | VARCHAR2(128)  |      | Name of the oldest edition in which the index may be used as part of a query plan                                                                                                |
| UNUSABLE_BEGINNING | VARCHAR2(128)  |      | Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants                                                        |
| COLLATION          | VARCHAR2(100)  |      | Collation for the column. Only applies to columns with character data types.                                                                                                     |
| COLLATED_COLUMN_ID | NUMBER         |      | Internal sequence number of a column, for which this virtual column generates a collation key                                                                                    |

## 7.33 DBA\_TAB\_COLUMNS

DBA\_TAB\_COLUMNS describes the columns of all tables, views, and clusters in the database.

Its columns (except for SENSITIVE\_COLUMN) are the same as those in ALL\_TAB\_COLUMNS.

To gather statistics for this view, use the DBMS\_STATS package.

This view filters out system-generated hidden columns. The DBA\_TAB\_COLS view does not filter out system-generated hidden columns.

Columns marked with an asterisk (\*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]\_COL\_STATISTICS views.

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2(128) | NOT NULL | Owner of the table, view, or cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TABLE_NAME           | VARCHAR2(128) | NOT NULL | Name of the table, view, or cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COLUMN_NAME          | VARCHAR2(128) | NOT NULL | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DATA_TYPE            | VARCHAR2(128) |          | Data type of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DATA_TYPE_MOD        | VARCHAR2(3)   |          | Data type modifier of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATA_TYPE_OWNER      | VARCHAR2(128) |          | Owner of the data type of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DATA_LENGTH          | NUMBER        | NOT NULL | Length of the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DATA_PRECISION       | NUMBER        |          | Decimal precision for NUMBER data type; binary precision for FLOAT data type; NULL for all other data types                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DATA_SCALE           | NUMBER        |          | Digits to the right of the decimal point in a number                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| NULLABLE             | VARCHAR2(1)   |          | Indicates whether a column allows NULLs. The value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY. The constraint should be in an ENABLE VALIDATE state.                                                                                                                                                                                                                                                                                                                         |
| COLUMN_ID            | NUMBER        |          | Sequence number of the column as created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DEFAULT_LENGTH       | NUMBER        |          | Length of the default value for the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| NUM_BUCKETS          | NUMBER        |          | <p>Number of buckets in the histogram for the column</p> <p><b>Note:</b> The number of buckets in a histogram is specified in the SIZE parameter of the ANALYZE SQL statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm.</p> |
| LAST_ANALYZED        | DATE          |          | Date on which this column was most recently analyzed                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|--------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER_STATS         | VARCHAR2(3)   |      | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                                       |
| AVG_COL_LEN        | NUMBER        |      | Average length of the column (in bytes)                                                                                                                                                                                                                                |
| CHAR_LENGTH        | NUMBER        |      | Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul>                                               |
| CHAR_USED          | VARCHAR2(1)   |      | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul> |
| V80_FMT_IMAGE      | VARCHAR2(3)   |      | Indicates whether the column data is in release 8.0 image format (YES) or not (NO)                                                                                                                                                                                     |
| DATA_UPGRADED      | VARCHAR2(3)   |      | Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)                                                                                                                                                                |
| HISTOGRAM          | VARCHAR2(15)  |      | Indicates existence/type of histogram: <ul style="list-style-type: none"> <li>• NONE</li> <li>• FREQUENCY</li> <li>• TOP-FREQUENCY</li> <li>• HEIGHT BALANCED</li> <li>• HYBRID</li> </ul>                                                                             |
| DEFAULT_ON_NULL    | VARCHAR2(3)   |      | Indicates whether the column has DEFAULT ON NULL semantics (YES) or not (NO)                                                                                                                                                                                           |
| IDENTITY_COLUMN    | VARCHAR2(3)   |      | Indicates whether this is an identity column (YES) or not (NO)                                                                                                                                                                                                         |
| SENSITIVE_COLUMN   | VARCHAR2(3)   |      | Indicates whether this is a sensitive column (YES) or not (NO)                                                                                                                                                                                                         |
| EVALUATION_EDITION | VARCHAR2(128) |      | Name of the edition in which editioned objects referenced in an expression column are resolved                                                                                                                                                                         |
| UNUSABLE_BEFORE    | VARCHAR2(128) |      | Name of the oldest edition in which the index may be used as part of a query plan                                                                                                                                                                                      |
| UNUSABLE_BEGINNING | VARCHAR2(128) |      | Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants                                                                                                                                              |
| COLLATION          | VARCHAR2(100) |      | Collation for the column. Only applies to columns with character data types.                                                                                                                                                                                           |

## 7.34 DBA\_TAB\_COMMENTS

DBA\_TAB\_COMMENTS displays comments on all tables and views in the database. Its columns are the same as those in ALL\_TAB\_COMMENTS.

**① See Also**

["ALL\\_TAB\\_COMMENTS"](#)

## 7.35 DBA\_TAB\_HISTGRM\_PENDING\_STATS

DBA\_TAB\_HISTGRM\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in ALL\_TAB\_HISTGRM\_PENDING\_STATS.

**① See Also**

["ALL\\_TAB\\_HISTGRM\\_PENDING\\_STATS"](#)

## 7.36 DBA\_TAB\_HISTOGRAMS

DBA\_TAB\_HISTOGRAMS describes histograms on columns of all tables in the database. Its columns are the same as those in ALL\_TAB\_HISTOGRAMS.

**① See Also**

["ALL\\_TAB\\_HISTOGRAMS"](#)

## 7.37 DBA\_TAB\_IDENTITY\_COLS

DBA\_TAB\_IDENTITY\_COLS describes all table identity columns. Its columns are the same as those in ALL\_TAB\_IDENTITY\_COLS.

### ① See Also

["ALL\\_TAB\\_IDENTITY\\_COLS"](#)

## 7.38 DBA\_TAB\_MODIFICATIONS

DBA\_TAB\_MODIFICATIONS describes modifications to all tables in the database that have been modified since the last time statistics were gathered on the tables. Its columns are the same as those in ALL\_TAB\_MODIFICATIONS.

### ① See Also

["ALL\\_TAB\\_MODIFICATIONS"](#)

## 7.39 DBA\_TAB\_PARTITIONS

DBA\_TAB\_PARTITIONS displays partition-level partitioning information, partition storage parameters, and partition statistics generated by the DBMS\_STATS package for all partitions in the database.

Its columns are the same as those in ["ALL\\_TAB\\_PARTITIONS"](#).

## 7.40 DBA\_TAB\_PENDING\_STATS

DBA\_TAB\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in ALL\_TAB\_PENDING\_STATS.

### ① See Also

["ALL\\_TAB\\_PENDING\\_STATS"](#)

## 7.41 DBA\_TAB\_PRIVS

DBA\_TAB\_PRIVS describes all object grants in the database.

### Related View

USER\_TAB\_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee.

| Column     | Datatype      | NULL | Description                                                                                                                                                                                                                                               |
|------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE    | VARCHAR2(128) |      | Name of the user or role to whom access was granted                                                                                                                                                                                                       |
| OWNER      | VARCHAR2(128) |      | Owner of the object                                                                                                                                                                                                                                       |
| TABLE_NAME | VARCHAR2(128) |      | Name of the object. The object can be any object, including tables, packages, indexes, sequences, and so on.                                                                                                                                              |
| GRANTOR    | VARCHAR2(128) |      | Name of the user who performed the grant                                                                                                                                                                                                                  |
| PRIVILEGE  | VARCHAR2(40)  |      | Privilege on the object                                                                                                                                                                                                                                   |
| GRANTABLE  | VARCHAR2(3)   |      | Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)                                                                                                                                                                       |
| HIERARCHY  | VARCHAR2(3)   |      | Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)                                                                                                                                                                   |
| COMMON     | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| TYPE       | VARCHAR2(24)  |      | Type of the object                                                                                                                                                                                                                                        |
| INHERITED  | VARCHAR2(3)   |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                        |

① **See Also**

["USER\\_TAB\\_PRIVS"](#)

## 7.42 DBA\_TAB\_STATISTICS

DBA\_TAB\_STATISTICS displays optimizer statistics for all tables in the database. Its columns are the same as those in ALL\_TAB\_STATISTICS.

① **See Also**

["ALL\\_TAB\\_STATISTICS"](#)

## 7.43 DBA\_TAB\_STAT\_PREFS

DBA\_TAB\_STAT\_PREFS displays information about statistics preferences for all tables in the database. Its columns are the same as those in ALL\_TAB\_STAT\_PREFS.

① **See Also**

["ALL\\_TAB\\_STAT\\_PREFS"](#).

## 7.44 DBA\_TAB\_STATS\_HISTORY

DBA\_TAB\_STATS\_HISTORY provides a history of table statistics modifications for all tables in the database. Its columns are the same as those in ALL\_TAB\_STATS\_HISTORY.

### See Also

["ALL\\_TAB\\_STATS\\_HISTORY"](#)

## 7.45 DBA\_TAB\_SUBPARTITIONS

DBA\_TAB\_SUBPARTITIONS displays, for each table subpartition, the subpartition name, name of the table and partition to which it belongs, its storage attributes, and statistics generated by the DBMS\_STATS package.

Its columns are the same as those in ["ALL\\_TAB\\_SUBPARTITIONS"](#).

## 7.46 DBA\_TABLES

DBA\_TABLES describes all relational tables in the database. Its columns are the same as those in ALL\_TABLES.

To gather statistics for this view, use the DBMS\_STATS package.

### See Also

["ALL\\_TABLES"](#)

## 7.47 DBA\_TABLESPACE\_GROUPS

DBA\_TABLESPACE\_GROUPS describes all tablespace groups in the database.

| Column          | Datatype     | NULL     | Description                  |
|-----------------|--------------|----------|------------------------------|
| GROUP_NAME      | VARCHAR2(30) | NOT NULL | Name of the tablespace group |
| TABLESPACE_NAME | VARCHAR2(30) | NOT NULL | Name of the tablespace       |

## 7.48 DBA\_TABLESPACE\_THRESHOLDS

DBA\_TABLESPACE\_THRESHOLDS describes space utilization threshold settings for all tablespaces in the database.

| Column          | Datatype     | NULL | Description     |
|-----------------|--------------|------|-----------------|
| TABLESPACE_NAME | VARCHAR2(30) |      | Tablespace name |

| Column            | Datatype      | NULL | Description                                                                                                                                                                                                           |
|-------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONTENTS          | VARCHAR2(9)   |      | Tablespace contents: <ul style="list-style-type: none"> <li>• UNDO</li> <li>• PERMANENT</li> <li>• TEMPORARY</li> </ul>                                                                                               |
| EXTENT_MANAGEMENT | VARCHAR2(10)  |      | Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)                                                                                                        |
| THRESHOLD_TYPE    | VARCHAR2(8)   |      | Indicates whether the threshold value is derived from a DEFAULT threshold or an EXPLICIT threshold                                                                                                                    |
| METRICS_NAME      | VARCHAR2(64)  |      | Name of the metric for which the threshold is set                                                                                                                                                                     |
| WARNING_OPERATOR  | VARCHAR2(12)  |      | Relational operator for warning thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO_NOT_CHECK</li> </ul>  |
| WARNING_VALUE     | VARCHAR2(256) |      | Warning threshold value                                                                                                                                                                                               |
| CRITICAL_OPERATOR | VARCHAR2(12)  |      | Relational operator for critical thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO_NOT_CHECK</li> </ul> |

## 7.49 DBA\_TABLESPACE\_USAGE\_METRICS

DBA\_TABLESPACE\_USAGE\_METRICS describes tablespace usage metrics for all types of tablespaces, including permanent, temporary, and undo tablespaces.

| Column          | Datatype     | NULL | Description                                                                                                                                                                                                              |
|-----------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2(30) |      | Tablespace name                                                                                                                                                                                                          |
| USED_SPACE      | NUMBER       |      | Total space consumed by all objects created in the tablespace, expressed as number of data blocks<br>For undo tablespaces, the value of this column includes space consumed by both expired and unexpired undo segments. |

| Column        | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABSPACE_SIZE | NUMBER   |      | <p>The maximum size of the tablespace, expressed as number of data blocks</p> <ul style="list-style-type: none"> <li>If the tablespace contains any datafiles with autoextend enabled, then this column displays the maximum size to which the tablespace can grow. Underlying storage free space, such as Oracle ASM or file system storage, is taken into account when computing this value. If the value of the MAX_PDB_STORAGE property of the CDB_PROPERTIES view is non-zero, then that value is also taken into account.</li> </ul> <p>For example:</p> <ul style="list-style-type: none"> <li>If a tablespace has a current size of 5 GB, the combined maximum size of its datafiles is 32 GB, and its underlying storage has 20 GB of free space, then this column will have a value of approximately 25 GB.</li> <li>If a tablespace has a current size of 10 GB, the combined maximum size of its datafiles is 20 GB, and its underlying storage has 25 GB of free space, then this column will have a value of approximately 20 GB.</li> <li>If a tablespace has a current size of 15 GB, the combined maximum size of its datafiles is 32 GB, its underlying storage has 90 GB of free space, the current PDB size is 40 GB, and MAX_PDB_STORAGE is 50 GB, then this column will have a value of approximately 25 GB.</li> <li>If the tablespace contains only datafiles with autoextend disabled, then this column displays the combined size of all datafiles in the tablespace.</li> </ul> |
| USED_PERCENT  | NUMBER   |      | Percentage of used space, as a function of the maximum possible tablespace size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 7.50 DBA\_TABLESPACES

DBA\_TABLESPACES describes all tablespaces in the database.

### Related View

USER\_TABLESPACES describes the tablespaces accessible to the current user. This view does not display the PLUGGED\_IN column.

| Column         | Datatype     | NULL     | Description                                |
|----------------|--------------|----------|--------------------------------------------|
| TABSPACE_NAME  | VARCHAR2(30) | NOT NULL | Name of the tablespace                     |
| BLOCK_SIZE     | NUMBER       | NOT NULL | Tablespace block size (in bytes)           |
| INITIAL_EXTENT | NUMBER       |          | Default initial extent size (in bytes)     |
| NEXT_EXTENT    | NUMBER       |          | Default incremental extent size (in bytes) |
| MIN_EXTENTS    | NUMBER       | NOT NULL | Default minimum number of extents          |
| MAX_EXTENTS    | NUMBER       |          | Default maximum number of extents          |

| Column                   | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|--------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_SIZE                 | NUMBER       |      | Default maximum size of segments (in Oracle blocks)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PCT_INCREASE             | NUMBER       |      | Default percent increase for extent size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MIN_EXTLEN               | NUMBER       |      | Minimum extent size for this tablespace (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 7.51 DBA\_TEMP\_FILES

DBA\_TEMP\_FILES describes all temporary files (tempfiles) in the database.

| Column          | Datatype      | NULL     | Description                                                                                                                               |
|-----------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME       | VARCHAR2(513) |          | Name of the database temp file                                                                                                            |
| FILE_ID         | NUMBER        |          | File identifier number of the database temp file                                                                                          |
| TABLESPACE_NAME | VARCHAR2(30)  | NOT NULL | Name of the tablespace to which the file belongs                                                                                          |
| BYTES           | NUMBER        |          | Size of the file (in bytes)                                                                                                               |
| BLOCKS          | NUMBER        |          | Size of the file (in Oracle blocks)                                                                                                       |
| STATUS          | VARCHAR2(7)   |          | <p>File status:</p> <ul style="list-style-type: none"> <li>• <b>OFFLINE</b></li> <li>• <b>ONLINE</b></li> <li>• <b>UNKNOWN</b></li> </ul> |
| RELATIVE_FNO    | NUMBER        |          | Tablespace-relative file number                                                                                                           |
| AUTOEXTENSIBLE  | VARCHAR2(3)   |          | Indicates whether the file is autoextensible (YES) or not (NO)                                                                            |

| Column       | Datatype     | NULL | Description                                                                                                                                                                                                                                                                               |
|--------------|--------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXBYTES     | NUMBER       |      | maximum size of the file (in bytes)                                                                                                                                                                                                                                                       |
| MAXBLOCKS    | NUMBER       |      | Maximum size of the file (in Oracle blocks)                                                                                                                                                                                                                                               |
| INCREMENT_BY | NUMBER       |      | Default increment for autoextension (in Oracle blocks)                                                                                                                                                                                                                                    |
| USER_BYTES   | NUMBER       |      | Size of the useful portion of the file (in bytes)                                                                                                                                                                                                                                         |
| USER_BLOCKS  | NUMBER       |      | Size of the useful portion of the file (in Oracle blocks)                                                                                                                                                                                                                                 |
| SHARED       | VARCHAR2(12) |      | Type of tablespace this file belongs to: <ul style="list-style-type: none"> <li>• SHARED: For shared tablespace</li> <li>• LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances</li> <li>• LOCAL_FOR_ALL: Local temporary tablespace for all instance types</li> </ul> |
| INST_ID      | NUMBER       |      | Instance ID of the instance to which the temp file belongs. This column has a NULL value for temp files that belong to shared tablespaces.                                                                                                                                                |

## 7.52 DBA\_TEMP\_FREE\_SPACE

DBA\_TEMP\_FREE\_SPACE displays temporary space usage information at tablespace level.

| Column          | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                               |
|-----------------|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2(30) | NOT NULL | Name of the tablespace                                                                                                                                                                                                                                                                    |
| TABLESPACE_SIZE | NUMBER       |          | Total size of the tablespace, in bytes                                                                                                                                                                                                                                                    |
| ALLOCATED_SPACE | NUMBER       |          | Total allocated space, in bytes, including space that is currently allocated and used and space that is currently allocated and available for reuse                                                                                                                                       |
| FREE_SPACE      | NUMBER       |          | Total free space available, in bytes, including space that is currently allocated and available for reuse and space that is currently unallocated                                                                                                                                         |
| SHARED          | VARCHAR2(12) |          | Type of tablespace this file belongs to: <ul style="list-style-type: none"> <li>• SHARED: For shared tablespace</li> <li>• LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances</li> <li>• LOCAL_FOR_ALL: Local temporary tablespace for all instance types</li> </ul> |
| INST_ID         | NUMBER       |          | Instance ID of the instance to which the tempfile belongs                                                                                                                                                                                                                                 |

## 7.53 DBA\_THRESHOLDS

DBA\_THRESHOLDS describes all thresholds.

| Column       | Datatype     | NULL | Description  |
|--------------|--------------|------|--------------|
| METRICS_NAME | VARCHAR2(64) |      | Metrics name |

| Column                  | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WARNING_OPERATOR        | VARCHAR2(12)  |      | Relational operator for warning thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO NOT CHECK</li> <li>• DO_NOT_CHECK</li> </ul>                                                                                                                                                                                                                                                                                                          |
| WARNING_VALUE           | VARCHAR2(256) |      | Warning threshold value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CRITICAL_OPERATOR       | VARCHAR2(12)  |      | Relational operator for critical thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO NOT CHECK</li> <li>• DO_NOT_CHECK</li> </ul>                                                                                                                                                                                                                                                                                                         |
| CRITICAL_VALUE          | VARCHAR2(256) |      | Critical threshold value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBSERVATION_PERIOD      | NUMBER        |      | Observation period length (in minutes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CONSECUTIVE_OCCURRENCES | NUMBER        |      | Number of occurrences before an alert is issued                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| INSTANCE_NAME           | VARCHAR2(16)  |      | Instance name; NULL for database-wide alerts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OBJECT_TYPE             | VARCHAR2(64)  |      | Object type: <ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• SERVICE</li> <li>• EVENT_CLASS</li> <li>• TABLESPACE</li> <li>• FILE</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                               |
| OBJECT_NAME             | VARCHAR2(513) |      | Name of the object for which the threshold is set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| STATUS                  | VARCHAR2(7)   |      | Indicates whether the threshold is applicable on a valid object (VALID) or not (INVALID) <p>Thresholds for non-tablespace metrics can only be set in R00T and apply to a CDB as a whole. Any pre-existing non-tablespace thresholds that may exist in a PDB have a status of INVALID in the DBA_THRESHOLDS view. You can remove these threshold settings using the DBMS_SERVER_ALERT.SET_THRESHOLD API.</p> <p>See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the DBMS_SERVER_ALERT.SET_THRESHOLD API.</p> |

## 7.54 DBA\_TRANSFORMATIONS

DBA\_TRANSFORMATIONS displays information about all transformations in the database. These transformations can be specified with Advanced Queuing operations such as enqueue,

dequeue, and subscribe to automatically integrate transformations in AQ messaging. Its columns are the same as those in ALL\_TRANSFORMATIONS.

① **See Also**

["ALL\\_TRANSFORMATIONS"](#)

## 7.55 DBA\_TRIGGER\_COLS

DBA\_TRIGGER\_COLS describes the use of columns in all triggers in the database. Its columns are the same as those in ALL\_TRIGGER\_COLS.

① **See Also**

["ALL\\_TRIGGER\\_COLS"](#)

## 7.56 DBA\_TRIGGER\_ORDERING

DBA\_TRIGGER\_ORDERING describes all triggers in the database that have FOLLOWS or PRECEDES ordering. Its columns are the same as those in ALL\_TRIGGER\_ORDERING.

① **See Also**

["ALL\\_TRIGGER\\_ORDERING"](#)

## 7.57 DBA\_TRIGGERS

DBA\_TRIGGERS describes all triggers in the database. Its columns are the same as those in ALL\_TRIGGERS.

① **See Also**

["ALL\\_TRIGGERS"](#)

## 7.58 DBA\_TRIGGERS\_AE

DBA\_TRIGGERS\_AE describes all triggers (across all editions) in the database. Its columns are the same as those in ALL\_TRIGGERS\_AE.

### See Also

["ALL\\_TRIGGERS\\_AE"](#)

## 7.59 DBA\_TS\_QUOTAS

DBA\_TS\_QUOTAS describes tablespace quotas for all users.

### Related View

USER\_TS\_QUOTAS describes tablespace quotas for the current user. This view does not display the USERNAME column.

| Column          | Datatype      | NULL     | Description                                      |
|-----------------|---------------|----------|--------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2(30)  | NOT NULL | Tablespace name                                  |
| USERNAME        | VARCHAR2(128) | NOT NULL | User with resource rights on the tablespace      |
| BYTES           | NUMBER        |          | Number of bytes charged to the user              |
| MAX_BYTES       | NUMBER        |          | User's quota in bytes, or -1 if no limit         |
| BLOCKS          | NUMBER        |          | Number of Oracle blocks charged to the user      |
| MAX_BLOCKS      | NUMBER        |          | User's quota in Oracle blocks, or -1 if no limit |
| DROPPED         | VARCHAR2(3)   |          | Whether the tablespace has been dropped          |

## 7.60 DBA\_TSDP\_IMPORT\_ERRORS

DBA\_TSDP\_IMPORT\_ERRORS shows information about the errors encountered during import of the Transparent Sensitive Data Protection discovery result.

This error information corresponds to the last import of the discovery result done using the DBMS\_TSDP\_MANAGE.IMPORT\_DISCOVERY\_RESULT API.

| Column      | Datatype      | NULL     | Description                                 |
|-------------|---------------|----------|---------------------------------------------|
| ERROR_CODE  | NUMBER        | NOT NULL | The ORA error code of the error encountered |
| SCHEMA_NAME | VARCHAR2(128) |          | The schema corresponding to the error       |
| TABLE_NAME  | VARCHAR2(128) |          | The table corresponding to the error        |

| Column         | Datatype      | NULL | Description                                   |
|----------------|---------------|------|-----------------------------------------------|
| COLUMN_NAME    | VARCHAR2(128) |      | The column corresponding to the error         |
| SENSITIVE_TYPE | VARCHAR2(128) |      | The sensitive type corresponding to the error |

## 7.61 DBA\_TSDP\_POLICY\_CONDITION

DBA\_TSDP\_POLICY\_CONDITION describes the Transparent Sensitive Data Protection policy and condition mapping. It also lists the property-value pairs for the condition.

| Column      | Datatype      | NULL     | Description                                                                                                                                                          |
|-------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME | VARCHAR2(128) |          | The name of the Transparent Sensitive Data Protection policy                                                                                                         |
| SUB_POLICY  | NUMBER        | NOT NULL | The sub policy of the Transparent Sensitive Data Protection policy                                                                                                   |
| PROPERTY    | VARCHAR2(11)  |          | The condition property. Possible values: <ul style="list-style-type: none"> <li>• DATATYPE</li> <li>• LENGTH</li> <li>• SCHEMA_NAME</li> <li>• TABLE_NAME</li> </ul> |
| VALUE       | VARCHAR2(128) |          | The value of the condition property                                                                                                                                  |

## 7.62 DBA\_TSDP\_POLICY\_FEATURE

DBA\_TSDP\_POLICY\_FEATURE shows the Transparent Sensitive Data Protection policy security feature mapping for all the TSDP policies in the database.

At this time, only Oracle Data Redaction is supported.

| Column      | Datatype      | NULL | Description                                                  |
|-------------|---------------|------|--------------------------------------------------------------|
| POLICY_NAME | VARCHAR2(128) |      | The name of the Transparent Sensitive Data Protection policy |

| Column           | Datatype     | NULL | Description                                                                                           |
|------------------|--------------|------|-------------------------------------------------------------------------------------------------------|
| SECURITY_FEATURE | VARCHAR2(12) |      | The Oracle security feature with which the Transparent Sensitive Data Protection policy is associated |

## 7.63 DBA\_TSDP\_POLICY\_PARAMETER

DBA\_TSDP\_POLICY\_PARAMETER shows the parameter-value pairs for the condition of the Transparent Sensitive Data Protection policy.

| Column         | Datatype       | NULL     | Description                                                                                                                                                                                                                  |
|----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME    | VARCHAR2(128)  |          | The name of the Transparent Sensitive Data Protection policy                                                                                                                                                                 |
| SUB_POLICY     | NUMBER         | NOT NULL | The sub policy of the Transparent Sensitive Data Protection policy                                                                                                                                                           |
| PARAMETER      | VARCHAR2(128)  |          | The parameter for the Transparent Sensitive Data Protection sub policy                                                                                                                                                       |
| VALUE          | VARCHAR2(4000) |          | The value of the parameter                                                                                                                                                                                                   |
| DEFAULT_OPTION | VARCHAR2(5)    |          | Indicates whether this is the default option for the policy: <ul style="list-style-type: none"> <li>TRUE: This is the default option for the policy</li> <li>FALSE: This is not the default option for the policy</li> </ul> |

## 7.64 DBA\_TSDP\_POLICY\_PROTECTION

DBA\_TSDP\_POLICY\_PROTECTION shows the list of columns that have been protected through Transparent Sensitive Data Protection.

| Column      | Datatype      | NULL     | Description                                                           |
|-------------|---------------|----------|-----------------------------------------------------------------------|
| SCHEMA_NAME | VARCHAR2(128) | NOT NULL | The schema containing the sensitive data                              |
| TABLE_NAME  | VARCHAR2(128) | NOT NULL | The table containing the sensitive column                             |
| COLUMN_NAME | VARCHAR2(128) | NOT NULL | The name of the sensitive column                                      |
| TSDP_POLICY | VARCHAR2(128) |          | The TSDP policy name based on which the column protection was enabled |

| Column                  | Datatype      | NULL     | Description                                                                                                  |
|-------------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------|
| SECURITY_FEATURE        | VARCHAR2(12)  |          | The security feature enabled on the sensitive column                                                         |
| SECURITY_FEATURE_POLICY | VARCHAR2(128) | NOT NULL | Name of the underlying Oracle security feature policy                                                        |
| SUBPOLICY#              | NUMBER        | NOT NULL | The subpolicy of the Transparent Sensitive Data Protection policy based on which protection has been enabled |

#### ① See Also

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.65 DBA\_TSDP\_POLICY\_TYPE

DBA\_TSDP\_POLICY\_TYPE shows the Transparent Sensitive Data Protection policy to sensitive column type mapping.

| Column         | Datatype      | NULL | Description                                           |
|----------------|---------------|------|-------------------------------------------------------|
| POLICY_NAME    | VARCHAR2(128) |      | The Transparent Sensitive Data Protection policy name |
| SENSITIVE_TYPE | VARCHAR2(128) |      | The sensitive column type name                        |

#### ① See Also

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.66 DBA\_TSM\_DESTINATION

DBA\_TSM\_DESTINATION lists transparent session migration (TSM) destination session statistics.

| Column                      | Datatype                    | NULL | Description                                |
|-----------------------------|-----------------------------|------|--------------------------------------------|
| SOURCE_DATABASE_NAME        | VARCHAR2(4000)              |      | Database name of source session            |
| DESTINATION_DATABASE_NAME   | VARCHAR2(4000)              |      | Database name of destination session       |
| DESTINATION_INSTANCE_NAME   | VARCHAR2(4000)              |      | Instance name of destination session       |
| DESTINATION_INSTANCE_ID     | VARCHAR2(4000)              |      | Instance ID of destination session         |
| DESTINATION_INST_START_TIME | TIMESTAMP(6) WITH TIME ZONE |      | Instance start time of destination session |
| SEQUENCE#                   | NUMBER                      |      | Migration sequence number                  |
| DESTINATION_SID             | NUMBER                      |      | Session ID of destination session          |

| Column                  | Datatype                    | NULL     | Description                                     |
|-------------------------|-----------------------------|----------|-------------------------------------------------|
| DESTINATION_SERIAL#     | NUMBER                      |          | Session serial number of destination session    |
| DESTINATION_START_TIME  | TIMESTAMP(6) WITH TIME ZONE |          | Start time for migration on destination session |
| DESTINATION_END_TIME    | TIMESTAMP(6) WITH TIME ZONE |          | End time for migration on destination session   |
| DESTINATION_USER_NAME   | VARCHAR2(128)               | NOT NULL | User associated with the destination session    |
| DESTINATION_SCHEMA_NAME | VARCHAR2(128)               | NOT NULL | Schema associated with the destination session  |
| DESTINATION_STATE       | VARCHAR2(24)                |          | Migration state of destination session          |

## 7.67 DBA\_TSM\_SOURCE

DBA\_TSM\_SOURCE lists transparent session migration (TSM) source session statistics.

| Column                     | Datatype                    | NULL     | Description                                          |
|----------------------------|-----------------------------|----------|------------------------------------------------------|
| SOURCE_DATABASE_NAME       | VARCHAR2(4000)              |          | Database name of source session                      |
| SOURCE_INSTANCE_NAME       | VARCHAR2(4000)              |          | Instance name of source session                      |
| SOURCE_INSTANCE_ID         | VARCHAR2(4000)              |          | Instance ID of source session                        |
| SOURCE_INSTANCE_START_TIME | TIMESTAMP(6) WITH TIME ZONE |          | Instance start time of source session                |
| SEQUENCE#                  | NUMBER                      |          | Migration sequence number                            |
| SOURCE_SID                 | NUMBER                      |          | Session ID of source session                         |
| SOURCE_SERIAL#             | NUMBER                      |          | Source serial number of source session               |
| SOURCE_STATE               | VARCHAR2(24)                |          | Migration state of source session                    |
| CONNECT_STRING             | VARCHAR2(4000)              |          | Connect string specified for migration               |
| SOURCE_START_TIME          | TIMESTAMP(6) WITH TIME ZONE |          | Start time for migration on source session           |
| COST                       | NUMBER                      |          | Estimate of migration cost                           |
| FAILURE_REASON             | VARCHAR2(34)                |          | Reason for migration failure, if any                 |
| SOURCE_END_TIME            | TIMESTAMP(6) WITH TIME ZONE |          | End time for migration on source session             |
| ROUNDTRIPS                 | NUMBER                      |          | Number of client/server round trips during migration |
| SOURCE_USER_NAME           | VARCHAR2(128)               | NOT NULL | User associated with the source session              |
| SOURCE_SCHEMA_NAME         | VARCHAR2(128)               | NOT NULL | Schema associated with the source session            |
| DESTINATION_DATABASE_NAME  | VARCHAR2(4000)              |          | Database name of the destination session             |

## 7.68 DBA\_TSTZ\_TAB\_COLS

DBA\_TSTZ\_TAB\_COLS displays information about the columns of all tables in the database, which have columns defined on `TIMESTAMP WITH TIME ZONE` data types or object types containing attributes of `TIMESTAMP WITH TIME ZONE` data types.

Its columns (except for `COLUMN_NAME`, `NESTED`, `VIRTUAL_COLUMN`, `SCALAR_COLUMN`, and `UNUSED_COLUMN`) are the same as those in `ALL_TSTZ_TAB_COLS`.

**① See Also**

["ALL\\_TSTZ\\_TAB\\_COLS"](#)

## 7.69 DBA\_TSTZ\_TABLES

DBA\_TSTZ\_TABLES displays information about all tables in the database, which have columns defined on `TIMESTAMP WITH TIME ZONE` data types or object types containing attributes of `TIMESTAMP WITH TIME ZONE` data types.

Its columns are the same as those in `ALL_TSTZ_TABLES`.

**① See Also**

["ALL\\_TSTZ\\_TABLES"](#)

## 7.70 DBA\_TUNE\_MVIEW

DBA\_TUNE\_MVIEW displays the result of executing the `DBMS_ADVISOR.TUNE_MVIEW` procedure.

**Related View**

USER\_TUNE\_MVIEW displays the result of executing the `DBMS_ADVISOR.TUNE_MVIEW` procedure. This view does not display the `OWNER` column.

| Column      | Datatype      | NULL     | Description                                                                                         |
|-------------|---------------|----------|-----------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2(128) |          | Owner of the task                                                                                   |
| TASK_NAME   | VARCHAR2(128) |          | Name of the task                                                                                    |
| ACTION_ID   | NUMBER        | NOT NULL | Identifier of the action                                                                            |
| SCRIPT_TYPE | VARCHAR2(14)  |          | Type of the script: <ul style="list-style-type: none"><li>• IMPLEMENTATION</li><li>• UNDO</li></ul> |
| STATEMENT   | CLOB          |          | Action statement                                                                                    |

## 7.71 DBA\_TYPE\_ATTRS

DBA\_TYPE\_ATTRS describes the attributes of all object types in the database. Its columns (except for CHAR\_USED) are the same as those in ALL\_TYPE\_ATTRS.

### ① See Also

["ALL\\_TYPE\\_ATTRS"](#)

## 7.72 DBA\_TYPE\_METHODS

DBA\_TYPE\_METHODS describes the methods of all object types in the database. Its columns are the same as those in ALL\_TYPE\_METHODS.

### ① See Also

["ALL\\_TYPE\\_METHODS"](#)

## 7.73 DBA\_TYPE\_VERSIONS

DBA\_TYPE\_VERSIONS describes the versions of all object types in the database. Its columns are the same as those in ALL\_TYPE\_VERSIONS.

### ① See Also

["ALL\\_TYPE\\_VERSIONS"](#)

## 7.74 DBA\_TYPES

DBA\_TYPES describes all object types in the database. Its columns are the same as those in ALL\_TYPES.

### ① See Also

["ALL\\_TYPES"](#)

## 7.75 DBA\_UMF\_LINK

DBA\_UMF\_LINK displays information about the registered database links in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered database links in the topology if you are querying on a target node.

| Column        | Datatype      | NULL     | Description                        |
|---------------|---------------|----------|------------------------------------|
| TOPOLOGY_NAME | VARCHAR2(128) | NOT NULL | Topology name for the link         |
| FROM_NODE_ID  | NUMBER        | NOT NULL | Node ID of the local node          |
| TO_NODE_ID    | NUMBER        | NOT NULL | Node ID of the remote node         |
| LINK_NAME     | VARCHAR2(128) | NOT NULL | Fully qualified database link name |

### ① See Also

## 7.76 DBA\_UMF\_REGISTRATION

DBA\_UMF\_REGISTRATION displays information about the registered nodes in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered nodes in the topology if you are querying on a target node.

| Column              | Datatype      | NULL     | Description                                                                                                                                                                                                                                                               |
|---------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOPOLOGY_NAME       | VARCHAR2(128) | NOT NULL | Topology name for the node                                                                                                                                                                                                                                                |
| NODE_NAME           | VARCHAR2(128) | NOT NULL | Unique node name in the topology                                                                                                                                                                                                                                          |
| NODE_ID             | NUMBER        | NOT NULL | Unique node ID in the topology                                                                                                                                                                                                                                            |
| NODE_TYPE           | NUMBER        | NOT NULL | Node type. Possible value: <ul style="list-style-type: none"><li>• 0: RDBMS node</li></ul>                                                                                                                                                                                |
| AS_SOURCE           | VARCHAR2(5)   |          | Indicates whether the node is a source node. Possible values: <ul style="list-style-type: none"><li>• TRUE: The node is a source node, and it can provide remote services</li><li>• FALSE: The node is not a source node, and it cannot provide remote services</li></ul> |
| AS_CANDIDATE_TARGET | VARCHAR2(5)   |          | Node is a candidate target. Possible values: <ul style="list-style-type: none"><li>• TRUE: Node can be promoted to target role</li><li>• FALSE: Node cannot be promoted to target role</li></ul>                                                                          |

| Column | Datatype     | NULL | Description                                                                                                                                                                                                                                                                            |
|--------|--------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE  | VARCHAR2(20) |      | Current state of the node. Possible values: <ul style="list-style-type: none"><li>• OK: Node is registered</li><li>• REGISTRATION_PENDING: Node registration has started, but has not been completed</li><li>• SYNC_FAILED: Unable to synchronize the topology with the node</li></ul> |

## 7.77 DBA\_UMF\_SERVICE

DBA\_UMF\_SERVICE displays information about the registered services in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered services in the topology if you are querying on a target node

| Column        | Datatype      | NULL     | Description                                                                                                                                     |
|---------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| TOPOLOGY_NAME | VARCHAR2(128) | NOT NULL | Topology name for the service                                                                                                                   |
| NODE_ID       | NUMBER        | NOT NULL | Node ID of the node providing the service                                                                                                       |
| SERVICE_ID    | VARCHAR2(7)   |          | Service Identifier. Possible values: <ul style="list-style-type: none"><li>• 1: Automatic Workload Repository</li><li>• 2: SQL Tuning</li></ul> |

## 7.78 DBA\_UMF\_TOPOLOGY

DBA\_UMF\_TOPOLOGY displays information about the registered topologies in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns one row per registered topology if you are querying on a target node.

| Column        | Datatype      | NULL     | Description                |
|---------------|---------------|----------|----------------------------|
| TOPOLOGY_NAME | VARCHAR2(128) | NOT NULL | Unique topology name       |
| TARGET_ID     | NUMBER        |          | Node ID of the target node |

| Column           | Datatype    | NULL     | Description                                                                                                                                                                      |
|------------------|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOPOLOGY_VERSION | NUMBER      | NOT NULL | Topology version number                                                                                                                                                          |
| TOPOLOGY_STATE   | VARCHAR2(8) |          | Possible values: <ul style="list-style-type: none"> <li>ACTIVE: Topology can be used for RMF operations</li> <li>INACTIVE: Topology cannot be used for RMF operations</li> </ul> |

## 7.79 DBA\_UNDO\_EXTENTS

DBA\_UNDO\_EXTENTS describes the extents comprising the segments in all undo tablespaces in the database.

### Note

The status of the undo space distribution reported by DBA\_UNDO\_EXTENTS is correct for the undo tablespace that is active on the instance on which DBA\_UNDO\_EXTENTS is queried. However, due to the use of in-memory information that is different on each instance, there can be a discrepancy in the status of the undo space distribution of undo tablespaces active on other instances when queried from one instance. This does not affect undo functionality and is only a reporting discrepancy for other instances' undo tablespace space distribution status. As a best practice, query the space distribution for an undo tablespace from the instance on which it is active.

| Column          | Datatype      | NULL     | Description                                                                                                                                 |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | CHAR(3)       |          | Owner of the undo tablespace                                                                                                                |
| SEGMENT_NAME    | VARCHAR2(128) | NOT NULL | Name of the undo segment                                                                                                                    |
| TABLESPACE_NAME | VARCHAR2(128) | NOT NULL | Name of the undo tablespace                                                                                                                 |
| EXTENT_ID       | NUMBER        |          | ID of the extent                                                                                                                            |
| FILE_ID         | NUMBER        | NOT NULL | Absolute file number of the data file containing the extent                                                                                 |
| BLOCK_ID        | NUMBER        |          | Start block number of the extent                                                                                                            |
| BYTES           | NUMBER        |          | Size of the extent (in bytes)                                                                                                               |
| BLOCKS          | NUMBER        |          | Size of the extent (in blocks)                                                                                                              |
| RELATIVE_FNO    | NUMBER        |          | Relative number of the file containing the segment header                                                                                   |
| COMMIT_JTIME    | NUMBER        |          | Commit time of the undo in the extent expressed as Julian time. This column is deprecated, but retained for backward compatibility reasons. |

| Column       | Datatype     | NULL | Description                                                                                                                                      |
|--------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMIT_WTIME | VARCHAR2(20) |      | Commit time of the undo in the extent expressed as Wallclock time. This column is deprecated, but retained for backward compatibility reasons.   |
| STATUS       | VARCHAR2(9)  |      | Transaction Status of the undo in the extent: <ul style="list-style-type: none"> <li>• ACTIVE</li> <li>• EXPIRED</li> <li>• UNEXPIRED</li> </ul> |

## 7.80 DBA\_UNUSED\_COL\_TABS

DBA\_UNUSED\_COL\_TABS describes all tables in the database containing unused columns. Its columns are the same as those in ALL\_UNUSED\_COL\_TABS.

## 7.81 DBA\_UNUSED\_GRANTS

DBA\_UNUSED\_GRANTS shows all the grants that are not used during the privilege capture.

| Column       | Datatype      | NULL | Description                                                               |
|--------------|---------------|------|---------------------------------------------------------------------------|
| CAPTURE      | VARCHAR2(128) |      | Name of the privilege analysis policy                                     |
| RUN_NAME     | VARCHAR2(128) |      | Name of the run of the privilege analysis policy                          |
| GRANTEE      | VARCHAR2(128) |      | Name of the user who is granted with the privilege or role                |
| ROLENAME     | VARCHAR2(128) |      | Name of the role that is granted to the grantee                           |
| SYS_PRIV     | VARCHAR2(40)  |      | Name of the system privilege that is granted to the grantee               |
| OBJ_PRIV     | VARCHAR2(40)  |      | Name of the object privilege that is granted to the grantee               |
| USER_PRIV    | VARCHAR2(25)  |      | Name of the user privilege that is granted to the grantee                 |
| OBJECT_OWNER | VARCHAR2(128) |      | Name of the owner of the object for which the object privilege is granted |
| OBJECT_NAME  | VARCHAR2(128) |      | Name of the object for which the object privilege is granted              |
| OBJECT_TYPE  | VARCHAR2(23)  |      | Type of the object for which the object privilege is granted              |
| COLUMN_NAME  | VARCHAR2(128) |      | Name of the column in the table for which the object privilege is granted |
| OPTION\$     | NUMBER        |      | Whether the grant option of the privilege is granted                      |

# 7.82 DBA\_UNUSED\_OBJPRIVS

DBA\_UNUSED\_OBJPRIVS lists the object privileges (without privilege grant paths) that are not used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column       | Datatype      | NULL     | Description                                                                                                                                                                                                                                                      |

## 7.85 DBA\_UNUSED\_SYSPRIVS

DBA\_UNUSED\_SYSPRIVS lists the system privileges (without privilege grant paths) that are not used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column   | Datatype      | NULL     | Description                                    |
|----------|---------------|----------|------------------------------------------------|
| CAPTURE  | VARCHAR2(128) | NOT NULL | Name of a privilege analysis policy            |
| USERNAME | VARCHAR2(128) |          | Name of the user whose privileges are reported |

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                                         |

## 7.88 DBA\_UNUSED\_USERPRIVS\_PATH

DBA\_UNUSED\_USERPRIVS\_PATH lists the user privileges that are not used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column       | Datatype      | NULL     | Description                                                                                                                                                                                                                                                         |

## 7.90 DBA\_USED\_OBJPRIVS

DBA\_USED\_OBJPRIVS lists the object privileges (without privilege grant paths) that are used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column       | Datatype      | NULL     | Description                                                                                                                                                                                           |

## 7.92 DBA\_USED\_PRIVS

DBA\_USED\_PRIVS lists the privileges that are used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column   | Datatype      | NULL     | Description                                                                               |
|----------|---------------|----------|-------------------------------------------------------------------------------------------|
| CAPTURE  | VARCHAR2(128) | NOT NULL | Name of a privilege analysis policy                                                       |
| SEQUENCE | NUMBER        | NOT NULL | The sequence number of the privilege analysis run during which the privilege was reported |
| OS_USER  | VARCHAR2(128) |          | Operating system login username                                                           |

| Column       | Datatype      | NULL     | Description                                                                                                                                                                                                                                                   |
|--------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 7.94 DBA\_USED\_SYSPRIVS

DBA\_USED\_SYSPRIVS lists the system privileges (without privilege grant paths) that are used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column    | Datatype      | NULL     | Description                                                                           |
|-----------|---------------|----------|---------------------------------------------------------------------------------------|
| CAPTURE   | VARCHAR2(128) | NOT NULL | Name of a privilege analysis policy                                                   |
| SEQUENCE  | NUMBER        | NOT NULL | The sequence number of the privilege analysis run during which the privilege was used |
| OS_USER   | VARCHAR2(128) |          | Operating system login username                                                       |
| USERHOST  | VARCHAR2(128) |          | Client host machine name                                                              |

## 7.97 DBA\_USED\_USERPRIVS\_PATH

DBA\_USED\_USERPRIVS\_PATH lists the user privileges that are used for the privilege analysis policies reported by the DBMS\_PRIVILEGE\_CAPTURE.GENERATE\_RESULT procedure.

This view provides access to analyzed privilege records in SYS tables.

You must have the CAPTURE\_ADMIN role to access this view.

| Column       | Datatype      | NULL     | Description                                                                                                                                                                                                                                                         |
|--------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAPTURE      | VARCHAR2(128) | NOT NULL | Name of a privilege analysis policy                                                                                                                                                                                                                                 |
| SEQUENCE     | NUMBER        | NOT NULL | The sequence number of the privilege analysis run during which the privilege was reported                                                                                                                                                                           |

| EXTERNAL_NAME               | VARCHAR2(4000) |          | User external name. For centrally managed users, if the database user mapping is an exclusive mapping, then this will be the directory service DN for the user. If this database user is a shared schema, it will be the DN of a group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PASSWORD_VERSIONS           | VARCHAR2(12)   |          | <p>Shows the list of versions of the password hashes (also known as "verifiers") existing for the account. The values for this column can include:</p> <ul style="list-style-type: none"> <li>• 10G: If an old case-insensitive ORCL hash exists</li> <li>• 11G: If a SHA-1 hash exists</li> <li>• 12C: If a de-optimized PBKDF2-based hash exists</li> <li>• HTTP: If an MD5 hash (for HTTP Digest authentication) exists</li> </ul> <p>For more information about the 12C verifier, see <i>Oracle Database Concepts</i>.</p> <p>Note that any combination of these verifiers can exist for any given account.</p>                                                                                                                                                                                                                                                                                                                         |
| EDITIONS_ENABLED            | VARCHAR2(1)    |          | Indicates whether editions have been enabled for the corresponding user (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column                      | Datatype                    | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTHENTICATION_TYPE         | VARCHAR2(8)                 |      | Indicates the authentication mechanism for the user: <ul style="list-style-type: none"> <li>NONE - The user has not been configured for an authentication method</li> <li>EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY;</li> <li>GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY;</li> <li>PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;</li> </ul>                                                                                                         |
| PROXY_ONLY_CONNECT          | VARCHAR2(1)                 |      | Indicates whether a user can connect directly (N) or whether the account can only be proxied (Y) by users who have proxy privileges for this account (that is, by users who have been granted the "connect through" privilege for this account).<br><br>For more information about creating proxy user accounts and authorizing users to connect through them, see <i>Oracle Database Security Guide</i> .                                                                                          |
| COMMON                      | VARCHAR2(3)                 |      | Indicates whether a given user is common. Possible values <ul style="list-style-type: none"> <li>YES if a user is common</li> <li>NO if a user is local (not common)</li> </ul>                                                                                                                                                                                                                                                                                                                     |
| LAST_LOGIN                  | TIMESTAMP(9) WITH TIME ZONE |      | The time of the last user login<br><br>This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM   SYSBACKUP   SYSDBA   SYSDG   SYSOPER   SYSRAC   SYSKM }.                                                                                                                                                                                                                                                                            |
| ORACLE_MAINTAINED           | VARCHAR2(1)                 |      | Denotes whether the user was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A user for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.                                                                                                                                                                                                                                                  |
| INHERITED                   | VARCHAR2(3)                 |      | Indicates whether the user definition was inherited from another container (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                        |
| DEFAULT_COLLATION           | VARCHAR2(100)               |      | Default collation for the user's schema                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IMPLICIT                    | VARCHAR2(3)                 |      | Indicates whether this user is a common user created by an implicit application (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                   |
| ALL_SHARD                   | VARCHAR2(3)                 |      | In a sharded database, the value in this column indicates whether the user was created with shard DDL enabled. The possible values are: <ul style="list-style-type: none"> <li>YES: The user was created with shard DDL enabled. The user exists on all shards and the shard catalog.</li> <li>NO: The user was created without shard DDL enabled. The user exists only in the database in which the user was created.</li> </ul> In a non-sharded database, the value in this column is always NO. |
| EXTERNAL_SHARD <sup>1</sup> | VARCHAR2(3)                 |      | In a federated sharded database, the value in this column indicates whether the user is an external shard user (YES) or not (NO).<br><br>In other types of databases, the value in this column is always NO.                                                                                                                                                                                                                                                                                        |

| Column                                   | Datatype    | NULL | Description                                                                                                                                                                                                                           |
|------------------------------------------|-------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PASSWORD_CHANGE_DATE                     | DATE        |      | Date on which the user's password was last set<br>This column is populated only when the value of the AUTHENTICATION_TYPE column is PASSWORD. Otherwise, this column is null.                                                         |
| MANDATORY_PROFILE_VIOLATION <sup>1</sup> | VARCHAR2(3) |      | If the value in this column is YES, then the user account password violates the mandatory profile password complexity requirements and must be changed before the grace period expires.<br>Otherwise, the value in this column is NO. |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 7.99 DBA\_USERS\_WITH\_DEFPWD

DBA\_USERS\_WITH\_DEFPWD displays all users in the database that are still using their default passwords.

| Column   | Datatype       | NULL     | Description                             |
|----------|----------------|----------|-----------------------------------------|
| USERNAME | VARCHAR2(128)  | NOT NULL | Name of the user                        |
| PRODUCT  | VARCHAR2(4000) |          | Name of the product the user belongs to |

#### Note

In a CDB, when DBA\_USERS\_WITH\_DEFPWD is queried from a PDB, information about local users who are using their default passwords is displayed. To display information about common users, query DBA\_USERS\_WITH\_DEFPWD from the root.

## 7.100 DBA\_USTATS

DBA\_USTATS describes the user-defined statistics collected on all tables and indexes in the database. Its columns are the same as those in ALL\_USTATS.

### ① See Also

["ALL\\_USTATS"](#)

## 7.101 DBA\_VARRAYS

DBA\_VARRAYS describes all varrays in the database. Its columns are the same as those in ALL\_VARRAYS.

### ① See Also

["ALL\\_VARRAYS"](#)

## 7.102 DBA\_VIEWS

DBA\_VIEWS describes all views in the database. Its columns are the same as those in ALL\_VIEWS.

### ① See Also

["ALL\\_VIEWS"](#)

## 7.103 DBA\_VIEWS\_AE

DBA\_VIEWS\_AE describes all views (across all editions) in the database. Its columns are the same as those in ALL\_VIEWS\_AE.

### ① See Also

["ALL\\_VIEWS\\_AE"](#)

## 7.104 DBA\_WAITERS

DBA\_WAITERS shows all the sessions that are waiting for a lock. In an Oracle RAC environment, this only applies if the waiter is on the same instance.

| Column          | Datatype     | NULL | Description                                       |
|-----------------|--------------|------|---------------------------------------------------|
| WAITING_SESSION | NUMBER       |      | The waiting session                               |
| WAITING_CON_ID  | NUMBER       |      | The container ID (CON_ID) of the waiting session  |
| HOLDING_SESSION | NUMBER       |      | The holding session                               |
| HOLDING_CON_ID  | NUMBER       |      | The container ID (CON_ID) of the holding session. |
| LOCK_TYPE       | VARCHAR2(26) |      | The lock type                                     |
| MODE_HELD       | VARCHAR2(40) |      | The mode held                                     |
| MODE_REQUESTED  | VARCHAR2(40) |      | The mode requested                                |
| LOCK_ID1        | NUMBER       |      | Lock ID 1                                         |
| LOCK_ID2        | NUMBER       |      | Lock ID 2                                         |

## 7.105 DBA\_WALLET\_ACES

DBA\_WALLET\_ACES describes access control entries defined in wallet access control lists.

### Related View

USER\_WALLET\_ACES describes the status of access control entries for the current user to access wallets through PL/SQL network utility packages. This view does not display the ACE\_ORDER, START\_DATE, END\_DATE, GRANT\_TYPE, INVERTED\_PRINCIPAL, PRINCIPAL, or PRINCIPAL\_TYPE columns.

| Column             | Datatype       | NULL     | Description                                                               |
|--------------------|----------------|----------|---------------------------------------------------------------------------|
| WALLET_PATH        | VARCHAR2(1000) | NOT NULL | Wallet path                                                               |
| ACE_ORDER          | NUMBER         | NOT NULL | Order number of the access control entry                                  |
| START_DATE         | TIMESTAMP(6)   |          | Start date of the access control entry                                    |
| END_DATE           | TIMESTAMP(6)   |          | End date of the access control entry                                      |
| GRANT_TYPE         | VARCHAR2(5)    |          | Indicates whether the access control entry grants or denies the privilege |
| INVERTED_PRINCIPAL | VARCHAR2(3)    |          | Indicates whether the principal is inverted or not                        |
| PRINCIPAL          | VARCHAR2(128)  |          | Principal the privilege is applied to                                     |
| PRINCIPAL_TYPE     | VARCHAR2(16)   |          | Type of the principal                                                     |
| PRIVILEGE          | VARCHAR2(128)  |          | Privilege                                                                 |

## 7.106 DBA\_WALLET\_ACLS

DBA\_WALLET\_ACLS displays the access control lists assigned to restrict access to wallets through PL/SQL network utility packages.

| Column      | Datatype       | NULL     | Description                          |
|-------------|----------------|----------|--------------------------------------|
| WALLET_PATH | VARCHAR2(1000) | NOT NULL | Wallet path                          |
| ACL         | VARCHAR2(4000) |          | Path of the access control list      |
| ACLID       | RAW(8)         |          | Object ID of the access control list |
| ACL_OWNER   | VARCHAR2(128)  |          | Owner of the access control list     |

## 7.107 DBA\_WARNING\_SETTINGS

DBA\_WARNING\_SETTINGS displays information about the warning parameter settings for all objects in the database. Its columns are the same as those in ALL\_WARNING\_SETTINGS.

## 7.108 DBA\_WI\_CAPTURE\_FILES

Each row in DBA\_WI\_CAPTURE\_FILES represents a capture file that belongs to the workload analyzed in the current Workload Intelligence job.

| Column    | Datatype       | NULL     | Description                                                                       |
|-----------|----------------|----------|-----------------------------------------------------------------------------------|
| JOB_ID    | NUMBER         | NOT NULL | The identifier of the job in the workload to which the given capture file belongs |
| FILE_ID   | NUMBER         | NOT NULL | The identifier of the current capture file                                        |
| FILE_PATH | VARCHAR2(4000) | NOT NULL | The path of the current capture file                                              |

## 7.109 DBA\_WI\_JOBS

Each row in DBA\_WI\_JOBS describes a Workload Intelligence job, that is, a task that applies the algorithms of Workload Intelligence on a given capture directory.

| Column            | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                     |
|-------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_ID            | NUMBER         | NOT NULL | The job identifier                                                                                                                                                                                                                                                              |
| JOB_NAME          | VARCHAR2(128)  | NOT NULL | A name that uniquely identifies the given job                                                                                                                                                                                                                                   |
| CAPTURE_DIRECTORY | VARCHAR2(4000) | NOT NULL | Path to the capture directory on which the given job has been applied                                                                                                                                                                                                           |
| MODEL_ORDER       | NUMBER         |          | The order of the markov model that describes the workload associated with the current job. If NULL, the corresponding order has not been calculated yet.                                                                                                                        |
| THRESHOLD         | NUMBER         |          | A number in the range [0, 1] that represents the threshold that the user has given as an input parameter to the current job of Workload Intelligence for the identification of significant patterns. If NULL, the process of pattern identification has not been initiated yet. |

## 7.110 DBA\_WI\_OBJECTS

Each row in DBA\_WI\_OBJECTS represents a database object (table) that is accessed by the given template in the given Workload Intelligence job.

| Column      | Datatype    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|-------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_ID      | NUMBER      | NOT NULL | The identifier of the job in the workload of which the given object has been accessed                                                                                                                                                                                                                                                                                                |
| TEMPLATE_ID | NUMBER      | NOT NULL | The identifier of the template in the given job by which the current object has been accessed                                                                                                                                                                                                                                                                                        |
| OBJECT_ID   | NUMBER      | NOT NULL | The identifier of the current object                                                                                                                                                                                                                                                                                                                                                 |
| ACCESS_TYPE | VARCHAR2(2) | NOT NULL | Possible values: <ul style="list-style-type: none"> <li>R - Indicates that the current object has been accessed for reading by the given template</li> <li>W - Indicates that the current object has been accessed for writing by the given template</li> <li>RW - Indicates that the current object has been accessed for both reading and writing by the given template</li> </ul> |

## 7.111 DBA\_WI\_PATTERN\_ITEMS

Each row in DBA\_WI\_PATTERN\_ITEMS represents a template that participates in a significant pattern that has been found by the given Workload Intelligence job.

| Column           | Datatype | NULL     | Description                                                                                                                                |
|------------------|----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_ID           | NUMBER   | NOT NULL | The identifier of the job in the workload of which the current pattern has been found                                                      |
| PATTERN_ID       | NUMBER   | NOT NULL | The identifier of the pattern to which the current item (template) belongs                                                                 |
| SEQUENCE_NUMBER  | NUMBER   | NOT NULL | Number that indicates the position of the current item in the given pattern                                                                |
| TEMPLATE_ID      | NUMBER   | NOT NULL | The identifier of the template that participates in the given position of the current pattern                                              |
| IS_FIRST_IN_LOOP | CHAR(1)  | NOT NULL | A flag that indicates whether or not the current item marks the beginning of a loop in the given pattern. The possible values are Y and N. |
| IS_LAST_IN_LOOP  | CHAR(1)  | NOT NULL | A flag that indicates whether or not the current item marks the end of a loop in the given pattern. The possible values are Y and N.       |

## 7.112 DBA\_WI\_PATTERNS

Each row in DBA\_WI\_PATTERNS represents a pattern that has been identified by Workload Intelligence as significant in the workload associated with the given job. Such a pattern consists of one or more templates.

These templates that comprise the given pattern are described in the related view DBA\_WI\_PATTERN\_ITEMS.

| Column               | Datatype | NULL     | Description                                                                                                       |
|----------------------|----------|----------|-------------------------------------------------------------------------------------------------------------------|
| JOB_ID               | NUMBER   | NOT NULL | The identifier of the job in the workload of which the current pattern has been found                             |
| PATTERN_ID           | NUMBER   | NOT NULL | The identifier of the current pattern                                                                             |
| LENGTH               | NUMBER   | NOT NULL | The length of the pattern, that is, the number of items (templates) it consists of                                |
| NUMBER_OF_EXECUTIONS | NUMBER   | NOT NULL | The number of times the current pattern has been executed in the given workload                                   |
| DB_TIME              | NUMBER   | NOT NULL | The total time consumed in the database server by all the executions of the current pattern in the given workload |

① **See Also**

["DBA\\_WI\\_PATTERN\\_ITEMS"](#)

## 7.113 DBA\_WI\_STATEMENTS

Each row in DBA\_WI\_STATEMENTS describes a statement (SQL or PL/SQL) that is part of the template with identifier TEMPLATE\_ID, which has been found in the workload that is related to the Workload Intelligence job whose identifier is equal to JOB\_ID.

A template may consist of multiple statements, for example, if it represents a transaction. In this case, there is one row in this view for every one of these statements. These statements are ordered, based on the order defined by the corresponding transaction. Column SEQUENCE\_NUMBER is used to describe this order.

| Column          | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                            |
|-----------------|----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_ID          | NUMBER   | NOT NULL | The identifier of the job in the workload of which the given statement has been found                                                                                                                                                                                                                  |
| TEMPLATE_ID     | NUMBER   | NOT NULL | The identifier of the template in the given job to which the current statement belongs                                                                                                                                                                                                                 |
| SEQUENCE_NUMBER | NUMBER   | NOT NULL | A number that indicates the order of the current statement in the given template                                                                                                                                                                                                                       |
| SQL_TEXT        | CLOB     | NOT NULL | The SQL text associated with the current statement. Note that although multiple SQL statements can be classified to the same template, only one row is stored that represents them all. This row corresponds to the first instance of the given template that is found during parsing of the workload. |

## 7.114 DBA\_WI\_TEMPLATE\_EXECUTIONS

Each row in DBA\_WI\_TEMPLATE\_EXECUTIONS represents an execution of a template in a capture that belongs to the workload that is associated with the current Workload Intelligence job.

| Column          | Datatype | NULL     | Description                                                                                            |
|-----------------|----------|----------|--------------------------------------------------------------------------------------------------------|
| JOB_ID          | NUMBER   | NOT NULL | The identifier of the job in the workload of which the current execution of the given template belongs |
| CAPTURE_FILE_ID | NUMBER   | NOT NULL | The identifier of the capture file in which the current execution of the given template was found      |
| SEQUENCE_NUMBER | NUMBER   | NOT NULL | A number that indicates the order of the current execution in the given capture file                   |
| TEMPLATE_ID     | NUMBER   | NOT NULL | The identifier of the template that was executed in the execution represented by the current row       |
| DB_TIME         | NUMBER   | NOT NULL | The time that the current execution consumed on the database server                                    |

## 7.115 DBA\_WI\_TEMPLATES

Each row in DBA\_WI\_TEMPLATES describes a template that has been found in the workload that is related to the Workload Intelligence job whose identifier is equal to JOB\_ID.

A template can represent either a simple query, or an entire transaction. Two queries in the given workload belong to the same template, if they exhibit trivial differences, for example, if they contain different literal values, different bind variable names, different comments, or different white spaces.

| Column         | Datatype | NULL     | Description                                                                                                                                                                                                                                                               |
|----------------|----------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_ID         | NUMBER   | NOT NULL | The identifier of the job in the workload of which the given template has been found                                                                                                                                                                                      |
| TEMPLATE_ID    | NUMBER   | NOT NULL | The identifier of a template in a given job                                                                                                                                                                                                                               |
| IS_TRANSACTION | CHAR(1)  | NOT NULL | Flag that indicates whether the given template represents a transaction: <ul style="list-style-type: none"> <li>Y - indicates that the given template represents a transaction</li> <li>N - indicates that the given template does not represent a transaction</li> </ul> |

## 7.116 DBA\_WORKLOAD\_ACTIVE\_USER\_MAP

DBA\_WORKLOAD\_ACTIVE\_USER\_MAP contains the mappings that are going to be valid for the next replay or are valid for the current replay.

| Column          | Datatype       | NULL     | Description                                                           |
|-----------------|----------------|----------|-----------------------------------------------------------------------|
| SCHEDULE_CAP_ID | NUMBER         |          | The ID of a capture in the schedule                                   |
| CAPTURE_USER    | VARCHAR2(4000) | NOT NULL | The user name during the time of the workload capture                 |
| REPLAY_USER     | VARCHAR2(4000) |          | The user name to which captured user should be remapped during replay |

## 7.117 DBA\_WORKLOAD\_CAPTURE\_SQLTEXT

DBA\_WORKLOAD\_CAPTURE\_SQLTEXT displays all the SQL statements that have been recorded in a workload capture. For those SQL statements whose length exceeds 1000 characters, the full statements can be loaded to the DBA\_WORKLOAD\_LONG\_SQLTEXT view using the DBMS\_WORKLOAD\_REPLAY.LOAD\_LONG\_SQLTEXT procedure.

| Column            | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                       |
|-------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAPTURE_ID        | NUMBER(38)     | NOT NULL | Internal key for the workload capture                                                                                                                                                                                                                                                                             |
| SQL_ID            | VARCHAR2(13)   | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                          |
| SQL_TYPE          | VARCHAR2(64)   |          | Type of the SQL statement, which can include values such as INSERT, SELECT, and CREATE INDEX                                                                                                                                                                                                                      |
| SQL_TEXT          | VARCHAR2(1000) |          | First thousand characters of the SQL text for the current cursor                                                                                                                                                                                                                                                  |
| SQL_LENGTH        | NUMBER(38)     |          | The length of the SQL statement                                                                                                                                                                                                                                                                                   |
| SQL_TEXT_COMPLETE | CHAR(1)        |          | Indicates whether the SQL_TEXT column includes the full text of the SQL statement. Possible values: <ul style="list-style-type: none"><li>Y: The column SQL_TEXT includes the full text of the SQL statement</li><li>N: The column SQL_TEXT contains only the first thousand characters of the SQL text</li></ul> |

## 7.118 DBA\_WORKLOAD\_CAPTURES

DBA\_WORKLOAD\_CAPTURES displays all the workload captures that have been performed in the current database.

It also lists captures on which DBMS\_WORKLOAD\_CAPTURE.GET\_CAPTURE\_INFO( ) or DBMS\_WORKLOAD\_REPLAY.GET\_REPLAY\_INFO( ) have been called. Each row contains information about one workload capture.

| Column | Datatype      | NULL     | Description                                             |
|--------|---------------|----------|---------------------------------------------------------|
| ID     | NUMBER        | NOT NULL | Internal key for the workload capture                   |
| NAME   | VARCHAR2(128) | NOT NULL | Name for the workload capture                           |
| DBID   | NUMBER        | NOT NULL | ID of the database in which the workload was captured   |
| DBNAME | VARCHAR2(128) | NOT NULL | Name of the database in which the workload was captured |

| Column                  | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBVERSION               | VARCHAR2(17)  | NOT NULL | Version of the database in which the workload was captured                                                                                                                                                                                                                                                                                                  |
| PARALLEL                | VARCHAR2(3)   |          | Indicates whether the database in which the workload was captured is an Oracle RAC database (YES) or a single instance database (NO)                                                                                                                                                                                                                        |
| DIRECTORY               | VARCHAR2(128) | NOT NULL | Name of the directory object for workload capture                                                                                                                                                                                                                                                                                                           |
| STATUS                  | VARCHAR2(40)  | NOT NULL | Current status of the workload capture: <ul style="list-style-type: none"> <li>• IN PROGRESS - Workload capture is in progress</li> <li>• COMPLETED - Workload capture has completed successfully</li> <li>• FAILED - Workload capture was terminated due to errors encountered</li> </ul>                                                                  |
| START_TIME              | DATE          | NOT NULL | Datetime when the capture began                                                                                                                                                                                                                                                                                                                             |
| END_TIME                | DATE          |          | Datetime when the capture completed or failed; NULL if the capture is still in progress                                                                                                                                                                                                                                                                     |
| DURATION_SECS           | NUMBER        |          | Duration of the workload capture (in seconds)                                                                                                                                                                                                                                                                                                               |
| START_SCN               | NUMBER        | NOT NULL | Start SCN value for this capture                                                                                                                                                                                                                                                                                                                            |
| END_SCN                 | NUMBER        |          | End SCN value for this capture; NULL if the capture is still in progress                                                                                                                                                                                                                                                                                    |
| DEFAULT_ACTION          | VARCHAR2(30)  | NOT NULL | Mode in which to apply workload capture filters: <ul style="list-style-type: none"> <li>• INCLUDE - All the capture filters are treated as EXCLUSION filters, determining the workload that will not be captured.</li> <li>• EXCLUDE - All the capture filters are treated as INCLUSION FILTERS, determining the workload that will be captured.</li> </ul> |
| FILTERS_USED            | NUMBER        |          | Number of filters that were used for this capture                                                                                                                                                                                                                                                                                                           |
| CAPTURE_SIZE            | NUMBER        |          | Total size of workload capture                                                                                                                                                                                                                                                                                                                              |
| DBTIME                  | NUMBER        |          | Total amount of database time (in microseconds) that has been recorded in this workload capture                                                                                                                                                                                                                                                             |
| DBTIME_TOTAL            | NUMBER        |          | Total amount of database time (in microseconds) across the entire database during the workload capture, including the part of the workload that was not captured.                                                                                                                                                                                           |
| USER_CALLS              | NUMBER        |          | Total number of user calls that have been recorded in this workload capture                                                                                                                                                                                                                                                                                 |
| USER_CALLS_TOTAL        | NUMBER        |          | Total number of user calls across the entire database during the workload capture, including the part of the workload that was not captured.                                                                                                                                                                                                                |
| USER_CALLS_UNREPLAYABLE | NUMBER        |          | Total number of user calls that will not be replayed in a subsequent replay of this workload capture                                                                                                                                                                                                                                                        |
| PLSQL_SUBCALL_SIZE      | NUMBER        |          | Total size of workload capture for SQL executed from PL/SQL                                                                                                                                                                                                                                                                                                 |
| PLSQL_CALLS             | NUMBER        |          | Total number of PL/SQL calls recorded in the workload capture                                                                                                                                                                                                                                                                                               |
| PLSQL_SUBCALLS          | NUMBER        |          | Total number of calls recorded in the workload capture for SQL executed from PL/SQL                                                                                                                                                                                                                                                                         |

| Column                 | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLSQL_DBTIME           | NUMBER         |          | Total amount of database time (in microseconds) from PL/SQL calls that have been recorded in the workload capture                                                                                                                                                                                                                                                                    |
| TRANSACTIONS           | NUMBER         |          | Total number of transactions that have been recorded in this workload capture                                                                                                                                                                                                                                                                                                        |
| TRANSACTIONS_TOTAL     | NUMBER         |          | Total number of transactions across the entire database during the workload capture, including the part of the workload that was not captured.                                                                                                                                                                                                                                       |
| CONNECTS               | NUMBER         |          | Total number of session connects that have been recorded in this workload capture                                                                                                                                                                                                                                                                                                    |
| CONNECTS_TOTAL         | NUMBER         |          | Total number of session connects across the entire database during the workload capture, including the part of the workload that was not captured                                                                                                                                                                                                                                    |
| ERRORS                 | NUMBER         |          | Total number of errors that have been recorded in this workload capture                                                                                                                                                                                                                                                                                                              |
| AWR_DBID               | NUMBER         |          | Database ID of the AWR snapshots that correspond to this workload capture. For captures that were performed in the current database, this value is equal to the current database's DBID. For captures that were performed in other databases, this value will either be NULL or will be populated by <code>DBMS_WORKLOAD_CAPTURE.IMPORT_AWR()</code> .                               |
| AWR_BEGIN_SNAP         | NUMBER         |          | Begin snapshot ID of the AWR snapshots that correspond to this workload capture                                                                                                                                                                                                                                                                                                      |
| AWR_END_SNAP           | NUMBER         |          | End snapshot ID of the AWR snapshots that correspond to this workload capture                                                                                                                                                                                                                                                                                                        |
| AWR_EXPORTED           | VARCHAR2(12)   |          | Indicates whether the AWR snapshots that correspond to this workload capture have been exported using <code>DBMS_WORKLOAD_CAPTURE.EXPORT_AWR()</code> (YES) or not (NO), or whether AWR snapshots cannot be exported because the capture is still in progress, has run to completion successfully, or was done in a different database from which it was not exported (NOT POSSIBLE) |
| ERROR_CODE             | NUMBER         |          | Error code for this workload capture                                                                                                                                                                                                                                                                                                                                                 |
| ERROR_MESSAGE          | VARCHAR2(512)  |          | Error message for this workload capture                                                                                                                                                                                                                                                                                                                                              |
| DIR_PATH               | VARCHAR2(4000) | NOT NULL | Full directory path for the workload capture directory object                                                                                                                                                                                                                                                                                                                        |
| DIR_PATH_SHARED        | VARCHAR2(10)   | NOT NULL | Indicates whether the workload capture directory is shared by all the instances of the recording database (applicable only for Oracle RAC databases)                                                                                                                                                                                                                                 |
| LAST_PROCESSED_VERSION | VARCHAR2(128)  |          | Database version in which this capture was preprocessed using <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE()</code> last; NULL if the capture has never been preprocessed                                                                                                                                                                                                              |
| SQLSET_OWNER           | VARCHAR2(128)  |          | User name of the SQL tuning set owner                                                                                                                                                                                                                                                                                                                                                |
| SQLSET_NAME            | VARCHAR2(128)  |          | Name of the SQL tuning set for this workload capture                                                                                                                                                                                                                                                                                                                                 |

| Column              | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLSQL_MODE          | VARCHAR2(12)  |      | Capture options for PL/SQL calls. Possible values: <ul style="list-style-type: none"> <li>• TOP_LEVEL: Top-level PL/SQL only</li> <li>• EXTENDED: Both top-level PL/SQL and SQL executed from PL/SQL</li> </ul>                                                                                                                                 |
| ENCRYPTION          | VARCHAR2(128) |      | Indicates the encryption standard used for the given capture: <ul style="list-style-type: none"> <li>• NULL - Capture files are not encrypted</li> <li>• AES128 – Capture files are encrypted using AES128</li> <li>• AES192 – Capture files are encrypted using AES192</li> <li>• AES256 – Capture files are encrypted using AES256</li> </ul> |
| ENCRYPTION_VERIFIER | RAW(512)      |      | Data used internally for creating an encrypted capture                                                                                                                                                                                                                                                                                          |
| PATCH_NAME          | VARCHAR2(128) |      | Database workload capture and replay patch name<br>This column is populated only for backports to Oracle Database 12c Release 1 (12.1) and earlier releases.                                                                                                                                                                                    |
| STORAGE_TYPE        | NUMBER(38)    |      | Describes where the captured workload is stored                                                                                                                                                                                                                                                                                                 |

## 7.119 DBA\_WORKLOAD\_CONNECTION\_MAP

DBA\_WORKLOAD\_CONNECTION\_MAP displays the connection mapping information for workload replay. Each row defines one connection mapping for a particular workload replay.

| Column          | Datatype       | NULL     | Description                                                                         |
|-----------------|----------------|----------|-------------------------------------------------------------------------------------|
| REPLAY_ID       | NUMBER         | NOT NULL | ID of the replay (corresponds to DBA_WORKLOAD_REPLAYS.ID)                           |
| CONN_ID         | NUMBER         | NOT NULL | Key (ID) of the connection mapping table                                            |
| SCHEDULE_CAP_ID | NUMBER         |          | Schedule capture ID (corresponds to DBA_WORKLOAD_SCHEDULE_CAPTURES.SCHEDULE_CAP_ID) |
| CAPTURE_CONN    | VARCHAR2(4000) | NOT NULL | Connection string that was used during capture                                      |
| REPLAY_CONN     | VARCHAR2(4000) |          | Connection string that should be used during replay                                 |

## 7.120 DBA\_WORKLOAD\_DIV\_SUMMARY

DBA\_WORKLOAD\_DIV\_SUMMARY displays a summary of the replay divergence information in the DBA\_WORKLOAD\_REPLAY\_DIVERGENCE view. DBA\_WORKLOAD\_REPLAY\_DIVERGENCE may have

duplicate entries, while DBA\_WORKLOAD\_DIV\_SUMMARY keeps only one entry and tracks the number of occurrences of each duplicate entry.

Starting with Oracle Database 12.2.0.1, the replay report is generated from DBA\_WORKLOAD\_DIV\_SUMMARY instead of from DBA\_WORKLOAD\_REPLAY\_DIVERGENCE, which results in faster generation of the replay report.

| Column                   | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_ID                | NUMBER         | NOT NULL | ID (key) for the workload replay                                                                                                                                                                                                                                                                                                                                                                                                         |
| DIVERGENCE_TYPE          | NUMBER         | NOT NULL | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IS_QUERY_DATA_DIVERGENCE | VARCHAR2(1)    |          | Indicates whether the data divergence is from the number of rows fetched by SELECT queries (Y) or not (N)                                                                                                                                                                                                                                                                                                                                |
| IS_DML_DATA_DIVERGENCE   | VARCHAR2(1)    |          | Indicates whether the divergence is from the number of rows affected by INSERT, UPDATE, or DELETE SQL statements (Y) or not (N)                                                                                                                                                                                                                                                                                                          |
| IS_ERROR_DIVERGENCE      | VARCHAR2(1)    |          | Indicates whether the divergence is from errors seen during capture or replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                             |
| IS_THREAD_FAILURE        | VARCHAR2(1)    |          | Indicates whether the divergence is from sessions that failed during replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                               |
| IS_DATA_MASKED           | VARCHAR2(1)    |          | Indicates whether the SQL call contains masked bind data (Y) or not (N).<br><br>If data masking technology is used at the replay database, the workload capture files need to be masked. Otherwise, SQL statements generated from capture files that contain sensitive bind data will not match the database. When the replay client sends masked bind data to the server, it turns on the IS_DATA_MASKED flag for the current SQL call. |
| IS_CLIENT_FAILURE        | VARCHAR2(1)    |          | Indicates whether the workload replay client failed during replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                         |
| STREAM_ID                | NUMBER         | NOT NULL | Stream ID of the session that reported the divergence                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_ID                   | VARCHAR2(13)   |          | SQL ID of the SQL that reported the divergence                                                                                                                                                                                                                                                                                                                                                                                           |
| EXPECTED_ERROR#          | NUMBER         |          | Error number that was seen during capture (0 if the capture ran successfully)                                                                                                                                                                                                                                                                                                                                                            |
| EXPECTED_ERROR_MESSAGE   | VARCHAR2(4000) |          | Text of the error message whose number appears in the EXPECTED_ERROR# column                                                                                                                                                                                                                                                                                                                                                             |
| OBSERVED_ERROR#          | NUMBER         |          | Actual error number seen during replay (0 if the replay ran successfully, 15566 (corresponding to ORA-15566) if the captured call could not be replayed)                                                                                                                                                                                                                                                                                 |
| OBSERVED_ERROR_MESSAGE   | VARCHAR2(4000) |          | Text of the error message whose number appears in the OBSERVED_ERROR# column                                                                                                                                                                                                                                                                                                                                                             |
| SERVICE                  | VARCHAR2(64)   |          | Service name of the session that reported the divergence                                                                                                                                                                                                                                                                                                                                                                                 |
| MODULE                   | VARCHAR2(64)   |          | Module name of the session that reported the divergence                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE_NUMBER          | NUMBER         |          | The number of the instance that reported the divergence                                                                                                                                                                                                                                                                                                                                                                                  |
| WRC_ID                   | NUMBER         |          | The identifier of the workload replay client                                                                                                                                                                                                                                                                                                                                                                                             |
| OCCURRENCES              | NUMBER         |          | Number of times the divergence occurred during replay                                                                                                                                                                                                                                                                                                                                                                                    |

### Example

The following query prints the top 3 SQL statements that got error divergence during replay. This query shows the captured error number and the actual error number seen during replay.

```
SQL> SELECT * FROM
 (SELECT occurrences, sql_id, expected_error#, observed_error#
 FROM dba_workload_div_summary
 WHERE replay_id = 123
 AND is_error_divergence = 'Y'
 ORDER BY occurrences DESC)
 WHERE ROWNUM <= 3;
```

| OCCURRENCES | SQL_ID         | EXPECTED_ERROR# | OBSERVED_ERROR# |
|-------------|----------------|-----------------|-----------------|
| 8           | 0xrm2wjddqv17m | 0               | 1               |
| 4           | 8bzwdnnznspjd  | 1422            | 0               |
| 3           | 6d8rwrac8dsk7  | 1               | 1400            |

## 7.121 DBA\_WORKLOAD\_FILTERS

DBA\_WORKLOAD\_FILTERS displays all the workload filters that have been defined in the current database.

In Oracle Database 11g, only workload filters of type CAPTURE are supported. Starting with Oracle Database 11gR2, filters of type REPLAY are supported.

| Column    | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE      | VARCHAR2(30)   |      | Type of the workload filter (CAPTURE or REPLAY)                                                                                                                                                                                                                                                                                                                                                                       |
| ID        | VARCHAR2(40)   |      | Sequence number of the workload filter                                                                                                                                                                                                                                                                                                                                                                                |
| STATUS    | VARCHAR2(6)    |      | Status of the workload filter: <ul style="list-style-type: none"> <li>NEW - This filter will be used by the next subsequent operation such as the next workload capture.</li> <li>IN USE - This filter is currently being used by an operation that is in progress such as an active workload capture.</li> <li>USED - This filter was used in the past by some operation such as a past workload capture.</li> </ul> |
| SET_NAME  | VARCHAR2(1000) |      | Name of the filter set to which the filter belongs                                                                                                                                                                                                                                                                                                                                                                    |
| NAME      | VARCHAR2(128)  |      | Name of the workload filter                                                                                                                                                                                                                                                                                                                                                                                           |
| ATTRIBUTE | VARCHAR2(128)  |      | Name of the attribute on which the filter is defined                                                                                                                                                                                                                                                                                                                                                                  |
| VALUE     | VARCHAR2(4000) |      | Value of the attribute on which the filter is defined. Wildcards such as % and _ are supported if the attribute is of string type.                                                                                                                                                                                                                                                                                    |

## 7.122 DBA\_WORKLOAD\_GROUP\_ASSIGNMENTS

DBA\_WORKLOAD\_GROUP\_ASSIGNMENTS displays all the workload capture groups and their assigned instances. A workload capture group is a subset of the captured workload. Each group accesses its own set of recorded database objects.

| Column            | Datatype   | NULL     | Description                                                                                                                   |
|-------------------|------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_DIR_NUMBER | NUMBER(38) | NOT NULL | The value that is associated with the subdirectory under the replay directory. See REPLAY_DIR_NUMBER in DBA_WORKLOAD_REPLAYS. |
| GROUP_ID          | NUMBER(38) | NOT NULL | The identifier of a workload capture group                                                                                    |
| INSTANCE_NUMBER   | NUMBER(38) | NOT NULL | The instance a given group is assigned to                                                                                     |

## 7.123 DBA\_WORKLOAD\_LONG\_SQLTEXT

DBA\_WORKLOAD\_LONG\_SQLTEXT displays the captured SQL statements that are longer than 1000 characters. You can load SQL statements longer than 1000 characters to the DBA\_WORKLOAD\_LONG\_SQLTEXT view using the DBMS\_WORKLOAD\_REPLAY.LOAD\_LONG\_SQLTEXT procedure.

| Column       | Datatype     | NULL     | Description                                              |
|--------------|--------------|----------|----------------------------------------------------------|
| CAPTURE_ID   | NUMBER(38)   | NOT NULL | Internal key for the workload capture                    |
| SQL_ID       | VARCHAR2(13) | NOT NULL | SQL identifier of the parent cursor in the library cache |
| SQL_FULLTEXT | CLOB         |          | Full text for the SQL statement exposed as a CLOB column |

## 7.124 DBA\_WORKLOAD\_REPLAY\_CLIENTS

DBA\_WORKLOAD\_REPLAY\_CLIENTS displays all workload replay clients and their assigned instances.

| Column          | Datatype   | NULL     | Description                                                                                            |
|-----------------|------------|----------|--------------------------------------------------------------------------------------------------------|
| WRC_ID          | NUMBER(38) | NOT NULL | The identifier of a workload replay client                                                             |
| SCHEDULE_CAP_ID | NUMBER(38) | NOT NULL | A unique identifier for a workload capture added to a replay schedule. 0 for a non-consolidated replay |
| INSTANCE_NUMBER | NUMBER(38) | NOT NULL | The instance that the replay client connects to                                                        |

## 7.125 DBA\_WORKLOAD\_REPLAY\_DIVERGENCE

DBA\_WORKLOAD\_REPLAY\_DIVERGENCE displays information about data/error divergence for a user call that has been replayed.

DBA\_WORKLOAD\_DIV\_SUMMARY displays a summary of the replay divergence information in the DBA\_WORKLOAD\_REPLAY\_DIVERGENCE view. DBA\_WORKLOAD\_REPLAY\_DIVERGENCE may have duplicate entries, while DBA\_WORKLOAD\_DIV\_SUMMARY keeps only one entry and tracks the number of occurrences of each duplicate entry.

| Column                   | Datatype                    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|-----------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_ID                | NUMBER                      | NOT NULL | ID (key) for the workload replay                                                                                                                                                                                                                                                                                                                                                                                                     |
| TIMESTAMP                | TIMESTAMP(6) WITH TIME ZONE |          | Time that the divergence occurred                                                                                                                                                                                                                                                                                                                                                                                                    |
| DIVERGENCE_TYPE          | NUMBER                      | NOT NULL | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                              |
| IS_QUERY_DATA_DIVERGENCE | VARCHAR2(1)                 |          | Indicates whether the data divergence is from the number of rows fetched by SELECT queries (Y) or not (N)                                                                                                                                                                                                                                                                                                                            |
| IS_DML_DATA_DIVERGENCE   | VARCHAR2(1)                 |          | Indicates whether the divergence is from the number of rows affected by INSERT, UPDATE, or DELETE SQL statements (Y) or not (N)                                                                                                                                                                                                                                                                                                      |
| IS_ERROR_DIVERGENCE      | VARCHAR2(1)                 |          | Indicates whether the divergence is from errors seen during capture or replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                         |
| IS_THREAD_FAILURE        | VARCHAR2(1)                 |          | Indicates whether the divergence is from sessions that failed during replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                           |
| IS_DATA_MASKED           | VARCHAR2(1)                 |          | Indicates whether the SQL call contains masked bind data (Y) or not (N).<br>If data masking technology is used at the replay database, the workload capture files need to be masked. Otherwise, SQL statements generated from capture files that contain sensitive bind data will not match the database. When the replay client sends masked bind data to the server, it turns on the IS_DATA_MASKED flag for the current SQL call. |
| IS_CLIENT_FAILURE        | VARCHAR2(1)                 |          | Indicates whether the workload replay client failed during replay (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                     |
| EXPECTED_ROW_COUNT       | NUMBER                      |          | Number of rows fetched for SELECT queries or rows affected for INSERT, UPDATE, or DELETE SQL statements during capture                                                                                                                                                                                                                                                                                                               |
| OBSERVED_ROW_COUNT       | NUMBER                      |          | Actual number of rows fetched for SELECT queries or rows affected for INSERT, UPDATE, or DELETE SQL statements during replay                                                                                                                                                                                                                                                                                                         |
| EXPECTED_ERROR#          | NUMBER                      |          | Error number that was seen during capture (0 if the capture ran successfully)                                                                                                                                                                                                                                                                                                                                                        |

| Column                 | Datatype       | NULL     | Description                                                                                                                                              |
|------------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPECTED_ERROR_MESSAGE | VARCHAR2(4000) |          | Text of the error message whose number appears in the EXPECTED_ERROR# column                                                                             |
| OBSERVED_ERROR#        | NUMBER         |          | Actual error number seen during replay (0 if the replay ran successfully, 15566 (corresponding to ORA-15566) if the captured call could not be replayed) |
| OBSERVED_ERROR_MESSAGE | VARCHAR2(4000) |          | Text of the error message whose number appears in the OBSERVED_ERROR# column                                                                             |
| STREAM_ID              | NUMBER         | NOT NULL | Stream ID of the session that reported the divergence                                                                                                    |
| CALL_COUNTER           | NUMBER         | NOT NULL | Call counter of the user call that reported the divergence                                                                                               |
| CAPTURE_STREAM_ID      | NUMBER         |          | Internal ID of the capture file whose replay produced the divergence                                                                                     |
| SQL_ID                 | VARCHAR2(13)   |          | SQL ID of the SQL that reported the divergence                                                                                                           |
| SESSION_ID             | NUMBER         | NOT NULL | Session ID of the session that reported the divergence                                                                                                   |
| SESSION_SERIAL#        | NUMBER         | NOT NULL | Captured session serial number of the session that reported the divergence                                                                               |
| SERVICE                | VARCHAR2(64)   |          | Service name of the session that reported the divergence                                                                                                 |
| MODULE                 | VARCHAR2(64)   |          | Module name of the session that reported the divergence                                                                                                  |
| ACTION                 | VARCHAR2(64)   |          | Action name of the session that reported the divergence                                                                                                  |
| INSTANCE_NUMBER        | NUMBER         |          | The number of the instance that reported the divergence                                                                                                  |
| WRC_ID                 | NUMBER         |          | The identifier of the workload replay client                                                                                                             |

## 7.126 DBA\_WORKLOAD\_REPLAY\_SCHEDULES

DBA\_WORKLOAD\_REPLAY\_SCHEDULES displays the names of replay schedules for the current replay directory.

A replay schedule defines one or multiple workload captures, and the order to start their replays. The current replay directory is set by `DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY('replay_dir')`. Each row in the view contains information about one replay schedule.

| Column        | Datatype      | NULL     | Description                                                                                                                |
|---------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------|
| SCHEDULE_NAME | VARCHAR2(128) | NOT NULL | The name of a schedule to be replayed. It defines one or multiple workload captures, and the order to start their replays. |
| DIRECTORY     | VARCHAR2(128) | NOT NULL | Directory object name for the replay schedule name                                                                         |

| Column | Datatype      | NULL | Description                                                                                                       |
|--------|---------------|------|-------------------------------------------------------------------------------------------------------------------|
| STATUS | VARCHAR2(128) |      | NEW if the schedule is being created, CURRENT if the schedule is currently being used by a replay, otherwise NULL |

## 7.127 DBA\_WORKLOAD\_REPLAYS

DBA\_WORKLOAD\_REPLAYS displays all the workload replays that have been performed in the current database.

It also lists replays on which DBMS\_WORKLOAD\_REPLAY.GET\_REPLAY\_INFO( ) has been called. Each row contains information about one workload replay.

| Column     | Datatype      | NULL     | Description                                                                                                                            |
|------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------|
| ID         | NUMBER        | NOT NULL | Internal key for the workload replay                                                                                                   |
| NAME       | VARCHAR2(128) | NOT NULL | Name of the workload replay                                                                                                            |
| DBID       | NUMBER        | NOT NULL | ID of the database in which the workload was replayed                                                                                  |
| DBNAME     | VARCHAR2(128) | NOT NULL | Name of the database in which the workload was replayed                                                                                |
| DBVERSION  | VARCHAR2(17)  | NOT NULL | Version of the database in which the workload was replayed                                                                             |
| PARALLEL   | VARCHAR2(3)   |          | Indicates whether the database in which the workload was replayed was an Oracle RAC database (YES) or a single instance database (NO)  |
| DIRECTORY  | VARCHAR2(128) | NOT NULL | Name of the directory object for the workload replay                                                                                   |
| CAPTURE_ID | NUMBER        |          | ID of the capture (DBA_WORKLOAD_CAPTURES.ID) that was replayed. If the replay involves a replay schedule, the CAPTURE_ID will be null. |

| Column             | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS             | VARCHAR2(40)  | NOT NULL | <p>Current status of the workload replay:</p> <ul style="list-style-type: none"> <li>• PREPARE - Workload prepare has been started and is waiting for clients to join</li> <li>• IN PROGRESS - Workload replay is in progress</li> <li>• COMPLETED - Workload replay has successfully completed</li> <li>• CANCELLED - Workload replay or the workload prepare has been cancelled</li> <li>• FAILED - Workload replay was terminated due to errors encountered. See the COMMENTS column for further information.</li> </ul>                                                                                                 |
| PREPARE_TIME       | DATE          |          | Datetime at which the workload prepare started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| START_TIME         | DATE          |          | Datetime when the replay began                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| FILTER_SET_NAME    | VARCHAR2(128) |          | Name of the filter set used for the replay                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DEFAULT_ACTION     | VARCHAR2(30)  | NOT NULL | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SYNCHRONIZATION    | VARCHAR2(9)   |          | <p>Indicates whether recorded transaction semantics should be maintained (TRUE) or not (FALSE)</p> <p>When synchronization is on, the commit order observed during the original workload capture will be preserved. Every action that is replayed will be executed only after all of its dependent commits have been executed. Dependent commits are commits that were issued before the given action in the original workload capture.</p> <p><b>See Also:</b> DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter</p> |
| CONNECT_TIME_SCALE | NUMBER        | NOT NULL | <p>Connection time scaling factor for captured streams during replay. The value is interpreted as a percentage. The default value of 100 means 100 percent.</p> <p><b>See Also:</b> DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter</p>                                                                                                                                                                                                                                                                             |

| Column                  | Datatype    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| THINK_TIME_SCALE        | NUMBER      | NOT NULL | <p>Think time scaling factor for captured streams during replay. It scales the thinking time elapsed between two successive user calls from the same captured stream. The input is interpreted as a percentage. The default value of 100 means 100 percent.</p> <p><b>See Also:</b> DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter</p> |
| THINK_TIME_AUTO_CORRECT | VARCHAR2(5) |          | <p>Indicates whether the think time should be automatically corrected between calls (TRUE) or not (FALSE)</p> <p>A value of TRUE reduces think time if replay goes slower than capture.</p> <p>A value of FALSE results in no action.</p> <p><b>See Also:</b> DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY() in <i>Oracle Database PL/SQL Packages and Types Reference</i> for a detailed explanation of this replay parameter</p>                       |
| SCALE_UP_MULTIPLIER     | NUMBER      | NOT NULL | <p>Before the multiple-capture replay, SCALE_UP_MULTIPLIER is used to scale up the query part of a workload capture. The queries from each captured session are replayed concurrently as many times as the value of SCALE_UP_MULTIPLIER.</p>                                                                                                                                                                                                    |
| USER_CALLS              | NUMBER      |          | Total number of user calls replayed                                                                                                                                                                                                                                                                                                                                                                                                             |
| DBTIME                  | NUMBER      |          | Accumulated database time (in microseconds) for the replay                                                                                                                                                                                                                                                                                                                                                                                      |
| NETWORK_TIME            | NUMBER      |          | Accumulated network time for the replay (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                       |
| THINK_TIME              | NUMBER      |          | Accumulated think time (in microseconds) for the replay                                                                                                                                                                                                                                                                                                                                                                                         |
| PAUSE_TIME              | NUMBER      |          | The total time (in seconds) that the replay has been paused (by calling the PAUSE_REPLAY procedure)                                                                                                                                                                                                                                                                                                                                             |
| PLSQL_CALLS             | NUMBER      |          | Total number of replayed top-level PL/SQL calls                                                                                                                                                                                                                                                                                                                                                                                                 |
| PLSQL_SUBCALLS          | NUMBER      |          | Total number of replayed calls for SQL executed from PL/SQL                                                                                                                                                                                                                                                                                                                                                                                     |
| PLSQL_DBTIME            | NUMBER      |          | Total amount of database time (in microseconds) from PL/SQL calls                                                                                                                                                                                                                                                                                                                                                                               |

| SCHEDULE_NAME             | VARCHAR2(128) |      | <p>The name of a schedule to be replayed. It defines one or multiple workload captures, and the order to start their replays.</p> <p>If SCHEDULE_NAME is NULL, the replay is a regular replay introduced since Oracle Database 11g, done with existing APIs from DBMS_WORKLOAD_REPLAY: INITIALIZE_REPLAY, PREPARE_REPLAY, and START_REPLAY.</p> <p>If SCHEDULE_NAME is not NULL, the replay is a new consolidated replay introduced in Oracle Database 12c. That is, it is a replay of one or more workload captures done with new APIs at DBMS_WORKLOAD_REPLAY: INITIALIZE_CONSOLIDATED_REPLAY, PREPARE_CONSOLIDATED_REPLAY, and START_CONSOLIDATED_REPLAY.</p> <p><b>See Also:</b> DBMS_WORKLOAD_REPLAY in <i>Oracle Database PL/SQL Packages and Types Reference</i></p> |
| DIVERGENCE_LOAD_STATUS    | VARCHAR2(5)   |      | Indicates whether replay divergence data have been loaded (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PLSQL_MODE                | VARCHAR2(12)  |      | <p>Replay options for PL/SQL calls. Possible values:</p> <ul style="list-style-type: none"> <li>• TOP_LEVEL: Top-level PL/SQL only</li> <li>• EXTENDED: SQL executed from PL/SQL or top-level PL/SQL if there is no SQL recorded inside the PL/SQL</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CONNECT_TIME_AUTO_CORRECT | VARCHAR2(12)  |      | <p>Indicates whether the waiting time for a new session to be connected is automatically reduced when the replay proceeds faster than its capture. The reduced amount is determined by the elapsed-time difference between the replay and the capture of the slowest session. The default value is true.</p> <p>There is no impact when the replay proceeds slower than the capture.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| RAC_MODE                  | VARCHAR2(19)  |      | <p>Replay options in an Oracle RAC environment:</p> <ul style="list-style-type: none"> <li>• GLOBAL_SYNC: Synchronization is across all instances. This is the default.<br/>Database connections from workload replay client (wrc) are done based on connection remapping.</li> <li>• PER_INSTANCE_CLIENT: Synchronization is across all instances.<br/>All database connections from one wrc are connected to only one instance.</li> <li>• PER_INSTANCE_SYNC: Synchronization is within one instance.<br/>All database connections from one wrc are connected to only one instance.</li> </ul>                                                                                                                                                                            |
| QUERY_ONLY                | VARCHAR2(1)   |      | Indicates whether only the query-only workload from the current workload capture will be replayed, skipping all the DML/DDDL that might update the database (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Column              | Datatype      | NULL | Description                                                                                                                                                  |
|---------------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDB_LEVEL           | VARCHAR2(1)   |      | Indicates whether the replay is a PDB-level replay (Y) or not (N)                                                                                            |
| NUM_CLIENTS_ABORTED | NUMBER        |      | Number of workload replay clients terminated during the replay                                                                                               |
| PATCH_NAME          | VARCHAR2(128) |      | Database workload capture and replay patch name<br>This column is only populated for backports to Oracle Database 12c Release 1 (12.1) and earlier releases. |
| DURATION_LIMIT      | NUMBER(38)    |      | Replay duration limit (in seconds)<br>If the replay duration limit has not been set, then the value of this column is null.                                  |
| STATUS_DETAILS      | VARCHAR2(128) |      | Provides additional details about the replay status<br>If additional details are not available, then the value of this column is null.                       |

## 7.128 DBA\_WORKLOAD\_SCHEDULE\_CAPTURES

DBA\_WORKLOAD\_SCHEDULE\_CAPTURES displays the workload captures used by replay schedules.

Each row in the view contains information about one workload capture.

| Column                  | Datatype       | NULL     | Description                                                                                                                                                                                                                                 |
|-------------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCHEDULE_NAME           | VARCHAR2(128)  | NOT NULL | The name of a schedule to be replayed                                                                                                                                                                                                       |
| SCHEDULE_CAP_ID         | NUMBER         | NOT NULL | Identifies a workload capture added to a replay schedule. It starts with 1. If the same capture is added multiple times to a schedule, there will be multiple rows with different SCHEDULE_CAP_ID columns and identical CAPTURE_ID columns. |
| CAPTURE_ID              | NUMBER         | NOT NULL | Points to the capture ID from DBA_WORKLOAD_CAPTURES.                                                                                                                                                                                        |
| CAPTURE_DIR             | VARCHAR2(128)  | NOT NULL | Name of the directory object for workload capture                                                                                                                                                                                           |
| OS_SUBDIR               | VARCHAR2(4000) | NOT NULL | Name of the subdirectory under the replay directory for this workload capture                                                                                                                                                               |
| MAX_CONCURRENT_SESSIONS | NUMBER         |          | The maximal number of concurrent sessions that was seen in this workload capture                                                                                                                                                            |
| NUM_CLIENTS_ASSIGNED    | NUMBER         |          | Number of clients assigned to this workload capture before replay starts                                                                                                                                                                    |
| NUM_CLIENTS             | NUMBER         |          | Number of clients that are running for this workload capture during replay                                                                                                                                                                  |
| NUM_CLIENTS_DONE        | NUMBER         |          | Number of clients that have finished the replay of this workload capture                                                                                                                                                                    |
| STOP_REPLAY             | VARCHAR2(1)    | NOT NULL | Indicates whether the whole replay will stop once the replay of this workload capture is done (Y) or not (N)                                                                                                                                |

| Column              | Datatype    | NULL     | Description                                                                                                                                                                                                                                                           |
|---------------------|-------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TAKE_BEGIN_SNAPSHOT | VARCHAR2(1) | NOT NULL | Indicates whether an AWR snapshot will be taken when the replay of this capture starts (Y) or not (N)                                                                                                                                                                 |
| TAKE_END_SNAPSHOT   | VARCHAR2(1) | NOT NULL | Indicates whether an AWR snapshot will be taken when the replay of this capture finishes (Y) or not (N)                                                                                                                                                               |
| QUERY_ONLY          | VARCHAR2(1) | NOT NULL | Indicates whether only the query-only workload from the current workload capture will be replayed, skipping all the DML/DDDL that might update the database (Y) or not (N)                                                                                            |
| START_DELAY_SECS    | NUMBER      |          | Displays the wait time (in seconds) when the replay of a workload capture is ready to start. "Ready to start" means the capture does not wait for any other capture, or all the captures for which it should wait have already been replayed. The default value is 0. |
| START_TIME          | DATE        |          | Start time for the replay of this capture                                                                                                                                                                                                                             |
| END_TIME            | DATE        |          | Finish time for the replay of this capture                                                                                                                                                                                                                            |
| AWR_DBID            | NUMBER      |          | AWR database ID of the replay                                                                                                                                                                                                                                         |
| AWR_BEGIN_SNAP      | NUMBER      |          | AWR snapshot ID when the replay starts                                                                                                                                                                                                                                |
| AWR_END_SNAP        | NUMBER      |          | AWR snapshot ID when the replay finishes                                                                                                                                                                                                                              |
| NUM_CLIENTS_ABORTED | NUMBER      |          | Number of workload replay clients terminated during the replay                                                                                                                                                                                                        |

## 7.129 DBA\_WORKLOAD\_SCHEDULE\_ORDERING

DBA\_WORKLOAD\_SCHEDULE\_ORDERING displays the start ordering between workload captures in the replay schedule.

Each row in the view defines one start ordering between two workload captures in the same replay schedule.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCHEDULE_NAME   | VARCHAR2(128) | NOT NULL | Name of a schedule to be replayed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SCHEDULE_CAP_ID | NUMBER        | NOT NULL | Identifies the workload capture that will wait                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| WAITFOR_CAP_ID  | NUMBER        | NOT NULL | Identifies the workload capture for which the workload capture identified by SCHEDULE_CAP_ID needs to wait. The replay of capture SCHEDULE_CAP_ID will not start until capture WAITFOR_CAP_ID finishes its replay.<br><br>If the view has multiple rows with the same SCHEDULE_CAP_ID but different WAITFOR_CAP_ID, it defines a schedule so that the replay of a capture specified by SCHEDULE_CAP_ID will not start unless all the replays of the waited captures run into completion.<br><br>If the view has multiple rows with the same WAITFOR_CAP_ID but different SCHEDULE_CAP_ID, it defines a schedule so that the replay of multiple captures will not start unless the replay of the capture specified by WAITFOR_CAP_ID finishes. |

## 7.130 DBA\_WORKLOAD\_SQL\_MAP

DBA\_WORKLOAD\_SQL\_MAP contains the mapping information for skipping or replacing a SQL statement based on its sql\_id during workload replay.

| Column               | Datatype       | NULL     | Description                                                                                                                                                                |
|----------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_ID            | NUMBER(38)     | NOT NULL | A foreign key to the ID column in the DBA_WORKLOAD_REPLAYs view                                                                                                            |
| SCHEDULE_CAP_ID      | NUMBER(38)     | NOT NULL | The ID of a capture in the schedule                                                                                                                                        |
| SQL_ID               | VARCHAR2(13)   | NOT NULL | SQL identifier of the SQL statement at the time of capture                                                                                                                 |
| OPERATION            | VARCHAR2(7)    |          | SKIP or REPLACE                                                                                                                                                            |
| SQL_ID_NUMBER        | NUMBER         |          | Internal representation of SQL_ID                                                                                                                                          |
| REPLACEMENT_SQL_TEXT | VARCHAR2(4000) |          | When the value in the OPERATION column is SKIP, this column is NULL.<br>When the value in the OPERATION column is REPLACE, this column shows the SQL statement to be used. |

## 7.131 DBA\_WORKLOAD\_TRACKED\_COMMITS

DBA\_WORKLOAD\_TRACKED\_COMMITS displays the commits tracked every second during a database replay.

| Column                     | Datatype   | NULL     | Description                                                                                                                               |
|----------------------------|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_DIR_NUMBER          | NUMBER     | NOT NULL | The numerical value that is associated with the subdirectory under the replay directory.<br>See REPLAY_DIR_NUMBER in DBA_WORKLOAD_REPLAYS |
| INSTANCE_NUMBER            | NUMBER(38) |          | The instance where the commit is executed                                                                                                 |
| FILE_ID                    | NUMBER(38) | NOT NULL | The file ID                                                                                                                               |
| CALL_CTR                   | NUMBER(38) | NOT NULL | The call counter of the commit                                                                                                            |
| COMMIT_SCN                 | NUMBER(38) |          | The recorded commit SCN value                                                                                                             |
| PREV_GLOBAL_COMMIT_FILE_ID | NUMBER(38) |          | The file ID of the latest commit across all sessions                                                                                      |
| PREV_GLOBAL_COMMIT_SCN     | NUMBER(38) |          | The recorded SCN of the latest commit across all sessions                                                                                 |
| PREV_LOCAL_COMMIT_CALL_CTR | NUMBER(38) |          | The call counter of the latest commit in the same session                                                                                 |
| CAPTURE_COMMIT_TIME        | NUMBER(38) |          | The time in seconds since the capture started                                                                                             |
| CAPTURE_COMMIT_TIME_DELTA  | NUMBER(38) |          | The elapsed time in seconds since the previous commit across all sessions during capture                                                  |
| REPLAY_COMMIT_TIME         | NUMBER(38) |          | The time in seconds since the replay started                                                                                              |
| REPLAY_COMMIT_TIME_DELTA   | NUMBER(38) |          | The elapsed time in seconds since the previous commit across all sessions during the replay                                               |

## 7.132 DBA\_WORKLOAD\_USER\_MAP

DBA\_WORKLOAD\_USER\_MAP contains all the mappings ever done until they are removed at some point.

The mappings are stored in a table made public through this view.

To remove old mappings, execute this statement:

```
SQL> delete * from DBA_WORKLOAD_USER_MAP;
```

| Column          | Datatype       | NULL     | Description                                                                                                                                                                               |
|-----------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_ID       | NUMBER         |          | This is a foreign key to the ID column in the DBA_WORKLOAD_REPLAYS view                                                                                                                   |
| SCHEDULE_CAP_ID | NUMBER         |          | The ID of a capture in the schedule                                                                                                                                                       |
| CAPTURE_USER    | VARCHAR2(4000) | NOT NULL | The user name during the time of the workload capture                                                                                                                                     |
| REPLAY_USER     | VARCHAR2(4000) |          | The user name to which the captured user should be remapped during replay. If the REPLAY_USER is null, the CAPTURE_USER is used during replay. In other words, the original user is used. |

## 7.133 DBA\_XML\_INDEXES

DBA\_XML\_INDEXES describes all XML indexes in the database. Its columns are the same as those in ALL\_XML\_INDEXES.

**① See Also**["ALL\\_XML\\_INDEXES"](#)

## 7.134 DBA\_XML\_NESTED\_TABLES

DBA\_XML\_NESTED\_TABLES describes all the tables and their corresponding nested tables. Its columns are the same as those in ALL\_XML\_NESTED\_TABLES.

### ① See Also

["ALL\\_XML\\_NESTED\\_TABLES"](#)

## 7.135 DBA\_XML\_OUT\_OF\_LINE\_TABLES

DBA\_XML\_OUT\_OF\_LINE\_TABLES describes all the out of line tables connected to a given root table for the same schema. Its columns are the same as those in ALL\_XML\_OUT\_OF\_LINE\_TABLES.

### ① See Also

["ALL\\_XML\\_OUT\\_OF\\_LINE\\_TABLES"](#)

## 7.136 DBA\_XML\_SCHEMA\_ATTRIBUTES

DBA\_XML\_SCHEMA\_ATTRIBUTES describes all the attributes and their properties. Its columns are the same as those in ALL\_XML\_SCHEMA\_ATTRIBUTES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_ATTRIBUTES"](#)

## 7.137 DBA\_XML\_SCHEMA\_COMPLEX\_TYPES

DBA\_XML\_SCHEMA\_COMPLEX\_TYPES describes all complex types in the database. Its columns are the same as those in ALL\_XML\_SCHEMA\_COMPLEX\_TYPES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_COMPLEX\\_TYPES"](#)

## 7.138 DBA\_XML\_SCHEMA\_ELEMENTS

DBA\_XML\_SCHEMA\_ELEMENTS describes all the elements and their properties. Its columns are the same as those in ALL\_XML\_SCHEMA\_ELEMENTS.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_ELEMENTS"](#)

## 7.139 DBA\_XML\_SCHEMA\_NAMESPACES

DBA\_XML\_SCHEMA\_NAMESPACES describes all the available namespaces. Its columns are the same as those in ALL\_XML\_SCHEMA\_NAMESPACES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_NAMESPACES"](#)

## 7.140 DBA\_XML\_SCHEMA\_SIMPLE\_TYPES

DBA\_XML\_SCHEMA\_SIMPLE\_TYPES describes all simple types. Its columns are the same as those in ALL\_XML\_SCHEMA\_SIMPLE\_TYPES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SIMPLE\\_TYPES"](#)

## 7.141 DBA\_XML\_SCHEMA\_SUBSTGRP\_HEAD

DBA\_XML\_SCHEMA\_SUBSTGRP\_HEAD describes the heads of substitution groups. Its columns are the same as those in ALL\_XML\_SCHEMA\_SUBSTGRP\_HEAD.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SUBSTGRP\\_HEAD"](#)

## 7.142 DBA\_XML\_SCHEMA\_SUBSTGRP\_MBRS

DBA\_XML\_SCHEMA\_SUBSTGRP\_MBRS describes all members of substitution groups. Its columns are the same as those in ALL\_XML\_SCHEMA\_SUBSTGRP\_MBRS.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SUBSTGRP\\_MBRS"](#)

## 7.143 DBA\_XML\_SCHEMAS

DBA\_XML\_SCHEMAS describes all registered XML schemas in the database. Its columns are the same as those in ALL\_XML\_SCHEMAS.

### ① See Also

["ALL\\_XML\\_SCHEMAS"](#)

## 7.144 DBA\_XML\_TAB\_COLS

DBA\_XML\_TAB\_COLS describes the columns of all XML tables in the database. Its columns are the same as those in ALL\_XML\_TAB\_COLS.

### ① See Also

["ALL\\_XML\\_TAB\\_COLS"](#)

## 7.145 DBA\_XML\_TABLES

DBA\_XML\_TABLES describes all XML tables in the database. Its columns are the same as those in ALL\_XML\_TABLES.

### ① See Also

["ALL\\_XML\\_TABLES"](#)

## 7.146 DBA\_XML\_VIEW\_COLS

DBA\_XML\_VIEW\_COLS describes the columns of all XML views in the database. Its columns are the same as those in ALL\_XML\_VIEW\_COLS.

### ① See Also

["ALL\\_XML\\_VIEW\\_COLS"](#)

## 7.147 DBA\_XML\_VIEWS

DBA\_XML\_VIEWS describes all XML views in the database. Its columns are the same as those in ALL\_XML\_VIEWS.

### ① See Also

["ALL\\_XML\\_VIEWS"](#)

## 7.148 DBA\_XS\_AUDIT\_POLICY\_OPTIONS

DBA\_XS\_AUDIT\_POLICY\_OPTIONS describes auditing options defined under all audit policies specific to Oracle Database Real Application Security.

| Column             | Datatype       | NULL | Description                                                                                                                 |
|--------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME        | VARCHAR2(128)  |      | Name of the audit policy                                                                                                    |
| AUDIT_CONDITION    | VARCHAR2(4000) |      | Condition associated with the audit policy                                                                                  |
| AUDIT_OPTION       | VARCHAR2(128)  |      | Auditing option defined in the audit policy                                                                                 |
| CONDITION_EVAL_OPT | VARCHAR2(9)    |      | Evaluation option associated with the audit policy's condition. The possible values are STATEMENT, SESSION, INSTANCE, NONE. |
| COMMON             | VARCHAR2(3)    |      | Indicates whether the audit policy is a common audit policy (YES) or local (NO). The value is NULL in non-CDBs.             |

## 7.149 DBA\_XS\_AUDIT\_TRAIL

DBA\_XS\_AUDIT\_TRAIL describes all audit records specific to Oracle Database Real Application Security.

| Column                   | Datatype                    | NULL | Description                                                                                                                                                                                        |
|--------------------------|-----------------------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERID                   | VARCHAR2(128)               |      | Name of the database user whose actions were audited                                                                                                                                               |
| ACTION                   | NUMBER                      |      | Numeric audit trail action type code. The corresponding name of the action type is in the ACTION_NAME column.                                                                                      |
| ACTION_NAME              | VARCHAR2(64)                |      | Name of the action type corresponding to the numeric code in the ACTION column                                                                                                                     |
| OBJ_OWNER                | VARCHAR2(128)               |      | Owner of the object affected by the action                                                                                                                                                         |
| OBJ_NAME                 | VARCHAR2(128)               |      | Name of the object affected by the action                                                                                                                                                          |
| RETURN_CODE              | NUMBER                      |      | Oracle error code generated by the action                                                                                                                                                          |
| XS_USER_NAME             | VARCHAR2(128)               |      | Name of the Real Application Security user                                                                                                                                                         |
| XS_SESSIONID             | RAW(33)                     |      | Identifier of the Real Application Security session                                                                                                                                                |
| XS_INACTIVITY_TIMEOUT    | NUMBER                      |      | Inactivity timeout of the Real Application Security session                                                                                                                                        |
| XS_ENTITY_TYPE           | VARCHAR2(32)                |      | Type of the Real Application Security entity. Possible values are USER, ROLE, ROLESSET, SECURITYCLASS, ACL, DATASECURITY, and NSTEMPLATE.                                                          |
| XS_TARGET_PRINCIPAL_NAME | VARCHAR2(128)               |      | Target principal name in Real Application Security operations. Possible operations are set verifier, set password, add proxy, remove proxy, switch user, assign user, create session, grant roles. |
| XS_PROXY_USER_NAME       | VARCHAR2(128)               |      | Name of the Real Application Security proxy user.                                                                                                                                                  |
| XS_DATASEC_POLICY_NAME   | VARCHAR2(128)               |      | Name of the Real Application Security data security policy enabled or disabled                                                                                                                     |
| XS_SCHEMA_NAME           | VARCHAR2(128)               |      | Name of the schema in enable, disable data security policy and global callback operation                                                                                                           |
| XS_CALLBACK_EVENT_TYPE   | VARCHAR2(32)                |      | Real Application Security global callback event type                                                                                                                                               |
| XS_PACKAGE_NAME          | VARCHAR2(128)               |      | Real Application Security callback package name for the global callback                                                                                                                            |
| XS_PROCEDURE_NAME        | VARCHAR2(128)               |      | Real Application Security callback procedure name for the global callback                                                                                                                          |
| XS_ENABLED_ROLE          | VARCHAR2(128)               |      | The role that is enabled                                                                                                                                                                           |
| XS_COOKIE                | VARCHAR2(1024)              |      | Real Application Security session cookie                                                                                                                                                           |
| XS_NS_NAME               | VARCHAR2(128)               |      | Name of the Real Application Security session namespace                                                                                                                                            |
| XS_NS_ATTRIBUTE          | VARCHAR2(4000)              |      | Name of the Real Application Security session namespace attribute                                                                                                                                  |
| XS_NS_ATTRIBUTE_OLD_VAL  | VARCHAR2(4000)              |      | The old value of the Real Application Security session namespace attribute                                                                                                                         |
| XS_NS_ATTRIBUTE_NEW_VAL  | VARCHAR2(4000)              |      | The new value of the Real Application Security session namespace attribute                                                                                                                         |
| EVENT_TIMESTAMP          | TIMESTAMP(6) WITH TIME ZONE |      | Timestamp of audit record                                                                                                                                                                          |

## 7.150 DBA\_XS\_ENABLED\_AUDIT\_POLICIES

DBA\_XS\_ENABLED\_AUDIT\_POLICIES describes all the audit policies specific to Oracle Database Real Application Security that are enabled to users.

**① Note**

This view was known as DBA\_XS\_ENB\_AUDIT\_POLICIES in Oracle Database 12c Release 1. It was renamed to DBA\_XS\_ENABLED\_AUDIT\_POLICIES in Oracle Database 12c Release 2 (12.2.0.1).

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                            |
|----------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME    | VARCHAR2(128) |      | Name of the audit policy                                                                                                                                                                                                                                                                                                                               |
| ENABLED_OPTION | VARCHAR2(15)  |      | Enabled option of the audit policy. Possible values: <ul style="list-style-type: none"> <li>• BY USER: For policies that are enabled on users</li> <li>• EXCEPT USERS: For policies that are enabled on users</li> <li>• BY GRANTED ROLE: For policies that are enabled on roles</li> <li>• INVALID: For policies that are enabled on roles</li> </ul> |
| ENTITY_NAME    | VARCHAR2(128) |      | Database entity (user name or role name) on which the audit policy is enabled                                                                                                                                                                                                                                                                          |
| ENTITY_TYPE    | VARCHAR2(7)   |      | Database entity type. Possible values: <ul style="list-style-type: none"> <li>• USER: Indicates that the policy is enabled on a user or users.</li> <li>• ROLE: Indicates that the policy is enabled on a role or roles.</li> </ul>                                                                                                                    |
| SUCCESS        | VARCHAR2(3)   |      | Indicates whether the audit policy is enabled for auditing successful events (YES) or not (NO)                                                                                                                                                                                                                                                         |
| FAILURE        | VARCHAR2(3)   |      | Indicates whether the audit policy is enabled for auditing unsuccessful events (YES) or not (NO)                                                                                                                                                                                                                                                       |

## 7.152 DBA\_XSTREAM\_ADMINISTRATOR

DBA\_XSTREAM\_ADMINISTRATOR displays information about the users who have been granted privileges to be XStream administrators by procedures in the DBMS\_XSTREAM\_AUTH package. Its columns are the same as those in ALL\_XSTREAM\_ADMINISTRATOR.

**① See Also**

["ALL\\_XSTREAM\\_ADMINISTRATOR"](#)

## 7.153 DBA\_XSTREAM\_INBOUND

DBA\_XSTREAM\_INBOUND displays information about all XStream inbound servers in the database. Its columns are the same as those in ALL\_XSTREAM\_INBOUND.

**① See Also**

["ALL\\_XSTREAM\\_INBOUND"](#)

## 7.154 DBA\_XSTREAM\_INBOUND\_PROGRESS

DBA\_XSTREAM\_INBOUND\_PROGRESS displays information about the progress made by all XStream inbound servers in the database. Its columns are the same as those in ALL\_XSTREAM\_INBOUND\_PROGRESS.

**① See Also**

["ALL\\_XSTREAM\\_INBOUND\\_PROGRESS"](#)

## 7.155 DBA\_XSTREAM\_OUT\_SUPPORT\_MODE

DBA\_XSTREAM\_OUT\_SUPPORT\_MODE displays information about the level of XStream capture process support for the tables in the database. Its columns are the same as those in ALL\_XSTREAM\_OUT\_SUPPORT\_MODE.

### ① See Also

["ALL\\_XSTREAM\\_OUT\\_SUPPORT\\_MODE"](#)

## 7.156 DBA\_XSTREAM\_OUTBOUND

DBA\_XSTREAM\_OUTBOUND displays information about all XStream outbound servers in the database. Its columns are the same as those in ALL\_XSTREAM\_OUTBOUND.

### ① See Also

["ALL\\_XSTREAM\\_OUTBOUND"](#)

## 7.157 DBA\_XSTREAM\_OUTBOUND\_PROGRESS

DBA\_XSTREAM\_OUTBOUND\_PROGRESS displays information about the progress made by all XStream outbound servers in the database. Its columns are the same as those in ALL\_XSTREAM\_OUTBOUND\_PROGRESS.

### ① See Also

["ALL\\_XSTREAM\\_OUTBOUND\\_PROGRESS"](#)

## 7.158 DBA\_XSTREAM\_RULES

DBA\_XSTREAM\_RULES displays information about all XStream rules in the database. Its columns are the same as those in ALL\_XSTREAM\_RULES.

### ① See Also

["ALL\\_XSTREAM\\_RULES"](#)

## 7.159 DBA\_XSTREAM\_SPLIT\_MERGE

DBA\_XSTREAM\_SPLIT\_MERGE displays information about XStream current automatic split and merge operations.

| Column                  | Datatype      | NULL     | Description                                                                                                                                                                         |
|-------------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORIGINAL_CAPTURE_NAME   | VARCHAR2(128) | NOT NULL | Name of the original capture process                                                                                                                                                |
| CLONED_CAPTURE_NAME     | VARCHAR2(128) |          | Name of the cloned capture process                                                                                                                                                  |
| ORIGINAL_CAPTURE_STATUS | VARCHAR2(8)   |          | Status of the original capture process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                          |
| CLONED_CAPTURE_STATUS   | VARCHAR2(8)   |          | Status of the cloned capture process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                            |
| ORIGINAL_XSTREAM_NAME   | VARCHAR2(128) |          | Name of the original XStream component that receives database changes directly from the original capture process. The component is either a propagation or a local apply process.   |
| CLONED_XSTREAM_NAME     | VARCHAR2(128) |          | Name of the cloned XStream component that receives database changes directly from the cloned capture process. The component is either a propagation or a local apply process.       |
| XSTREAM_TYPE            | VARCHAR2(11)  |          | Type of the component in ORIGINAL_XSTREAM_NAME and CLONED_XSTREAM_NAME: <ul style="list-style-type: none"> <li>• PROPAGATION</li> <li>• APPLY</li> </ul>                            |
| RECOVERABLE_SCRIPT_ID   | RAW(16)       |          | Unique ID of the script to split or merge operation                                                                                                                                 |
| SCRIPT_STATUS           | VARCHAR2(12)  |          | Status of the recoverable script: <ul style="list-style-type: none"> <li>• GENERATING</li> <li>• NOT EXECUTING</li> <li>• EXECUTING</li> <li>• EXECUTED</li> <li>• ERROR</li> </ul> |
| ACTION_TYPE             | VARCHAR2(7)   |          | type of action performed by the script: <ul style="list-style-type: none"> <li>• SPLIT</li> <li>• MERGE</li> <li>• MONITOR</li> </ul>                                               |
| ACTION_THRESHOLD        | VARCHAR2(40)  |          | For SPLIT actions, the threshold set by the split_threshold capture process parameter. For MERGE actions, the threshold set by the merge_threshold capture process parameter.       |

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS             | VARCHAR2(16)   |      | Status of the action: <ul style="list-style-type: none"> <li>• NOTHING TO SPLIT - Not ready to split or does not need to split</li> <li>• ABOUT TO SPLIT</li> <li>• SPLITTING - A split is in progress</li> <li>• SPLIT DONE - A split is done</li> <li>• NOTHING TO MERGE - Not ready to merge</li> <li>• ABOUT TO MERGE</li> <li>• MERGING - A merge is in progress</li> <li>• MERGE DONE - A merge is done</li> <li>• ERROR - An error was returned during a split or merge</li> <li>• NONSPLITTABLE - The original capture is not splittable either because it is disabled, it has more than one publisher to its queue, or it has only one destination for captured messages</li> </ul> |
| STATUS_UPDATE_TIME | TIMESTAMP(6)   |      | Time when status was last updated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CREATION_TIME      | TIMESTAMP(6)   |      | Time when the action started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LAG                | NUMBER         |      | Time (in seconds) that the cloned capture process lags behind the original capture process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 7.160 DBA\_XSTREAM\_SPLIT\_MERGE\_HIST

DBA\_XSTREAM\_SPLIT\_MERGE\_HIST displays information about past XStream automatic split and merge operations.

| Column                | Datatype      | NULL     | Description                          |
|-----------------------|---------------|----------|--------------------------------------|
| ORIGINAL_CAPTURE_NAME | VARCHAR2(128) | NOT NULL | Name of the original capture process |
| CLONED_CAPTURE_NAME   | VARCHAR2(128) |          | Name of the cloned capture process   |

| Column                  | Datatype      | NULL | Description                                                                                                                                                                         |
|-------------------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORIGINAL_QUEUE_OWNER    | VARCHAR2(128) |      | Owner of the queue used by the original capture process                                                                                                                             |
| ORIGINAL_QUEUE_NAME     | VARCHAR2(128) |      | Name of the queue used by the original capture process                                                                                                                              |
| CLONED_QUEUE_OWNER      | VARCHAR2(128) |      | Owner of the queue used by the cloned capture process                                                                                                                               |
| CLONED_QUEUE_NAME       | VARCHAR2(128) |      | Name of the queue used by the cloned capture process                                                                                                                                |
| ORIGINAL_CAPTURE_STATUS | VARCHAR2(8)   |      | Status of the original capture process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                          |
| CLONED_CAPTURE_STATUS   | VARCHAR2(8)   |      | Status of the cloned capture process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                            |
| ORIGINAL_XSTREAM_NAME   | VARCHAR2(128) |      | Name of the original XStream component that receives database changes directly from the original capture process. The component is either a propagation or a local apply process.   |
| CLONED_XSTREAM_NAME     | VARCHAR2(128) |      | Name of the cloned XStream component that receives database changes directly from the cloned capture process. The component is either a propagation or a local apply process.       |
| XSTREAM_TYPE            | VARCHAR2(11)  |      | Type of the component in ORIGINAL_XSTREAM_NAME and CLONED_XSTREAM_NAME: <ul style="list-style-type: none"> <li>• PROPAGATION</li> <li>• APPLY</li> </ul>                            |
| RECOVERABLE_SCRIPT_ID   | RAW(16)       |      | Unique ID of the script to split or merge operation                                                                                                                                 |
| SCRIPT_STATUS           | VARCHAR2(12)  |      | Status of the recoverable script: <ul style="list-style-type: none"> <li>• GENERATING</li> <li>• NOT EXECUTING</li> <li>• EXECUTING</li> <li>• EXECUTED</li> <li>• ERROR</li> </ul> |
| ACTION_TYPE             | VARCHAR2(7)   |      | type of action performed by the script: <ul style="list-style-type: none"> <li>• SPLIT</li> <li>• MERGE</li> <li>• MONITOR</li> </ul>                                               |
| ACTION_THRESHOLD        | VARCHAR2(40)  |      | For SPLIT actions, the threshold set by the split_threshold capture process parameter. For MERGE actions, the threshold set by the merge_threshold capture process parameter.       |

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS             | VARCHAR2(16)   |      | Status of the action: <ul style="list-style-type: none"> <li>• NOTHING TO SPLIT - Not ready to split or does not need to split</li> <li>• ABOUT TO SPLIT</li> <li>• SPLITTING - A split is in progress</li> <li>• SPLIT DONE - A split is done</li> <li>• NOTHING TO MERGE - Not ready to merge</li> <li>• ABOUT TO MERGE</li> <li>• MERGING - A merge is in progress</li> <li>• MERGE DONE - A merge is done</li> <li>• ERROR - An error was returned during a split or merge</li> <li>• NONSPLITTABLE - The original capture is not splittable either because it is disabled, it has more than one publisher to its queue, or it has only one destination for captured messages</li> </ul> |
| STATUS_UPDATE_TIME | TIMESTAMP(6)   |      | Time when status was last updated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CREATION_TIME      | TIMESTAMP(6)   |      | Time when the action started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LAG                | NUMBER         |      | Time (in seconds) that the cloned capture process lags behind the original capture process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| JOB_OWNER          | VARCHAR2(128)  |      | Owner of the job that performs the split or merge operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| JOB_NAME           | VARCHAR2(128)  |      | Name of the job that performs the split or merge operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ERROR_NUMBER       | NUMBER         |      | Error number if the capture process was terminated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ERROR_MESSAGE      | VARCHAR2(4000) |      | Error message if the capture process was terminated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 7.161 DBA\_XSTREAM\_STMT\_HANDLERS

DBA\_XSTREAM\_STMT\_HANDLERS displays information about all XStream statement DML handlers in the database.

| Column            | Datatype       | NULL     | Description                       |
|-------------------|----------------|----------|-----------------------------------|
| HANDLER_NAME      | VARCHAR2(128)  | NOT NULL | Name of the statement handler     |
| HANDLER_COMMENT   | VARCHAR2(4000) |          | Comment of the statement handler  |
| CREATION_TIME     | TIMESTAMP(6)   |          | Timestamp for script creation     |
| MODIFICATION_TIME | TIMESTAMP(6)   |          | Timestamp for script modification |

## 7.162 DBA\_XSTREAM\_STMTS

DBA\_XSTREAM\_STMTS displays information about the statements in all XStream statement DML handlers in the database.

| Column             | Datatype      | NULL     | Description                         |
|--------------------|---------------|----------|-------------------------------------|
| HANDLER_NAME       | VARCHAR2(128) | NOT NULL | Name of the statement handler       |
| EXECUTION_SEQUENCE | NUMBER        | NOT NULL | Execution sequence of the statement |

| Column            | Datatype     | NULL | Description                          |
|-------------------|--------------|------|--------------------------------------|
| STATEMENT         | CLOB         |      | Text of the SQL statement            |
| CREATION_TIME     | TIMESTAMP(6) |      | Timestamp for statement creation     |
| MODIFICATION_TIME | TIMESTAMP(6) |      | Timestamp for statement modification |

## 7.163 DBA\_XSTREAM\_TRANSFORMATIONS

DBA\_XSTREAM\_TRANSFORMATIONS displays information about all XStream transformations available on a system, in order of execution. Its columns are the same as those in ALL\_XSTREAM\_TRANSFORMATIONS.

### ① See Also

["ALL\\_XSTREAM\\_TRANSFORMATIONS"](#)

## 7.164 DBA\_XTERNAL\_LOC\_PARTITIONS

DBA\_XTERNAL\_LOC\_PARTITIONS describes partition-level locations in the database. Its columns are the same as those in ALL\_XTERNAL\_LOC\_PARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_LOC\\_PARTITIONS"](#)

## 7.165 DBA\_XTERNAL\_LOC\_SUBPARTITIONS

DBA\_XTERNAL\_LOC\_SUBPARTITIONS describes subpartition-level locations in the database. Its columns are the same as those in ALL\_XTERNAL\_LOC\_SUBPARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_LOC\\_SUBPARTITIONS"](#)

## 7.166 DBA\_XTERNAL\_PART\_TABLES

DBA\_XTERNAL\_PART\_TABLES describes object-level information for partitioned external tables in the database. Its columns are the same as those in ALL\_XTERNAL\_PART\_TABLES.

### ① See Also

["ALL\\_XTERNAL\\_PART\\_TABLES"](#)

## 7.167 DBA\_XTERNAL\_TAB\_PARTITIONS

DBA\_XTERNAL\_TAB\_PARTITIONS describes partition-level information for partitioned external tables in the database. Its columns are the same as those in ALL\_XTERNAL\_TAB\_PARTITIONS.

### See Also

["ALL\\_XTERNAL\\_TAB\\_PARTITIONS"](#)

## 7.168 DBA\_XTERNAL\_TAB\_SUBPARTITIONS

DBA\_XTERNAL\_TAB\_SUBPARTITIONS describes subpartition-level information for partitioned external tables in the database. Its columns are the same as those in ALL\_XTERNAL\_TAB\_SUBPARTITIONS.

### See Also

["ALL\\_XTERNAL\\_TAB\\_SUBPARTITIONS"](#)

## 7.169 DBA\_ZONEMAP\_AUTO\_ACTIONS

DBA\_ZONEMAP\_AUTO\_ACTIONS provides information about automatic zone map tasks and executions.

| Column     | Datatype       | NULL     | Description                 |
|------------|----------------|----------|-----------------------------|
| TASK_ID    | NUMBER         | NOT NULL | Zone map task identifier    |
| MSG_ID     | NUMBER         | NOT NULL | Zone map message identifier |
| EXEC_NAME  | VARCHAR2(128)  |          | Zone map execution name     |
| ACTION_MSG | VARCHAR2(4000) |          | Execution message text      |
| TIME_STAMP | TIMESTAMP(9)   |          | Execution timestamp         |

The TASK\_ID, MSG\_ID, and EXEC\_NAME columns in this view correspond to the same columns in the DBA\_ZONEMAP\_AUTO\_FINDINGS view. This allows you to correlate the actions in DBA\_ZONEMAP\_AUTO\_ACTIONS with their corresponding findings in DBA\_ZONEMAP\_AUTO\_FINDINGS.

### Note

This view is available starting with Oracle Database 21c.

## 7.170 DBA\_ZONEMAP\_AUTO\_FINDINGS

DBA\_ZONEMAP\_AUTO\_FINDINGS provides information about automatic zone map findings.

| Column         | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASK_ID        | NUMBER         | NOT NULL | Zone map task identifier                                                                                                                                                                                                                                                                                                                                                                    |
| MSG_ID         | NUMBER         | NOT NULL | Zone map message identifier                                                                                                                                                                                                                                                                                                                                                                 |
| EXEC_NAME      | VARCHAR2(128)  |          | Zone map execution name                                                                                                                                                                                                                                                                                                                                                                     |
| MESSAGE        | VARCHAR2(4000) |          | Execution message text                                                                                                                                                                                                                                                                                                                                                                      |
| TIME_STAMP     | TIMESTAMP(9)   |          | Finding timestamp                                                                                                                                                                                                                                                                                                                                                                           |
| OBJECT_NAME    | VARCHAR2(128)  | NOT NULL | Name of the object for which the finding was observed, typically a table name or a zone map name                                                                                                                                                                                                                                                                                            |
| FINDING_REASON | VARCHAR2(9)    |          | Finding reason code                                                                                                                                                                                                                                                                                                                                                                         |
| FINDING_TYPE   | VARCHAR2(9)    |          | Finding type. Possible values: <ul style="list-style-type: none"><li>• BLACKLIST: The table is no longer a candidate for automatic zone maps</li><li>• ERROR: An error occurred</li><li>• EVICT: The table does not meet automatic zone map creation criteria</li><li>• OTHER</li></ul> Refer to the MESSAGE column for additional information about the reasoning behind the finding type. |

Automatic zone map findings contain information that the database learned when performing automatic zone map executions. The database uses these findings to optimize subsequent automatic zone maps executions, which saves on execution time and resources.

The TASK\_ID, MSG\_ID, and EXEC\_NAME columns in this view correspond to the same columns in the DBA\_ZONEMAP\_AUTO\_ACTIONS view. This allows you to correlate the findings in DBA\_ZONEMAP\_AUTO\_FINDINGS with their corresponding actions in DBA\_ZONEMAP\_AUTO\_ACTIONS.

**① Note**

This view is available starting with Oracle Database 21c.

## 7.171 DBA\_ZONEMAP\_MEASURES

DBA\_ZONEMAP\_MEASURES describes the measures for all the zone maps in the database. Its columns are the same as those in ALL\_ZONEMAP\_MEASURES.

### Note

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

### See Also

## 7.172 DBA\_ZONEMAPS

DBA\_ZONEMAPS describes all the zone maps in the database. Its columns are the same as those in ALL\_ZONEMAPS.

### Note

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

### See Also

## 7.173 DBFS\_CONTENT

DBFS\_CONTENT displays all the path items from all available content stores in the system.

| Column   | Datatype       | NULL | Description                                                           |
|----------|----------------|------|-----------------------------------------------------------------------|
| STORE    | VARCHAR2(256)  |      | Name of store                                                         |
| MOUNT    | VARCHAR2(256)  |      | Location at which instance of store is mounted                        |
| PATHNAME | VARCHAR2(1024) |      | Name of path to item                                                  |
| PATHTYPE | VARCHAR2(32)   |      | Type of path item (see DBMS_DBFS_CONTENT Constants - Path Name Types) |
| FILEDATA | BLOB           |      | BLOB locator that can be used to access data in the path item         |

| Column                | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STD_ACCESS_TIME       | TIMESTAMP(6)   |      | Time of last access of a path name's contents                                                                                                                                                                                                                                                                                                                       |
| STD_ACL               | VARCHAR2(1024) |      | Access Control List (in standard ACL syntax)                                                                                                                                                                                                                                                                                                                        |
| STD_CHANGE_TIME       | TIMESTAMP(6)   |      | Time of last change to the path name                                                                                                                                                                                                                                                                                                                                |
| STD_CHILDREN          | NUMBER         |      | Number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)                                                                                                                                                                                                           |
| STD_CONTENT_TYPE      | VARCHAR2(1024) |      | One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of TYPE_FILE. The content type is not necessarily interpreted by the store.                                                                                                                                                                             |
| STD_CREATION_TIME     | TIMESTAMP(6)   |      | Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.                                                                                                                                                                                                                                                        |
| STD_DELETED           | NUMBER         |      | Set to a nonzero number if the path name has been soft-deleted but not yet purged (see DBMS_DBFS_CONTENT Constants - Store Features)                                                                                                                                                                                                                                |
| STD_GUID              | NUMBER         |      | Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.                                                                                                                                       |
| STD_MODIFICATION_TIME | TIMESTAMP(6)   |      | Time of last change to the data associated with a path name. Changes to the content of a TYPE_FILE or TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.                                                                                                |
| STD_OWNER             | VARCHAR2(32)   |      | Client-supplied (or implicit) owner name for the path name                                                                                                                                                                                                                                                                                                          |
| STD_PARENT_GUID       | NUMBER         |      | Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.<br><br>The GUID of the parent of this path name (that is that std_parent_guid(pathname) == std_guid(parent(pathname))). |
| STD_REFERENT          | VARCHAR2(1024) |      | Content of the symbolic link of a TYPE_LINK path, otherwise NULL. The STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).                                                                                                                              |
| OPT_HASH_TYPE         | VARCHAR2(32)   |      | Type of hash provided in the OPT_HASH_VALUE property (see DBMS_CRYPTO for possible options)                                                                                                                                                                                                                                                                         |
| OPT_HASH_VALUE        | VARCHAR2(128)  |      | Hash value of type OPT_HASH_TYPE describing the content of the path name                                                                                                                                                                                                                                                                                            |
| OPT_LOCK_COUNT        | NUMBER         |      | Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the OPT_LOCKER must specify all lockers with repeats so that lock counts can be correctly maintained.                                                                                                                             |

| Column           | Datatype       | NULL | Description                                                                                                                                                                                                                                       |
|------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPT_LOCK_DATA    | VARCHAR2(128)  |      | Client-supplied user-data associated with a user-lock, uninterpreted by the store                                                                                                                                                                 |
| OPT_LOCKER       | VARCHAR2(128)  |      | One or more implicit or client-specified principals that applied a user-lock on a path name                                                                                                                                                       |
| OPT_LOCK_STATUS  | NUMBER         |      | One of the (LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE) values describing the type of lock currently applied on a path name                                                                                                                 |
| OPT_VERSION      | NUMBER         |      | Sequence number for linear versioning of a path name                                                                                                                                                                                              |
| OPT_VERSION_PATH | VARCHAR2(1024) |      | Version path name for hierarchical versioning of a path name                                                                                                                                                                                      |
| OPT_CONTENT_ID   | RAW(128)       |      | A provider-generated store-specific unique contentID in the form of a string for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in DBMS_DBFS_CONTENT Constants - Store Features) |

## 7.174 DBFS\_CONTENT\_PROPERTIES

DBFS\_CONTENT\_PROPERTIES displays all the property/value pairs for all path items in all content stores in the system.

| Column         | Datatype       | NULL | Description                                    |
|----------------|----------------|------|------------------------------------------------|
| STORE          | VARCHAR2(256)  |      | Name of store                                  |
| MOUNT          | VARCHAR2(256)  |      | Location at which instance of store is mounted |
| PATHNAME       | VARCHAR2(1024) |      | Name of path to item                           |
| PROPERTY_NAME  | VARCHAR2(32)   |      | Name of the property                           |
| PROPERTY_VALUE | VARCHAR2(1024) |      | Value of the property                          |
| PROPERTY_TYPE  | NUMBER         |      | PL/SQL typecode for the property value         |

## 7.175 DBMS\_ALERT\_INFO

DBMS\_ALERT\_INFO describes registered alerts.

| Column | Datatype     | NULL     | Description       |
|--------|--------------|----------|-------------------|
| NAME   | VARCHAR2(30) | NOT NULL | Name of the alert |

| Column  | Datatype       | NULL     | Description                                                                               |
|---------|----------------|----------|-------------------------------------------------------------------------------------------|
| SID     | VARCHAR2(30)   | NOT NULL | Session ID of a session waiting for this alert                                            |
| CHANGED | VARCHAR2(1)    |          | Boolean flag to indicate that an alert has been signaled. Y: alert signaled, N: no alert. |
| MESSAGE | VARCHAR2(1800) |          | Optional message passed by signaler                                                       |

## 7.176 DBMS\_LOCK\_ALLOCATED

DBMS\_LOCK\_ALLOCATED describes user-allocated locks.

| Column     | Datatype      | NULL     | Description                                                                     |
|------------|---------------|----------|---------------------------------------------------------------------------------|
| NAME       | VARCHAR2(128) | NOT NULL | Name of the lock                                                                |
| LOCKID     | NUMBER(38)    |          | Lock identifier number                                                          |
| EXPIRATION | DATE          |          | Planned lock expiration date (updates whenever the allocation procedure is run) |

## 7.177 DBMS\_METADATA\_PARSE\_ITEMS

DBMS\_METADATA\_PARSE\_ITEMS documents the valid parse items.

| Column         | Datatype       | NULL     | Description                                       |
|----------------|----------------|----------|---------------------------------------------------|
| OBJECT_TYPE    | VARCHAR2(128)  | NOT NULL | Object type name                                  |
| PARSE_ITEM     | VARCHAR2(124)  |          | Parse item name                                   |
| ALTER_XML      | VARCHAR2(1)    |          | Y: Can be used when generating ALTER_XML document |
| FETCH_XML_CLOB | VARCHAR2(1)    |          | Y: Can be returned by FETCH_XML_CLOB              |
| CONVERT        | VARCHAR2(1)    |          | Y: Can be returned by CONVERT or FETCH_DDL        |
| DESCRIPTION    | VARCHAR2(4000) |          | Description of the parse item                     |

## 7.178 DBMS\_METADATA\_TRANSFORM\_PARAMS

DBMS\_METADATA\_TRANSFORM\_PARAMS documents the valid transform parameters for each transform.

| Column      | Datatype      | NULL     | Description      |
|-------------|---------------|----------|------------------|
| OBJECT_TYPE | VARCHAR2(128) | NOT NULL | Object type name |
| TRANSFORM   | VARCHAR2(128) | NOT NULL | Transform name   |

| Column      | Datatype       | NULL     | Description                                                                                   |
|-------------|----------------|----------|-----------------------------------------------------------------------------------------------|
| PARAM       | VARCHAR2(128)  | NOT NULL | Parameter name                                                                                |
| DATATYPE    | VARCHAR2(11)   |          | BOOLEAN, TEXT, NUMBER or UNSPECIFIED                                                          |
| DEFAULT_VAL | VARCHAR2(2000) |          | Default value of the transform parameter                                                      |
| CLIENT      | VARCHAR2(1)    |          | Indicates whether the transform parameter is available to the Data Pump client (Y) or not (N) |
| API         | VARCHAR2(1)    |          | Indicates whether the transform parameter is available to the Data Pump API (Y) or not (N)    |
| DESCRIPTION | VARCHAR2(4000) |          | Description of the transform parameter                                                        |

## 7.179 DBMS\_METADATA\_TRANSFORMS

DBMS\_METADATA\_TRANSFORMS documents the valid Oracle-supplied transforms.

| Column      | Datatype      | NULL     | Description                  |
|-------------|---------------|----------|------------------------------|
| OBJECT_TYPE | VARCHAR2(128) | NOT NULL | Object type name             |
| TRANSFORM   | VARCHAR2(128) | NOT NULL | Transform name               |
| INPUT_TYPE  | VARCHAR2(24)  |          | Type of input document       |
| OUTPUT_TYPE | VARCHAR2(24)  |          | Type of output document      |
| DESCRIPTION | VARCHAR2(71)  |          | Description of the transform |

## 7.180 DEPTREE

This view, created by `utldtree.sql`, contains information on the object dependency tree.

For user SYS, this view displays shared cursors (and only shared cursors) that depend on the object. For all other users, it displays objects other than shared cursors. Other users can access SYS.DEPTREE for information on shared cursors.

| Column       | Datatype | NULL | Description                          |
|--------------|----------|------|--------------------------------------|
| NESTED_LEVEL | NUMBER   |      | Nesting level in the dependency tree |

| Column                                 | Datatype       | NULL | Description                                                        |
|----------------------------------------|----------------|------|--------------------------------------------------------------------|
| TYPE                                   | VARCHAR2(23)   |      | Object type                                                        |
| SCHEMA                                 | VARCHAR2(128)  |      | Object schema                                                      |
| NAME                                   | VARCHAR2(1002) |      | Object name                                                        |
| SEQ#                                   | NUMBER         |      | Sequence number in the dependency tree. Used for ordering queries. |
| See Also: " <a href="#">IDeptree</a> " |                |      |                                                                    |

## 7.181 DICT

DICT is a synonym for DICTIONARY.

① See Also  
"[DICTIONARY](#)"

## 7.182 DICT\_COLUMNS

DICT\_COLUMNS contains descriptions of columns in data dictionary tables and views.

| Column      | Datatype       | NULL | Description                                 |
|-------------|----------------|------|---------------------------------------------|
| TABLE_NAME  | VARCHAR2(128)  |      | Name of the object that contains the column |
| COLUMN_NAME | VARCHAR2(128)  |      | Name of the column                          |
| COMMENTS    | VARCHAR2(4000) |      | Text comment on the column                  |

## 7.183 DICTIONARY

DICTIONARY contains descriptions of data dictionary tables and views.

| Column     | Datatype       | NULL | Description                |
|------------|----------------|------|----------------------------|
| TABLE_NAME | VARCHAR2(128)  |      | Name of the object         |
| COMMENTS   | VARCHAR2(4000) |      | Text comment on the object |

## 7.184 DICTIONARY\_CREDENTIALS\_ENCRYPT

DICTIONARY\_CREDENTIALS\_ENCRYPT indicates whether encryption of dictionary credentials is enforced or not. You can encrypt sensitive credential information, such as passwords that are stored in the data dictionary.

| Column      | Datatype    | NULL | Description                                                                                                                                                                                                                                                       |
|-------------|-------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENFORCEMENT | VARCHAR2(8) |      | Enforcement status for encryption of dictionary credentials. Possible values: <ul style="list-style-type: none"> <li>ENABLED: Encryption of dictionary credentials is enforced</li> <li>DISABLED: Encryption of dictionary credentials is not enforced</li> </ul> |

### 📘 See Also

## 7.185 DM\_USER\_MODELS

DM\_USER\_MODELS displays information about the models in the user's schema.

| Column        | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|---------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME          | VARCHAR2(128) | NOT NULL | Name of the model                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FUNCTION_NAME | VARCHAR2(30)  |          | Model function: <ul style="list-style-type: none"> <li>association - Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set.</li> <li>attribute_importance - Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome.</li> <li>classification - Classification is a predictive mining function. A classification model uses historical data to predict new discrete or categorical data.<br/>The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</li> <li>clustering - Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set.</li> <li>feature_extraction - Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model.</li> <li>regression - Regression is a predictive mining function. A regression model uses historical data to predict new continuous, numeric data.</li> </ul> |

| Column           | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALGORITHM_NAME   | VARCHAR2(30)  |          | Algorithm used by the model: <ul style="list-style-type: none"> <li>• algo_name - Setting that specifies the algorithm used by the model.</li> <li>• asso_max_rule_length - Setting that specifies the maximum length of a rule used by an association model.</li> <li>• asso_min_confidence - Setting that specifies the minimum confidence for an association model.</li> <li>• asso_min_support - Setting that specifies the minimum support for an association model.</li> <li>• clas_cost_table_name - Setting that specifies the name of the cost matrix table for a classification model.</li> <li>• clas_priors_table_name - Setting that specifies the name of the prior probability table for NB and ABN models. Decision Tree is the only classification algorithm that does not use priors. For SVM classification models, this setting specifies the name of a table of weights.</li> <li>• clus_num_clusters - Setting that specifies the number of clusters for a clustering model.</li> <li>• feat_num_features - Setting that specifies the number of features for a feature selection model.</li> </ul> |
| CREATION_DATE    | DATE          | NOT NULL | Date on which the model was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BUILD_DURATION   | NUMBER        |          | Duration of the model build process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TARGET_ATTRIBUTE | VARCHAR2(128) |          | Attribute designated as the target of a classification model                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MODEL_SIZE       | NUMBER        |          | Size of the model (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 7.186 DOCUMENT\_LINKS

DOCUMENT\_LINKS provides system information about Oracle XML DB document links in Oracle XML DB Repository documents.

When an XML document that includes XLink or XInclude links is added to the repository, these links can be mapped to document links, which are tracked using view DOCUMENT\_LINKS.

| Column      | Datatype       | NULL | Description                                                            |
|-------------|----------------|------|------------------------------------------------------------------------|
| SOURCE_ID   | RAW(16)        |      | The source resource OID                                                |
| TARGET_ID   | RAW(16)        |      | The target resource OID                                                |
| TARGET_PATH | VARCHAR2(4000) |      | This column is always NULL. It is reserved for future use.             |
| LINK_TYPE   | VARCHAR2(8)    |      | The document link type: Hard or Weak                                   |
| LINK_FORM   | VARCHAR2(8)    |      | Whether the original link was of form XLink or XInclude                |
| SOURCE_TYPE | VARCHAR2(17)   |      | Whether the link is contained in Resource Content or Resource Metadata |

- ["USER\\_OBJECT\\_SIZE"](#)

## 7.188 EXCEPTIONS

EXCEPTIONS contains information on violations of integrity constraints. This table is created by the `utlexcpt.sql` script.

| Column     | Datatype      | NULL | Description                            |
|------------|---------------|------|----------------------------------------|
| ROW_ID     | ROWID         |      | Row that caused the violation          |
| OWNER      | VARCHAR2(128) |      | Owner of the table                     |
| TABLE_NAME | VARCHAR2(128) |      | Name of the table                      |
| CONSTRAINT | VARCHAR2(128) |      | Integrity constraint that was violated |

## 7.189 FLASHBACK\_TRANSACTION\_QUERY

FLASHBACK\_TRANSACTION\_QUERY displays information about all flashback transaction queries in the database.

The database must have at least minimal supplemental logging enabled to avoid unpredictable behavior.

| Column           | Datatype      | NULL | Description                                                           |
|------------------|---------------|------|-----------------------------------------------------------------------|
| XID              | RAW(8)        |      | Transaction identifier                                                |
| START_SCN        | NUMBER        |      | Transaction start system change number (SCN)                          |
| START_TIMESTAMP  | DATE          |      | Transaction start timestamp                                           |
| COMMIT_SCN       | NUMBER        |      | Transaction commit system change number; NULL for active transactions |
| COMMIT_TIMESTAMP | DATE          |      | Transaction commit timestamp; NULL for active transactions            |
| LOGON_USER       | VARCHAR2(128) |      | Logon user for the transaction                                        |
| UNDO_CHANGE#     | NUMBER        |      | Undo system change number (1 or higher)                               |

| Column      | Datatype       | NULL | Description                                                                                                                                                                                          |
|-------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPERATION   | VARCHAR2(32)   |      | Forward-going DML operation performed by the transaction: <ul style="list-style-type: none"> <li>• D - Delete</li> <li>• I - Insert</li> <li>• U - Update</li> <li>• B</li> <li>• UNKNOWN</li> </ul> |
| TABLE_NAME  | VARCHAR2(256)  |      | Name of the table to which the DML applies                                                                                                                                                           |
| TABLE_OWNER | VARCHAR2(386)  |      | Owner of the table to which the DML applies                                                                                                                                                          |
| ROW_ID      | VARCHAR2(19)   |      | Rowid of the row that was modified by the DML                                                                                                                                                        |
| UNDO_SQL    | VARCHAR2(4000) |      | SQL to undo the DML indicated by OPERATION                                                                                                                                                           |

## 7.190 GLOBAL\_CONTEXT

GLOBAL\_CONTEXT displays the values of global context attributes, which are accessible for the current session, based on the CLIENT\_IDENTIFIER value.

GLOBAL\_CONTEXT is similar to SESSION\_CONTEXT, which lists the values of session (or local) context attributes set under the current session.

| Column            | Datatype       | NULL | Description                                                        |
|-------------------|----------------|------|--------------------------------------------------------------------|
| NAMESPACE         | VARCHAR2(31)   |      | Namespace of the globally accessible context                       |
| ATTRIBUTE         | VARCHAR2(31)   |      | Attribute of the globally accessible context                       |
| VALUE             | VARCHAR2(4000) |      | Value of the attribute of the globally accessible context          |
| USERNAME          | VARCHAR2(31)   |      | Username for which globally accessible context value is applicable |
| CLIENT_IDENTIFIER | VARCHAR2(65)   |      | Client identifier of the globally accessible context               |

### ① See Also

## 7.191 GLOBAL\_NAME

GLOBAL\_NAME contains one row that displays the global name of the current database.

| Column      | Datatype       | NULL | Description                 |
|-------------|----------------|------|-----------------------------|
| GLOBAL_NAME | VARCHAR2(4000) |      | Global name of the database |

## 7.192 HS\_ALL\_CAPS

HS\_ALL\_CAPS contains information about all of the capabilities (that is, features) associated with non-Oracle (FDS) data stores.

| Column          | Datatype      | NULL | Description                                              |
|-----------------|---------------|------|----------------------------------------------------------|
| CAP_NUMBER      | NUMBER        |      | Capability number                                        |
| CONTEXT         | NUMBER        |      | Context in which this capability is applicable           |
| TRANSLATION     | VARCHAR2(255) |      | Valid for functions; contains translation to FDS dialect |
| ADDITIONAL_INFO | NUMBER        |      | Flag for internal use                                    |
| FDS_CLASS_NAME  | VARCHAR2(30)  |      | Name of the FDS Class                                    |
| FDS_INST_NAME   | VARCHAR2(30)  |      | Name of the FDS instance                                 |

## 7.193 HS\_ALL\_DD

HS\_ALL\_DD contains data dictionary information about non-Oracle (FDS) data stores.

| Column           | Datatype       | NULL | Description                                     |
|------------------|----------------|------|-------------------------------------------------|
| DD_TABLE_NAME    | VARCHAR2(128)  |      | Data dictionary table name                      |
| TRANSLATION_TYPE | CHAR(1)        |      | T = Translation, M = Mimic                      |
| TRANSLATION_TEXT | VARCHAR2(4000) |      | SQL statement containing the mapping            |
| FDS_CLASS_NAME   | VARCHAR2(30)   |      | Name of the FDS Class                           |
| FDS_INST_NAME    | VARCHAR2(30)   |      | Name of the FDS instance                        |
| DD_TABLE_DESC    | VARCHAR2(255)  |      | Description of the Oracle data dictionary table |

## 7.194 HS\_ALL\_INITS

HS\_ALL\_INITS contains initialization parameter information about non-Oracle (FDS) data stores.

| Column          | Datatype      | NULL | Description                                                                                                           |
|-----------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------|
| INIT_VALUE_NAME | VARCHAR2(64)  |      | Name of the initialization parameter                                                                                  |
| INIT_VALUE      | VARCHAR2(255) |      | Value of the initialization parameter                                                                                 |
| INIT_VALUE_TYPE | VARCHAR2(1)   |      | Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable |
| FDS_CLASS_NAME  | VARCHAR2(30)  |      | Name of the FDS Class                                                                                                 |
| FDS_INST_NAME   | VARCHAR2(30)  |      | Name of the FDS instance                                                                                              |

## 7.195 HS\_BASE\_CAPS

HS\_BASE\_CAPS contains information about base capability (that is, base features) of the non-Oracle (FDS) data store.

| Column          | Datatype      | NULL     | Description                   |
|-----------------|---------------|----------|-------------------------------|
| CAP_NUMBER      | NUMBER        | NOT NULL | Capability number             |
| CAP_DESCRIPTION | VARCHAR2(255) |          | Description of the capability |

## 7.196 HS\_BASE\_DD

HS\_BASE\_DD displays information from the base data dictionary translation table.

| Column        | Datatype      | NULL     | Description                                                                      |
|---------------|---------------|----------|----------------------------------------------------------------------------------|
| DD_TABLE_NAME | VARCHAR2(128) | NOT NULL | Name of the Oracle data dictionary table                                         |
| DD_TABLE_DESC | VARCHAR2(255) |          | Description of the Oracle data dictionary table                                  |
| DD_TABLE_ID   | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.197 HS\_CLASS\_CAPS

HS\_CLASS\_CAPS contains information about the class-specific (driver) capabilities belonging to the non-Oracle (FDS) data store.

| Column          | Datatype      | NULL     | Description                                                                      |
|-----------------|---------------|----------|----------------------------------------------------------------------------------|
| CAP_NUMBER      | NUMBER        | NOT NULL | Capability number                                                                |
| CAP_DESCRIPTION | VARCHAR2(255) |          | Capability description                                                           |
| CONTEXT         | NUMBER        |          | Flag indicating the context in which the capability is enabled                   |
| TRANSLATION     | VARCHAR2(255) |          | Valid for functions; contains translation to FDS dialect                         |
| ADDITIONAL_INFO | NUMBER        |          | Additional flags for internal use                                                |
| FDS_CLASS_NAME  | VARCHAR2(30)  | NOT NULL | Name of the FDS Class                                                            |
| FDS_CLASS_ID    | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.198 HS\_CLASS\_DD

HS\_CLASS\_DD displays information from the non-Oracle data store (FDS) class-specific data dictionary translations.

| Column           | Datatype      | NULL     | Description                                     |
|------------------|---------------|----------|-------------------------------------------------|
| DD_TABLE_NAME    | VARCHAR2(128) | NOT NULL | Name of the Oracle data dictionary table        |
| DD_TABLE_DESC    | VARCHAR2(255) |          | Description of the Oracle data dictionary table |
| TRANSLATION_TYPE | CHAR(1)       | NOT NULL | T = Translation, M = Mimic                      |

| Column           | Datatype       | NULL     | Description                                                                      |
|------------------|----------------|----------|----------------------------------------------------------------------------------|
| TRANSLATION_TEXT | VARCHAR2(4000) |          | SQL statement containing the mapping                                             |
| FDS_CLASS_NAME   | VARCHAR2(30)   | NOT NULL | Name of the FDS Class                                                            |
| DD_TABLE_ID      | NUMBER         | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |
| FDS_CLASS_ID     | NUMBER         | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.199 HS\_CLASS\_INIT

HS\_CLASS\_INIT displays information about the non-Oracle (FDS) class-specific initialization parameters.

| Column            | Datatype      | NULL     | Description                                                                                                           |
|-------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------|
| INIT_VALUE_NAME   | VARCHAR2(64)  | NOT NULL | Name of the initialization parameter                                                                                  |
| INIT_VALUE        | VARCHAR2(255) | NOT NULL | Value of the initialization parameter                                                                                 |
| INIT_VALUE_TYPE   | VARCHAR2(1)   | NOT NULL | Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable |
| FDS_CLASS_NAME    | VARCHAR2(30)  | NOT NULL | Name of the FDS Class                                                                                                 |
| FDS_CLASS_INIT_ID | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally)                                      |
| FDS_CLASS_ID      | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally)                                      |

## 7.200 HS\_FDS\_CLASS

HS\_FDS\_CLASS contains information about legal non-Oracle (FDS) classes.

| Column             | Datatype      | NULL     | Description                                                                      |
|--------------------|---------------|----------|----------------------------------------------------------------------------------|
| FDS_CLASS_NAME     | VARCHAR2(30)  | NOT NULL | Name of the FDS class (for example, ODBC, DB2)                                   |
| FDS_CLASS_COMMENTS | VARCHAR2(255) |          | Text description of the non-Oracle class                                         |
| FDS_CLASS_ID       | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.201 HS\_FDS\_INST

HS\_FDS\_INST contains information about non-Oracle (FDS) instances.

| Column            | Datatype      | NULL     | Description                                 |
|-------------------|---------------|----------|---------------------------------------------|
| FDS_INST_NAME     | VARCHAR2(30)  | NOT NULL | Name of the FDS instance                    |
| FDS_INST_COMMENTS | VARCHAR2(255) |          | Text description of the non-Oracle instance |
| FDS_CLASS_NAME    | VARCHAR2(30)  | NOT NULL | Name of the FDS class                       |

| Column       | Datatype | NULL     | Description                                                                      |
|--------------|----------|----------|----------------------------------------------------------------------------------|
| FDS_INST_ID  | NUMBER   | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |
| FDS_CLASS_ID | NUMBER   | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.202 HS\_INST\_CAPS

HS\_INST\_CAPS contains information about instance-specific capabilities (that is, features).

| Column          | Datatype      | NULL     | Description                                                                      |
|-----------------|---------------|----------|----------------------------------------------------------------------------------|
| CAP_NUMBER      | NUMBER        | NOT NULL | Capability number                                                                |
| CAP_DESCRIPTION | VARCHAR2(255) |          | Capability description                                                           |
| CONTEXT         | NUMBER        |          | Context in which this capability is applicable                                   |
| TRANSLATION     | VARCHAR2(255) |          | Valid for functions; contains translation to FDS dialect                         |
| ADDITIONAL_INFO | NUMBER        |          | Additional flags for internal use                                                |
| FDS_CLASS_NAME  | VARCHAR2(30)  | NOT NULL | Name of the FDS class (for example, ODBC, DB2)                                   |
| FDS_INST_NAME   | VARCHAR2(30)  | NOT NULL | Name of the FDS instance                                                         |
| FDS_CLASS_ID    | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |
| FDS_INST_ID     | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.203 HS\_INST\_DD

HS\_INST\_DD displays information from the non-Oracle (FDS) instance-specific data dictionary translations.

| Column           | Datatype       | NULL     | Description                                                                      |
|------------------|----------------|----------|----------------------------------------------------------------------------------|
| DD_TABLE_NAME    | VARCHAR2(128)  | NOT NULL | Name of the Oracle data dictionary table                                         |
| DD_TABLE_DESC    | VARCHAR2(255)  |          | Description of the Oracle data dictionary table                                  |
| TRANSLATION_TYPE | CHAR(1)        | NOT NULL | T = Translation, M = Mimic                                                       |
| TRANSLATION_TEXT | VARCHAR2(4000) |          | SQL statement containing the mapping                                             |
| FDS_CLASS_NAME   | VARCHAR2(30)   | NOT NULL | Name of the FDS class (for example, ODBC, DB2)                                   |
| FDS_INST_NAME    | VARCHAR2(30)   | NOT NULL | Name of the FDS instance                                                         |
| DD_TABLE_ID      | NUMBER         | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |
| FDS_CLASS_ID     | NUMBER         | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |
| FDS_INST_ID      | NUMBER         | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally) |

## 7.204 HS\_INST\_INIT

HS\_INST\_INIT contains information about the non-Oracle (FDS) instance-specific initialization parameters.

| Column           | Datatype      | NULL     | Description                                                                                                           |
|------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------|
| INIT_VALUE_NAME  | VARCHAR2(64)  | NOT NULL | Name of the initialization parameter                                                                                  |
| INIT_VALUE       | VARCHAR2(255) | NOT NULL | Value of the initialization parameter                                                                                 |
| INIT_VALUE_TYPE  | VARCHAR2(1)   | NOT NULL | Environment variable (T or F). T means this is an environment variable; F means do not set as an environment variable |
| FDS_CLASS_NAME   | VARCHAR2(30)  | NOT NULL | Name of the FDS class (for example: ODBC, DB2)                                                                        |
| FDS_INST_NAME    | VARCHAR2(30)  | NOT NULL | Name of the FDS instance                                                                                              |
| FDS_INST_INIT_ID | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally)                                      |
| FDS_CLASS_ID     | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally)                                      |
| FDS_INST_ID      | NUMBER        | NOT NULL | Sequence: a counter that is incremented for every row inserted (used internally)                                      |

## 7.205 IDEPTREE

This view, created by `utldeptree.sql`, lists the indented dependency tree. It is a pre-sorted, pretty-print version of DEPTREE.

| Column       | Datatype       | NULL | Description                          |
|--------------|----------------|------|--------------------------------------|
| NESTED_LEVEL | NUMBER         |      | Nesting level in the dependency tree |
| TYPE         | VARCHAR2(23)   |      | Object type                          |
| OWNER        | VARCHAR2(28)   |      | Object schema                        |
| NAME         | VARCHAR2(1002) |      | Object name                          |

## 7.206 IND

IND is a synonym for USER\_INDEXES.

### ① See Also

["USER\\_INDEXES"](#)

## 7.207 INDEX\_HISTOGRAM

INDEX\_HISTOGRAM contains information from the ANALYZE INDEX ... VALIDATE STRUCTURE statement.

### Note

The ANALYZE INDEX ... VALIDATE STRUCTURE OFFLINE statement must be used to collect statistics.

| Column                 | Datatype | NULL | Description                                                          |
|------------------------|----------|------|----------------------------------------------------------------------|
| REPEAT_COUNT           | NUMBER   |      | Number of times that one or more index keys is repeated in the table |
| KEYS_WITH_REPEAT_COUNT | NUMBER   |      | Number of index keys that are repeated that many times               |

## 7.208 INDEX\_STATS

INDEX\_STATS stores information from the last ANALYZE INDEX ... VALIDATE STRUCTURE statement.

### Note

The ANALYZE INDEX ... VALIDATE STRUCTURE OFFLINE statement must be used in order to collect statistics

| Column         | Datatype      | NULL     | Description                                                                                               |
|----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------|
| HEIGHT         | NUMBER        |          | Height of the B-Tree                                                                                      |
| BLOCKS         | NUMBER        | NOT NULL | Blocks allocated to the segment                                                                           |
| NAME           | VARCHAR2(128) | NOT NULL | Name of the index                                                                                         |
| PARTITION_NAME | VARCHAR2(128) |          | Name of the partition of the index which was analyzed. If the index is not partitioned, NULL is returned. |
| LF_ROWS        | NUMBER        |          | Number of leaf rows (values in the index)                                                                 |
| LF_BLKs        | NUMBER        |          | Number of leaf blocks in the B-Tree                                                                       |
| LF_ROWS_LEN    | NUMBER        |          | Sum of the lengths of all the leaf rows                                                                   |
| LF_BLK_LEN     | NUMBER        |          | Usable space in a leaf block                                                                              |
| BR_ROWS        | NUMBER        |          | Number of branch rows in the B-Tree                                                                       |
| BR_BLKs        | NUMBER        |          | Number of branch blocks in the B-Tree                                                                     |
| BR_ROWS_LEN    | NUMBER        |          | Sum of the lengths of all the branch blocks in the B-Tree                                                 |
| BR_BLK_LEN     | NUMBER        |          | Usable space in a branch block                                                                            |
| DEL_LF_ROWS    | NUMBER        |          | Number of deleted leaf rows in the index                                                                  |

| Column                | Datatype | NULL | Description                                                                                                                                                                                                     |
|-----------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEL_LF_ROWS_LEN       | NUMBER   |      | Total length of all deleted rows in the index                                                                                                                                                                   |
| DISTINCT_KEYS         | NUMBER   |      | Number of distinct keys in the index (may include rows that have been deleted)                                                                                                                                  |
| MOST_REPEATED_KEY     | NUMBER   |      | How many times the most repeated key is repeated (may include rows that have been deleted)                                                                                                                      |
| BTREE_SPACE           | NUMBER   |      | Total space currently allocated in the B-Tree                                                                                                                                                                   |
| USED_SPACE            | NUMBER   |      | Total space that is currently being used in the B-Tree                                                                                                                                                          |
| PCT_USED              | NUMBER   |      | Percent of space allocated in the B-Tree that is being used                                                                                                                                                     |
| ROWS_PER_KEY          | NUMBER   |      | Average number of rows per distinct key (this figure is calculated without consideration of deleted rows)                                                                                                       |
| BLKS_GETS_PER_ACCESS  | NUMBER   |      | Expected number of consistent mode block reads per row, assuming that a randomly chosen row is accessed using the index. Used to calculate the number of consistent reads that will occur during an index scan. |
| PRE_ROWS              | NUMBER   |      | Number of prefix rows (values in the index)                                                                                                                                                                     |
| PRE_ROWS_LEN          | NUMBER   |      | Sum of lengths of all prefix rows                                                                                                                                                                               |
| OPT_CMPR_COUNT        | NUMBER   |      | Optimal index compression length                                                                                                                                                                                |
| OPT_CMPR_PCTSAVE      | NUMBER   |      | Corresponding space savings after an ANALYZE                                                                                                                                                                    |
| DEL_LF_CMP_ROWS       | NUMBER   |      | Number of deleted rows that are within a compression unit (CU)                                                                                                                                                  |
| PRG_LF_CMP_ROWS       | NUMBER   |      | Number of purged rows that are within a CU                                                                                                                                                                      |
| LF_CMP_ROWS           | NUMBER   |      | Number of rows that are in a CU or prefix compressed                                                                                                                                                            |
| LF_CMP_ROWS_LEN       | NUMBER   |      | Sum of lengths of all prefix rows and CUs                                                                                                                                                                       |
| LF_UNCMP_ROWS         | NUMBER   |      | Number of rows that are neither in a CU nor prefix compressed                                                                                                                                                   |
| LF_UNCMP_ROWS_LEN     | NUMBER   |      | Sum of lengths of rows that are neither in a CU nor prefix compressed                                                                                                                                           |
| LF_SUF_ROWS_LEN       | NUMBER   |      | Sum of lengths of suffix rows                                                                                                                                                                                   |
| LF_CMP_ROWS_UNCMP_LEN | NUMBER   |      | Sum of the uncompressed lengths of rows that are in a CU or prefix compressed                                                                                                                                   |
| LF_CMP_RECMP_COUNT    | NUMBER   |      | Sum of CU recompression counts                                                                                                                                                                                  |
| LF_CMP_LOCK_VEC_LEN   | NUMBER   |      | Sum of CU lock vector lengths                                                                                                                                                                                   |
| LF_CMP_BLKs           | NUMBER   |      | Number of blocks that have a CU or nonzero prefix column count                                                                                                                                                  |
| LF_UNCMP_BLKs         | NUMBER   |      | Number of blocks that do not have a CU and have a zero prefix column count                                                                                                                                      |

## 7.209 LOGSTDBY\_UNSUPPORTED\_TABLES

LOGSTDBY\_UNSUPPORTED\_TABLES is a synonym for DBA\_LOGSTDBY\_UNSUPPORTED\_TABLE.

["DBA\\_LOGSTDBY\\_UNSUPPORTED\\_TABLE"](#)

## 7.210 MAP\_OBJECT

MAP\_OBJECT is a global temporary table that displays the hierarchical arrangement of storage containers for objects. Each row in the table represents a level in the hierarchy.

| Column        | Datatype       | NULL | Description                                                                                                                                                                                        |
|---------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_NAME   | VARCHAR2(2000) |      | Name of the object                                                                                                                                                                                 |
| OBJECT_OWNER  | VARCHAR2(2000) |      | Owner of the object                                                                                                                                                                                |
| OBJECT_TYPE   | VARCHAR2(2000) |      | Object type                                                                                                                                                                                        |
| FILE_MAP_IDX  | NUMBER         |      | File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE)                                                                                                                                            |
| DEPTH         | NUMBER         |      | Element depth within the I/O stack                                                                                                                                                                 |
| ELEM_IDX      | NUMBER         |      | Index corresponding to the element                                                                                                                                                                 |
| CU_SIZE       | NUMBER         |      | Contiguous set of logical blocks of the file (in HKB units) that is resident contiguously on the element                                                                                           |
| STRIDE        | NUMBER         |      | Number of HKB between contiguous units (CU) in the file that are contiguous on this element. Used in RAID5 and striped files.                                                                      |
| NUM_CU        | NUMBER         |      | Number of contiguous units that are adjacent to each other on this element that are separated by STRIDE HKB in the file. In RAID5, the number of contiguous units also include the parity stripes. |
| ELEM_OFFSET   | NUMBER         |      | Element offset (in HKB units)                                                                                                                                                                      |
| FILE_OFFSET   | NUMBER         |      | Offset (in HKB units) from the start of the file to the first byte of the contiguous units                                                                                                         |
| DATA_TYPE     | VARCHAR2(2000) |      | Data type (DATA, PARITY, or DATA AND PARITY)                                                                                                                                                       |
| PARITY_POS    | NUMBER         |      | Position of the parity. Only for RAID5. This field is needed to distinguish the parity from the data part.                                                                                         |
| PARITY_PERIOD | NUMBER         |      | Parity period. Only for RAID5.                                                                                                                                                                     |

## 7.211 NLS\_DATABASE\_PARAMETERS

NLS\_DATABASE\_PARAMETERS lists permanent NLS parameters of the database.

| Column    | Datatype      | NULL | Description    |
|-----------|---------------|------|----------------|
| PARAMETER | VARCHAR2(128) |      | Parameter name |

| Column | Datatype     | NULL | Description     |
|--------|--------------|------|-----------------|
| VALUE  | VARCHAR2(64) |      | Parameter value |

## 7.212 NLS\_INSTANCE\_PARAMETERS

NLS\_INSTANCE\_PARAMETERS lists NLS parameters of the instance.

| Column    | Datatype     | NULL | Description     |
|-----------|--------------|------|-----------------|
| PARAMETER | VARCHAR2(30) |      | Parameter name  |
| VALUE     | VARCHAR2(64) |      | Parameter value |

## 7.213 NLS\_SESSION\_PARAMETERS

NLS\_SESSION\_PARAMETERS lists NLS parameters of the user session.

| Column    | Datatype     | NULL | Description     |
|-----------|--------------|------|-----------------|
| PARAMETER | VARCHAR2(30) |      | Parameter name  |
| VALUE     | VARCHAR2(64) |      | Parameter value |

## 7.214 OBJ

OBJ is a synonym for USER\_OBJECTS.

## 7.215 PATH\_VIEW

PATH\_VIEW contains one row for each unique path to access a resource in the Oracle XML DB repository.

| Column | Datatype                                                                                                  | NULL | Description                                   |
|--------|-----------------------------------------------------------------------------------------------------------|------|-----------------------------------------------|
| PATH   | VARCHAR2(1024)                                                                                            |      | An (absolute) path to repository resource RES |
| RES    | XMLTYPE(XMLSch<br>ema "http://<br>xmlns.oracle.com/xd<br>b/<br>XDBResource.xsd"<br>Element<br>"Resource") |      | The resource referred to by the PATH column   |
| LINK   | XMLTYPE                                                                                                   |      | Link property                                 |
| RESID  | RAW(16)                                                                                                   |      | Resource OID                                  |

## 7.216 PDB\_ALERTS

PDB\_ALERTS contains descriptions of reasons for PDB alerts.

| Column   | Datatype       | NULL     | Description                                             |
|----------|----------------|----------|---------------------------------------------------------|
| TIME     | TIMESTAMP(6)   | NOT NULL | Time when the violation happened                        |
| NAME     | VARCHAR2(128)  | NOT NULL | A name of a PDB or non-CDB to which this record applies |
| CAUSE_NO | NUMBER         | NOT NULL | Number identifying a specific reason for a PDB alert    |
| TYPE_NO  | NUMBER         | NOT NULL | Type of the violation                                   |
| ERROR    | NUMBER         |          | Oracle error, if any, for this violation                |
| LINE     | NUMBER         | NOT NULL | Line number for the violation message                   |
| MESSAGE  | VARCHAR2(4000) | NOT NULL | Description of the violation                            |
| STATUS   | NUMBER         |          | Status of the violation                                 |
| ACTION   | VARCHAR2(4000) |          | Actions to take to resolve the violations               |

## 7.217 PDB\_PLUG\_IN\_VIOLATIONS

PDB\_PLUG\_IN\_VIOLATIONS displays information about incompatibilities between a PDB and the CDB to which it belongs.

This view is also used to display information generated by executing  
DBMS\_PDB.CHECK\_PLUG\_COMPATIBILITY.

| Column       | Datatype       | NULL     | Description                                                                                                                                 |
|--------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| TIME         | TIMESTAMP(6)   | NOT NULL | Time when a violation described by this row was discovered                                                                                  |
| NAME         | VARCHAR2(128)  | NOT NULL | The name of an existing PDB or a PDB intended to be created (if a row was entered as a result of running DBMS_PDB.CHECK_PLUG_COMPATIBILITY) |
| CAUSE        | VARCHAR2(64)   | NOT NULL | Attribute which was being checked                                                                                                           |
| TYPE         | VARCHAR2(9)    | NOT NULL | ERROR or WARNING                                                                                                                            |
| ERROR_NUMBER | NUMBER         |          | Oracle error number, if any, encountered during a check                                                                                     |
| LINE         | NUMBER         | NOT NULL | Used to differentiate between violations which share a cause                                                                                |
| MESSAGE      | VARCHAR2(4000) | NOT NULL | Description of a violation                                                                                                                  |
| STATUS       | VARCHAR2(9)    |          | PENDING, RESOLVED, or IGNORE                                                                                                                |
| ACTION       | VARCHAR2(4000) |          | Description of an action to take to correct the violation                                                                                   |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container to which the data pertains. Possible values:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.218 PLAN\_TABLE

PLAN\_TABLE is automatically created as a global temporary table to hold the output of an EXPLAIN PLAN statement for all users.

PLAN\_TABLE is the default sample output table into which the EXPLAIN PLAN statement inserts rows describing execution plans.

While a PLAN\_TABLE table is automatically set up for each user, you can use the SQL script `utlxplan.sql` to manually create a local PLAN\_TABLE in your schema.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                   |
|--------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATEMENT_ID | VARCHAR2(30)   |      | Value of the optional STATEMENT_ID parameter specified in the EXPLAIN PLAN statement                                                                                                                                                                                                                                                          |
| PLAN_ID      | NUMBER         |      | Unique identifier of a plan in the database                                                                                                                                                                                                                                                                                                   |
| TIMESTAMP    | DATE           |      | Date and time when the EXPLAIN PLAN statement was generated                                                                                                                                                                                                                                                                                   |
| REMARKS      | VARCHAR2(4000) |      | <p>Any comment (of up to 4000 bytes) you want to associate with each step of the explained plan. This column is used to indicate whether an outline or SQL Profile was used for the query.</p> <p>If you need to add or change a remark on any row of the PLAN_TABLE, then use the UPDATE statement to modify the rows of the PLAN_TABLE.</p> |
| OPERATION    | VARCHAR2(30)   |      | <p>Name of the internal operation performed in this step. In the first row generated for a statement, the column contains one of the following values:</p> <ul style="list-style-type: none"> <li>• DELETE STATEMENT</li> <li>• INSERT STATEMENT</li> <li>• SELECT STATEMENT</li> <li>• UPDATE STATEMENT</li> </ul>                           |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS         | VARCHAR2(255) |      | A variation on the operation described in the OPERATION column                                                                                                                                                                                                                                                                                           |
| OBJECT_NODE     | VARCHAR2(128) |      | Name of the database link used to reference the object (a table name or view name). For local queries using parallel execution, this column describes the order in which output from operations is consumed.                                                                                                                                             |
| OBJECT_OWNER    | VARCHAR2(128) |      | Owner of the table or index                                                                                                                                                                                                                                                                                                                              |
| OBJECT_NAME     | VARCHAR2(128) |      | Name of the table or index                                                                                                                                                                                                                                                                                                                               |
| OBJECT_ALIAS    | VARCHAR2(261) |      | Unique alias of a table or view in a SQL statement. For indexes, it is the object alias of the underlying table.                                                                                                                                                                                                                                         |
| OBJECT_INSTANCE | NUMBER(38)    |      | Number corresponding to the ordinal position of the object as it appears in the original statement. The numbering proceeds from left to right, outer to inner with respect to the original statement text. View expansion results in unpredictable numbers.                                                                                              |
| OBJECT_TYPE     | VARCHAR2(30)  |      | Modifier that provides descriptive information about the object; for example, NON-UNIQUE for indexes                                                                                                                                                                                                                                                     |
| OPTIMIZER       | VARCHAR2(255) |      | Current mode of the optimizer                                                                                                                                                                                                                                                                                                                            |
| SEARCH_COLUMNS  | NUMBER        |      | Not currently used                                                                                                                                                                                                                                                                                                                                       |
| ID              | NUMBER(38)    |      | A number assigned to each step in the execution plan                                                                                                                                                                                                                                                                                                     |
| PARENT_ID       | NUMBER(38)    |      | ID of the next execution step that operates on the output of the ID step                                                                                                                                                                                                                                                                                 |
| DEPTH           | NUMBER(38)    |      | Depth of the operation in the row source tree that the plan represents. The value can be used for indenting the rows in a plan table report.                                                                                                                                                                                                             |
| POSITION        | NUMBER(38)    |      | For the first row of output, this indicates the optimizer's estimated cost of executing the statement. For the other rows, it indicates the position relative to the other children of the same parent.                                                                                                                                                  |
| COST            | NUMBER(38)    |      | Cost of the operation as estimated by the optimizer's query approach. Cost is not determined for table access operations. The value of this column does not have any particular unit of measurement; it is merely a weighted value used to compare costs of execution plans. The value of this column is a function of the CPU_COST and IO_COST columns. |
| CARDINALITY     | NUMBER(38)    |      | Estimate by the query optimization approach of the number of rows accessed by the operation                                                                                                                                                                                                                                                              |
| BYTES           | NUMBER(38)    |      | Estimate by the query optimization approach of the number of bytes accessed by the operation                                                                                                                                                                                                                                                             |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OTHER_TAG       | VARCHAR2(255) |      | <p>Describes the contents of the OTHER column:</p> <ul style="list-style-type: none"> <li>SERIAL - Serial execution. Currently, SQL is not loaded in the OTHER column for this case.</li> <li>SERIAL_FROM_REMOTE - Serial execution at a remote site.</li> <li>PARALLEL_FROM_SERIAL - Serial execution. Output of step is partitioned or broadcast to parallel execution servers.</li> <li>PARALLEL_TO_SERIAL - Parallel execution. Output of step is returned to serial query coordinator (QC) process.</li> <li>PARALLEL_TO_PARALLEL - Parallel execution. Output of step is repartitioned to second set of parallel execution servers.</li> <li>PARALLEL_COMBINED_WITH_PARENT - Parallel execution; Output of step goes to next step in same parallel process. No interprocess communication to parent.</li> <li>PARALLEL_COMBINED_WITH_CHILD - Parallel execution. Input of step comes from prior step in same parallel process. No interprocess communication from child.</li> </ul> |
| PARTITION_START | VARCHAR2(255) |      | <p>Start partition of a range of accessed partitions:</p> <ul style="list-style-type: none"> <li><i>number</i> - Start partition has been identified by the SQL compiler, and its partition number is given by <i>number</i></li> <li>KEY - Start partition will be identified at run time from partitioning key values</li> <li>ROW LOCATION - Start partition (same as the stop partition) will be computed at run time from the location of each record being retrieved. The record location is obtained from a user-specified ROWID or from a global index.</li> <li>INVALID - Range of accessed partitions is empty</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| PARTITION_STOP  | VARCHAR2(255) |      | <p>Stop partition of a range of accessed partitions:</p> <ul style="list-style-type: none"> <li><i>number</i> - Stop partition has been identified by the SQL compiler, and its partition number is given by <i>number</i></li> <li>KEY - Stop partition will be identified at run time from partitioning key values</li> <li>ROW LOCATION - Stop partition (same as the start partition) will be computed at run time from the location of each record being retrieved. The record location is obtained from a user-specified ROWID or from a global index.</li> <li>INVALID - Range of accessed partitions is empty</li> </ul>                                                                                                                                                                                                                                                                                                                                                          |
| PARTITION_ID    | NUMBER(38)    |      | Step that has computed the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OTHER           | LONG          |      | Other information that is specific to the execution step that a user might find useful (see the OTHER_TAG column)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column            | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| OTHER_XML         | CLOB           |      | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> </ul> |
| DISTRIBUTION      | VARCHAR2(30)   |      | Method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CPU_COST          | NUMBER(38)     |      | CPU cost of the operation as estimated by the query optimizer's approach. The value of this column is proportional to the number of machine cycles required for the operation. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IO_COST           | NUMBER(38)     |      | I/O cost of the operation as estimated by the query optimizer's approach. The value of this column is proportional to the number of data blocks read by the operation. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TEMP_SPACE        | NUMBER(38)     |      | Temporary space (in bytes) used by the operation as estimated by the query optimizer's approach. For statements that use the rule-based approach, or for operations that do not use any temporary space, this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ACCESS_PREDICATES | VARCHAR2(4000) |      | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FILTER_PREDICATES | VARCHAR2(4000) |      | Predicates used to filter rows before producing them                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PROJECTION        | VARCHAR2(4000) |      | Expressions produced by the operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TIME              | NUMBER(38)     |      | Elapsed time (in seconds) of the operation as estimated by query optimization. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| QBLOCK_NAME       | VARCHAR2(128)  |      | Name of the query block (either system-generated or defined by the user with the QB_NAME hint)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 7.219 PLUGGABLE\_SET\_CHECK

PLUGGABLE\_SET\_CHECK contains pluggable set checks.

| Column     | Datatype      | NULL | Description         |
|------------|---------------|------|---------------------|
| OBJ1_OWNER | VARCHAR2(128) |      | Owner of the object |
| OBJ1_NAME  | VARCHAR2(128) |      | Object 1            |

| Column          | Datatype      | NULL | Description                          |
|-----------------|---------------|------|--------------------------------------|
| OBJ1_SUBNAME    | VARCHAR2(128) |      | SubObject1Name                       |
| OBJ1_TYPE       | VARCHAR2(18)  |      | Object Type                          |
| TS1_NAME        | VARCHAR2(30)  |      | Tablespace containing Object 1       |
| OBJ2_NAME       | VARCHAR2(128) |      | Object Name                          |
| OBJ2_SUBNAME    | VARCHAR2(128) |      | SubObject2Name                       |
| OBJ2_TYPE       | VARCHAR2(18)  |      | Object Type                          |
| OBJ2_OWNER      | VARCHAR2(128) |      | Object owner of second object        |
| TS2_NAME        | VARCHAR2(30)  |      | Tablespace containing Object 1       |
| CONSTRAINT_NAME | VARCHAR2(128) |      | Name of dependent constraint         |
| REASON          | VARCHAR2(86)  |      | Reason for Pluggable check violation |
| MESG_ID         | NUMBER        |      | The message ID                       |

## 7.220 PRODUCT\_COMPONENT\_VERSION

PRODUCT\_COMPONENT\_VERSION contains version and status information for component products.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                  |
|--------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRODUCT      | VARCHAR2(80)  |      | Product name                                                                                                                                                                                                                 |
| VERSION      | VARCHAR2(80)  |      | Version number                                                                                                                                                                                                               |
| VERSION_FULL | VARCHAR2(160) |      | The version number with the new Oracle Database version scheme introduced in Oracle Database 18c. The version number is displayed only for the database component. All other components return a null value for this column. |
| STATUS       | VARCHAR2(80)  |      | Status of release                                                                                                                                                                                                            |

## 7.221 PROXY\_USERS

PROXY\_USERS describes the list of proxy users and the clients on whose behalf they can act.

| Column         | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                               |
|----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROXY          | VARCHAR2(128) | NOT NULL | Name of a proxy user                                                                                                                                                                                                                                                                                      |
| CLIENT         | VARCHAR2(128) | NOT NULL | Name of the client user who the proxy user can act as                                                                                                                                                                                                                                                     |
| AUTHENTICATION | VARCHAR2(3)   |          | Indicates whether the proxy is required to supply the client's authentication credentials (YES) or not (NO)                                                                                                                                                                                               |
| FLAGS          | VARCHAR2(35)  |          | Flags associated with the proxy/client pair: <ul style="list-style-type: none"> <li>• PROXY MAY ACTIVATE ALL CLIENT ROLES</li> <li>• NO CLIENT ROLES MAY BE ACTIVATED</li> <li>• PROXY MAY ACTIVATE ROLE</li> <li>• PROXY MAY ACTIVATE ALL CLIENT ROLES</li> <li>• PROXY MAY NOT ACTIVATE ROLE</li> </ul> |

## 7.222 PSTUBTBL

This table contains information on stubs generated by the PSTUB utility so that an Oracle Forms 3.0 client can call stored procedures in Oracle Database.

**① Note**

The contents of this table are intended only for use by the PSTUB utility.

| Column   | Datatype       | NULL | Description                                                    |
|----------|----------------|------|----------------------------------------------------------------|
| USERNAME | VARCHAR2(128)  |      | Schema part of the identifier of a stored procedure            |
| DBNAME   | VARCHAR2(128)  |      | Database link part of the identifier of a stored procedure     |
| LUN      | VARCHAR2(128)  |      | Library unit name part of the identifier of a stored procedure |
| LUTYPE   | VARCHAR2(3)    |      | Type of the stored procedure                                   |
| LINENO   | NUMBER         |      | Line number of the stub                                        |
| LINE     | VARCHAR2(1800) |      | Text of the stub                                               |

## 7.223 PUBLIC\_DEPENDENCY

PUBLIC\_DEPENDENCY lists dependencies to and from objects, by object number.

| Column               | Datatype | NULL     | Description                           |
|----------------------|----------|----------|---------------------------------------|
| OBJECT_ID            | NUMBER   | NOT NULL | Object number                         |
| REFERENCED_OBJECT_ID | NUMBER   | NOT NULL | Referenced object (the parent object) |

## 7.224 PUBLICSYN

PUBLICSYN contains information on public synonyms.

| Column   | Datatype      | NULL | Description                         |
|----------|---------------|------|-------------------------------------|
| SNAME    | VARCHAR2(128) |      | Name of the synonym                 |
| CREATOR  | VARCHAR2(128) |      | Owner of the synonym                |
| TNAME    | VARCHAR2(128) |      | Table of which this is a synonym    |
| DATABASE | VARCHAR2(128) |      | Database in which the table resides |
| TABTYPE  | VARCHAR2(10)  |      | Type of table                       |

## 7.225 QUEUE\_PRIVILEGES

QUEUE\_PRIVILEGES shows all Advanced Queuing object privileges granted to the session.

| Column            | Datatype      | NULL     | Description                                         |
|-------------------|---------------|----------|-----------------------------------------------------|
| GRANTEE           | VARCHAR2(128) | NOT NULL | Name of the user or role to whom access was granted |
| OWNER             | VARCHAR2(128) | NOT NULL | Owner of the object                                 |
| NAME              | VARCHAR2(128) | NOT NULL | Name of the object                                  |
| GRANTOR           | VARCHAR2(128) | NOT NULL | Name of the user who performed the grant            |
| ENQUEUE_PRIVILEGE | NUMBER        |          | Permission to ENQUEUE to the queue                  |
| DEQUEUE_PRIVILEGE | NUMBER        |          | Permission to DEQUEUE from the queue                |

## 7.226 RECYCLEBIN

RECYCLEBIN is a synonym for USER\_RECYCLEBIN.

### ① See Also

["USER\\_RECYCLEBIN"](#)

## 7.227 REDACTION\_COLUMNS

REDACTION\_COLUMNS describes all redacted columns in the database, giving the owner of the table or view within which the column resides, the object name, the column name, the type of redaction function, the parameters to the redaction function (if any), and an optional user-provided description of the redaction function that is performed on the column.

| Column                | Datatype       | NULL     | Description                                                                                                                                             |
|-----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_OWNER          | VARCHAR2(128)  | NOT NULL | Owner of the object that is redacted                                                                                                                    |
| OBJECT_NAME           | VARCHAR2(128)  | NOT NULL | Name of the object that is redacted                                                                                                                     |
| COLUMN_NAME           | VARCHAR2(128)  | NOT NULL | Name of the column that is redacted                                                                                                                     |
| FUNCTION_TYPE         | VARCHAR2(27)   |          | Redaction function for this column                                                                                                                      |
| FUNCTION_PARAMETERS   | VARCHAR2(1000) |          | Redaction function_parameters for this column                                                                                                           |
| REGEXP_PATTERN        | VARCHAR2(512)  |          | Regular expression pattern to search for                                                                                                                |
| REGEXP_REPLACE_STRING | VARCHAR2(4000) |          | Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, (where n is a number from 1 to 9) |
| REGEXP_POSITION       | NUMBER         |          | Integer counting from 1, giving the position where the search should begin                                                                              |
| REGEXP_OCCURRENCE     | NUMBER         |          | Either 0 (to replace all occurrences of the match), or a positive integer n (to replace the nth occurrence of the match)                                |

| Column                 | Datatype       | NULL | ullDescription                                                                                                                                                                                                                     |
|------------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGEXP_MATCH_PARAMETER | VARCHAR2(10)   |      | To change the default matching behavior, possible values are a combination of i, c, n, m, and x. See the documentation of the match_parameter in the REGEXP_REPLACE section of the <i>Oracle Database SQL Language Reference</i> . |
| COLUMN_DESCRIPTION     | VARCHAR2(4000) |      | User-provided description of the redaction function that is performed on the column. For example, for a Social Security Number column, the description might be: "redact SSN to XXX-XX-(last 4 digits)".                           |

## 7.228 REDACTION\_EXPRESSIONS

REDACTION\_EXPRESSIONS shows all the Data Redaction named Policy Expressions in the database.

| Column                           | Datatype       | NULL | Description                                                                      |
|----------------------------------|----------------|------|----------------------------------------------------------------------------------|
| POLICY_EXPRESSION_NAME           | VARCHAR2(256)  |      | Customer-specified name of the named Policy Expression                           |
| EXPRESSION                       | VARCHAR2(4000) |      | The SQL expression defined for this Data Redaction named Policy Expression       |
| OBJECT_OWNER                     | VARCHAR2(128)  |      | Owner of the table or view which this named Policy Expression is associated with |
| OBJECT_NAME                      | VARCHAR2(128)  |      | Name of the table or view which this named Policy Expression is associated with  |
| COLUMN_NAME                      | VARCHAR2(128)  |      | Name of the column which this named Policy Expression is associated with         |
| POLICY_EXPRESSION_DESCR<br>PTION | VARCHAR2(4000) |      | Description of this named Policy Expression                                      |

### ① See Also

*Oracle Database Advanced Security Guide* for more information about Oracle Data Redaction

## 7.229 REDACTION\_POLICIES

REDACTION\_POLICIES displays all redaction policies in the database.

| Column             | Datatype       | NULL     | Description                                               |
|--------------------|----------------|----------|-----------------------------------------------------------|
| OBJECT_OWNER       | VARCHAR2(128)  | NOT NULL | Owner of the object with the policy                       |
| OBJECT_NAME        | VARCHAR2(128)  | NOT NULL | Name of the object with the policy                        |
| POLICY_NAME        | VARCHAR2(128)  | NOT NULL | Name of the policy                                        |
| EXPRESSION         | VARCHAR2(4000) | NOT NULL | Expression for this policy                                |
| ENABLE             | VARCHAR2(7)    |          | Indicates whether the policy is enabled (YES) or not (NO) |
| POLICY_DESCRIPTION | VARCHAR2(4000) |          | Description of the policy                                 |

## 7.230 REDACTION\_VALUES\_FOR\_TYPE\_FULL

REDACTION\_VALUES\_FOR\_TYPE\_FULL shows all of the current values for full redaction.

For example, if a redaction policy is applied to a column of type BINARY\_DOUBLE and the redaction type is full redaction, that column will be redacted with the value shown in the BINARY\_DOUBLE\_VALUE column of this view.

| Column                         | Datatype                    | NULL     | Description                                                             |
|--------------------------------|-----------------------------|----------|-------------------------------------------------------------------------|
| NUMBER_VALUE                   | NUMBER                      | NOT NULL | Redaction result for full redaction on NUMBER columns                   |
| BINARY_FLOAT_VALUE             | BINARY_FLOAT                | NOT NULL | Redaction result for full redaction on BINARY_FLOAT columns             |
| BINARY_DOUBLE_VALUE            | BINARY_DOUBLE               | NOT NULL | Redaction result for full redaction on BINARY_DOUBLE columns            |
| CHAR_VALUE                     | VARCHAR2(1)                 |          | Redaction result for full redaction on CHAR columns                     |
| VARCHAR_VALUE                  | VARCHAR2(1)                 |          | Redaction result for full redaction on VARCHAR2 columns                 |
| NCHAR_VALUE                    | NCHAR(1)                    |          | Redaction result for full redaction on NCHAR columns                    |
| NVARCHAR_VALUE                 | NVARCHAR2(1)                |          | Redaction result for full redaction on NVARCHAR2 columns                |
| DATE_VALUE                     | DATE                        | NOT NULL | Redaction result for full redaction on DATE columns                     |
| TIMESTAMP_VALUE                | TIMESTAMP(6)                | NOT NULL | Redaction result for full redaction on TIMESTAMP columns                |
| TIMESTAMP_WITH_TIME_ZONE_VALUE | TIMESTAMP(6) WITH TIME ZONE | NOT NULL | Redaction result for full redaction on TIMESTAMP WITH TIME ZONE columns |
| BLOB_VALUE                     | BLOB                        |          | Redaction result for full redaction on BLOB columns                     |
| CLOB_VALUE                     | CLOB                        |          | Redaction result for full redaction on CLOB columns                     |
| NCLOB_VALUE                    | NCLOB                       |          | Redaction result for full redaction on NCLOB columns                    |

## 7.231 REPORT\_COMPONENTS

REPORT\_COMPONENTS displays metadata about different database components offering reports in XML, HTML, or Text formats.

Reports are first generated in XML and can then be translated into HTML or Text formats, for supported report types. Each component generates one or more reports containing different types of content. You can request reports using the component's own PL/SQL interface (for example, DBMS\_SQLTUNE for SQL Tuning Advisor).

| Column                | Datatype      | NULL     | Description                                                                                      |
|-----------------------|---------------|----------|--------------------------------------------------------------------------------------------------|
| COMPONENT_ID          | NUMBER        | NOT NULL | ID number of the database component building the report                                          |
| COMPONENT_NAME        | VARCHAR2(128) | NOT NULL | Name of the database component building the report (for example, sqltune for SQL Tuning Advisor) |
| COMPONENT_DESCRIPTION | VARCHAR2(256) |          | Component description                                                                            |
| REPORT_ID             | NUMBER        | NOT NULL | ID number of the report type                                                                     |
| REPORT_NAME           | VARCHAR2(128) | NOT NULL | Name of the report type                                                                          |
| REPORT_DESCRIPTION    | VARCHAR2(256) |          | Description of the report type                                                                   |
| SCHEMA_FILENAME       | VARCHAR2(500) |          | Filename of the XML schema for the report (optional)                                             |
| SCHEMA_DATA           | XMLTYPE       |          | XML schema for this report (optional)                                                            |

**① See Also**

*Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_SQLTUNE package

## 7.232 REPORT\_FILES

REPORT\_FILES displays data for all of the XML schema and XSLT files associated with reports for a given component.

| Column   | Datatype      | NULL     | Description                      |
|----------|---------------|----------|----------------------------------|
| FILENAME | VARCHAR2(500) | NOT NULL | Name of the XSLT/XML schema file |
| DATA     | XMLTYPE       |          | XSLT/XML schema data             |

## 7.233 REPORT\_FORMATS

REPORT\_FORMATS displays metadata about the different output formats supported for reports.

Some reports are generated in XML only, in which case no data will appear in this view. When reports support HTML or Text formats (for example, the SQL Performance Analyzer reports), metadata about the format will appear in this view.

| Column         | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID   | NUMBER        | NOT NULL | ID number of the database component building the report                                                                                                                                                                                                                                                                                                                                                                                                      |
| COMPONENT_NAME | VARCHAR2(128) | NOT NULL | Name of the database component building the report (for example, sqltune for SQL Tuning Advisor)                                                                                                                                                                                                                                                                                                                                                             |
| REPORT_ID      | NUMBER        | NOT NULL | ID number of the report type                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| REPORT_NAME    | VARCHAR2(128) | NOT NULL | Name of the report type                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FORMAT_NAME    | VARCHAR2(128) | NOT NULL | Name of the report format                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DESCRIPTION    | VARCHAR2(256) |          | Description of the report format                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TYPE           | VARCHAR2(6)   |          | Format type: <ul style="list-style-type: none"> <li>• XSLT - Reports generated by applying an XSLT style sheet to XML data (for example, HTML reports)</li> <li>• Text - Reports generated by first applying an XSLT style sheet to convert XML data to HTML, and then converting the HTML to formatted Text using the internal report HTML-to-text translation engine.</li> <li>• Custom - Custom formats implemented natively by report clients</li> </ul> |
| XSLT_FILENAME  | VARCHAR2(500) |          | Name of the XSLT used for this format (XSLT and Text format types only)                                                                                                                                                                                                                                                                                                                                                                                      |
| XSLT_DATA      | XMLTYPE       |          | XSLT data (XSLT and Text format types only)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TEXT_LINESIZE  | NUMBER        |          | Maximum line size of the formatted text report (Text format types only)                                                                                                                                                                                                                                                                                                                                                                                      |

## 7.234 RESOURCE\_COST

RESOURCE\_COST lists the cost for each resource.

| Column        | Datatype     | NULL     | Description          |
|---------------|--------------|----------|----------------------|
| RESOURCE_NAME | VARCHAR2(32) | NOT NULL | Name of the resource |
| UNIT_COST     | NUMBER       | NOT NULL | Cost of the resource |

## 7.235 RESOURCE\_MAP

RESOURCE\_MAP describes resources. This table can be used to map resource names to resource numbers.

| Column    | Datatype     | NULL     | Description           |
|-----------|--------------|----------|-----------------------|
| RESOURCE# | NUMBER       | NOT NULL | Numeric resource code |
| TYPE#     | NUMBER       | NOT NULL | Numeric type code     |
| NAME      | VARCHAR2(32) | NOT NULL | Name of the resource  |

## 7.236 RESOURCE\_VIEW

RESOURCE\_VIEW contains one row for each resource in the Oracle XML DB repository.

| Column   | Datatype                                                                                          | NULL | Description                                            |
|----------|---------------------------------------------------------------------------------------------------|------|--------------------------------------------------------|
| RES      | XMLTYPE(XMLSchema "http://xmlns.oracle.com/xd<br>b/<br>XDBResource.xsd"<br>Element<br>"Resource") |      | A resource in the repository                           |
| ANY_PATH | VARCHAR2(4000)                                                                                    |      | An (absolute) path to the resource                     |
| RESID    | RAW(16)                                                                                           |      | Resource OID, which is a unique handle to the resource |

## 7.237 ROLE\_ROLE\_PRIVS

ROLE\_ROLE\_PRIVS describes the roles granted to other roles.

Information is provided only about roles to which the user has access.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                     |
|--------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROLE         | VARCHAR2(128) |      | Name of the role                                                                                                                                                                                                                                |
| GRANTED_ROLE | VARCHAR2(128) |      | Role that was granted                                                                                                                                                                                                                           |
| ADMIN_OPTION | VARCHAR2(3)   |      | Signifies that the role was granted with ADMIN option                                                                                                                                                                                           |
| COMMON       | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the role was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the role was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED    | VARCHAR2(3)   |      | Indicates whether the role grant was inherited from another container (YES) or not (NO)                                                                                                                                                         |

## 7.238 ROLE\_SYS\_PRIVS

ROLE\_SYS\_PRIVS describes system privileges granted to roles.

Information is provided only about roles to which the user has access.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                               |
|--------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROLE         | VARCHAR2(128) |      | Name of the role                                                                                                                                                                                                                                          |
| PRIVILEGE    | VARCHAR2(40)  |      | System privilege granted to the role                                                                                                                                                                                                                      |
| ADMIN_OPTION | VARCHAR2(3)   |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO)                                                                                                                                                                                   |
| COMMON       | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED    | VARCHAR2(3)   |      | Indicates whether the role grant was inherited from another container (YES) or not (NO)                                                                                                                                                                   |

## 7.239 ROLE\_TAB\_PRIVS

ROLE\_TAB\_PRIVS describes table privileges granted to roles. Information is provided only about roles to which the user has access.

### Note

When a user with the SYSDBA privilege queries this view, information is provided only about roles to which the user has been explicitly granted access. To view information about all roles, a user with the SYSDBA privilege can query the [DBA\\_TAB\\_PRIVS](#) view.

| Column      | Datatype      | NULL | Description                                                                                                                                                                                                                                               |
|-------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROLE        | VARCHAR2(128) |      | Name of the role                                                                                                                                                                                                                                          |
| OWNER       | VARCHAR2(128) |      | Owner of the object                                                                                                                                                                                                                                       |

| COLUMN_NAME | VARCHAR2(128) |      | Name of the column, if applicable                                                                                                                                                                                                                         |
| PRIVILEGE   | VARCHAR2(40)  |      | Object privilege granted to the role                                                                                                                                                                                                                      |
| GRANTABLE   | VARCHAR2(3)   |      | YES if the role was granted with ADMIN OPTION; otherwise NO                                                                                                                                                                                               |
| COMMON      | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED   | VARCHAR2(3)   |      | Indicates whether the role grant was inherited from another container (YES) or not (NO)                                                                                                                                                                   |

## 7.240 SCHEDULER\_BATCH\_ERRORS

SCHEDULER\_BATCH\_ERRORS displays the errors caused by each call in the batch after a Scheduler batch call (when the COMMIT\_SEMANTICS argument has been set to ABSORB\_ERRORS).

| Column          | Datatype       | NULL | Description                                                                                                  |
|-----------------|----------------|------|--------------------------------------------------------------------------------------------------------------|
| ARRAY_INDEX     | NUMBER         |      | Index of the job in the batch                                                                                |
| OBJECT_TYPE     | VARCHAR2(30)   |      | Object type: <ul style="list-style-type: none"> <li>JOB</li> <li>LIGHTWEIGHT JOB</li> <li>UNKNOWN</li> </ul> |
