| NFS_READBYTES   | NUMBER   | Number of bytes read from NFS server                                                                                                                                                                                                                                                                                                                                                                                                            |
| NFS_WRITEBYTES  | NUMBER   | Number of bytes written to NFS server                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.192 V\$DYNAMIC\_REMASTER\_STATS

V\$DYNAMIC\_REMASTER\_STATS displays statistical information about the dynamic remastering process of object affinity and read-mostly. All times are given in hundredths of a second, and total values reflect what has been collected since instance startup.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REMASTER_TYPE | VARCHAR2(11) | Remaster process type. Possible values: <ul style="list-style-type: none"> <li>AFFINITY: This value is used for the row containing statistics that pertain to dynamic remastering activity on object affinity.</li> <li>READ-MOSTLY: This value is used for the row containing statistics that pertain to dynamic remastering activity on read-mostly objects.</li> </ul> |
| REMASTER_OPS  | NUMBER       | Total number of dynamic remastering operations                                                                                                                                                                                                                                                                                                                            |
| REMASTER_TIME | NUMBER       | Total dynamic remastering time                                                                                                                                                                                                                                                                                                                                            |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REMASTERED_OBJECTS      | NUMBER   | Total number of objects dynamically remastered due to affinity                                                                                                                                                                                                                                                                                                                                                                                  |
| PERSISTENT_OBJECTS      | NUMBER   | Current number of objects that are marked persistent read-mostly in the cluster                                                                                                                                                                                                                                                                                                                                                                 |
| QUIESCE_TIME            | NUMBER   | Total quiesce step time                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FREEZE_TIME             | NUMBER   | Total freeze step time                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CLEANUP_TIME            | NUMBER   | Total cleanup step time                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REPLAY_TIME             | NUMBER   | Total replay step time                                                                                                                                                                                                                                                                                                                                                                                                                          |
| FIXWRITE_TIME           | NUMBER   | Total fixwrite step time                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SYNC_TIME               | NUMBER   | Total synchronization step time                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RESOURCES_CLEAVED       | NUMBER   | Total number of resources cleaned in the cleanup steps                                                                                                                                                                                                                                                                                                                                                                                          |
| REPLAYED_LOCKS_SENT     | NUMBER   | Total number of locks replayed to other instances in the replay steps                                                                                                                                                                                                                                                                                                                                                                           |
| REPLAYED_LOCKS_RECEIVED | NUMBER   | Total number of locks received from other instances in the replay steps                                                                                                                                                                                                                                                                                                                                                                         |
| CURRENT_OBJECTS         | NUMBER   | Current number of objects remastered on this instance due to affinity or the current number of objects that are marked read-mostly in the cluster                                                                                                                                                                                                                                                                                               |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.193 V\$EDITIONABLE\_TYPES

V\$EDITIONABLE\_TYPES lists all the editionable types based on the current compatibility setting. The SELECT privilege on V\$EDITIONABLE\_TYPES will be granted to PUBLIC.

The database compatibility setting will determine the set of editionable types.

With compatibility set to 11.2 or 12, this set includes FUNCTION, LIBRARY, PACKAGE, PACKAGE BODY, PROCEDURE, SYNONYM, TRIGGER, TYPE, TYPE BODY, and VIEW. With compatibility set to 12, the set will include these types as well as the SQL TRANSLATION PROFILE.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EDITIONABLE_TYPE | VARCHAR2(64) | The name of the type that is editionable                                                                                                                                                                                                                                                                                                                                                                                                        |
| TYPE#            | NUMBER       | The number of the type that is editionable                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.194 V\$EMON

V\$EMON displays performance statistics per event monitor (EMON) worker for diagnosability of notifications. All processing time and latency is in seconds.

| Column                    | Datatype                    | Description                                                                                                                       |
|---------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| EMON#                     | NUMBER                      | EMON identifier (0 - 9)                                                                                                           |
| SID                       | NUMBER                      | Session identifier                                                                                                                |
| STARTUP_TIME              | TIMESTAMP(3) WITH TIME ZONE | Time when this EMON worker was started                                                                                            |
| SERVER_TYPE               | VARCHAR2(8)                 | Notification quality of the service provided by EMON: <ul style="list-style-type: none"> <li>REGULAR</li> <li>RELIABLE</li> </ul> |
| STATUS                    | VARCHAR2(6)                 | EMON status: <ul style="list-style-type: none"> <li>IDLE</li> <li>ACTIVE</li> </ul>                                               |
| STATUS_CHANGE_TIME        | TIMESTAMP(3) WITH TIME ZONE | Time at which EMON switched to the current STATUS                                                                                 |
| NUM_NTFNS                 | NUMBER                      | Total number of notifications (including grouping notifications)                                                                  |
| NUM_GROUPING_NTFNS        | NUMBER                      | Number of grouping notifications                                                                                                  |
| NUM_NTFNS_ALL_GROUPS      | NUMBER                      | Total number of events in all notification groups                                                                                 |
| NUM_OCI_NTFNS             | NUMBER                      | Number of OCI notifications                                                                                                       |
| NUM_PLSQL_NTFNS           | NUMBER                      | Number of PL/SQL notifications                                                                                                    |
| NUM_EMAIL_NTFNS           | NUMBER                      | Number of E-mail notifications                                                                                                    |
| NUM_HTTP_NTFNS            | NUMBER                      | Number of HTTP notifications                                                                                                      |
| NUM_EVENTS_PROCESSED      | NUMBER                      | Number of events posted by a publisher for which notifications have been delivered                                                |
| NUM_EVENTS_PENDING        | NUMBER                      | Number of events posted by a publisher for which notifications are not yet delivered                                              |
| NUM_ANONYMOUS_NTFNS       | NUMBER                      | Number of anonymous notifications                                                                                                 |
| NUM_AQ_NTFNS              | NUMBER                      | Number of AQ notifications                                                                                                        |
| NUM_DBCHANGE_NTFNS        | NUMBER                      | Number of DBChange notifications                                                                                                  |
| TOTAL_ANONYMOUS_NTFN_TIME | NUMBER                      | Total time to process Anonymous notifications                                                                                     |
| TOTAL_AQ_NTFN_TIME        | NUMBER                      | Total time to process AQ notifications                                                                                            |
| TOTAL_DBCHANGE_NTFN_TIME  | NUMBER                      | Total time to process dbchange notifications                                                                                      |
| TOTAL_PLSQL_NTFN_TIME     | NUMBER                      | Total time to process PL/SQL notifications                                                                                        |
| TOTAL_OCI_NTFN_TIME       | NUMBER                      | Total time to process OCI notifications                                                                                           |
| TOTAL_EMAIL_NTFN_TIME     | NUMBER                      | Total time to process E-mail notifications                                                                                        |

| Column                | Datatype                    | Description                                                                                                                                          |
|-----------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_HTTP_NTFN_TIME  | NUMBER                      | Total time to process HTTP notifications                                                                                                             |
| TOTAL_EMON_LATENCY    | NUMBER                      | Total latency in processing events                                                                                                                   |
| REGISTRATIONS_EXPIRED | NUMBER                      | Number of expired registrations                                                                                                                      |
| REGISTRATIONS_PURGED  | NUMBER                      | Number of purged registrations                                                                                                                       |
| REGISTRATIONS_INVALID | NUMBER                      | Number of registrations invalidated due to notification delivery failure                                                                             |
| LAST_UPDATE_TIME      | TIMESTAMP(3) WITH TIME ZONE | Time when statistics were last updated                                                                                                               |
| CON_ID                | NUMBER                      | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 8.195 V\$EMX\_USAGE\_STATS

V\$EMX\_USAGE\_STATS is used to track how often each report in Oracle Enterprise Manager Database Express (EM Express) is used and how long the EM Express servlet takes to serve these reports to the client.

This view contains statistics such as the number of requests captured in the EM Express servlet for each report, total elapsed time for the EM Express servlet to render each report, as well as a detailed time breakdown including database login time, request initialization time, time to run the SQL query, and time to stream and send the query result back to the client.

All statistics are accumulated over all requests for each EM Express report since the last time the database instance was restarted.

It also includes the timestamp of the last request for each report.

| Column               | Datatype      | Description                                                                                                                                                                                |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPORT               | VARCHAR2(400) | Name of the EM Express report. All EM Express reports are XML reports with this format: <i>%/orarep/component/report</i>                                                                   |
| COUNT                | NUMBER        | Number of requests captured by the EM Express servlet for this report since the last time the database instance was restarted                                                              |
| LOGIN_ELAPSED_TIME   | NUMBER        | Accumulated elapsed time for logging into the database across all requests for this report since the last time the database instance was restarted                                         |
| INITREQ_ELAPSED_TIME | NUMBER        | Accumulated elapsed time for initializing and preparing requests across all requests for this report since the last time the database instance was restarted                               |
| SQL_ELAPSED_TIME     | NUMBER        | Accumulated elapsed time for all requests that ran SQL queries for this report since the last time the database instance was restarted                                                     |
| SEND_ELAPSED_TIME    | NUMBER        | Accumulated elapsed time for streaming and sending the query result back to the client browser across all requests for this report since the last time the database instance was restarted |
| TOTAL_ELAPSED_TIME   | NUMBER        | Accumulated total elapsed time across all requests for this report since the last time the database instance was restarted                                                                 |
| LAST_REQ_TIME        | DATE          | Timestamp of the last request for this report since the last time the database instance was restarted                                                                                      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.196 V\$ENABLEDPRIVS

V\$ENABLEDPRIVS displays the system privileges that have been granted to the current user directly or through the currently enabled roles.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIV_NUMBER | NUMBER       | <p>Numeric identifier of the system privilege</p> <p>The matching privilege name for each PRIV_NUMBER can be found in the table SYSTEM_PRIVILEGE_MAP.</p>                                                                                                                                                                                                                                                                                              |
| SCOPE       | VARCHAR2(11) | <p>Indicates the scope with which a privilege was granted. Possible values:</p> <ul style="list-style-type: none"> <li>COMMON</li> <li>APPLICATION</li> <li>LOCAL</li> </ul>                                                                                                                                                                                                                                                                           |
| CON_ID      | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.197 V\$ENCRYPTED\_TABLESPACES

V\$ENCRYPTED\_TABLESPACES displays information about tablespaces that are encrypted.

The information displayed by this view is meaningful only for tablespaces in open containers and for the data files that are online. This is because the information is derived after the file headers making up a tablespace have been examined during the open operation.

During an encryption or decryption operation, the encryption or decryption progress can be obtained by comparing the values of the BLOCKS\_ENCRYPTED and BLOCKS\_DECRYPTED columns in this view with the value of the BLOCKS column in the DBA\_DATA\_FILES view.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| ENCRYPTEDKEY     | RAW(32)      | Encrypted version of the tablespace key for the encrypted tablespace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MASTERKEYID      | RAW(16)      | ID of the master key that was used to encrypt the tablespace key                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| BLOCKS_ENCRYPTED | NUMBER       | Number of tablespace blocks that have been encrypted during the lifetime of this instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| BLOCKS_DECRYPTED | NUMBER       | Number of tablespace blocks that have been decrypted during the lifetime of this instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| KEY_VERSION      | NUMBER       | Every encrypt/decrypt/rekey of a tablespace adds a carnation/version of the tablespace key, and the key version is incremented. A decrypted tablespace could still have a none-zero key version. In certain scenarios, however, the tablespace key version might reset to 0; for example, when a tablespace or a pluggable database (PDB) is plugged into a foreign database, or if the control file is recreated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STATUS           | VARCHAR2(10) | Shows the status of a tablespace. Possible values: <ul style="list-style-type: none"> <li>NORMAL: Used when the tablespace is not in one of the other statuses.</li> <li>REKEYING: Used when a rekey operation is taking place</li> <li>ENCRYPTING: Used when an encrypt operation is taking place</li> <li>DECRYPTING: Used when a decrypt operation is taking place</li> <li>UNKNOWN: Used when the database is mounted but not open (before the datafile is online and the key is known to the database)</li> </ul> <b>Note:</b> The REKEYING, ENCRYPTING, and DECRYPTING values can also be reported after a datafile, whose encryption state is different from the tablespace definition, is restored. In such cases, the value represents the operation that is required to make all datafiles in the tablespace consistent by using the FINISH clause of the ALTER TABLESPACE ENCRYPTION statement. See <i>Oracle Database Advanced Security Guide</i> for information about changing the encryption state of a tablespace. |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 8.198 V\$ENCRYPTION\_KEYS

V\$ENCRYPTION\_KEYS displays master key description attributes.

Note that, even if Transparent Data Encryption (TDE) is not configured in the database, a query of V\$ENCRYPTION\_KEYS checks for TDE configuration validity and may print warnings in alert log.

| Column                  | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 8.199 V\$ENCRYPTION\_WALLET

V\$ENCRYPTION\_WALLET displays information on the status of the wallet and the wallet location for Transparent Data Encryption (TDE).

In a multitenant container database (CDB), this view displays information on the wallets for all pluggable database (PDBs) when queried from CDB\$ROOT. When queried from a PDB, this view only displays wallet details of that PDB.

Note that, even if TDE is not configured in the database, a query of V\$ENCRYPTION\_WALLET checks for TDE configuration validity and may print warnings in alert log.

| Column        | Datatype       | Description                                                                                                                       |
|---------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| WRL_TYPE      | VARCHAR2(20)   | Type of the wallet resource locator (for example, FILE)                                                                           |
| WRL_PARAMETER | VARCHAR2(4000) | Parameter of the wallet resource locator (for example, absolute directory location of the wallet or keystore, if WRL_TYPE = FILE) |

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS          | VARCHAR2(30) | <p>Status of the wallet. Possible values:</p> <ul style="list-style-type: none"> <li>CLOSED: The wallet is closed</li> <li>NOT_AVAILABLE: The wallet is not available in the location specified by the WALLET_ROOT initialization parameter</li> <li>OPEN: The wallet is open</li> <li>OPEN_NO_MASTER_KEY: The wallet is open, but no master key is set</li> <li>OPEN_UNKNOWN_MASTER_KEY_STATUS: The wallet is open, but the database could not determine whether the master key is set. This situation can occur when the database is in the mounted state and cannot check if the master key for a hardware keystore is set because the data dictionary is not available.</li> <li>UNDEFINED: The database could not determine the status of the wallet</li> </ul>                                                                                                                                                                                                                                                                   |
| WALLET_TYPE     | VARCHAR2(20) | <p>Displays the type of keystore being used, FILE or OKV</p> <p>If the keystore was created with the mkstore utility, then the WALLET_TYPE is UNKNOWN. Oracle recommends that you create keystores with the ADMINISTER KEY MANAGEMENT statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| WALLET_ORDER    | VARCHAR2(9)  | <p>Possible values:</p> <ul style="list-style-type: none"> <li>SINGLE - This value is displayed: <ul style="list-style-type: none"> <li>When only a single wallet is configured</li> <li>In an auto-login OKV configuration. In this case, TDE_CONFIGURATION = OKV FILE, and the SINGLE value is displayed for both the OKV and FILE keystores.</li> </ul> </li> <li>PRIMARY - When more than one wallet is configured, this value indicates that the wallet is primary (holds the current master key).</li> <li>SECONDARY - When more than one wallet is configured, this value indicates that the wallet is secondary (holds old keys).</li> </ul> <p>The lookup of master keys happens in the primary keystore first, and then in the secondary keystore, if required.</p> <p>If there is only one type of keystore (Hardware Security Module or Software Keystore) being used, then SINGLE will appear.</p> <p>If both types are used, then the value in this column shows the order in which each keystore will be looked up.</p> |
| KESTORE_MODE    | VARCHAR2(8)  | <p>Displays the keystore mode:</p> <ul style="list-style-type: none"> <li>NONE: This value is seen when this column is queried from the CDB\$ROOT, or when the database is a non-CDB. The keystore mode does not apply in these cases.</li> <li>UNITED: The PDB is configured to use the wallet of the CDB\$ROOT. To open the wallet in this configuration, the password of the wallet of the CDB\$ROOT must be used.</li> <li>ISOLATED: The PDB is configured to use its own wallet. To open the wallet in this configuration, the password of the isolated wallet must be used.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FULLY_BACKED_UP | VARCHAR2(9)  | Indicates whether all the keys in the keystore have been backed up                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID          | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.201 V\$ENQUEUE\_STAT

V\$ENQUEUE\_STAT displays statistics on the number of enqueue (lock) requests for each type of lock.

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID       | NUMBER      | ID of the instance                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EQ_TYPE       | VARCHAR2(2) | Type of enqueue requested                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_REQ#    | NUMBER      | Total number of enqueue requests or enqueue conversions for this type of enqueue                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_WAIT#   | NUMBER      | Total number of times an enqueue request or conversion resulted in a wait                                                                                                                                                                                                                                                                                                                                                                       |
| SUCC_REQ#     | NUMBER      | Number of times an enqueue request or conversion was granted                                                                                                                                                                                                                                                                                                                                                                                    |
| FAILED_REQ#   | NUMBER      | Number of times an enqueue request or conversion failed                                                                                                                                                                                                                                                                                                                                                                                         |
| CUM_WAIT_TIME | NUMBER      | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID        | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.202 V\$ENQUEUE\_STATISTICS

V\$ENQUEUE\_STATISTICS displays statistics on the number of enqueue (lock) requests for each type of lock.

V\$ENQUEUE\_STATISTICS encompasses V\$ENQUEUE\_STAT and gives more detailed information (several rows for same enqueues with different reasons).

| Column     | Datatype     | Description                    |
|------------|--------------|--------------------------------|
| EQ_NAME    | VARCHAR2(64) | Name of the enqueue request    |
| EQ_TYPE    | VARCHAR2(2)  | Type of enqueue requested      |
| REQ_REASON | VARCHAR2(64) | Reason for the enqueue request |

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_REQ#      | NUMBER         | Total number of enqueue requests or enqueue conversions for this type of enqueue                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_WAIT#     | NUMBER         | Total number of times an enqueue request or conversion resulted in a wait                                                                                                                                                                                                                                                                                                                                                                       |
| SUCC_REQ#       | NUMBER         | Number of times an enqueue request or conversion was granted                                                                                                                                                                                                                                                                                                                                                                                    |
| FAILED_REQ#     | NUMBER         | Number of times an enqueue request or conversion failed                                                                                                                                                                                                                                                                                                                                                                                         |
| CUM_WAIT_TIME   | NUMBER         | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion                                                                                                                                                                                                                                                                                                                                                      |
| REQ_DESCRIPTION | VARCHAR2(4000) | Description of the enqueue request                                                                                                                                                                                                                                                                                                                                                                                                              |
| EVENT#          | NUMBER         | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. ## 8.203 V\$EQ\_CACHED\_PARTITIONS

V\$EQ\_CACHED\_PARTITIONS describes all cached Transactional Event Queue (TEQ) event stream partitions.

| Column                    | Datatype | Description                            |
|---------------------------|----------|----------------------------------------|
| QUEUE                     | NUMBER   | Queue ID                               |
| EVENT_STREAM_ID           | NUMBER   | Event stream ID                        |
| PRIORITY                  | NUMBER   | Priority of the event stream partition |
| EVENT_STREAM_PARTITION_ID | NUMBER   | Event stream partition ID              |

| Column    | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPT_STATE | VARCHAR2(19)                | Current message cache optimizer state of the event stream partition.<br>Possible values: <ul style="list-style-type: none"><li>• EMPTY</li><li>• READY</li><li>• EVICTION_PROGRESS</li><li>• EVICTED</li><li>• UNEVICTION_PROGRESS</li><li>• PREFETCH_PROGRESS</li><li>• NEED_RELOAD</li><li>• RELOAD_PROGRESS</li><li>• NA: Error in the message cache optimizer state of the event stream partition</li></ul>                                   |
| OPT_TIME  | TIMESTAMP(3) WITH TIME ZONE | The predicted absolute time when the event stream partition could be accessed in future                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID    | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.204 V\$EQ\_CROSS\_INSTANCE\_JOBS

V\$EQ\_CROSS\_INSTANCE\_JOBS describes Transactional Event Queue (TEQ) cross-instance jobs.

Each job forwards messages for an event stream from a source instance to a destination instance for a set of subscribers of a TEQ.

| Column          | Datatype      | Description                    |
|-----------------|---------------|--------------------------------|
| JOB_ID          | NUMBER        | Job ID within this coordinator |
| SCHEMA_NAME     | VARCHAR2(128) | Source schema of the job       |
| QUEUE_NAME      | VARCHAR2(128) | Source queue name of the job   |
| EVENT_STREAM_ID | NUMBER        | Source event stream ID         |

| Column                          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.205 V\$EQ\_INACTIVE\_PARTITIONS

V\$EQ\_INACTIVE\_PARTITIONS describes all inactive Transactional Event Queue (TEQ) event stream partitions.

| Column                    | Datatype | Description                            |
|---------------------------|----------|----------------------------------------|
| QUEUE                     | NUMBER   | Queue ID                               |
| EVENT_STREAM_ID           | NUMBER   | Event stream ID                        |
| PRIORITY                  | NUMBER   | Priority of the event stream partition |
| EVENT_STREAM_PARTITION_ID | NUMBER   | Event stream partition ID              |

| Column    | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPT_STATE | VARCHAR2(19)                | Current message cache optimizer state of the event stream partition. Possible values: <ul style="list-style-type: none"> <li>EMPTY</li> <li>CACHED</li> <li>EVICTIION_PROGRESS</li> <li>EVICTED</li> <li>UNEVICTION_PROGRESS</li> <li>PREFETCH_PROGRESS</li> <li>NA: Error in the message cache optimizer state of the event stream partition</li> </ul>                                                                                        |
| OPT_TIME  | TIMESTAMP(3) WITH TIME ZONE | The predicted absolute time when the event stream partition could be accessed in future                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID    | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.206 V\$EQ\_MESSAGE\_CACHE

V\$EQ\_MESSAGE\_CACHE provides performance statistics of the message cache for Transactional Event Queues (TEQs) at the event stream partition level in the instance.

| Column                    | Datatype | Description                                                     |
|---------------------------|----------|-----------------------------------------------------------------|
| QUEUE_ID                  | NUMBER   | Queue ID                                                        |
| EVENT_STREAM_ID           | NUMBER   | Event stream ID                                                 |
| PRIORITY                  | NUMBER   | Priority of the event stream partition for dequeue, range 0 - 9 |
| EVENT_STREAM_PARTITION_ID | NUMBER   | Event stream partition ID                                       |
| PARTITION_ID              | NUMBER   | Queue partition ID                                              |
| MAX_MSGS                  | NUMBER   | Maximum number of messages for the event stream partition       |
| ENQUEUED_MSGS             | NUMBER   | Number of messages enqueued for the event stream partition      |

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSGS_MADE_EXPIRED | NUMBER       | Number of messages made expired                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CHUNK_SIZE        | NUMBER       | The size of the memory chunk for storing messages                                                                                                                                                                                                                                                                                                                                                                                                 |
| NUM_CHUNKS        | NUMBER       | Number of chunks for the event stream partition                                                                                                                                                                                                                                                                                                                                                                                                   |
| NUM_FREE_CHUNKS   | NUMBER       | Number of free chunks for the event stream partition                                                                                                                                                                                                                                                                                                                                                                                              |
| USED_MEMORY_SIZE  | NUMBER       | Total estimated size of memory in use (in bytes) for the event stream partition                                                                                                                                                                                                                                                                                                                                                                   |
| STATE             | VARCHAR2(13) | Event stream partition state. Possible values: <ul style="list-style-type: none"><li>• CACHED (in memory)</li><li>• UNCACHED (on disk)</li><li>• UNCACHED_FREE</li><li>• CACHED_FREE</li><li>• UNKNOWN</li></ul>                                                                                                                                                                                                                                  |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.207 V\$EQ\_MESSAGE\_CACHE\_ADVICE

V\$EQ\_MESSAGE\_CACHE\_ADVICE shows simulated metrics for a range of potential message cache sizes for Transactional Event Queues (TEQs). This view assists in cache sizing by providing information in the form of metrics as described below.

| Column            | Datatype | Description                                        |
|-------------------|----------|----------------------------------------------------|
| SIZE_FOR_ESTIMATE | NUMBER   | Cache size for simulation (in megabytes)           |
| SIZE_FACTOR       | NUMBER   | Size factor with respect to the current cache size |

| Column                   | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_SIZE_TYPE           | VARCHAR2(9) | Possible values: <ul style="list-style-type: none"> <li>• MINIMUM: This cache size is required to have all dequeues in-memory (no uncached).</li> <li>• CURRENT: This is the current size of the message cache.</li> <li>• MAXIMUM: This cache size is required to have zero evictions.</li> <li>• NULL: This is the value in all other cases.</li> </ul>                                                                                             |

## 8.208 V\$EQ\_MESSAGE\_CACHE\_STAT

V\$EQ\_MESSAGE\_CACHE\_STAT displays statistics about memory management for Transactional Event Queues (TEQs) in the Streams pool within the System Global Area (SGA). TEQs use the Streams pool in units of event queue partitions. Thus, columns of this view shows statistics at the event queue partition level. This view shows statistics across all TEQs.

| Column                            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| AVG_LOAD_TIME                     | NUMBER   | Average time taken to un-evict one event queue partition (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| AVG_MISS_RATIO                    | NUMBER   | Average ratio of number of foreground un-evictions versus background pre-fetch                                                                                                                                                                                                                                                                                                                                                                  |
| AVG_THRASH_RATIO                  | NUMBER   | Average ratio of number of event queue partitions pre-fetched by background without dequeue attempt versus total number of event queue partitions prefetched                                                                                                                                                                                                                                                                                    |
| MANDATORY_AFF_SWITCH_ATT<br>EMPTS | NUMBER   | An affinity switch is a change in dequeue instance for a TEQ-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that TEQ-subscriber pair. This column shows the number of times mandatory affinity switches were attempted across all instances. Populated at the smallest instance ID only. |

| Column                       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

| OPTIONAL_AFF_SWITCH_ATTEMPTS | NUMBER   | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were attempted across all instances. Populated at the smallest instance ID only.                                                                       |
| MIN_EVICT_PERCENT            | NUMBER   | Percentage of streams_pool memory beyond which event queue partition eviction is triggered                                                                                                                                                                                                                                                                                                                                        |
| LAST_AVG_CACHED_HORIZON      | NUMBER   | Last average number of cached event queue partitions seen in TEQ memory manager horizon                                                                                                                                                                                                                                                                                                                                           |
| LAST_AVG_MEMORY_HORIZON      | NUMBER   | Last average memory of cached event queue partitions seen in TEQ memory manager horizon                                                                                                                                                                                                                                                                                                                                           |
| LAST_AVG_SUBSHARD_HORIZON    | NUMBER   | Last average number of event queue partitions seen in TEQ memory manager horizon                                                                                                                                                                                                                                                                                                                                                  |
| LAST_LEEWAY_SHIFT            | NUMBER   | Internal leeway for memory threshold                                                                                                                                                                                                                                                                                                                                                                                              |
| AVG_OPTTIME_DRIFT            | NUMBER   | Average drift of opt_time for all event queue partitions. A drift is defined as a difference between opt_time as set on an event queue partition and the actual time at which an event queue partition is first dequeued after prefetch/uneviction.                                                                                                                                                                               |
| NUM_THRESHOLD_DRIFT          | NUMBER   | Number of times drift value has gone over threshold time. A typical threshold time can be horizon_time/2.                                                                                                                                                                                                                                                                                                                         |
| MAX_OPT_TIME_DRIFT           | NUMBER   | Maximum drift until now                                                                                                                                                                                                                                                                                                                                                                                                           |
| MIN_OPT_TIME_DRIFT           | NUMBER   | Minimum drift until now                                                                                                                                                                                                                                                                                                                                                                                                           |
| AVG_OPT_TIME_ERROR           | NUMBER   | An opt_time error occurs when a cached event queue partition is unevicted by a foreground process (instead of being prefetched by the AQ background). Thus, opt_time error is the difference between the actual opt_time set for an event queue partition and the absolute time at which foreground unevicts the same event queue partition. This column represents the average time of this error.                               |
| MAX_OPT_TIME_ERROR           | NUMBER   | Maximum opt_time error                                                                                                                                                                                                                                                                                                                                                                                                            |
| MIN_OPT_TIME_ERROR           | NUMBER   | Minimum opt_time error                                                                                                                                                                                                                                                                                                                                                                                                            |
| NUM_FG_RELOADED              | NUMBER   | Number of event stream partitions reloaded from disk into message cache by foreground processes                                                                                                                                                                                                                                                                                                                                   |
| NUM_PRERELOADED              | NUMBER   | Number of event stream partitions reloaded from disk into message cache in advance by background processes                                                                                                                                                                                                                                                                                                                        |
| AVG_RELOAD_TIME              | NUMBER   | Average time to reload an event stream partition from disk into message cache (in milliseconds)                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 8.210 V\$EQ\_NONDUR\_SUBSCRIBER\_LWM

V\$EQ\_NONDUR\_SUBSCRIBER\_LWM projects the low watermarks (LWMs) of non-durable subscribers in a Transactional Event Queue (TEQ). The LWM of a non-durable subscriber is a combination of event stream, priority, and LWM (event queue partition).

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID        | NUMBER   | Queue ID                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SUBSCRIBER_ID   | NUMBER   | ID of the non-durable subscriber                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EVENT_STREAM_ID | NUMBER   | Event stream ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PRIORITY        | NUMBER   | Priority of the event stream                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LWM             | NUMBER   | Lower watermark (in an event stream partition) of the non-durable subscriber                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.211 V\$EQ\_PARTITION\_STATS

V\$EQ\_PARTITION\_STATS displays usage statistics for the Transactional Event Queue (TEQ) queue partition cache and the dequeue log partition cache.

| Column   | Datatype | Description         |
|----------|----------|---------------------|
| INST_ID  | NUMBER   | Current instance ID |
| QUEUE_ID | NUMBER   | Queue ID            |

| Column                 | Datatype      | Description                                                                                                                                                                                                                       |
|------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_TABLE_ID         | NUMBER        | Queue table object ID                                                                                                                                                                                                             |
| QUEUE_SCHEMA           | VARCHAR2(128) | Queue schema name                                                                                                                                                                                                                 |
| QUEUE_NAME             | VARCHAR2(128) | Queue name                                                                                                                                                                                                                        |
| PT_TUNED_SIZ_QT        | NUMBER        | Current tuned size of the queue partition cache, expressed in number of partition cache elements                                                                                                                                  |
| PT_CACHED_PTNS_QT      | NUMBER        | Current number of cached partitions in the queue partition cache                                                                                                                                                                  |
| PT_OVER_CACHED_PTNS_QT | NUMBER        | Current number of over-cached partitions in the queue partition cache, that is, the number of cached partitions whose partition cache elements exceed the current tuned size of the queue partition cache                         |
| PT_TOTAL_UPTUNE_QT     | NUMBER        | Total amount of space added to the queue partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements                                                                        |
| PT_NO_OF_UPTUNES_QT    | NUMBER        | Total number of times a tune-up was triggered on the queue partition cache, since the cache was initialized                                                                                                                       |
| PT_TOTAL_DOWNTUNE_QT   | NUMBER        | Total amount of space removed from the queue partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements                                                                  |
| PT_NO_OF_DOWNTUNES_QT  | NUMBER        | Total number of times a tune-down was triggered on the queue partition cache, since the cache was initialized                                                                                                                     |
| PT_CACHE_MISS_QT       | NUMBER        | Total number of cache misses during partition lookups on the queue partition cache                                                                                                                                                |
| PT_CACHE_HIT_QT        | NUMBER        | Total number of cache hits during partition lookups on the queue partition cache                                                                                                                                                  |
| PT_TOTAL_CACH_GET_QT   | NUMBER        | Total number of successful fetches from the queue partition cache                                                                                                                                                                 |
| PT_TOTAL_CACH_PUT_QT   | NUMBER        | Total number of caching operations that occurred on the queue partition cache                                                                                                                                                     |
| PT_UNBOUNDINGS_QT      | NUMBER        | Total number of times queue partitions were unbounded                                                                                                                                                                             |
| PT_TUNED_SIZ_DQ        | NUMBER        | Current tuned size of the dequeue log partition cache, expressed in number of partition cache elements                                                                                                                            |
| PT_CACHED_PTNS_DQ      | NUMBER        | Current number of cached partitions in the dequeue log partition cache                                                                                                                                                            |
| PT_OVER_CACHED_PTNS_DQ | NUMBER        | Current number of over-cached partitions in the dequeue log partition cache, that is, the number of cached dequeue log partitions whose partition cache elements exceed the current tuned size of the dequeue log partition cache |
| PT_TOTAL_UPTUNE_DQ     | NUMBER        | Total amount of space added to the dequeue log partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements                                                                  |
| PT_NO_OF_UPTUNES_DQ    | NUMBER        | Total number of times a tune-up was triggered on the dequeue log partition cache, since the cache was initialized                                                                                                                 |
| PT_TOTAL_DOWNTUNE_DQ   | NUMBER        | Total amount of space removed from the dequeue log partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements                                                            |
| PT_NO_OF_DOWNTUNES_DQ  | NUMBER        | Total number of times a tune-down was triggered on the dequeue log partition cache, since the cache was initialized                                                                                                               |
| PT_CACHE_MISS_DQ       | NUMBER        | Total number of cache misses during partition lookups on the dequeue log partition cache                                                                                                                                          |
| PT_CACHE_HIT_DQ        | NUMBER        | Total number of cache hits during partition lookups on the dequeue log partition cache                                                                                                                                            |

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 8.212 V\$EQ\_REMOTE\_DEQUEUE\_AFFINITY

V\$EQ\_REMOTE\_DEQUEUE\_AFFINITY lists the for Transactional Event Queue (TEQ) dequeue affinity instance of the subscribers not dequeuing locally from the event streams's owner instance. Cross-instance message forwarding is used for these subscribers.

| Column             | Datatype | Description                                                                                  |
|--------------------|----------|----------------------------------------------------------------------------------------------|
| QUEUE_ID           | NUMBER   | Queue ID                                                                                     |
| EVENT_STREAM_ID    | NUMBER   | Event stream ID, which is being forwarded from SOURCE_INSTANCE to INST_ID for the subscriber |
| SOURCE_INSTANCE_ID | NUMBER   | Owner instance ID from which the event stream is being forwarded                             |

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 8.213 V\$EQ\_SUBSCRIBER\_LOAD

V\$EQ\_SUBSCRIBER\_LOAD describes the load of all subscribers of Transactional Event Queue (TEQ) event streams in terms of latency at every instance in an Oracle RAC environment.

Latency denotes the predicted amount of time (in seconds) required from the current time to drain all the messages for that subscriber at each respective instance. The latency calculation considers past enqueue/dequeue rates and future enqueue/dequeue rates based on history.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                      |
|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID         | NUMBER        | Queue ID                                                                                                                                                                                                                                                                                                         |
| QUEUE_SCHEMA     | VARCHAR2(128) | Queue schema                                                                                                                                                                                                                                                                                                     |

| SUBSCRIBER_ID    | NUMBER        | Subscriber ID                                                                                                                                                                                                                                                                                                    |
| SUBSCRIBER_NAME  | VARCHAR2(128) | Subscriber name                                                                                                                                                                                                                                                                                                  |
| LATENCY_STATE    | VARCHAR2(8)   | Latency state. Possible values: <ul style="list-style-type: none"> <li>FINITE - The subscriber will be able to dequeue all the messages in a finite amount of time</li> <li>INFINITE - The subscriber's dequeue rate may not catch up to the enqueue rate</li> <li>UNKNOWN - Latency is not yet known</li> </ul> |
| LATENCY          | NUMBER        | Latency (in seconds). Valid only when LATENCY_STATE is FINITE.                                                                                                                                                                                                                                                   |
| DEQUEUE_REQUESTS | NUMBER        | Approximate number of dequeue requests noted recently                                                                                                                                                                                                                                                            |

| Column                 | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVE_EVENT_STREAM_ID | NUMBER      | Number of event streams that have messages for this subscriber                                                                                                                                                                                                                                                                                                                                                                                       |
| ACTIVE_LISTENER        | VARCHAR2(5) | Indicates whether the subscriber is actively listening at this instance for messages (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                           |
| DEQUEUE_SESSIONS       | NUMBER      | Displays the number of active dequeue sessions for this subscriber                                                                                                                                                                                                                                                                                                                                                                                   |
| FLAGS                  | NUMBER      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MANDATORY_AFF_SWITCHES | NUMBER      | An affinity switch is a change in the dequeue instance for an event stream-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that event stream-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this subscriber. |
| OPTIONAL_AFF_SWITCHES  | NUMBER      | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this subscriber.                                                                                                            |
| CON_ID                 | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>      |

## 8.214 V\$EQ\_SUBSCRIBER\_STAT

V\$EQ\_SUBSCRIBER\_STAT displays basic statistical information about the subscribers of Transactional Event Queue (TEQ) event streams. There is one row per queue per event stream per subscriber.

| Column          | Datatype | Description             |
|-----------------|----------|-------------------------|
| QUEUE_ID        | NUMBER   | Queue identifier        |
| SUBSCRIBER_ID   | NUMBER   | Subscriber identifier   |
| EVENT_STREAM_ID | NUMBER   | Event stream identifier |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIORITY                  | NUMBER   | Priority value of the event stream                                                                                                                                                                                                                                                                                                                                                                                                              |
| MSG_SN                    | NUMBER   | Message serial number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DEQUEUE_PARTITION_ID      | NUMBER   | Last known dequeue position in this event stream                                                                                                                                                                                                                                                                                                                                                                                                |
| ENQUEUED_MSGS             | NUMBER   | Number of enqueued messages                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DEQUEUED_MSGS             | NUMBER   | Number of dequeued messages                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ELAPSED_DEQUEUE_TIME      | NUMBER   | Amount of time spent performing dequeues (in seconds)                                                                                                                                                                                                                                                                                                                                                                                           |
| CPU_DEQUEUE_TIME          | NUMBER   | Actual amount of CPU time spent performing dequeues (in seconds)                                                                                                                                                                                                                                                                                                                                                                                |
| DEQUEUE_RATE              | NUMBER   | Number of messages dequeued per second                                                                                                                                                                                                                                                                                                                                                                                                          |
| DEQUEUE_POSITION          | RAW(16)  | Message ID at the dequeue position of the subscriber in this event stream<br>A NULL value indicates that either the event stream is empty or no dequeues have been done on this event stream.                                                                                                                                                                                                                                                   |
| TIME_SINCE_LAST_DEQUEUE   | NUMBER   | Time since last dequeue activity (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTD_TIME_TO_DRAIN        | NUMBER   | Estimated amount of time to drain the event stream (in seconds) with current enqueue and dequeue rates. Null, if the enqueue rate is greater than the dequeue rate.                                                                                                                                                                                                                                                                             |
| ESTD_TIME_TO_DRAIN_NO_ENQ | NUMBER   | Estimated amount of time to drain the event stream (in seconds) with no new enqueues                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.215 V\$EQ\_UNCACHED\_PARTITIONS

V\$EQ\_UNCACHED\_PARTITIONS describes all uncached Transactional Event Queue (TEQ) event stream partitions.

| Column   | Datatype | Description |
|----------|----------|-------------|
| QUEUE_ID | NUMBER   | Queue ID    |

| Column                    | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT_STREAM_ID           | NUMBER                      | Event stream ID                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PRIORITY                  | NUMBER                      | Priority of the event stream partition                                                                                                                                                                                                                                                                                                                                                                                                          |
| EVENT_STREAM_PARTITION_ID | NUMBER                      | Event stream partition ID                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OPT_STATE                 | VARCHAR2(19)                | Current message cache optimizer state of the event stream partition.<br>Possible values: <ul style="list-style-type: none"> <li>EMPTY</li> <li>READY</li> <li>EVICTION_PROGRESS</li> <li>EVICTED</li> <li>UNEVICTION_PROGRESS</li> <li>PREFETCH_PROGRESS</li> <li>NEED_RELOAD</li> <li>RELOAD_PROGRESS</li> <li>NA: Error in the message cache optimizer state of the event stream partition</li> </ul>                                         |
| OPT_TIME                  | TIMESTAMP(3) WITH TIME ZONE | The predicted absolute time when the event stream partition could be accessed in future                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                    | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.216 V\$EVENT\_HISTOGRAM

V\$EVENT\_HISTOGRAM displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in milliseconds. The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2<sup>21</sup> ms, < 2<sup>22</sup> ms, and ≥ 2<sup>22</sup> ms.

The histogram will not be filled unless the TIMED\_STATISTICS initialization parameter is set to true.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WAIT_TIME_MILLI  | NUMBER       | Amount of time the bucket represents (in milliseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.                                                                                                                                                                                                                                                  |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_UPDATE_TIME | VARCHAR2(64) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                                       |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. ## 8.217 V\$EVENT\_HISTOGRAM\_MICRO

V\$EVENT\_HISTOGRAM\_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in microseconds. The histogram has buckets of time intervals from < 1 us, < 2 us, < 4 us, < 8 us, ... < 2<sup>31</sup> us, < 2<sup>32</sup> us, and >= 2<sup>32</sup> us.

The histogram will not be filled unless the TIMED\_STATISTICS initialization parameter is set to true.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                 |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                            |
| WAIT_TIME_FORMAT | VARCHAR2(30) | A human readable time string which is converted from WAIT_TIME_MICRO. When WAIT_TIME_MICRO < 1 millisecond, WAIT_TIME_FORMAT is shown in microseconds. When WAIT_TIME_MICRO < 1 second, WAIT_TIME_FORMAT is shown in milliseconds. When WAIT_TIME_MICRO < 1 minute, WAIT_TIME_FORMAT is shown in seconds. When WAIT_TIME_MICRO > 1 minute, WAIT_TIME_FORMAT is shown in minutes and seconds. |
| WAIT_TIME_MICRO  | NUMBER       | Amount of time the bucket represents (in microseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.                                                                                                                                                                                               |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                     |

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| LAST_UPDATE_TIME | VARCHAR2(64) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                                       |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.218 V\$EVENT\_NAME

V\$EVENT\_NAME displays information about wait events.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#        | NUMBER       | Number of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EVENT_ID      | NUMBER       | Identifier of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME          | VARCHAR2(64) | Name of the wait event. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.                                                                                                                                                                                                                                                                                          |
| PARAMETER1    | VARCHAR2(64) | Description of the first parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                           |
| PARAMETER2    | VARCHAR2(64) | Description of the second parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                          |
| PARAMETER3    | VARCHAR2(64) | Description of the third parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_CLASS_ID | NUMBER       | Identifier of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                       |
| WAIT_CLASS#   | NUMBER       | Number of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_CLASS    | VARCHAR2(64) | Name of the class of the wait event<br><b>See Also:</b> " <a href="#">Classes of Wait Events</a> " for a description of the different wait event classes                                                                                                                                                                                                                                                                                        |
| DISPLAY_NAME  | VARCHAR2(64) | A clearer and more descriptive name for the wait event that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                                                                                                    |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.219 V\$EVENTMETRIC

V\$EVENTMETRIC displays values of wait event metrics for the most recent 60-second interval.

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME       | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME         | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC     | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| EVENT#           | NUMBER   | Number of the event                                                                                                                                                                                                                                                                                                                                                                                                                             |
| EVENT_ID         | NUMBER   | Identifier of the event                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NUM_SESS_WAITING | NUMBER   | Number of sessions waiting at the end of the interval                                                                                                                                                                                                                                                                                                                                                                                           |
| TIME_WAITED      | NUMBER   | Time waited (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                         |
| WAIT_COUNT       | NUMBER   | Number of times waited                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED_FG   | NUMBER   | Time waited (in hundredths of a second), from foreground sessions                                                                                                                                                                                                                                                                                                                                                                               |
| WAIT_COUNT_FG    | NUMBER   | Number of times waited, from foreground sessions                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.220 V\$EXADIRECT\_ACL

V\$EXADIRECT\_ACL monitors current ACLs propagated to the database instance.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME | VARCHAR2(512) | Database service name                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SGID         | VARCHAR2(39)  | Identifier of the VM allowed access to the specified service name                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.221 V\$EXECUTION

V\$EXECUTION displays information on parallel execution.

| Column   | Datatype     | Description                           |
|----------|--------------|---------------------------------------|
| PID      | NUMBER       | Session ID                            |
| DEPTH    | NUMBER       | The depth                             |
| FUNCTION | VARCHAR2(10) | Session serial number                 |
| TYPE     | VARCHAR2(7)  | Name of the OBJECT_NODE in plan table |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NVALS  | NUMBER   | Elapsed time for OBJECT_NODE                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VAL1   | NUMBER   | The value for number 1                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VAL2   | NUMBER   | The value for number 2                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SEQH   | NUMBER   | A sequence                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SEQL   | NUMBER   | A sequence                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.222 V\$EXP\_STATS

V\$EXP\_STATS stores the expression tracking statistics of recently executed queries.

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPID    | NUMBER   | Expression ID of the current expression                                                                                                                                                                                                                                                                                                                                                                                                         |
| OBJNUM   | NUMBER   | The object number contained in the expression                                                                                                                                                                                                                                                                                                                                                                                                   |
| DYNOCOST | NUMBER   | Optimizer dynamic cost of evaluating the expression                                                                                                                                                                                                                                                                                                                                                                                             |
| EVALCNT  | NUMBER   | Number of times the expression has been evaluated                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.225 V\$FAST\_START\_TRANSACTIONS

V\$FAST\_START\_TRANSACTIONS displays information about the progress of the transactions that Oracle is recovering.

This view displays only transactions recovered in parallel. Recovery progress for serial transactions is not displayed.

| Column          | Datatype     | Description                                                                 |
|-----------------|--------------|-----------------------------------------------------------------------------|
| USN             | NUMBER       | Undo segment number of the transaction                                      |
| SLT             | NUMBER       | Slot within the rollback segment                                            |
| SEQ             | NUMBER       | Incarnation number of the slot                                              |
| STATE           | VARCHAR2(16) | State of the transaction (may be TO BE RECOVERED, RECOVERED, or RECOVERING) |
| UNDOBLOCKSDONE  | NUMBER       | Number of undo blocks completed on the transaction                          |
| UNDOBLOCKSTOTAL | NUMBER       | Total number of undo blocks that need recovery                              |
| PID             | NUMBER       | ID of the current server it has been assigned to                            |
| CPUTIME         | NUMBER       | Time for which recovery has progressed (in seconds)                         |
| PARENTUSN       | NUMBER       | Undo segment number of the parent transaction in PDML                       |
| PARENTSLT       | NUMBER       | Slot of the parent transaction in PDML                                      |
| PARENTSEQ       | NUMBER       | Sequence number of the parent transaction in PDML                           |
| XID             | RAW(8)       | Transaction ID                                                              |
| PXID            | RAW(8)       | Parent transaction ID                                                       |
| RCVSERVERS      | NUMBER       | Number of servers used in the last recovery                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.226 V\$FILE\_CACHE\_TRANSFER

V\$FILE\_CACHE\_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.227 V\$FILE\_HISTOGRAM

V\$FILE\_HISTOGRAM displays a histogram of all synchronous single block reads on a per-file basis (for data files). The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2<sup>21</sup> ms, < 2<sup>22</sup> ms, and ≥ 2<sup>22</sup> ms.

The histogram will not be filled unless the STATISTICS\_LEVEL initialization parameter is set to ALL.

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#                | NUMBER   | File number                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SINGLEBLKRDTIM_MILLI | NUMBER   | Amount of time the bucket represents (in milliseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.                                                                                                                                                                                                                                                        |
| SINGLEBLKRDS         | NUMBER   | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.228 V\$FILEMETRIC

V\$FILEMETRIC displays values of file metrics for the most recent 10-minute interval. A history of the last one hour will be kept in the system.

| Column               | Datatype | Description                                         |
|----------------------|----------|-----------------------------------------------------|
| BEGIN_TIME           | DATE     | Begin time of the interval                          |
| END_TIME             | DATE     | End time of the interval                            |
| INTSIZE_CSEC         | NUMBER   | Interval size (in hundredths of a second)           |
| FILE_ID              | NUMBER   | File number                                         |
| CREATION_TIME        | NUMBER   | Timestamp of the file creation                      |
| AVERAGE_READ_TIME    | NUMBER   | Average file read time (in hundredths of a second)  |
| AVERAGE_WRITE_TIME   | NUMBER   | Average file write time (in hundredths of a second) |
| PHYSICAL_READS       | NUMBER   | Number of physical reads                            |
| PHYSICAL_WRITES      | NUMBER   | Number of physical writes                           |
| PHYSICAL_BLOCK_READS | NUMBER   | Number of physical block reads                      |

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHYSICAL_BLOCK_WRITES | NUMBER   | Number of physical block writes                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.229 V\$FILEMETRIC\_HISTORY

V\$FILEMETRIC\_HISTORY displays values of file metrics for all intervals in the last one hour.

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME            | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME              | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC          | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| FILE_ID               | NUMBER   | File number                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATION_TIME         | NUMBER   | Timestamp of the file creation                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AVERAGE_READ_TIME     | NUMBER   | Average file read time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                              |
| AVERAGE_WRITE_TIME    | NUMBER   | Average file write time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                             |
| PHYSICAL_READS        | NUMBER   | Number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_WRITES       | NUMBER   | Number of physical writes                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_BLOCK_READS  | NUMBER   | Number of physical block reads                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PHYSICAL_BLOCK_WRITES | NUMBER   | Number of physical block writes                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.230 V\$FILESPEACE\_USAGE

V\$FILESPEACE\_USAGE summarizes space allocation information of each data file and temp file.

| Column          | Datatype | Description                                    |
|-----------------|----------|------------------------------------------------|
| TABLESPACE_ID   | NUMBER   | ID of the tablespace to which the file belongs |
| RFNO            | NUMBER   | Relative file number of the file               |
| ALLOCATED_SPACE | NUMBER   | Total allocated space in the file              |
| FILE_SIZE       | NUMBER   | Current file size                              |

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_MAXSIZE   | NUMBER   | Maximum file size                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CHANGESCN_BASE | NUMBER   | SCN base of the last change to the file                                                                                                                                                                                                                                                                                                                                                                                                         |
| CHANGESCN_WRAP | NUMBER   | SCN wrap of the last change to the file                                                                                                                                                                                                                                                                                                                                                                                                         |
| CHANGESCN8     | NUMBER   | The 8-byte representation of the SCN at which the last change happened to the file                                                                                                                                                                                                                                                                                                                                                              |
| FLAG           | NUMBER   | Flags for file attributes                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.231 V\$FILESTAT

V\$FILESTAT displays the number of physical reads and writes done and the total number of single-block and multiblock I/Os done at file level.

As of Oracle Database 10g Release 2 (10.2), this view also includes reads done by RMAN processes for backup operations.

| Column             | Datatype | Description                                                                                                               |
|--------------------|----------|---------------------------------------------------------------------------------------------------------------------------|
| FILE#              | NUMBER   | Number of the file                                                                                                        |
| PHYRDS             | NUMBER   | Number of physical reads done                                                                                             |
| PHYWRTS            | NUMBER   | Number of times DBWR is required to write                                                                                 |
| PHYBLKRD           | NUMBER   | Number of physical blocks read                                                                                            |
| OPTIMIZED_PHYBLKRD | NUMBER   | Number of physical reads from Database Smart Flash Cache blocks                                                           |
| PHYBLKWRT          | NUMBER   | Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks                        |
| SINGLEBLKRDS       | NUMBER   | Number of single block reads                                                                                              |
| READTIM            | NUMBER   | Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false                  |
| WRITETIM           | NUMBER   | Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false                 |
| SINGLEBLKRDTIM     | NUMBER   | Cumulative single block read time (in hundredths of a second)                                                             |
| AVGIOTIM           | NUMBER   | Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false              |
| LSTIOTIM           | NUMBER   | Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false          |
| MINIOTIM           | NUMBER   | Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false     |
| MAXIORTM           | NUMBER   | Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIOWTM | NUMBER   | Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                      |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.232 V\$FIXED\_TABLE

V\$FIXED\_TABLE displays all dynamic performance tables, views, and derived tables in the database.

Some V\$ tables (for example, V\$ROLLNAME) refer to real tables and are therefore not listed.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME      | VARCHAR2(128) | Name of the object                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_ID | NUMBER        | Identifier of the fixed object                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE      | VARCHAR2(5)   | Object type (TABLE   VIEW)                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TABLE_NUM | NUMBER        | Number that identifies the dynamic performance table if it is of type TABLE                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.233 V\$FIXED\_VIEW\_DEFINITION

V\$FIXED\_VIEW\_DEFINITION contains the definitions of all the fixed views (views beginning with V\$).

Use this table with caution. Oracle tries to keep the behavior of fixed views the same from release to release, but the definitions of the fixed views can change without notice. Use these definitions to optimize your queries by using indexed columns of the dynamic performance tables.

| Column          | Datatype       | Description                  |
|-----------------|----------------|------------------------------|
| VIEW_NAME       | VARCHAR2(128)  | Name of the fixed view       |
| VIEW_DEFINITION | VARCHAR2(4000) | Definition of the fixed view |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.234 V\$FLASHBACK\_DATABASE\_LOG

V\$FLASHBACK\_DATABASE\_LOG displays information about the flashback data. Use this view to help estimate the amount of flashback space required for the current workload.

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OLDEST_FLASHBACK_SCN     | NUMBER   | Lowest system change number (SCN) in the flashback data, for any incarnation                                                                                                                                                                                                                                                                                                                                                                    |
| OLDEST_FLASHBACK_TIME    | DATE     | Time of the lowest SCN in the flashback data, for any incarnation                                                                                                                                                                                                                                                                                                                                                                               |
| RETENTION_TARGET         | NUMBER   | Target retention time (in minutes)                                                                                                                                                                                                                                                                                                                                                                                                              |
| FLASHBACK_SIZE           | NUMBER   | Current size (in bytes) of the flashback data                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTIMATED_FLASHBACK_SIZE | NUMBER   | Estimated size of flashback data needed (in bytes) for the current target retention                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.235 V\$FLASHBACK\_DATABASE\_LOGFILE

V\$FLASHBACK\_DATABASE\_LOGFILE displays information about the flashback log files.

| Column        | Datatype      | Description                                       |
|---------------|---------------|---------------------------------------------------|
| NAME          | VARCHAR2(513) | Name of the log file                              |
| LOG#          | NUMBER        | Log file number                                   |
| THREAD#       | NUMBER        | Log file thread number                            |
| SEQUENCE#     | NUMBER        | Log file sequence number                          |
| BYTES         | NUMBER        | Log file size (in bytes)                          |
| FIRST_CHANGE# | NUMBER        | Lowest system change number (SCN) in the log file |
| FIRST_TIME    | DATE          | Time of the first SCN in the log file             |

| Column | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE   | VARCHAR2(9) | Log type: <ul style="list-style-type: none"> <li>• NORMAL</li> <li>• RESERVED</li> <li>• FREE</li> <li>• TO DELETE</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| CON_ID | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.236 V\$FLASHBACK\_DATABASE\_STAT

V\$FLASHBACK\_DATABASE\_STAT displays statistics for monitoring the I/O overhead of logging flashback data. This view also displays the estimated flashback space needed based on previous workloads.

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME               | DATE     | Beginning of the time interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| END_TIME                 | DATE     | End of the time interval                                                                                                                                                                                                                                                                                                                                                                                                                              |
| FLASHBACK_DATA           | NUMBER   | Number of bytes of flashback data written during the interval                                                                                                                                                                                                                                                                                                                                                                                         |
| DB_DATA                  | NUMBER   | Number of bytes of database data read and written during the interval                                                                                                                                                                                                                                                                                                                                                                                 |
| REDO_DATA                | NUMBER   | Number of bytes of redo data written during the interval                                                                                                                                                                                                                                                                                                                                                                                              |
| ESTIMATED_FLASHBACK_SIZE | NUMBER   | Value of ESTIMATED_FLASHBACK_SIZE in V\$FLASHBACK_DATABASE_LOG at the end of the time interval                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.237 V\$FLASHBACK\_TXN\_GRAPH

V\$FLASHBACK\_TXN\_GRAPH displays a tabular representation of the transaction dependency graph. For each dependency edge, there could be multiple rows, one for each conflicting operation.

This view is relevant AFTER a compensating transaction has been started through the DBMS\_FLASHBACK.TRANSACTION\_BACKOUT() set of functions, and is no longer relevant once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the DBA\_FLASHBACK\_TXN\_REPORT view.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.238 V\$FLASHBACK\_TXN\_MODS

V\$FLASHBACK\_TXN\_MODS displays the individual modifications of all the transactions in memory.

This view is relevant AFTER a compensating transaction has been started through the DBMS\_FLASHBACK.TRANSACTION\_BACKOUT() set of functions, and is no longer relevant once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the DBA\_FLASHBACK\_TXN\_REPORT view.

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPENSATING_XID      | RAW(8)         | Transaction ID of the compensating transaction                                                                                                                                                                                                                                                                                                                                                                                                  |

| XID                   | RAW(8)         | Transaction ID of a relevant transaction found in memory                                                                                                                                                                                                                                                                                                                                                                                        |
| TXN_NAME              | VARCHAR2(255)  | Name of the transaction with XID as the transaction ID; NULL if none                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_XID            | RAW(8)         | Parent transaction ID (for a PDML transaction)                                                                                                                                                                                                                                                                                                                                                                                                  |
| INTERESTING           | NUMBER         | If the transaction is in the transaction dependency graph                                                                                                                                                                                                                                                                                                                                                                                       |
| ORIGINAL              | NUMBER         | If the transaction is part of the input set provided                                                                                                                                                                                                                                                                                                                                                                                            |
| BACKOUT_SEQ           | NUMBER         | Order in which the transaction has been backed out                                                                                                                                                                                                                                                                                                                                                                                              |
| UNDO_SQL              | VARCHAR2(4000) | Undo SQL for the modification                                                                                                                                                                                                                                                                                                                                                                                                                   |
| UNDO_SQL_SQN          | NUMBER         | Order in which the given SQL has been executed to back out this transaction                                                                                                                                                                                                                                                                                                                                                                     |
| UNDO_SQL_SUB_SQN      | NUMBER         | If the undo SQL is greater than 4000 bytes, then a sequence number, starting from 1, of a 4000-byte division of the undo SQL                                                                                                                                                                                                                                                                                                                    |
| BACKOUT_SQL_ID        | NUMBER         | SQL ID of the undo SQL (used only for this compensating transaction)                                                                                                                                                                                                                                                                                                                                                                            |
| OPERATION             | VARCHAR2(128)  | Operation (such as insert/update/delete) performed by the forward-going operation                                                                                                                                                                                                                                                                                                                                                               |
| BACKEDOUT             | NUMBER         | Indicates whether the transaction has been backed out as of now                                                                                                                                                                                                                                                                                                                                                                                 |
| CONFLICT_MOD          | NUMBER         | If the concerned modification is causing a conflict                                                                                                                                                                                                                                                                                                                                                                                             |
| MODS_PER_LCR          | NUMBER         | Sometimes an LCR could cause multiple modifications (for example, an update of an IOT could actually be a delete followed by an insert)                                                                                                                                                                                                                                                                                                         |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.239 V\$FLASHFILESTAT

V\$FLASHFILESTAT displays statistics about Database Smart Flash Cache.

By taking snapshots of SINGLEBLKRDS and SINGLEBLKRDTIM\_MICRO, you can easily calculate the average latency of all the flash files in a given time period

| Column     | Datatype | Description                       |
|------------|----------|-----------------------------------|
| FLASHFILE# | NUMBER   | The file number of the flash file |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                 | VARCHAR2(513) | Name and path of the flash file                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES                | NUMBER        | Size of the flash file, in bytes                                                                                                                                                                                                                                                                                                                                                                                                                |
| ENABLED              | NUMBER        | Indicates whether this flash file is enabled or not                                                                                                                                                                                                                                                                                                                                                                                             |
| SINGLEBLKRDS         | NUMBER        | Number of reads to the flash file                                                                                                                                                                                                                                                                                                                                                                                                               |
| SINGLEBLKRDTIM_MICRO | NUMBER        | Cumulative latency of reading blocks from this particular flash file/device, in microseconds                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.240 V\$FOREIGN\_ARCHIVED\_LOG

V\$FOREIGN\_ARCHIVED\_LOG can be queried on a logical standby database to find out the list of foreign archived logs received by a database.

No rows are returned for this view on a physical standby database.

| Column            | Datatype      | Description                                                                                                                                                                                                                               |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER        | Archived log record ID                                                                                                                                                                                                                    |
| STAMP             | NUMBER        | Archived log record stamp                                                                                                                                                                                                                 |
| NAME              | VARCHAR2(513) | Archived log file name. If set to NULL, either the log file was cleared before it was archived or an RMAN BACKUP command with the delete input option was executed to back up archivelog all (RMAN> backup archivelog all delete input;). |
| DEST_ID           | NUMBER        | Original destination from which the archive log was generated. The value is 0 if the destination identifier is not available                                                                                                              |
| THREAD#           | NUMBER        | Redo thread number                                                                                                                                                                                                                        |
| SEQUENCE#         | NUMBER        | Redo log sequence number                                                                                                                                                                                                                  |
| RESETLOGS_CHANGE# | NUMBER        | Resetlogs change number of the database when the log was written                                                                                                                                                                          |
| RESETLOGS_TIME    | DATE          | Resetlogs time of the database when the log was written                                                                                                                                                                                   |
| RESETLOGS_ID      | NUMBER        | Resetlogs identifier associated with the archived redo log                                                                                                                                                                                |

| BLOCKS           | NUMBER      | Size of the archived log (in blocks)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| BLOCK_SIZE       | NUMBER      | Redo log block size. This is the logical block size of the archived log, which is the same as the logical block size of the online log from which the archived log was copied. The online log logical block size is a platform-specific value that is not adjustable by the user.                                                                                                                                                                                                                                                                                                                                                                                |
| CREATOR          | VARCHAR2(7) | Creator of the archive log:<br>ARCH - Archiver process<br>FGRD - Foreground process<br>RMAN - Recovery Manager<br>SRMN - RMAN at standby<br>LGWR - Logwriter process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| REGISTRAR        | VARCHAR2(7) | Registrar of the entry:<br>RFS - Remote File Server process<br>ARCH - Archiver process<br>FGRD - Foreground process<br>RMAN - Recovery Manager<br>SRMN - RMAN at standby<br>LGWR - Logwriter process                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ARCHIVED         | VARCHAR2(3) | Indicates whether the online redo log was archived (YES) or whether RMAN only inspected the log and created a record for future application of redo logs during recovery (NO).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| APPLIED          | VARCHAR2(3) | Indicates whether the archivelog has been applied to its corresponding standby database (YES) or not (NO). The value is always NO for local destinations.<br><br>This column is meaningful at the standby site for the ARCHIVED_LOG entries with REGISTRAR='RFS' (which means this log is shipped from the primary to the standby database). If REGISTRAR='RFS' and APPLIED is NO, then the log has arrived at the standby but has not yet been applied. If REGISTRAR='RFS' and APPLIED is YES, the log has arrived and been applied at the standby database.<br><br>You can use this field to identify archivelogs that can be backed up and removed from disk. |
| DELETED          | VARCHAR2(3) | Indicates whether an RMAN DELETE command has physically deleted the archived log file from disk, as well as logically removing it from the control file of the target database and from the recovery catalog (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATUS           | VARCHAR2(1) | Status of the archived log:<br>A - Available<br>D - Deleted<br>U - Unavailable<br>X - Expired                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMPLETION_TIME  | DATE        | Time when the archiving completed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DICTIONARY_BEGIN | VARCHAR2(3) | Indicates whether the log contains the start of a LogMiner dictionary (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DICTIONARY_END   | VARCHAR2(3) | Indicates whether the log contains the end of a LogMiner dictionary (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| END_OF_REDO           | VARCHAR2(3)  | Indicates whether the archived redo log contains the end of all redo information from the primary database (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ARCHIVAL_THREAD#      | NUMBER       | Redo thread number of the instance that performed the archival operation. This column differs from the THREAD# column only when a closed thread is archived by another instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)  | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPRESSED            | VARCHAR2(3)  | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FAL                   | VARCHAR2(3)  | Indicates whether the archive log was generated as the result of a FAL request (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| END_OF_REDO_TYPE      | VARCHAR2(10) | Possible values are as follows:<br>SWITCHOVER - Shows archived redo log files that are produced at the end of a switchover<br>TERMINAL - Shows archived redo log files produced after a failover<br>RESETLOGS - Shows online redo log files archived on the primary database after an ALTER DATABASE OPEN RESETLOGS statement is issued<br>ACTIVATION - Shows any log files archived on a physical standby database after an ALTER DATABASE ACTIVATE STANDBY DATABASE statement is issued<br>"empty string" - Any empty string implies that the log is just a normal archival and was not archived due to any of the other events |
| SOURCE_DBID           | NUMBER       | Database ID of the source database that generated this archived log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                 |

## 8.241 V\$FS\_FAILOVER\_OBSERVERS

V\$FS\_FAILOVER\_OBSERVERS provides information about fast-start failover observers.

If you are querying on the primary database, this view returns three rows, each describing one observer. However, only a row having a non-empty value in column NAME corresponds to a started observer. If you are querying on a non-primary database, the behavior of this view is not defined.

| Column     | Datatype      | Description                                                                                                                       |
|------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(513) | The fast-start failover observer name                                                                                             |
| REGISTERED | VARCHAR2(4)   | Indicates if this observer is registered (YES) or not (NO). Note that the observer is registered <i>only</i> if HOST is not NULL. |
| HOST       | VARCHAR2(513) | The name of the host where this observer is running                                                                               |
| ISMASTER   | VARCHAR2(4)   | Indicates if this observer is the master observer (YES) or not (NO)                                                               |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_SELECTED           | TIMESTAMP(9)  | Shows when this observer became master observer, if ISMASTER is YES; otherwise the following constant appears:<br>1990-01-01 00:00:00.00                                                                                                                                                                                                                                                                                                                                                    |
| PINGING_PRIMARY         | VARCHAR2(4)   | Possible values: <ul style="list-style-type: none"> <li>• YES: Observer is currently connected to the primary database</li> <li>• N0: Observer is not connected to the primary database</li> </ul> <b>Note:</b> This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the primary database in the Oracle RAC environment, all instances will show a value of YES.                      |
| PINGING_TARGET          | VARCHAR2(4)   | Possible values: <ul style="list-style-type: none"> <li>• YES: Observer is currently connected to the target standby database</li> <li>• N0: Observer is not connected to the target standby database</li> </ul> <b>Note:</b> This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the target standby database in the Oracle RAC environment, all instances will show a value of YES. |
| LOG_FILE <sup>1</sup>   | VARCHAR2(513) | Full path to the observer log file                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATE_FILE <sup>1</sup> | VARCHAR2(513) | Full path to the observer runtime data file                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                       |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 8.242 V\$FS\_FAILOVER\_STATS

V\$FS\_FAILOVER\_STATS displays statistics about fast-start failovers occurring on the system.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_FAILOVER_TIME   | VARCHAR2(20)  | Timestamp of the last fast-start failover                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_FAILOVER_REASON | VARCHAR2(255) | Reason for the last fast-start failover                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.243 V\$FS\_OBSERVER\_HISTOGRAM

V\$FS\_OBSERVER\_HISTOGRAM displays statistics that are based on the frequency of successful pings between the observer and primary database for different time intervals. The wait event in this histogram is the observer's wait until pings to the primary succeed.

The histogram displays only when there were ping failures between the observer and the primary database.

No rows are shown in this view for unregistered observers.

These statistics can be used to select an appropriate value for the FastStartFailoverThreshold configuration property for your environment.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBSERVER_NAME    | VARCHAR2(513) | The Fast-Start Failover observer name                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBSERVER_HOST    | VARCHAR2(513) | The name of the host where this observer is running                                                                                                                                                                                                                                                                                                                                                                                                                 |
| WAIT_TIME        | NUMBER        | The time interval between a pair of successful observer pings (ping-pairs) to this instance. Note that the values in this column are the upper bound of the inter-ping interval samples represented by a given histogram bucket. If WAIT_TIME = <i>number</i> , then this column represents inter-ping intervals <= <i>number</i> that are not included in any smaller bucket.<br><br>The value in this column is the time (in seconds) that a ping failure lasted. |
| WAIT_COUNT       | NUMBER        | The number of ping-pairs with an inter-ping interval that corresponds with this histogram bucket.<br><br>If all pings have been successful so far, this column has a value of 0.                                                                                                                                                                                                                                                                                    |
| LAST_UPDATE_TIME | VARCHAR2(20)  | The last time this row was updated                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                     |

### ① See Also

*Oracle Data Guard Broker* for more information about the FastStartFailoverThreshold configuration property

### Example

Assume that the following shows the status of observer's pings to the primary:

```

Ping time Ping result

1:00:00 SUCCESS
1:00:03 FAIL
1:00:06 FAIL

```

```
1:00:09 SUCCESS => Wait time of 6 seconds
1:00:12 SUCCESS
1:00:15 FAIL
1:00:18 FAIL
1:00:21 SUCCESS => Wait time of 6 seconds
1:00:24 SUCCESS
1:00:27 FAIL
1:00:30 SUCCESS => Wait time of 3 seconds
```

These ping results will result in the histogram view below:

| WAIT_TIME | WAIT_COUNT | LAST_UPDATE_TIME |
|-----------|------------|------------------|
| 3         | 1          | 1:00:30          |
| 6         | 2          | 1:00:21          |
| 9         | 0          |                  |
| 12        | 0          |                  |
| ...       |            |                  |

In this case, the FastStartFailoverThreshold value should be set to larger than 6 because communication between the observer and the primary sometimes fails for 6 seconds.

## 8.244 V\$GC\_ELEMENT

V\$GC\_ELEMENT displays one entry for each global cache resource that is used by the buffer cache. The name of the global cache resource that corresponds to a lock element is {'BL', indx, class}. This is an Oracle Real Application Clusters view.

| Column          | Datatype   | Description                                                                                                                                                                            |
|-----------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GC_ELEMENT_ADDR | RAW(4   8) | Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock. |
| INDX            | NUMBER     | Platform specific lock manager identifier                                                                                                                                              |
| CLASS           | NUMBER     | Platform specific lock manager identifier                                                                                                                                              |
| GC_ELEMENT_NAME | NUMBER     | Name of the lock that contains the PCM lock that is covering the buffer                                                                                                                |
| MODE_HELD       | NUMBER     | Platform dependent value for lock mode held; often: 3 = share; 5 = exclusive                                                                                                           |
| BLOCK_COUNT     | NUMBER     | Number of blocks covered by PCM lock                                                                                                                                                   |
| RELEASING       | NUMBER     | Nonzero if PCM lock is being downgraded                                                                                                                                                |
| ACQUIRING       | NUMBER     | Nonzero if PCM lock is being upgraded                                                                                                                                                  |
| WRITING         | NUMBER     | If the GC_ELEMENT is being written, the write status                                                                                                                                   |
| RECOVERING      | NUMBER     | If the GC_ELEMENT is being recovered, the recovery status                                                                                                                              |
| LOCAL           | NUMBER     | Zero if the GC_ELEMENT is local, one if it is global                                                                                                                                   |
| FLAGS           | NUMBER     | Process level flags for the lock element                                                                                                                                               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.245 V\$GC\_ELEMENTS\_WITH\_COLLISIONS

V\$GC\_ELEMENTS\_WITH\_COLLISIONS is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column          | Datatype   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GC_ELEMENT_ADDR | RAW(4   8) | Address of the lock element that contains the PCM lock covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                                         |
| CON_ID          | NUMBER     | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.246 V\$GCR\_ACTIONS

V\$GCR\_ACTIONS displays information about the current status of the actions defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

| Column      | Datatype     | Description                                                            |
|-------------|--------------|------------------------------------------------------------------------|
| ACTION_ID   | NUMBER       | Action identification number as used internally to refer to the metric |
| ACTION_NAME | VARCHAR2(40) | Name of the action                                                     |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENVIRONMENT        | NUMBER       | Environment that the action should run in: <ul style="list-style-type: none"> <li>• 0: Nowhere (do not run)</li> <li>• 1: Oracle ASM instance only</li> <li>• 2: Oracle Database instance only</li> <li>• 3: Oracle ASM and Oracle Database instance</li> <li>• 4: Standby instance</li> <li>• 5: Oracle ASM and Standby instance</li> <li>• 6: Oracle Database and Standby instance</li> <li>• 7: Oracle Database, Oracle ASM, and Standby instance</li> <li>• 15: All instance types</li> </ul> |
| FLAGS              | NUMBER       | Various flags describing the action. Used only by Oracle for diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ACTIVE             | VARCHAR2(9)  | Whether the action is active or not: <ul style="list-style-type: none"> <li>• ACTIVE: Action is active.</li> <li>• INACTIVE: Action is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| STATUS_CHANGE_TIME | TIMESTAMP(6) | Time of last action change of status                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LAST_RAN_ITERATION | NUMBER       | Iteration of the last time the action ran                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LAST_RAN_TIME      | TIMESTAMP(6) | Time of last run                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                             |

## 8.247 V\$GCR\_LOG

V\$GCR\_LOG provides information on the last 30 significant events that have occurred in GCR in the recent past.

| Column      | Datatype     | Description                                                                                                                                                                                       |
|-------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID     | NUMBER       | Instance identifier                                                                                                                                                                               |
| ITERATION   | NUMBER       | GCR internal iteration count                                                                                                                                                                      |
| TIME        | TIMESTAMP(6) | Timestamp of record                                                                                                                                                                               |
| TYPE        | VARCHAR2(14) | Type of record: <ul style="list-style-type: none"> <li>• METRIC</li> <li>• METRIC ENABLE</li> <li>• METRIC DISABLE</li> <li>• GLOBAL METRIC</li> <li>• ACTION RAN</li> <li>• RESET RAN</li> </ul> |
| DESCRIPTION | VARCHAR2(40) | Description of function                                                                                                                                                                           |
| RESULT      | VARCHAR2(7)  | Result: <ul style="list-style-type: none"> <li>• OK</li> <li>• FAIL</li> </ul>                                                                                                                    |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data.</li> </ul> |

## 8.248 V\$GCR\_METRICS

V\$GCR\_METRICS displays information about the current status of the metrics defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METRIC_ID          | NUMBER       | Metric identification number as used internally to refer to the metric                                                                                                                                                                                                                                                                                                                                                                                                                 |
| METRIC_NAME        | VARCHAR2(40) | Name of the metric                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ENVIRONMENT        | NUMBER       | <p>Environment that the metric should run in:</p> <ul style="list-style-type: none"> <li>0: Nowhere (do not run)</li> <li>1: Oracle ASM instance only</li> <li>2: Oracle Database instance only</li> <li>3: Oracle ASM and Oracle Database instance</li> <li>4: Standby instance</li> <li>5: Oracle ASM and Standby instance</li> <li>6: Oracle Database and Standby instance</li> <li>7: Oracle Database, Oracle ASM, and Standby instance</li> <li>15: All instance types</li> </ul> |
| FREQUENCY          | NUMBER       | How often the metric runs, in seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SCOPE              | NUMBER       | <p>The scope of sharing of the metric:</p> <ul style="list-style-type: none"> <li>0: The metric does not have associated data</li> <li>1: Global - shared with all other instances in the cluster</li> <li>2: Local - used only locally (not shared)</li> <li>4: Node Global - shared with other instances in the cluster on the same node only</li> <li>8: DB Only - Shared with other instances of the same database only</li> </ul>                                                 |

| LAST_FAIL_TIME      | TIMESTAMP(6) | Time of last metric failure                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_FAILS         | NUMBER       | Total number of times the metric has failed since start of LMHB                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID              | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.249 V\$GCR\_STATUS

V\$GCR\_STATUS provides information on the current GCR status, what metrics ran and their result. It records the last 100 events.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data.</li> </ul> |

## 8.250 V\$GC SHVMASTER\_INFO

V\$GC SHVMASTER\_INFO describes the current and previous master instances and the number of re-masterings of Global Cache Service resources except those belonging to files mapped to a particular master.

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HV_ID           | NUMBER   | PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CURRENT_MASTER  | NUMBER   | Master instance of this PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                                       |
| PREVIOUS_MASTER | NUMBER   | Previous master instance of this PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                              |
| REMASTER_CNT    | NUMBER   | Number of times this has been remastered                                                                                                                                                                                                                                                                                                                                                                                                        |

## 8.252 V\$GES\_BLOCKING\_ENQUEUE

V\$GES\_BLOCKING\_ENQUEUE describes all locks currently known to lock manager that are being blocked or blocking others.

The output of this view is a subset of the output from V\$GES\_ENQUEUE. This is an Oracle Real Application Clusters view.

## 8.253 V\$GES\_CONVERT\_LOCAL

V\$GES\_CONVERT\_LOCAL displays statistics for local GES enqueue operations. This view records average convert times, count information, and timed statistics for global enqueue requests.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| CON_ID               | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 8.254 V\$GES\_CONVERT\_REMOTE

V\$GES\_CONVERT\_REMOTE displays values for remote GES enqueue conversions. This view records average convert times, count information, and timed statistics for global enqueue requests.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| AVERAGE_CONVERT_TIME | NUMBER       | Average conversion time for each type of lock operation (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CONVERT_COUNT        | NUMBER       | Number of operations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.255 V\$GES\_DEADLOCK\_SESSIONS

V\$GES\_DEADLOCK\_SESSIONS displays information about sessions waiting for global enqueue service deadlocks detected by the distributed lock manager. This is an Oracle Real Application Clusters view.

This view displays a maximum of 20 sessions per deadlock.

| Column  | Datatype     | Description                   |
|---------|--------------|-------------------------------|
| DID     | VARCHAR2(30) | Deadlock ID                   |
| SID     | NUMBER       | Waiting session ID            |
| SERIAL# | NUMBER       | Waiting session serial number |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE         | NUMBER        | Waiting session instance                                                                                                                                                                                                                                                                                                                                                                                                                        |

| GRANT_LEVEL      | VARCHAR2(16)  | Granted level of the blocker                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.256 V\$GES\_DEADLOCKS

V\$GES\_DEADLOCKS displays information about global enqueue service deadlocks detected by the distributed lock manager. This is an Oracle Real Application Clusters view.

This view displays the 20 most recent deadlocks.

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| STATISTIC# | NUMBER       | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                                |
| NAME       | VARCHAR2(38) | Name of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE      | NUMBER       | Value associated with the statistic                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.261 V\$GG\_APPLY\_COORDINATOR

V\$GG\_APPLY\_COORDINATOR displays information about each GoldenGate apply process coordinator.

The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                | NUMBER        | Session ID of the coordinator's session                                                                                                                                                                                                                                                                               |
| SERIAL#            | NUMBER        | Serial number of the coordinator's session                                                                                                                                                                                                                                                                            |
| STATE              | VARCHAR2(21)  | State of the coordinator: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>APPLYING - Passing transactions to apply servers</li> <li>SHUTTING DOWN CLEANLY - Stopping without an error</li> <li>ABORTING - Stopping because of an apply error</li> </ul> |
| APPLY#             | NUMBER        | Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.                                                                                                                                                                                                                   |
| APPLY_NAME         | VARCHAR2(128) | Name of the apply process                                                                                                                                                                                                                                                                                             |
| TOTAL_APPLIED      | NUMBER        | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                    |
| TOTAL_WAIT_DEPS    | NUMBER        | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                        |
| TOTAL_WAIT_COMMITS | NUMBER        | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                  |
| TOTAL_ADMIN        | NUMBER        | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                         |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_ASSIGNED           | NUMBER   | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_RECEIVED           | NUMBER   | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_IGNORED            | NUMBER   | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                                                                                                                                                               |
| TOTAL_ROLLBACKS          | NUMBER   | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                                                                                                                                                            |
| TOTAL_ERRORS             | NUMBER   | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                                                                                                                                                          |
| UNASSIGNED_COMPLETE_TXNS | NUMBER   | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                                                                                                                                                      |
| LWM_TIME                 | DATE     | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                                                                                                                                                    |
| LWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                                                                                                                                                    |
| LWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                                                                                                                                                |
| HWM_TIME                 | DATE     | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                                                                                                                                                  |
| HWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.                                                                                                                                                                                                                                                                                      |
| HWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.                                                                                                                                                                                              |
| STARTUP_TIME             | DATE     | Time when the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                          |
| ELAPSED_SCHEDULE_TIME    | NUMBER   | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                                 |

## 8.262 V\$GG\_APPLY\_READER

V\$GG\_APPLY\_READER displays information about each GoldenGate apply reader.

The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column                       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| APPLY_NAME                   | VARCHAR2(128) | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| STATE                        | VARCHAR2(36)  | Shows the state of the apply reader and the hash server. The possible values include: <ul style="list-style-type: none"> <li>• INITIALIZING - Starting up</li> <li>• IDLE - Performing no work</li> <li>• DEQUEUE MESSAGES - Dequeuing messages from the queue</li> <li>• SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions</li> <li>• SPILLING - Spilling unapplied messages from memory to hard disk</li> <li>• PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied</li> </ul> The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state. |
| TOTAL_MESSAGES_DEQUEUED      | NUMBER        | Total number of messages dequeued since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TOTAL_MESSAGES_SPILLED       | NUMBER        | Number of messages spilled by the reader since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DEQUEUE_TIME                 | DATE          | Time when the last message was received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DEQUEUED_MESSAGE_CREATE_TIME | DATE          | For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SGA_USED              | NUMBER        | Amount (in bytes) of SGA memory used by the apply process since it was last started                                                                                                                                                                                                                                                                                                                                                             |
| ELAPSED_DEQUEUE_TIME  | NUMBER        | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| ELAPSED_SCHEDULE_TIME | NUMBER        | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.                                                                                                                                                                                                                                   |
| ELAPSED_SPILL_TIME    | NUMBER        | Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                       |
| SPILL_LWM_SCN         | NUMBER        | Spill low-watermark SCN                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PROXY_SID             | NUMBER        | When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                                                 |
| PROXY_SERIAL          | NUMBER        | When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                                              |
| PROXY_SPID            | VARCHAR2(12)  | When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                              |
| BYTES_RECEIVED        | NUMBER        | When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.                                                                                                                                                                       |
| DEQUEUED_POSITION     | RAW(64)       | Dequeued position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                                                       |
| SPILL_LWM_POSITION    | RAW(64)       | Spill low-watermark position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                                            |
| OLDEST_TRANSACTION_ID | VARCHAR2(128) | Oldest transaction ID                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_DEP   | NUMBER        | Total number of LCRs with row-level dependencies since the apply process last started                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_WMDEP | NUMBER        | Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                                                                                                                                                                                    |
| TOTAL_IN_MEMORY_LCRS  | NUMBER        | Total number of LCRs currently in memory                                                                                                                                                                                                                                                                                                                                                                                                        |
| SGA_ALLOCATED         | NUMBER        | The total amount of shared memory (in bytes) allocated from the GoldenGate pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                      |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

The ELAPSED\_SCHEDULE\_TIME column is only populated if the TIMED\_STATISTICS initialization parameter is set to true, or if the STATISTICS\_LEVEL initialization parameter is set to TYPICAL or ALL.

# 8.263 V\$GG\_APPLY\_RECEIVER

V\$GG\_APPLY\_RECEIVER displays information about the message receiver of the Replicat process.

The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts and when the Replicat process is stopped.

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                        | NUMBER        | Session ID of the apply receiver                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| LAST_RECEIVED_MSG_POSITION | VARCHAR2(64)  | Last received message position                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ACKNOWLEDGEMENT_POSITION   | VARCHAR2(64)  | acknowledgment position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN.                                                                                                                                                                                                                                                                                                                           |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| OS_PROCESS_ID      | VARCHAR2(12) | The OS process ID of the apply receiver process                                                                                                                                                                                                                                                                                                                                                                                                   |
| CURRENT_POSITION   | VARCHAR2(81) | The trail position of the current record processed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                          |
| TOTAL_TRANSACTIONS | NUMBER       | The total number of transactions processed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                  |
| TOTAL_COMMITS      | NUMBER       | The total number of commits executed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_ERRORS       | NUMBER       | The total number of errors encountered by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                      |

## 8.264 V\$GG\_APPLY\_SERVER

V\$GG\_APPLY\_SERVER displays information about each GoldenGate apply server and its activities.

An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column     | Datatype      | Description                                                                             |
|------------|---------------|-----------------------------------------------------------------------------------------|
| SID        | NUMBER        | Session ID of the apply server's session                                                |
| SERIAL#    | NUMBER        | Serial number of the apply server's session                                             |
| APPLY#     | NUMBER        | Apply process number. An apply process is an Oracle background process, prefixed by ap. |
| APPLY_NAME | VARCHAR2(128) | Name of the apply process                                                               |
| SERVER_ID  | NUMBER        | Parallel execution server number of the apply server                                    |

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE            | VARCHAR2(20) | <p>State of the apply server:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views</li> <li>ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions</li> <li>DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions</li> <li>EXECUTE TRANSACTION - Applying a transaction</li> <li>WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1.</li> <li>WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1.</li> <li>ROLLBACK TRANSACTION - Rolling back a transaction</li> <li>TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue</li> <li>WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs</li> <li>WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction</li> </ul> |
| XIDUSN           | NUMBER       | Transaction ID undo segment number of the transaction currently being applied                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| COMMIT_POSITION        | RAW(64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as a GoldenGate Integrated Replicat.                                                                                                                                                                                                                                                                                                 |
| DEP_COMMIT_POSITION    | RAW(64)       | Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                |
| LAST_APPLY_POSITION    | RAW(64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as a GoldenGate outbound server or inbound server.                                                                                                                                                         |
| TRANSACTION_ID         | VARCHAR2(128) | Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                              |
| DEP_TRANSACTION_ID     | VARCHAR2(128) | Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                 |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED     | NUMBER        | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION    | NUMBER        | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED     | NUMBER        | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION    | NUMBER        | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RECORDED    | NUMBER        | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

### Note

The ELAPSED\_SCHEDULE\_TIME column is only populated if the TIMED\_STATISTICS initialization parameter is set to true, or if the STATISTICS\_LEVEL initialization parameter is set to TYPICAL or ALL.

| ID2     | NUMBER      | Resource identifier #2 (number)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LMODE   | NUMBER      | Lock mode held (number)                                                                                                                                                                                                                                                                                                                                                                                                                           |
| REQUEST | NUMBER      | Lock mode requested (number)                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CTIME   | NUMBER      | Time since current mode was granted                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID  | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.266 V\$GLOBAL\_TRANSACTION

V\$GLOBAL\_TRANSACTION displays information on the currently active global transactions.

| Column       | Datatype | Description                                                                  |
|--------------|----------|------------------------------------------------------------------------------|
| FORMATID     | NUMBER   | Format identifier of the global transaction                                  |
| GLOBALID     | RAW(64)  | Global transaction identifier of the global transaction                      |
| BRANCHID     | RAW(64)  | Branch qualifier of the global transaction                                   |
| BRANCHES     | NUMBER   | Total number of branches in the global transaction                           |
| REFCOUNT     | NUMBER   | Number of siblings for the global transaction (must be the same as branches) |
| PREPARECOUNT | NUMBER   | Number of branches of the global transaction that have prepared              |

| Column   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE    | VARCHAR2(38) | <p>State of the branch of the global transaction:</p> <ul style="list-style-type: none"> <li>• ACTIVE</li> <li>• COLLECTING</li> <li>• FINALIZED</li> <li>• FAILED</li> <li>• RECOVERING</li> <li>• UNASSOCIATED</li> <li>• FORGOTTEN</li> <li>• READY FOR RECOVERY</li> <li>• NO-READONLY FAILED</li> <li>• SIBLING INFO WRITTEN</li> <li>• [ORACLE COORDINATED]ACTIVE</li> <li>• [ORACLE COORDINATED]COLLECTING</li> <li>• [ORACLE COORDINATED]FINALIZED</li> <li>• [ORACLE COORDINATED]FAILED</li> <li>• [ORACLE COORDINATED]RECOVERING</li> <li>• [ORACLE COORDINATED]UNASSOCIATED</li> <li>• [ORACLE COORDINATED]FORGOTTEN</li> <li>• [ORACLE COORDINATED]READY FOR RECOVERY</li> <li>• [ORACLE COORDINATED]NO-READONLY FAILED</li> <li>• [MULTINODE]ACTIVE</li> <li>• [MULTINODE]COLLECTING</li> <li>• [MULTINODE]FINALIZED</li> <li>• [MULTINODE]FAILED</li> <li>• [MULTINODE]RECOVERING</li> <li>• [MULTINODE]UNASSOCIATED</li> <li>• [MULTINODE]FORGOTTEN</li> <li>• [MULTINODE]READY FOR RECOVERY</li> <li>• [MULTINODE]NO-READONLY FAILED</li> <li>• [MULTINODE]SIBLING INFO WRITTEN</li> <li>• COMBINATION</li> </ul> |
| FLAGS    | NUMBER       | The numeric representation of the state                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| COUPLING | VARCHAR2(15) | Indicates whether the branches are free (FREE), loosely coupled (LOOSELY COUPLED), or tightly coupled (TIGHTLY COUPLED)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID   | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 8.267 V\$GOLDENGATE\_CAPABILITIES

V\$GOLDENGATE\_CAPABILITIES displays information about the usage of various Oracle GoldenGate features, as well as database features used by Oracle GoldenGate.

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME      | VARCHAR2(22) | Feature name. Possible values: <ul style="list-style-type: none"> <li>AUTOCDR</li> <li>DBENCRYPTION</li> <li>DBLOGREADER</li> <li>DDLTRIGGEROPTIMIZATION</li> <li>DELETECASCADEHINT</li> <li>GGSESSION</li> <li>PROCREPLICATION</li> <li>SUPPLEMENTALLOG</li> <li>TRANSIENTDUPLICATE</li> <li>TRIGGERSUPPRESSION</li> </ul>                                                                                                                     |
| COUNT     | NUMBER       | Number of times the feature has been used since instance startup                                                                                                                                                                                                                                                                                                                                                                                |
| LAST_USED | DATE         | Date on which the feature was last used                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.268 V\$GOLDENGATE\_CAPTURE

V\$GOLDENGATE\_CAPTURE displays information about each capture process that sends LCRs to an Oracle GoldenGate outbound server.

| Column       | Datatype      | Description                                                                              |
|--------------|---------------|------------------------------------------------------------------------------------------|
| SID          | NUMBER        | Session identifier of the capture process                                                |
| SERIAL#      | NUMBER        | Session serial number of the capture process session                                     |
| CAPTURE#     | NUMBER        | Capture process number. A capture process is an Oracle background process prefixed by cp |
| CAPTURE_NAME | VARCHAR2(128) | Name of the capture process                                                              |
| LOGMINER_ID  | NUMBER        | Session ID of the Oracle LogMiner session associated with the capture process            |
| STARTUP_TIME | DATE          | Time when the capture process was last started                                           |

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                       | VARCHAR2(589) | <p>State of the capture process and state of the network. The two states are separated by a semicolon. The possible values are:</p> <ul style="list-style-type: none"> <li>ABORTING - Terminating.</li> <li>CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets.</li> <li>CREATING LCR - Converting a change into an LCR.</li> <li>DICTIONARY INITIALIZATION - Processing a dictionary build.</li> <li>ENQUEUEING MESSAGE - Enqueueing an LCR that satisfies the capture process rule sets into the capture process queue.</li> <li>EVALUATING RULE - Evaluating a change against a capture process rule set.</li> <li>INITIALIZING - Starting up.</li> <li>PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable.</li> <li>SHUTTING DOWN - Stopping.</li> <li>SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete.</li> <li>WAITING FOR BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size.</li> <li>WAITING FOR CLIENT REQUESTS - Waiting for a response from the extract process.</li> <li>WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added.</li> <li>WAITING FOR INACTIVE DEQUEUEURS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue.</li> <li>WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes.</li> <li>WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session.</li> <li>WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions.</li> </ul> |
| TOTAL_PREFILTER_DISCARDED   | NUMBER        | Total number of prefiltered messages discarded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                          |
|-------------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_MESSAGES_CAPTURED       | NUMBER       | Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change. |
| CAPTURE_TIME                  | DATE         | Time when the most recent message was captured                                                                                                                                                                                                                                                                       |

| ENQUEUE_TIME                  | DATE         | Time when the last message was enqueued                                                                                                                                                                                                                                                                              |
| ENQUEUE_MESSAGE_NUMBER        | NUMBER       | Number of the last enqueued message                                                                                                                                                                                                                                                                                  |
| ENQUEUE_MESSAGE_CREATE_TIME   | DATE         | Creation time of the last enqueued message                                                                                                                                                                                                                                                                           |
| AVAILABLE_MESSAGE_NUMBER      | NUMBER       | For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.                                                                                                                                                           |
| AVAILABLE_MESSAGE_CREATE_TIME | DATE         | For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.                                                                                                                     |
| ELAPSED_CAPTURE_TIME          | NUMBER       | Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started                                                                                                                                                                                             |
| ELAPSED_RULE_TIME             | NUMBER       | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started                                                                                                                                                                                                                 |
| ELAPSED_ENQUEUE_TIME          | NUMBER       | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started                                                                                                                                                                                                              |
| ELAPSED_LCR_TIME              | NUMBER       | Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started                                                                                                                                                                                                                    |
| ELAPSED_REDO_WAIT_TIME        | NUMBER       | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state                                                                                                                                                                                                                  |
| ELAPSED_PAUSE_TIME            | NUMBER       | Elapsed flow control pause time (in hundredths of a second)                                                                                                                                                                                                                                                          |
| STATE_CHANGED_TIME            | DATE         | Time at which the state of the capture process changed                                                                                                                                                                                                                                                               |
| SGA_USED                      | NUMBER       | The total amount of shared memory used (in bytes) by the capture process                                                                                                                                                                                                                                             |
| SGA_ALLOCATED                 | NUMBER       | The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process                                                                                                                                                                                                                 |
| BYTES_OF_REDO_MINED           | VARCHAR2(64) | The total amount of redo data mined (in bytes) since the capture process last started                                                                                                                                                                                                                                |
| SESSION_RESTART_SCN           | VARCHAR2(64) | The SCN from which the capture process started mining redo data when it was last started                                                                                                                                                                                                                             |

| Column                        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SPID                          | VARCHAR2(12)  | Operating system process identifier of the capture process                                                                                                                                                                                                                                                                                                                                                                                      |
| EXTRACT_NAME                  | VARCHAR2(128) | Name of the extract process                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SERVER_SID                    | NUMBER        | Session ID of the capture server                                                                                                                                                                                                                                                                                                                                                                                                                |
| SERVER_SERIAL#                | NUMBER        | Session serial number of the capture server                                                                                                                                                                                                                                                                                                                                                                                                     |
| SERVER_SPID                   | VARCHAR2(12)  | Operating system process identifier of the capture server                                                                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_MESSAGES_SENT           | NUMBER        | Total number of LCRs sent by the capture process to the GoldenGate extract process since the last time the extract attached to the capture process                                                                                                                                                                                                                                                                                              |
| SEND_TIME                     | DATE          | Time the last LCR was sent by the capture process to the extract process                                                                                                                                                                                                                                                                                                                                                                        |

## 8.269 V\$GOLDENGATE\_MESSAGE\_TRACKING

V\$GOLDENGATE\_MESSAGE\_TRACKING displays information about LCRs tracked through the stream that are processed by Oracle GoldenGate components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency` apply process parameter to 1 or another relatively low value via the Oracle GoldenGate `DBOPTIONS INTEGRATEDPARAMS` parameter.
- Use the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAM_ADM.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

| Column         | Datatype      | Description                   |
|----------------|---------------|-------------------------------|
| TRACKING_LABEL | VARCHAR2(128) | User-specified tracking label |

| Column                | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 8.270 V\$GOLDENGATE\_PROCEDURE\_STATS

V\$GOLDENGATE\_PROCEDURE\_STATS displays procedural replication statistics processed by each Oracle GoldenGate apply server.

| Column          | Datatype      | Description                       |
|-----------------|---------------|-----------------------------------|
| APPLY_NAME      | VARCHAR2(128) | Name of the apply process         |
| SERVER_ID       | NUMBER        | Parallel apply server worker ID   |
| PROCEDURE_OWNER | VARCHAR2(128) | Owner of the replicated procedure |
| PACKAGE_NAME    | VARCHAR2(128) | Replicated procedure package      |
| PROCEDURE_NAME  | VARCHAR2(128) | Replicated procedure name         |

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_UPDATE      | DATE     | Time of the last update of the statistics                                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_EXECUTIONS | NUMBER   | Number of executions of the procedure by this apply server                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.271 V\$GOLDENGATE\_TABLE\_STATS

V\$GOLDENGATE\_TABLE\_STATS displays table statistics for all the tables used by each Oracle GoldenGate apply server.

| Column                  | Datatype      | Description                                                                                              |
|-------------------------|---------------|----------------------------------------------------------------------------------------------------------|
| APPLY_NAME              | VARCHAR2(128) | Name of the apply process                                                                                |
| SERVER_ID               | NUMBER        | Parallel apply server worker ID                                                                          |
| SOURCE_TABLE_OWNER      | VARCHAR2(128) | Source owner of the captured or replicated table                                                         |
| SOURCE_TABLE_NAME       | VARCHAR2(128) | Source name of the captured or replicated table                                                          |
| DESTINATION_TABLE_OWNER | VARCHAR2(128) | Target owner of the captured or replicated table                                                         |
| DESTINATION_TABLE_NAME  | VARCHAR2(30)  | Target name of the captured or replicated table                                                          |
| LAST_UPDATE             | DATE          | Time of the last update of the statistics                                                                |
| TOTAL_INSERTS           | NUMBER        | Number of insert operations on this table processed by this apply server                                 |
| TOTAL_UPDATES           | NUMBER        | Number of update operations on this table processed by this apply server                                 |
| TOTAL_DELETES           | NUMBER        | Number of delete operations on this table processed by this apply server                                 |
| INSERT_COLLISIONS       | NUMBER        | Number of insert collisions on this table encountered by this apply server                               |
| UPDATE_COLLISIONS       | NUMBER        | Number of update collisions on this table encountered by this apply server                               |
| DELETE_COLLISIONS       | NUMBER        | Number of delete collisions on this table encountered by this apply server                               |
| REPERROR_RECORDS        | NUMBER        | Number of change records that resulted in an error that were recorded on this table by this apply server |
| REPERROR_IGNORES        | NUMBER        | Number of change records that resulted in an error that were ignored on this table by this apply server  |
| WAIT_DEPENDENCIES       | NUMBER        | Number of waits for this table due to dependency                                                         |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CDR_INSERT_ROW_EXISTS      | NUMBER   | Number of conflicts where an insert gets an ORA-00001 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_EXISTS      | NUMBER   | Number of conflicts where an update gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_MISSING     | NUMBER   | Number of conflicts where an update gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_DELETE_ROW_EXISTS      | NUMBER   | Number of conflicts where a delete gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_DELETE_ROW_MISSING     | NUMBER   | Number of conflicts where a delete gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_SUCCESSFUL_RESOLUTIONS | NUMBER   | Number of successfully resolved conflicts                                                                                                                                                                                                                                                                                                                                                                                                       |
| CDR_FAILED_RESOLUTIONS     | NUMBER   | Number of conflicts that could not be resolved due to an error during resolution                                                                                                                                                                                                                                                                                                                                                                |
| LOB_OPERATIONS             | NUMBER   | The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.                                                                                                                                                                                                                                                                                                                                                |

## 8.272 V\$GOLDENGATE\_TRANSACTION

V\$GOLDENGATE\_TRANSACTION displays information about transactions that are being processed by Oracle GoldenGate capture processes, outbound servers, and inbound servers.

This view can identify long running transactions and display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.

This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the Oracle GoldenGate client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                    |
|----------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_NAME | VARCHAR2(138) | Name of the component                                                                                                                                                                                                                                                                          |
| COMPONENT_TYPE | VARCHAR2(20)  | Type of component <ul style="list-style-type: none"> <li>CAPTURE - Capture process</li> <li>APPLY - Apply reader subcomponent in an outbound server or inbound server</li> <li>PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server</li> </ul> |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XIDUSN                   | NUMBER   | Transaction ID undo segment number of the transaction                                                                                                                                                                                                                                                                                                                                                    |
| XIDSLT                   | NUMBER   | Transaction ID slot number of the transaction                                                                                                                                                                                                                                                                                                                                                            |
| XIDSQN                   | NUMBER   | Transaction ID sequence number of the transaction                                                                                                                                                                                                                                                                                                                                                        |
| BATCH_XIDUSN             | NUMBER   | Transaction ID undo segment number of the batch parent transaction.<br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled. |
| BATCH_XIDSLT             | NUMBER   | Transaction ID slot number of the batch parent transaction.<br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.         |
| BATCH_XIDSQN             | NUMBER   | Transaction ID sequence number of the batch parent transaction.<br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.     |
| CUMULATIVE_MESSAGE_COUNT | NUMBER   | Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.                                                                                                                                                                               |
| TOTAL_MESSAGE_COUNT      | NUMBER   | Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.                                                                                                                                                                                                                                                            |
| FIRST_MESSAGE_TIME       | DATE     | Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.                                                                                                                                                            |
| FIRST_MESSAGE_NUMBER     | NUMBER   | SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.                                                                                                                                                                            |
| LAST_MESSAGE_TIME        | DATE     | Time stamp of the last LCR processed in the transaction                                                                                                                                                                                                                                                                                                                                                  |
| LAST_MESSAGE_NUMBER      | NUMBER   | SCN of the most recent message encountered for the transaction                                                                                                                                                                                                                                                                                                                                           |
| FIRST_MESSAGE_POSITION   | RAW(64)  | Position of the first message seen by an XStream inbound server<br>This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.                                                                                                                                                                                                                        |
| LAST_MESSAGE_POSITION    | RAW(64)  | Position of the last message seen by an Oracle GoldenGate inbound server<br>This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.                                                                                                                                                                                                               |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.273 V\$HANG\_INFO

V\$HANG\_INFO displays information about hangs found on the cluster.

A hang can be an open wait chain or closed wait chain (cycle or deadlock). A wait chain is a series of sessions that are blocking one another. Each row represents a hang and describes how severe the hang is. This view also includes the victim or final blocker of the hang.

| Column                   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.274 V\$HANG\_SESSION\_INFO

V\$HANG\_SESSION\_INFO displays information about sessions involved in hangs described by V\$HANG\_INFO.

Each row with the same HANG\_ID describes a session that is in the hang wait chain described by the row with the same HANG\_ID in V\$HANG\_INFO. This session is blocked by the victim or final blocker of that hang.

| Column                 | Datatype     | Description                                                                                                                                                             |
|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HANG_ID                | NUMBER       | A number identifying the hang including this session. This column can be used to join V\$HANG_INFO with V\$HANG_SESSION_INFO.                                           |
| INSTANCE               | NUMBER       | Instance number of the instance on which this session resides                                                                                                           |
| SID                    | NUMBER       | Oracle session ID of this session                                                                                                                                       |
| SERIAL#                | NUMBER       | Oracle session serial number of this session                                                                                                                            |
| OSPID                  | VARCHAR2(24) | Operating system process ID of this session                                                                                                                             |
| FATAL_BACKGROUND       | VARCHAR2(1)  | Y - Session is a critical background process<br>N - Session is not a critical background process                                                                        |
| ROOT                   | VARCHAR2(1)  | Y - This session is the victim or final blocker of the hang<br>N - This session is not the victim or final blocker of the hang                                          |
| PNAME                  | VARCHAR2(5)  | Name of the victim or final blocker process                                                                                                                             |
| PDB_ID                 | NUMBER       | Oracle session's container ID or PDB ID                                                                                                                                 |
| WAIT_EVENT_TEXT        | VARCHAR2(64) | Resource or event for which this session is waiting; set to not in a wait if the session is not waiting on a resource                                                   |
| WAIT_TIME <sup>1</sup> | NUMBER       | Time spent in wait for this session (in seconds). If the value of WAIT_EVENT_TEXT is not in a wait, then this column returns the number of seconds since the last wait. |
| QOS_PC_RANK            | VARCHAR2(12) | Session's Oracle Database Quality of Service (QoS) Management Performance Class rank                                                                                    |
| QOS_PC_ITT             | NUMBER       | Session's Oracle Database Quality of Service (QoS) Management Performance Class In-Trouble Threshold                                                                    |
| QOS_PC_RTT             | NUMBER       | Session's Oracle Database Quality of Service (QoS) Management Performance Class Root Termination allowed Threshold                                                      |
| QOS_PC_KEY             | NUMBER       | Session's Oracle Database Quality of Service (QoS) Management Performance Class Key                                                                                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. ## 8.277 V\$HM\_CHECK

V\$HM\_CHECK displays information about all the checks registered with Health Monitor. Each check is uniquely identified by a name or an ID.

| Column          | Datatype       | Description                                                                                                 |
|-----------------|----------------|-------------------------------------------------------------------------------------------------------------|
| ID              | NUMBER         | Health check ID                                                                                             |
| NAME            | VARCHAR2(64)   | Health check name                                                                                           |
| NAME_NLS        | VARCHAR2(1024) | Internationalized names of the health checks                                                                |
| CLSID           | NUMBER         | Class ID to which this check belongs                                                                        |
| CLS_NAME        | VARCHAR2(15)   | Class name of the check: <ul style="list-style-type: none"> <li>GENERIC</li> <li>PERSISTENT_DATA</li> </ul> |
| FLAGS           | NUMBER         | Reserved for internal use                                                                                   |
| INTERNAL_CHECK  | VARCHAR2(1)    | Internal check                                                                                              |
| OFFLINE_CAPABLE | VARCHAR2(1)    | Ability to run when database is not open yet (Y or N)                                                       |

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION | VARCHAR2(1024) | Description of what the check does                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.278 V\$HM\_CHECK\_PARAM

V\$HM\_CHECK\_PARAM displays information about the input parameters of all Health Monitor checks.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID            | NUMBER         | Parameter ID                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| NAME          | VARCHAR2(64)   | Parameter name                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CHECK_ID      | NUMBER         | ID of the check to which this parameter belongs                                                                                                                                                                                                                                                                                                                                                                                                       |
| TYPE          | VARCHAR2(20)   | Data type of the input parameter: <ul style="list-style-type: none"> <li>• DBKH_PARAM_UB4</li> <li>• DBKH_PARAM_UB8</li> <li>• DBKH_PARAM_TEXT</li> <li>• DBKH_PARAM_DATE</li> <li>• DBKH_PARAM_UB4_LIST</li> <li>• DBKH_PARAM_UB8_LIST</li> <li>• DBKH_PARAM_TEXT_LIST</li> <li>• DBKH_PARAM_DATE_LIST</li> </ul>                                                                                                                                    |
| DEFAULT_VALUE | VARCHAR2(64)   | Default value for this parameter                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FLAGS         | NUMBER         | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DESCRIPTION   | VARCHAR2(1024) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID        | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.279 V\$HM\_FINDING

V\$HM\_FINDING displays information about all the findings of various Health Monitor runs.

| Column     | Datatype | Description                        |
|------------|----------|------------------------------------|
| FINDING_ID | NUMBER   | Unique ID to represent the finding |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RUN_ID             | NUMBER         | ID of the run that created this finding                                                                                                                                                                                                                                                                                                                                                                                                               |
| NAME               | VARCHAR2(32)   | Name of the finding                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PARENT_ID          | NUMBER         | Parent finding ID for this finding                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CHILD_COUNT        | NUMBER         | Number of active (open) child findings, if this finding is a parent finding type                                                                                                                                                                                                                                                                                                                                                                      |
| CLASS_NAME         | VARCHAR2(32)   | Name of the class to which this finding belongs                                                                                                                                                                                                                                                                                                                                                                                                       |
| TIME_DETECTED      | TIMESTAMP(6)   | Time this finding was detected                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MODIFIED           | TIMESTAMP(6)   | Time that this finding was last modified                                                                                                                                                                                                                                                                                                                                                                                                              |

This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.280 V\$HM\_INFO

V\$HM\_INFO displays information about Health Monitor runs, findings, and recommendations.

The information for a run/finding/recommendation is organized as a name, value pair.

If the type of information is RUN, then the data represents the input parameters for that run. If the type of information is FINDING or RECOMMENDATION, then the data represents the information about that particular finding/recommendation.

| Column | Datatype     | Description                                                                                                                                         |
|--------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ID     | NUMBER       | Unique identifier of the information                                                                                                                |

| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.283 V\$HS\_AGENT

V\$HS\_AGENT displays the set of HS agents currently running on a given host. There is one row per agent process.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGENT_ID     | NUMBER        | Oracle Net session identifier used for connections to the agent (the identifier used in the LISTENER.ORA file)                                                                                                                                                                                                                                                                                                                                  |
| MACHINE      | VARCHAR2(64)  | Operating system machine name                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PROCESS      | VARCHAR2(9)   | Operating system process identifier of the agent                                                                                                                                                                                                                                                                                                                                                                                                |
| PROGRAM      | VARCHAR2(48)  | Program name of the agent                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OSUSER       | VARCHAR2(128) | Operating system user                                                                                                                                                                                                                                                                                                                                                                                                                           |
| STARTTIME    | DATE          | Starting time                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AGENT_TYPE   | NUMBER        | Type of the agent                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FDS_CLASS_ID | NUMBER        | ID of the Foreign Data Store class                                                                                                                                                                                                                                                                                                                                                                                                              |
| FDS_INST_ID  | NUMBER        | Instance name of the Foreign Data Store                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.284 V\$HS\_PARAMETER

V\$HS\_PARAMETER describes the initialization parameters in use by the server and agent.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HS_SESSION_ID | NUMBER        | Unique HS session identifier (maps to the HS_SESSION_ID column of V\$HS_SESSION)                                                                                                                                                                                                                                                                                                                                                                |
| PARAMETER     | VARCHAR2(128) | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE         | VARCHAR2(64)  | Value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SOURCE        | VARCHAR2(1)   | Indicates whether the parameter was defined in the agent (A) or server (S)                                                                                                                                                                                                                                                                                                                                                                      |
| ENV           | VARCHAR2(1)   | Indicates whether the parameter was set as an environment variable in the agent (T) or elsewhere (F)                                                                                                                                                                                                                                                                                                                                            |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.285 V\$HS\_SESSION

V\$HS\_SESSION describes the current HS session.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HS_SESSION_ID | NUMBER        | Unique HS session identifier                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AGENT_ID      | NUMBER        | Oracle Net session identifier used for connections to the agent (maps to the AGENT_ID column of V\$HS_AGENT)                                                                                                                                                                                                                                                                                                                                    |
| SID           | NUMBER        | User session identifier (maps to the SID column of V\$SESSION)                                                                                                                                                                                                                                                                                                                                                                                  |
| DB_LINK       | VARCHAR2(128) | Server database link name used to access the agent; blank if no database link is used (for example, when using external procedures)                                                                                                                                                                                                                                                                                                             |
| DB_LINK_OWNER | NUMBER        | Owner of the database link in DB_LINK                                                                                                                                                                                                                                                                                                                                                                                                           |
| STARTTIME     | DATE          | Time the connection was initiated                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.286 V\$HVMMASTER\_INFO

V\$HVMMASTER\_INFO describes the current and previous master instances and the number of re-masterings of Global Enqueue Service resources.

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HV_ID           | NUMBER   | Hash value ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CURRENT_MASTER  | NUMBER   | Master instance of this hash value ID                                                                                                                                                                                                                                                                                                                                                                                                           |
| PREVIOUS_MASTER | NUMBER   | Previous master instance of this hash value ID                                                                                                                                                                                                                                                                                                                                                                                                  |
| REMASTER_CNT    | NUMBER   | Number of times this has been remastered                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## Dynamic Performance (V\$) Views: V\$IM\_COLUMN\_LEVEL to V\$RULE\_SET\_AGGREGATE\_STATS

This chapter contains the dynamic performance views V\$IM\_COLUMN\_LEVEL to V\$RULE\_SET\_AGGREGATE\_STATS.

### 9.1 V\$IM\_COLUMN\_LEVEL

V\$IM\_COLUMN\_LEVEL presents the selective column compression levels that are defined using the `inmemory_memcompress` clause of the `inmemory_column_clause` of the `CREATE TABLE` statement.

This view returns no rows for a table which has no associated selective column compression levels.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| TABLE_NAME           | VARCHAR2(31) | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SEGMENT_COLUMN_ID    | NUMBER       | Segment column number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COLUMN_NAME          | VARCHAR2(31) | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| INMEMORY_COMPRESSION | VARCHAR2(26) | Column compression level. Possible values: <ul style="list-style-type: none"><li>• <b>DEFAULT</b>: This value appears for physical columns of a table that do not have a selective column clause. It also appears when a virtual column has been explicitly enabled for in-memory storage using <code>ALTER TABLE table-name INMEMORY(VC)</code>.</li><li>• <b>UNSPECIFIED</b>: This value appears for virtual columns of a table that do not have a selective column clause.</li></ul> If the <code>INMEMORY_VIRTUAL_COLUMNS</code> initialization parameter is set to <code>MANUAL</code> , a virtual column with a <code>DEFAULT INMEMORY_COMPRESSION</code> clause will be materialized while a virtual column with an <code>UNSPECIFIED</code> value will not be. |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• <b>0</b>: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li><li>• <b>1</b>: This value is used for rows containing data that pertain to only the root</li><li>• <b>n</b>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                                                                                                                                                                                                                                                                       |

**Note**

The SYS\_IME hidden virtual columns automatically added by the In-Memory Expression (IME) infrastructure will not be shown in this view.

## 9.2 V\$IM\_SEGMENTS

V\$IM\_SEGMENTS presents information about all the in-memory segments in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2(128) | User name of the segment owner                                                                                                                                                                                                                                                                                            |
| SEGMENT_NAME        | VARCHAR2(128) | Name of the segment, if any                                                                                                                                                                                                                                                                                               |
| PARTITION_NAME      | VARCHAR2(128) | Object partition name (set to NULL for non-partitioned objects)                                                                                                                                                                                                                                                           |
| SEGMENT_TYPE        | VARCHAR2(18)  | Type of segment: <ul style="list-style-type: none"><li>• TABLE</li><li>• TABLE PARTITION</li><li>• TABLE SUBPARTION</li></ul>                                                                                                                                                                                             |
| TABLESPACE_NAME     | VARCHAR2(30)  | Name of the tablespace containing the segment                                                                                                                                                                                                                                                                             |
| INMEMORY_SIZE       | NUMBER        | Size of the in-memory version of the segment, in bytes                                                                                                                                                                                                                                                                    |
| BYTES               | NUMBER        | Number of on-disk data bytes for the segment that could be represented in memory (no space metadata blocks)                                                                                                                                                                                                               |
| BYTES_NOT_POPULATED | NUMBER        | Size of the portion of the on-disk segment that is not populated in memory, in bytes.                                                                                                                                                                                                                                     |
| POPULATE_STATUS     | VARCHAR2(13)  | Status of segment population: <ul style="list-style-type: none"><li>• STARTED: A populate task for the segment has started</li><li>• COMPLETED: There are no populate tasks pending for the segment</li><li>• OUT OF MEMORY: A populate task for the segment failed due to lack of space in the IM column store</li></ul> |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_PRIORITY     | VARCHAR2(8)   | Indicates the priority for IM column store population: <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> </ul>                                                                                                                                                                                                                                                                                                   |
| INMEMORY_DISTRIBUTE   | VARCHAR2(15)  | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>• AUTO</li> <li>• BY ROWID RANGE</li> <li>• BY PARTITION</li> <li>• BY SUBPARTITION</li> </ul>                                                                                                                                                                                                                                |
| INMEMORY_DUPLICATE    | VARCHAR2(13)  | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> <li>• NO DUPLICATE</li> <li>• DUPLICATE</li> <li>• DUPLICATE ALL</li> </ul>                                                                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION  | VARCHAR2(17)  | Compression level for the IM column store: <ul style="list-style-type: none"> <li>• NO MEMCOMPRESS</li> <li>• FOR DML</li> <li>• FOR QUERY [ LOW   HIGH ]</li> <li>• FOR CAPACITY [ LOW   HIGH ]</li> <li>• AUTO</li> </ul>                                                                                                                                                                                                                                                            |
| INMEMORY_SERVICE      | VARCHAR2(12)  | Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none"> <li>• DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior</li> <li>• NONE: Do not populate on any instance</li> <li>• ALL: Populate on all instances</li> <li>• USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.</li> </ul>       |
| INMEMORY_SERVICE_NAME | VARCHAR2(129) | Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.                                                                                                                                                                                                                                                                                                 |
| IS_EXTERNAL           | VARCHAR2(5)   | Indicates whether the IM segment is for an external table. Possible values: <ul style="list-style-type: none"> <li>• TRUE: The IM segment is for an external table.</li> <li>• FALSE: The IM segment is not for an external table.</li> </ul>                                                                                                                                                                                                                                          |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.3 V\$IM\_USER\_SEGMENTS

V\$IM\_USER\_SEGMENTS presents information about the in-memory segments for the current user in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEGMENT_NAME        | VARCHAR2(128) | Name of the segment, if any                                                                                                                                                                                                                                                                                                   |
| PARTITION_NAME      | VARCHAR2(128) | Object partition name (set to NULL for non-partitioned objects)                                                                                                                                                                                                                                                               |
| SEGMENT_TYPE        | VARCHAR2(18)  | Type of segment: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTITION</li> </ul>                                                                                                                                                                                           |
| TABLESPACE_NAME     | VARCHAR2(30)  | Name of the tablespace containing the segment                                                                                                                                                                                                                                                                                 |
| INMEMORY_SIZE       | NUMBER        | Size of the in-memory version of the segment, in bytes                                                                                                                                                                                                                                                                        |
| BYTES               | NUMBER        | Total size of the on-disk segment, in bytes                                                                                                                                                                                                                                                                                   |
| BYTES_NOT_POPULATED | NUMBER        | Size of the portion of the on-disk segment that is not populated in memory, in bytes                                                                                                                                                                                                                                          |
| POPULATE_STATUS     | VARCHAR2(13)  | Status of segment population: <ul style="list-style-type: none"> <li>• STARTED: A populate task for the segment has started</li> <li>• COMPLETED: There are no populate tasks pending for the segment</li> <li>• OUT OF MEMORY: A populate task for the segment failed due to lack of space in the IM column store</li> </ul> |
| INMEMORY_PRIORITY   | VARCHAR2(8)   | Indicates the priority for IM column store population: <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> </ul>                                                                                                                                          |
| INMEMORY_DISTRIBUTE | VARCHAR2(15)  | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>• AUTO</li> <li>• BY ROWID RANGE</li> <li>• BY PARTITION</li> <li>• BY SUBPARTITION</li> </ul>                                                                       |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_DUPLICATE    | VARCHAR2(13)  | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> <li>• NO DUPLICATE</li> <li>• DUPLICATE</li> <li>• DUPLICATE ALL</li> </ul>                                                                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION  | VARCHAR2(17)  | Compression level for the IM column store: <ul style="list-style-type: none"> <li>• NO MEMCOMPRESS</li> <li>• FOR DML</li> <li>• FOR QUERY [ LOW   HIGH ]</li> <li>• FOR CAPACITY [ LOW   HIGH ]</li> <li>• AUTO</li> </ul>                                                                                                                                                                                                                                                            |
| INMEMORY_SERVICE      | VARCHAR2(12)  | Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none"> <li>• DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior</li> <li>• NONE: Do not populate on any instance</li> <li>• ALL: Populate on all instances</li> <li>• USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.</li> </ul>       |
| INMEMORY_SERVICE_NAME | VARCHAR2(129) | Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.                                                                                                                                                                                                                                                                                                 |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.4 V\$INDEX\_USAGE\_INFO

V\$INDEX\_USAGE\_INFO keeps track of index usage since the last flush. A flush occurs every 15 minutes. After each flush, ACTIVE\_ELEM\_COUNT is reset to 0 and LAST\_FLUSH\_TIME is updated to the current time.

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDEX_STATS_ENABLED         | NUMBER        | Indicates whether the index usage statistics are enabled. Possible values: <ul style="list-style-type: none"> <li>0: Index statistics are disabled</li> <li>1: Index statistics are enabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| INDEX_STATS_COLLECTION_TYPE | NUMBER        | Indicates the type of collection used for the index usage statistics. Possible values: <ul style="list-style-type: none"> <li>0: Indicates the ALL collection type. With this type of collection, the statistics are collected for each execution that has index access. Selecting this statistics collection type may have some impact on performance.</li> <li>1: Indicates the SAMPLED collection type. With this type of collection, the statistics are collected based on sampling (only a few of the executions are considered when collecting the statistics). This is the default statistics collection type.</li> </ul> <p>Index statistics collected with the SAMPLED collection type are less accurate than index statistics collected with the ALL collection type.</p> |
| ACTIVE_ELEM_COUNT           | NUMBER        | The number of active indexes since the last flush                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ALLOC_ELEM_COUNT            | NUMBER        | The number of index entries allocated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_ELEM_COUNT              | NUMBER        | The maximum number of active indexes that can be tracked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FLUSH_COUNT                 | NUMBER        | Number of successful flushes since the database started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_FLUSH_DURATION        | NUMBER        | Cumulative elapsed time taken to complete the index usage statistics flush since the database start                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LAST_FLUSH_TIME             | TIMESTAMP(3)  | The time of the last flush                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATUS_MSG                  | VARCHAR2(256) | Status messages, if any. Flush errors are reported here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                       |

## 9.5 V\$INDEXED\_FIXED\_COLUMN

V\$INDEXED\_FIXED\_COLUMN displays the columns in dynamic performance tables that are indexed (X\$ tables).

The X\$ tables can change without notice. Use this view only to write queries against fixed views (V\$ views) more efficiently.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_NAME      | VARCHAR2(128) | Name of the dynamic performance table that is indexed                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INDEX_NUMBER    | NUMBER        | Number that distinguishes to which index a column belongs                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COLUMN_NAME     | VARCHAR2(128) | Name of the column that is being indexed                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| COLUMN_POSITION | NUMBER        | Position of the column in the index key (this is mostly relevant for multicolumn indexes)                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.6 V\$INMEMORY\_AREA

V\$INMEMORY\_AREA contains information on the space allocation inside the In-Memory area.

The In-Memory area is sub-divided into two pools: a 1MB pool used to store the actual column formatted data populated into memory, and a 64K pool used to store metadata about the objects that are populated into the In-Memory Column Store (IM column store). The amount of available memory in each pool is visible in the V\$INMEMORY\_AREA view. The relative size of the two pools is determined by internal heuristics. The majority of the In-Memory area memory is allocated to the 1MB pool.

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL            | VARCHAR2(26) | Name of the pools in the In-Memory area                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ALLOC_BYTES     | NUMBER       | Total amount of memory allocated to this pool                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| USED_BYTES      | NUMBER       | Amount of memory currently used in this pool                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| POPULATE_STATUS | VARCHAR2(26) | Shows the status of the IM column store, for example, whether it is currently being populated or if it is done                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.7 V\$INMEMORY\_FASTSTART\_AREA

V\$INMEMORY\_FASTSTART\_AREA provides information about the In-Memory FastStart (IM FastStart) area.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                       |
| TABSPACE_NAME        | VARCHAR2(128) | IM FastStart tablespace name. When IM FastStart is not enabled, the value of TABSPACE_NAME is INVALID_TABLESPACE and the value of STATUS is DISABLE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATUS               | VARCHAR2(10)  | IM FastStart status. Possible values include: <ul style="list-style-type: none"> <li>• ENABLE: An IM FastStart tablespace has been specified and the content of the IM column is being periodically checkpointed to disk.</li> <li>• ENABLING: An IM FastStart tablespace has been specified and the database is creating the IM FastStart area.</li> <li>• DISABLE: An IM FastStart tablespace has not been specified. This is the default.</li> <li>• MIGRATING: A user has requested the IM FastStart area be migrated from one tablespace to another.</li> <li>• DISABLING: A user has requested IM FastStart to be disabled.</li> </ul> |
| ALLOCATED_SIZE       | NUMBER        | The allocated size of an IM FastStart tablespace in bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| USED_SIZE            | NUMBER        | The currently used size of an IM FastStart area (in bytes) within the tablespace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_CHECKPOINT_TIME | TIMESTAMP(6)  | The time when the last IMCU was checkpointed to the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_POPULATE_TIME   | TIMESTAMP(6)  | The time of the last population from the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NUM_DEFERRED_WRITES  | NUMBER        | The number of pending deferred writes to the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 9.8 V\$INSTANCE

V\$INSTANCE displays the state of the current instance.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                             |
|------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER  | NUMBER       | Instance number used for instance registration (corresponds to the INSTANCE_NUMBER initialization parameter)<br><b>See Also:</b> " <a href="#">INSTANCE_NUMBER</a> "                                                                                                                                    |
| INSTANCE_NAME    | VARCHAR2(16) | Name of the instance                                                                                                                                                                                                                                                                                    |
| HOST_NAME        | VARCHAR2(64) | Name of the host machine                                                                                                                                                                                                                                                                                |
| VERSION          | VARCHAR2(17) | Database version                                                                                                                                                                                                                                                                                        |
| VERSION_LEGACY   | VARCHAR2(17) | The legacy database version used before Oracle Database 18c. This column displays the same value as the VERSION column                                                                                                                                                                                  |
| VERSION_FULL     | VARCHAR2(17) | The version string with the new Oracle Database version scheme introduced in Oracle Database 18c.                                                                                                                                                                                                       |
| STARTUP_TIME     | DATE         | Time when the instance was started                                                                                                                                                                                                                                                                      |
| STATUS           | VARCHAR2(12) | Status of the instance: <ul style="list-style-type: none"> <li>STARTED - After STARTUP NOMOUNT</li> <li>MOUNTED - After STARTUP MOUNT or ALTER DATABASE CLOSE</li> <li>OPEN - After STARTUP or ALTER DATABASE OPEN</li> <li>OPEN MIGRATE - After ALTER DATABASE OPEN { UPGRADE   DOWNGRADE }</li> </ul> |
| PARALLEL         | VARCHAR2(3)  | Indicates whether the instance is mounted in cluster database mode (YES) or not (NO)                                                                                                                                                                                                                    |
| THREAD#          | NUMBER       | Redo thread opened by the instance                                                                                                                                                                                                                                                                      |
| ARCHIVER         | VARCHAR2(7)  | Automatic archiving status: <ul style="list-style-type: none"> <li>STOPPED</li> <li>STARTED</li> <li>FAILED - Archiver failed to archive a log last time but will try again within 5 minutes</li> </ul>                                                                                                 |
| LOG_SWITCH_WAIT  | VARCHAR2(15) | Event that log switching is waiting for: <ul style="list-style-type: none"> <li>ARCHIVE LOG</li> <li>CLEAR LOG</li> <li>CHECKPOINT</li> <li>NULL - ALTER SYSTEM SWITCH LOGFILE is hung but there is room in the current online redo log</li> </ul>                                                      |
| LOGINS           | VARCHAR2(10) | Indicates whether the instance is in unrestricted mode, allowing logins by all users (ALLOWED), or in restricted mode, allowing logins by database administrators only (RESTRICTED)                                                                                                                     |
| SHUTDOWN_PENDING | VARCHAR2(3)  | Indicates whether a shutdown is pending (YES) or not (NO)                                                                                                                                                                                                                                               |
| DATABASE_STATUS  | VARCHAR2(17) | Status of the database: <ul style="list-style-type: none"> <li>ACTIVE</li> <li>SUSPENDED</li> <li>INSTANCE RECOVERY</li> </ul>                                                                                                                                                                          |
| INSTANCE_ROLE    | VARCHAR2(18) | Indicates whether the instance is an active instance (PRIMARY_INSTANCE) or an inactive secondary instance (SECONDARY_INSTANCE), or UNKNOWN if the instance has been started but not mounted                                                                                                             |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVE_STATE  | VARCHAR2(9)  | <p>Quiesce state of the instance:</p> <ul style="list-style-type: none"> <li>NORMAL - Database is in a normal state.</li> <li>QUIESCING - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no new user transactions, queries, or PL/SQL statements are processed in this instance. User transactions, queries, or PL/SQL statements issued before the ALTER SYSTEM QUIESCE RESTRICTED statement are unaffected. DBA transactions, queries, or PL/SQL statements are also unaffected.</li> <li>QUIESCED - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no user transactions, queries, or PL/SQL statements are processed. DBA transactions, queries, or PL/SQL statements are unaffected. User transactions, queries, or PL/SQL statements issued after the ALTER SYSTEM QUIESCE RESTRICTED statement are not processed.</li> </ul> <p>A single ALTER SYSTEM QUIESCE RESTRICTED statement quiesces all instances in an Oracle RAC environment. After this statement has been issued, some instances may enter into a quiesced state before other instances; the system is quiesced when all instances enter the quiesced state.</p> |
| BLOCKED       | VARCHAR2(3)  | Indicates whether all services are blocked (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 9.9 V\$INSTANCE\_CACHE\_TRANSFER

V\$INSTANCE\_CACHE\_TRANSFER displays statistics for the cache blocks transferred among instances.

Oracle keeps multiple versions of data buffered in the buffer cache. The current buffer (or block), CURRENT\_BLOCK, is the most up-to-date copy, containing all recent modifications. A consistent read buffer (or block), CR\_BLOCK, contains the version of the data at a particular time prior to the current buffer. It is read-consistent (that is, all the data shown in that buffer are consistent for the start time of a query).

Therefore, for the same data block there can be multiple copies in the buffer cache: one current copy, and one or more consistent read copies with data consistent as of different snapshot times.

| Column                    | Datatype     | Description                                                                                                                                                   |
|---------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE                  | NUMBER       | Instance from which the blocks are transferred                                                                                                                |
| CLASS                     | VARCHAR2(18) | Class of the cache block                                                                                                                                      |
| LOST                      | NUMBER       | The number of blocks that were sent by a particular instance but that never arrived in this instance                                                          |

| CURRENT_BUSY_TIME              | NUMBER   | The time waited for current blocks which were received by this instance from a particular instance and which were delayed by a log flushed on the sending instance                                                                                                                                                                                                                                                                                    |
| CURRENT_CONGESTED              | NUMBER   | Current block transfers affected by remote system load                                                                                                                                                                                                                                                                                                                                                                                                |
| CURRENT_CONGESTED_TIME         | NUMBER   | The time waited for current blocks which were received by this instance from a particular instance and which were delayed because LMS was busy                                                                                                                                                                                                                                                                                                        |
| CON_ID                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 9.10 V\$INSTANCE\_PING

V\$INSTANCE\_PING provides information about measured latency of the interconnect for all instances in an Oracle Real Application Clusters (Oracle RAC) environment.

In an Oracle RAC environment, every few seconds the PING process of each instance checks the response of the interconnect to all instances of the same database.

It sends two messages. One message is 500 bytes in size (referred to in the column descriptions as 500B), and the other is 8 kilobytes in size (referred to in column descriptions as 8K).

For each message sent to each instance, the amount of time it took to get a response back is measured (in microseconds). The view records the latest measurements as well as cumulative data since instance startup.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                    |
|------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE               | NUMBER   | The instance communicated with. In the V\$ view for each instance, there is one row for that instance, and in the GV\$ view for each instance, there is also one row for that instance, so there are $n^2$ rows for $n$ instances.                                             |
| CURRENT_500B           | NUMBER   | The latest response time for the 500B message (in microseconds)                                                                                                                                                                                                                |
| AVERAGE_500B           | NUMBER   | The average response time for the 500B messages since instance startup (in microseconds). Note that AVERAGE_500B should be the same as WAIT_TIME_500B/COUNT_500B.                                                                                                              |
| MAX_500B               | NUMBER   | The maximal response time for the 500B messages since instance startup (in microseconds)                                                                                                                                                                                       |
| COUNT_500B             | NUMBER   | The number of measurements for the 500B messages since instance startup                                                                                                                                                                                                        |
| WAIT_TIME_500B         | NUMBER   | The sum of all response times for the 500B messages since instance startup (in microseconds)                                                                                                                                                                                   |
| WAIT_TIME_SQUARED_500B | NUMBER   | The sum of the response time squared for 500B messages since instance startup. The unit is in microseconds squared and divided by 1000.                                                                                                                                        |
| CURRENT_8K             | NUMBER   | The latest response time for the 8K message (in microseconds)                                                                                                                                                                                                                  |
| AVERAGE_8K             | NUMBER   | The average response time for the 8K messages since instance startup (in microseconds). Note that AVERAGE_8K should be the same as WAIT_TIME_8K/COUNT_8K.                                                                                                                      |
| MAX_8K                 | NUMBER   | The maximal response time for the 8K messages since instance startup (in microseconds)                                                                                                                                                                                         |
| COUNT_8K               | NUMBER   | The number of measurements for the 8K messages since instance startup                                                                                                                                                                                                          |
| WAIT_TIME_8K           | NUMBER   | The sum of all response times for the 8K messages since instance startup (in microseconds)                                                                                                                                                                                     |
| WAIT_TIME_SQUARED_8K   | NUMBER   | The sum of the response time squared for 8K messages since instance startup. The unit is in microseconds squared and divided by 16.                                                                                                                                            |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. For this view, the possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> </ul> |

## 9.11 V\$INSTANCE\_RECOVERY

V\$INSTANCE\_RECOVERY monitors the mechanisms available to users to limit recovery I/O. Those mechanisms are:

- Set the LOG\_CHECKPOINT\_TIMEOUT initialization parameter
- Set the LOG\_CHECKPOINT\_INTERVAL initialization parameter
- Set the FAST\_START\_MTTR\_TARGET initialization parameter
- Set the size of the smallest redo log

| Column                 | Datatype | Description                                                |
|------------------------|----------|------------------------------------------------------------|
| RECOVERY_ESTIMATED_IOS | NUMBER   | Number of dirty buffers in the buffer cache.               |
| ACTUAL_REDO_BLKs       | NUMBER   | Current actual number of redo blocks required for recovery |

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TARGET_REDO_BKLS               | NUMBER   | Current target number of redo blocks that must be processed for recovery. This value is the minimum value of the following 3 columns, and identifies which of the 3 user-defined limits determines checkpointing.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LOG_FILE_SIZE_REDO_BKLS        | NUMBER   | Maximum number of redo blocks required to guarantee that a log switch does not occur before the checkpoint completes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LOG_CHKPT_TIMEOUT_REDO_BKLS    | NUMBER   | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_TIMEOUT parameter. The value displayed is not meaningful unless that parameter has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LOG_CHKPT_INTERVAL_REDO_BKLS   | NUMBER   | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_INTERVAL parameter. The value displayed is not meaningful unless that parameter has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FAST_START_IO_TARGET_REDO_BKLS | NUMBER   | This column is obsolete and maintained for backward compatibility. The value of this column is always null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TARGET_MTTR                    | NUMBER   | Effective MTTR (mean time to recover) target value in seconds. The TARGET_MTTR value is calculated based on the value of the FAST_START_MTTR_TARGET parameter (the TARGET_MTTR value is used internally), and is usually an approximation of the parameter's value. However, if the FAST_START_MTTR_TARGET parameter value is very small (for example, one second), or very large (for example, 3600 seconds), the calculation will produce a target value dictated by system limitations. In such cases, the TARGET_MTTR value will be the shortest calculated time, or the longest calculated time that recovery is expected to take. |
| ESTIMATED_MTTR                 | NUMBER   | Current estimated mean time to recover (MTTR) based on the number of dirty buffers and log blocks. Basically, this value tells you how long you could expect recovery to take based on the work your system is doing right now.                                                                                                                                                                                                                                                                                                                                                                                                         |
| CKPT_BLOCK_WRITES              | NUMBER   | Number of blocks written by checkpoint writes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIMAL_LOGFILE_SIZE           | NUMBER   | Redo log file size (in megabytes) that is considered optimal based on the current setting of FAST_START_MTTR_TARGET. It is recommended that the user configure all online redo logs to be at least this value. Note that redo log files must be at least 4 megabytes in size; otherwise an error is generated.                                                                                                                                                                                                                                                                                                                          |
| ESTD_CLUSTER_AVAILABLE_TIME    | NUMBER   | Estimated time (in seconds) that the cluster would become partially available should this instance fail. This column is only meaningful in an Oracle Real Application Clusters (Oracle RAC) environment. In a non-Oracle RAC environment, the value of this column is null.                                                                                                                                                                                                                                                                                                                                                             |
| WRITES_MTTR                    | NUMBER   | Number of writes driven by the FAST_START_MTTR_TARGET initialization parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRITES_LOGFILE_SIZE            | NUMBER   | Number of writes driven by the smallest redo log file size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WRITES_LOG_CHECKPOINT_SETTINGS | NUMBER   | Number of writes driven by the LOG_CHECKPOINT_INTERVAL or LOG_CHECKPOINT_TIMEOUT initialization parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WRITES_OTHER_SETTINGS          | NUMBER   | Number of writes driven by other reasons (such as the deprecated FAST_START_IO_TARGET initialization parameter)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRITES_AUTOTUNE                | NUMBER   | Number of writes due to auto-tune checkpointing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRITES_FULL_THREAD_CKPT        | NUMBER   | Number of writes due to full thread checkpoints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.12 V\$IO\_CALIBRATION\_STATUS

V\$IO\_CALIBRATION\_STATUS displays the status of I/O calibration in the instance.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS           | VARCHAR2(13) | <p>Calibration status:</p> <ul style="list-style-type: none"> <li>IN PROGRESS - Calibration in Progress (Results from a previous calibration run are displayed, if available)</li> <li>READY Results are ready and available from an earlier run</li> <li>NOT AVAILABLE Calibration results are not available</li> </ul>                                                                                                                               |
| CALIBRATION_TIME | TIMESTAMP(3) | End time of the last calibration run                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.13 V\$IO\_OUTLIER

V\$IO\_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there any occasional delays in serving disk I/O requests by the storage subsystem.

| Column        | Datatype      | Description                                                             |
|---------------|---------------|-------------------------------------------------------------------------|
| FUNCTION_NAME | VARCHAR2(18)  | I/O function name of the delayed I/O                                    |
| IO_SIZE       | NUMBER        | Size of the I/O in bytes                                                |
| WAIT_EVENT    | VARCHAR2(64)  | Wait event name that was used to track the I/O                          |
| FILE_NAME     | VARCHAR2(513) | Name of the file to which the I/O was targeted                          |
| IO_LATENCY    | NUMBER        | Time taken to complete the I/O (in milliseconds)                        |
| DISK1_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the first disk to which the I/O was issued  |
| DISK1_LATENCY | NUMBER        | Latency seen on the first disk (in milliseconds)                        |
| DISK2_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the second disk to which the I/O was issued |

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISK2_LATENCY | NUMBER        | Latency seen on the second disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| DISK3_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the third disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                          |
| DISK3_LATENCY | NUMBER        | Latency seen on the third disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.14 V\$IOFNCMETRIC

V\$IOFNCMETRIC displays I/O statistics information by database function for the most recent time interval period.

| Column           | Datatype     | Description                               |
|------------------|--------------|-------------------------------------------|
| BEGIN_TIME       | DATE         | Begin time of the interval                |
| END_TIME         | DATE         | End time of the interval                  |
| INTSIZE_CSEC     | NUMBER       | Interval size (in hundredths of a second) |
| FUNCTION_ID      | NUMBER       | Function ID                               |
| FUNCTION_NAME    | VARCHAR2(18) | Function name                             |
| SMALL_READ_MBPS  | NUMBER       | Single block megabytes read per second    |
| SMALL_WRITE_MBPS | NUMBER       | Single block megabytes written per second |
| LARGE_READ_MBPS  | NUMBER       | Multiblock megabytes read per second      |
| LARGE_WRITE_MBPS | NUMBER       | Multiblock megabytes written per second   |
| SMALL_READ_IOPS  | NUMBER       | Single block read requests per second     |
| SMALL_WRITE_IOPS | NUMBER       | Single block write requests per second    |
| LARGE_READ_IOPS  | NUMBER       | Multiblock read requests per second       |
| LARGE_WRITE_IOPS | NUMBER       | Multiblock write requests per second      |
| AVG_WAIT_TIME    | NUMBER       | Average wait time (in milliseconds)       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.15 V\$IOFUNCMETRIC\_HISTORY

V\$IOFUNCMETRIC\_HISTORY displays a recent history of the I/O statistics information by database function for the most recent time interval period.

The columns for V\$IOFUNCMETRIC\_HISTORY are the same as those for V\$IOFUNCMETRIC.

### ① See Also

["V\\$IOFUNCMETRIC"](#)

## 9.16 V\$IOS\_CLIENT

V\$IOS\_CLIENT provides more information about IO Server clients.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_ID     | NUMBER       | The unique ID for this client instance                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLUSTER_ID    | VARCHAR2(33) | The GUID of the cluster where the client instance is running                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CLUSTER_NAME  | VARCHAR2(16) | <p>When the query is executed on an Oracle IO Server (IOS) instance, this column shows the name of the cluster where the client (database) instance is running.</p> <p>When the query is executed on a database instance, this column shows the name of the cluster where the IOS instance that the database is connected to is running.</p>                                                                                                                                            |
| NODE          | NUMBER       | Number of the node within the cluster where the client instance is running                                                                                                                                                                                                                                                                                                                                                                                                              |
| INSTANCE_NAME | VARCHAR2(64) | Instance name of the database client instance                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DB_NAME       | VARCHAR2(64) | Database name of the database client instance                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID        | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 9.17 V\$IOSTAT\_CONSUMER\_GROUP

V\$IOSTAT\_CONSUMER\_GROUP displays disk I/O statistics for consumer groups.

If the resource manager is enabled, then I/O statistics for all consumer groups that are part of the currently enabled resource plan are captured.

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| WAIT_TIME             | NUMBER   | Total wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.18 V\$IOSTAT\_FILE

V\$IOSTAT\_FILE displays information about disk I/O statistics of database files (including data files, temp files, and other types of database files).

I/O statistics for Data files and Temp files are provided for each file. All other file types (for example, control files, log files, archive logs, and so on) have their statistics consolidated into one entry in the view.

| Column        | Datatype     | Description                                                                                                                                       |
|---------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NO       | NUMBER       | File identification number                                                                                                                        |
| FILETYPE_ID   | NUMBER       | Type of file (for example, log file, data file, and so on)                                                                                        |
| FILETYPE_NAME | VARCHAR2(28) | Name of the file, in the case of a data file or temp file. For all other files, a corresponding string to be displayed (for example, ARCHIVELOG). |

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| LARGE_WRITE_SERVICETIME | NUMBER       | Total service time (in milliseconds) for multiblock write requests                                                                                                                                                                                                                                                                                                                                                                              |
| ASYNCH_IO               | VARCHAR2(9)  | Indicates whether asynchronous I/O is available for the file (ASYNC_ON) or not (ASYNC_OFF)                                                                                                                                                                                                                                                                                                                                                      |
| ACCESS_METHOD           | VARCHAR2(11) | I/O library used to access the file. Possible values include: <ul style="list-style-type: none"> <li>OS_LIB - Operating system calls are used to access the file</li> <li>ODM_LIB - Oracle Disk Manager library is used to access the file</li> <li>ASM_MANAGED - The file is managed and accessed through ASM</li> <li>DNFS_LIB - The file is accessed through Direct NFS library</li> </ul>                                                   |
| RETRIES_ON_ERROR        | NUMBER       | Number of read retries on error                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.19 V\$IOSTAT\_FUNCTION

V\$IOSTAT\_FUNCTION displays disk I/O statistics for database functions (such as the LGWR and DBWR).

| Column      | Datatype | Description |
|-------------|----------|-------------|
| FUNCTION_ID | NUMBER   | Function ID |

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.20 V\$IOSTAT\_FUNCTION\_DETAIL

V\$IOSTAT\_FUNCTION\_DETAIL displays disk I/O statistics for database functions (such as the LGWR and DBWR), broken down by file type.

| Column      | Datatype | Description |
|-------------|----------|-------------|
| FUNCTION_ID | NUMBER   | Function ID |

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 9.21 V\$IOSTAT\_NETWORK

V\$IOSTAT\_NETWORK displays information about network I/O statistics that were caused by accessing files on a remote database instance.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT         | VARCHAR2(32) | Database client name initiating the network I/O (for example, RMAN or PL/SQL)                                                                                                                                                                                                                                                                                                                                                                   |
| READS#         | NUMBER       | Number of read operations issued                                                                                                                                                                                                                                                                                                                                                                                                                |
| WRITES#        | NUMBER       | Number of write operations issued                                                                                                                                                                                                                                                                                                                                                                                                               |
| KBYTES_READ    | NUMBER       | Total number of kilobytes read                                                                                                                                                                                                                                                                                                                                                                                                                  |
| KBYTES_WRITTEN | NUMBER       | Total number of kilobytes written                                                                                                                                                                                                                                                                                                                                                                                                               |
| READ_LATENCY   | NUMBER       | Total read wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRITE_LATENCY  | NUMBER       | Total write wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.22 V\$IP\_ACL

V\$IP\_ACL provides information about access control to database services from network hosts.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME | VARCHAR2(512) | The database service name                                                                                                                                                                                                                                                                                                                                                                                                                      |
| HOST         | VARCHAR2(64)  | The host being granted access to the SERVICE_NAME. The host can be a hostname, dotted-decimal IPv4 or heximal IPv6 address. Wildcard "*" for IPv4 and Classless Inter-Domain Routing (CIDR) format is allowed.                                                                                                                                                                                                                                 |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs</li> <li>1: This value is used for rows containing data that pertain only to the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.23 V\$JAVA\_LIBRARY\_CACHE\_MEMORY

V\$JAVA\_LIBRARY\_CACHE\_MEMORY displays information about memory allocated to library cache memory objects in different namespaces for Java objects.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

| Column                     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LC_NAMESPACE               | VARCHAR2(15) | Library cache namespace                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LC_INUSE_MEMORY_OBJECTS    | NUMBER       | Number of library cache memory objects currently in use in the Java pool                                                                                                                                                                                                                                                                                                                                                                        |
| LC_INUSE_MEMORY_SIZE       | NUMBER       | Total size of library cache in-use memory objects (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                |
| LC_FREEABLE_MEMORY_OBJECTS | NUMBER       | Number of freeable library cache memory objects in the Java pool                                                                                                                                                                                                                                                                                                                                                                                |
| LC_FREEABLE_MEMORY_SIZE    | NUMBER       | Size of library cache freeable memory objects (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                     | NUMBER       | The ID of the container to which the data pertains. ## 9.24 V\$JAVA\_POOL\_ADVICE

V\$JAVA\_POOL\_ADVICE displays information about estimated parse time in the Java pool for different pool sizes.

The sizes range from 10% of the current Java pool size or the amount of pinned Java library cache memory (whichever is higher) to 200% of the current Java pool size, in equal intervals. The value of the interval depends on the current size of the Java pool.

Parse time saved refers to the amount of time saved by keeping library cache memory objects in the Java pool, as opposed to having to reload these objects.

| Column                      | Datatype | Description                                                                                                                                                                                                                                                                                                         |
|-----------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JAVA_POOL_SIZE_FOR_ESTIMATE | NUMBER   | Java pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                      |
| JAVA_POOL_SIZE_FACTOR       | NUMBER   | Size factor with respect to the current Java pool size                                                                                                                                                                                                                                                              |
| ESTD_LC_SIZE                | NUMBER   | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                         |
| ESTD_LC_MEMORY_OBJECTS      | NUMBER   | Estimated number of library cache memory objects in the Java pool of the specified size                                                                                                                                                                                                                             |
| ESTD_LC_TIME_SAVED          | NUMBER   | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a Java pool of the specified size. This is the time that would have been spent in reloading the required objects in the Java pool had they been aged out due to insufficient amount of available free memory. |
| ESTD_LC_TIME_SAVED_FACTOR   | NUMBER   | Estimated parse time saved factor with respect to the current Java pool size                                                                                                                                                                                                                                        |
| ESTD_LC_LOAD_TIME           | NUMBER   | Estimated elapsed time (in seconds) for parsing in a Java pool of the specified size                                                                                                                                                                                                                                |
| ESTD_LC_LOAD_TIME_FACTOR    | NUMBER   | Estimated load time factor with respect to the current Java pool size                                                                                                                                                                                                                                               |
| ESTD_LC_MEMORY_OBJECT_HITS  | NUMBER   | Estimated number of times a library cache memory object was found in a Java pool of the specified size                                                                                                                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.25 V\$KERNEL\_IO\_OUTLIER

V\$KERNEL\_IO\_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete.

Use this view to see the individual kernel components of I/Os for which there are any occasional delays in serving disk I/O requests by the storage subsystem.

### Note

Although this view exists on all platforms in Oracle Database 12c, it is only populated on the Solaris platform.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIMESTAMP            | NUMBER        | Number of seconds elapsed since 00:00 UTC, January 1, 1970                                                                                                                                                                                                                                                                                                                                                                                             |
| IO_SIZE              | NUMBER        | Size of the I/O, in KB.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IO_OFFSET            | NUMBER        | Offset into the device of the I/O                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DEVICE_NAME          | VARCHAR2(513) | Name of the device to which the I/O was targeted                                                                                                                                                                                                                                                                                                                                                                                                       |
| PROCESS_NAME         | VARCHAR2(64)  | Name of the process that issued the I/O                                                                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_LATENCY        | NUMBER        | Total time the I/O spent in the kernel (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| SETUP_LATENCY        | NUMBER        | Time spent during initial I/O setup before sending to SCSI target device driver (in milliseconds)                                                                                                                                                                                                                                                                                                                                                      |
| QUEUE_TO_HBA_LATENCY | NUMBER        | Time spent in the SCSI target device driver before being sent to the Host Bus Adaptor (in milliseconds)                                                                                                                                                                                                                                                                                                                                                |
| TRANSFER_LATENCY     | NUMBER        | Time spent in the Host Bus Adaptor and physically transferring the I/O to the storage device (in milliseconds)                                                                                                                                                                                                                                                                                                                                         |
| CLEANUP_LATENCY      | NUMBER        | Time spent freeing resources used by the completed I/O (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                               |
| PID                  | NUMBER        | Process ID that issued the I/O                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID               | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.26 V\$KEY\_VECTOR

V\$KEY\_VECTOR provides debugging information related to the data structures used by in-memory aggregation for current and recent queries using key vectors.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| PROCESS        | VARCHAR2(64) | Operating system client process ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATE          | VARCHAR2(9)  | State of the in-memory aggregation operation: <ul style="list-style-type: none"><li>• BYPASS<br/>Refers to key vectors that are currently in use by queries that have undergone the vector transform.</li><li>• BYPASSED<br/>This is a historical entry for key vectors whose queries have already finished.</li><li>• FINISHED<br/>This is a historical entry for key vectors whose queries have already finished.</li><li>• RUNNING<br/>Refers to key vectors that are currently in use by queries that have undergone the vector transform.</li></ul> One query will probably have multiple key vectors if it has gone through the vector transform.<br>Also, if the query is operating in parallel, there may be multiple entries per PQ worker.<br>The PROCESS column can be joined to V\$SESSION to differentiate these cases. |

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE                | VARCHAR2(9)   | Type of translation vector created: <ul style="list-style-type: none"> <li>• DOUBLEIND</li> <li>• PAGED</li> <li>• SIMPLE</li> <li>• INDIRECT</li> <li>• HASH</li> <li>• OFFSET</li> </ul>                                                                                                                                                                                                                                                                  |
| WIDTH               | NUMBER        | Width (number of bits) of DOUBLEIND, SIMPLE, INDIRECT, or OFFSETvector translation array: <ul style="list-style-type: none"> <li>• 1</li> <li>• 4</li> <li>• 8</li> <li>• 16</li> <li>• 32</li> </ul>                                                                                                                                                                                                                                                       |
| KEY_DATA_TYPE       | VARCHAR2(13)  | The internal join column key data type of either DOUBLEIND, SIMPLE, INDIRECT, or OFFSET translation vectors: <ul style="list-style-type: none"> <li>• BINARY</li> <li>• BINARY_FLOAT</li> <li>• NUMBER</li> <li>• PACKED_BINARY</li> <li>• PACKED_DATE</li> <li>• PACKED_NUMBER</li> </ul> Also, a value of NULL is displayed for HASH translation vectors with non-numeric data types and for HASH translation vectors with more than one join key column. |
| JOIN_COLUMN_COUNT   | NUMBER        | Number of join columns. PAGED and HASHED are the only types which can have greater than one join column.                                                                                                                                                                                                                                                                                                                                                    |
| JOIN_KEY_COUNT      | NUMBER        | Number of join key values used to build translation vector                                                                                                                                                                                                                                                                                                                                                                                                  |
| DUP_JOIN_KEY_COUNT  | NUMBER        | Indicates the number of key values in the key vector that have more than one parent value                                                                                                                                                                                                                                                                                                                                                                   |
| MIN_JOIN_KEY        | NUMBER        | Min join key value in translation vector                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAX_JOIN_KEY        | NUMBER        | Max join key value in translation vector                                                                                                                                                                                                                                                                                                                                                                                                                    |
| GROUP_KEY_COUNT     | NUMBER        | Max dense grouping key value. This value is computed while the data that creates the translation vector is processed.                                                                                                                                                                                                                                                                                                                                       |
| FILTERED            | NUMBER        | Number of rows filtered by translation vector                                                                                                                                                                                                                                                                                                                                                                                                               |
| PROBED              | NUMBER        | Number of rows that probed the translation vector in key vector use row source                                                                                                                                                                                                                                                                                                                                                                              |
| ACTIVE              | NUMBER        | Number of active translation vectors used as filters across all workers                                                                                                                                                                                                                                                                                                                                                                                     |
| DISABLED            | NUMBER        | Number of translation vector filters across all workers that were disabled                                                                                                                                                                                                                                                                                                                                                                                  |
| MEMORY_ALLOCATED    | NUMBER        | Amount of memory allocated for the key vector                                                                                                                                                                                                                                                                                                                                                                                                               |
| JOIN_STRUCTURE_SIZE | NUMBER        | Amount of memory used out of the allocated space                                                                                                                                                                                                                                                                                                                                                                                                            |
| FACT_OWNER          | VARCHAR2(128) | The owner of the fact table. Null when the fact table is null.                                                                                                                                                                                                                                                                                                                                                                                              |
| FACT_NAME           | VARCHAR2(128) | The table that contains measure data. May be null if more than one fact table is used in the query.                                                                                                                                                                                                                                                                                                                                                         |
| DIMENSION_OWNER     | VARCHAR2(128) | When a single table is used to construct the key vector, the table owner will appear in this column. If multiple tables are joined to serve as the dimension (more of a snowflake than a star schema shape, for one example), then this column will be null.                                                                                                                                                                                                |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIMENSION_NAME       | VARCHAR2(128) | The table that contains attribute data and is joined to the fact table. May be null if two or more tables are used (for example, snowflake style dimension tables).                                                                                                                                                                                                                                                                                                                                                                                      |
| CREATION_DURATION    | NUMBER        | Records the total time in seconds that it took to create the key vector                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PAYLOAD_COLUMN_COUNT | NUMBER        | The number of columns being carried from the dimension table to the fact table scan for processing without joinback                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OFFLOADED            | VARCHAR2(10)  | Indicates whether and how the key vector has been sent to an Exadata cell. Possible values: <ul style="list-style-type: none"><li>• NO: The key vector has not been sent to an Exadata cell.</li><li>• YES: The key vector was fully sent to an Exadata cell.</li><li>• COMPRESSED: The key vector was fully sent to an Exadata cell and was compressed.</li><li>• EFILTER: The key vector could not be sent to an Exadata cell due to the size of another constraint. Instead, a bloom filter-like data structure was sent to aid filtration.</li></ul> |
| COMPRESSED_SIZE      | NUMBER        | If the value of OFFLOADED is COMPRESSED, then this column displays the compressed size of metadata transmitted to the Exadata cell (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                            |
| EFILTER_SIZE         | NUMBER        | If the value of OFFLOADED is EFILTER, then this column displays the size of the data structure sent to the Exadata cell (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 9.27 V\$LATCH

V\$LATCH displays aggregate latch statistics for both parent and child latches, grouped by latch name.

Individual parent and child latch statistics are broken down in the views V\$LATCH\_PARENT and V\$LATCH\_CHILDREN.

| Column         | Datatype     | Description                                                                                                |
|----------------|--------------|------------------------------------------------------------------------------------------------------------|
| ADDR           | RAW(4   8)   | Address of the latch object                                                                                |
| LATCH#         | NUMBER       | Latch number                                                                                               |
| LEVEL#         | NUMBER       | Latch level                                                                                                |
| NAME           | VARCHAR2(64) | Latch name                                                                                                 |
| HASH           | NUMBER       | Latch hash                                                                                                 |
| GETS           | NUMBER       | Number of times the latch was requested in willing-to-wait mode                                            |
| MISSES         | NUMBER       | Number of times the latch was requested in willing-to-wait mode and the requester had to wait              |
| SLEEPS         | NUMBER       | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch |
| IMMEDIATE_GETS | NUMBER       | Number of times a latch was requested in no-wait mode                                                      |

| Column                                             | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMMEDIATE_MISSES                                   | NUMBER   | Number of times a no-wait latch request did not succeed (that is, missed)                                                                                                                                                                                                                                                                                                                                                                       |
| WAITERS_WOKEN                                      | NUMBER   | This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.                                                                                                                                                                                                                                                            |
| WAITS_HOLDING_LATCH                                | NUMBER   | This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.                                                                                                                                                                                                                                                            |
| SPIN_GETS                                          | NUMBER   | Willing-to-wait latch requests which missed the first try but succeeded while spinning                                                                                                                                                                                                                                                                                                                                                          |
| SLEEP[1   2   3   4   5   6   7   8   9   10   11] | NUMBER   | These columns have been deprecated and are present only for compatibility with previous releases of Oracle. No data is accumulated for these columns; they will always have a value of zero. As a substitute for these columns you can query the appropriate rows of the V\$EVENT_HISTOGRAM view where the EVENT column has a value of latch free or latch: %.                                                                                  |
| WAIT_TIME                                          | NUMBER   | Elapsed time spent waiting for the latch (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                                             | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.28 V\$LATCH\_CHILDREN

V\$LATCH\_CHILDREN displays statistics about child latches.

This view includes all columns of V\$LATCH plus the CHILD# column. Note that child latches have the same parent if their LATCH# columns match each other.

| Column | Datatype     | Description                                                     |
|--------|--------------|-----------------------------------------------------------------|
| ADDR   | RAW(4   8)   | Address of the latch object                                     |
| LATCH# | NUMBER       | Latch number of the parent latch                                |
| CHILD# | NUMBER       | Child latch number (unique only to each parent latch)           |
| LEVEL# | NUMBER       | Latch level                                                     |
| NAME   | VARCHAR2(64) | Latch name                                                      |
| HASH   | NUMBER       | Latch hash                                                      |
| GETS   | NUMBER       | Number of times the latch was requested in willing-to-wait mode |

| Column                                             | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MISSES                                             | NUMBER   | Number of times the latch was requested in willing-to-wait mode and the requester had to wait                                                                                                                                                                                                                                                                                                                                                   |
| SLEEPS                                             | NUMBER   | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch                                                                                                                                                                                                                                                                                                                                      |
| IMMEDIATE_GETS                                     | NUMBER   | Number of times a latch was requested in no-wait mode                                                                                                                                                                                                                                                                                                                                                                                           |

## 9.29 V\$LATCH\_MISSES

V\$LATCH\_MISSES displays statistics about missed attempts to acquire a latch.

| Column        | Datatype     | Description                                                                                                                           |
|---------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| PARENT_NAME   | VARCHAR2(64) | Latch name of a parent latch                                                                                                          |
| WHERE         | VARCHAR2(80) | This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in LOCATION. |
| NWFAIL_COUNT  | NUMBER       | Number of times that no-wait acquisition of the latch failed                                                                          |
| SLEEP_COUNT   | NUMBER       | Number of times that acquisition attempts caused sleeps                                                                               |
| WTR_SLP_COUNT | NUMBER       | Number of times a waiter slept                                                                                                        |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LONGHOLD_COUNT | NUMBER       | Number of times someone held a latch for the entire duration of someone else's sleep                                                                                                                                                                                                                                                                                                                                                              |
| LOCATION       | VARCHAR2(80) | Location that attempted to acquire the latch                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.30 V\$LATCH\_PARENT

V\$LATCH\_PARENT displays statistics about parent latches.

\ The columns for V\$LATCH\_PARENT are the same as those for V\$LATCH.

## 9.31 V\$LATCHHOLDER

V\$LATCHHOLDER displays information about the current latch holders.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID    | NUMBER       | Identifier of the process holding the latch                                                                                                                                                                                                                                                                                                                                                                                                       |
| SID    | NUMBER       | Identifier of the session that owns the latch                                                                                                                                                                                                                                                                                                                                                                                                     |
| LADDR  | RAW(4   8)   | Latch address                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NAME   | VARCHAR2(64) | Name of the latch being held                                                                                                                                                                                                                                                                                                                                                                                                                      |
| GETS   | NUMBER       | Number of times that the latch was obtained in either wait mode or no-wait mode                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.32 V\$LATCHNAME

V\$LATCHNAME displays information about decoded latch names for the latches shown in V\$LATCH.

The rows of V\$LATCHNAME have a one-to-one correspondence to the rows of V\$LATCH.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LATCH#       | NUMBER       | Latch number                                                                                                                                                                                                                                                                                                                                                                                                                                |
| NAME         | VARCHAR2(64) | Latch name                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DISPLAY_NAME | VARCHAR2(64) | A clearer and more descriptive name for the latch that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                                                                                                     |
| HASH         | NUMBER       | Latch hash                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE         | VARCHAR2(4)  | Type of the latch (SGA, PDB, or OSP):                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

| REQUEST_COUNT  | NUMBER   | Total request count                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CACHE_HITS     | NUMBER   | Cache hit count                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ALT_CACHE_HITS | NUMBER   | Hit count from an alternate LCR cache entry                                                                                                                                                                                                                                                                                                                                                                                                     |
| PURGED_COUNT   | NUMBER   | Cache purge count                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SID            | NUMBER   | Session ID of the component process                                                                                                                                                                                                                                                                                                                                                                                                             |
| SERIAL#        | NUMBER   | Session serial number of the component process                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

This view is available starting with Oracle Database 21c.

## 9.34 V\$LGWRIO\_OUTLIER

V\$LGWRIO\_OUTLIER contains entries corresponding to Log Writer (LGWR) process I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there any occasional delays in serving disk I/O requests by the storage subsystem.

| Column        | Datatype      | Description                                                             |
|---------------|---------------|-------------------------------------------------------------------------|
| FUNCTION_NAME | VARCHAR2(18)  | I/O function name of the delayed I/O                                    |
| IO_SIZE       | NUMBER        | Size of the I/O in bytes                                                |
| WAIT_EVENT    | VARCHAR2(64)  | Wait event name that was used to track the I/O                          |
| FILE_NAME     | VARCHAR2(513) | Name of the file to which the I/O was targeted                          |
| IO_LATENCY    | NUMBER        | Time taken to complete the I/O (in milliseconds)                        |
| DISK1_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the first disk to which the I/O was issued  |
| DISK1_LATENCY | NUMBER        | Latency seen on the first disk (in milliseconds)                        |
| DISK2_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the second disk to which the I/O was issued |
| DISK2_LATENCY | NUMBER        | Latency seen on the second disk (in milliseconds)                       |
| DISK3_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the third disk to which the I/O was issued  |
| DISK3_LATENCY | NUMBER        | Latency seen on the third disk (in milliseconds)                        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 9.35 V\$LIBCACHE\_LOCKS

V\$LIBCACHE\_LOCKS displays information about the library cache locks and pins. Locks and pins are distinguished based on the value of the TYPE column.

| Column               | Datatype    | Description                                                                                                                                                                            |
|----------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE                 | VARCHAR2(4) | LOCK or PIN                                                                                                                                                                            |
| ADDR                 | RAW(4   8)  | Address of the lock/pin                                                                                                                                                                |
| HOLDING_USER_SESSION | RAW(4   8)  | User session holding this lock/pin                                                                                                                                                     |
| HOLDING_SESSION      | RAW(4   8)  | Session holding this lock/pin                                                                                                                                                          |
| OBJECT_HANDLE        | RAW(4   8)  | Handle address for which the lock/pin is acquired                                                                                                                                      |
| LOCK_HELD            | RAW(4   8)  | <p>If the type is LOCK, then LOCK_HELD represents the pin that is pinning the object.</p> <p>If the type is PIN, then LOCK_HELD represents the lock that is locking the object.</p>    |
| REFCOUNT             | NUMBER      | Reference count for this lock/pin                                                                                                                                                      |
| MODE_HELD            | NUMBER      | <p>Lock/pin mode held:</p> <ul style="list-style-type: none"> <li>0 - No lock/pin held</li> <li>1 - Null mode</li> <li>2 - Share mode</li> <li>3 - Exclusive mode</li> </ul>           |
| MODE_REQUESTED       | NUMBER      | <p>Lock/pin mode requested:</p> <ul style="list-style-type: none"> <li>0 - No lock/pin requested</li> <li>1 - Null mode</li> <li>2 - Share mode</li> <li>3 - Exclusive mode</li> </ul> |
| SAVEPOINT_NUMBER     | NUMBER      | Kernel transaction savepoint number at the time the lock/pin was acquired                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.36 V\$LIBRARY\_CACHE\_MEMORY

V\$LIBRARY\_CACHE\_MEMORY displays information about memory allocated to library cache memory objects in different namespaces.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

| Column                     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LC_NAMESPACE               | VARCHAR2(15) | Library cache namespace                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LC_INUSE_MEMORY_OBJECTS    | NUMBER       | Number of library cache memory objects currently in use in the shared pool                                                                                                                                                                                                                                                                                                                                                                             |
| LC_INUSE_MEMORY_SIZE       | NUMBER       | Total size of library cache in-use memory objects (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                       |
| LC_FREEABLE_MEMORY_OBJECTS | NUMBER       | Number of freeable library cache memory objects in the shared pool                                                                                                                                                                                                                                                                                                                                                                                     |
| LC_FREEABLE_MEMORY_SIZE    | NUMBER       | Size of library cache freeable memory objects (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                     | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.37 V\$LIBRARYCACHE

V\$LIBRARYCACHE contains statistics about library cache performance and activity.

| Column      | Datatype     | Description                                                                           |
|-------------|--------------|---------------------------------------------------------------------------------------|
| NAMESPACE   | VARCHAR2(64) | Library cache namespace                                                               |
| GETS        | NUMBER       | Number of times a lock was requested for objects of this namespace                    |
| GETHITS     | NUMBER       | Number of times an object's handle was found in memory                                |
| GETHITRATIO | NUMBER       | Ratio of GETHITS to GETS                                                              |
| PINS        | NUMBER       | Number of times a PIN was requested for objects of this namespace                     |
| PINHITS     | NUMBER       | Number of times all of the metadata pieces of the library object were found in memory |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PINHITRATIO               | NUMBER   | Ratio of PINHITS to PINS                                                                                                                                                                                                                                                                                                                                                                                                                              |
| RELOADS                   | NUMBER   | Any PIN of an object that is not the first PIN performed since the object handle was created, and which requires loading the object from disk                                                                                                                                                                                                                                                                                                         |
| INVALIDATIONS             | NUMBER   | Total number of times objects in this namespace were marked invalid because a dependent object was modified                                                                                                                                                                                                                                                                                                                                           |
| DLM_LOCK_REQUESTS         | NUMBER   | Number of GET requests lock instance locks                                                                                                                                                                                                                                                                                                                                                                                                            |
| DLM_PIN_REQUESTS          | NUMBER   | Number of PIN requests lock instance locks                                                                                                                                                                                                                                                                                                                                                                                                            |
| DLM_PIN_RELEASES          | NUMBER   | Number of release requests PIN instance locks                                                                                                                                                                                                                                                                                                                                                                                                         |
| DLM_INVALIDATION_REQUESTS | NUMBER   | Number of GET requests for invalidation instance locks                                                                                                                                                                                                                                                                                                                                                                                                |
| DLM_INVALIDATIONS         | NUMBER   | Number of invalidation pings received from other instances                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.38 V\$LICENSE

V\$LICENSE displays information about license limits.

| Column                     | Datatype | Description                                                                                                                                                                               |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSIONS_MAX               | NUMBER   | Maximum number of concurrent user sessions allowed for the instance                                                                                                                       |
| SESSIONS_WARNING           | NUMBER   | Warning limit for concurrent user sessions for the instance                                                                                                                               |
| SESSIONS_CURRENT           | NUMBER   | Current number of concurrent user sessions                                                                                                                                                |
| SESSIONS_HIGHWATER         | NUMBER   | Highest number of concurrent user sessions since the instance started                                                                                                                     |
| USERS_MAX                  | NUMBER   | Maximum number of named users allowed for the database                                                                                                                                    |
| CPU_COUNT_CURRENT          | NUMBER   | Current number of logical CPUs or processors on the system                                                                                                                                |
| CPU_CORE_COUNT_CURRENT     | NUMBER   | Current number of CPU cores on the system (includes subcores of multicore CPUs, as well as single-core CPUs)                                                                              |
| CPU_SOCKET_COUNT_CURRENT   | NUMBER   | Current number of CPU sockets on the system (represents an absolute count of CPU chips on the system, regardless of multithreading or multicore architectures)                            |
| CPU_COUNT_HIGHWATER        | NUMBER   | Highest number of logical CPUs or processors on the system since the instance started                                                                                                     |
| CPU_CORE_COUNT_HIGHWATER   | NUMBER   | Highest number of CPU cores on the system since the instance started (includes subcores of multicore CPUs, as well as single-core CPUs)                                                   |
| CPU_SOCKET_COUNT_HIGHWATER | NUMBER   | Highest number of CPU sockets on the system since the instance started (represents an absolute count of CPU chips on the system, regardless of multithreading or multicore architectures) |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note**

The availability of the CPU core count and CPU socket count statistics is subject to the operating system platform on which the Oracle Database is running. If a statistic is unavailable, the view will return NULL for the statistic value.

## 9.39 V\$LOADISTAT

V\$LOADISTAT contains errors that occurred when updating indexes on a table during a load using the Direct Path API.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| SID    | NUMBER      | Identifier for session holding or acquiring the lock                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TYPE   | VARCHAR2(2) | Type of user or system lock<br>The locks on the user types are obtained by user applications. Any process that is blocking others is likely to be holding one of these locks. The user type locks are:<br>TM - DML enqueue<br>TX - Transaction enqueue<br>UL - User supplied<br>The system type locks are listed in <a href="#">Table 9-1</a> . Be aware that not all types of locks are documented. To find a complete list of locks for the current release, query the V\$LOCK_TYPE data dictionary view, described on " <a href="#">V\$LOCK TYPE</a> ". |
| ID1    | NUMBER      | Lock identifier #1 (depends on type)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ID2    | NUMBER      | Lock identifier #2 (depends on type)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LMODE  | NUMBER      | Lock mode in which the session holds the lock: <ul style="list-style-type: none"> <li>0 - none</li> <li>1 - null (NULL)</li> <li>2 - row-S (SS)</li> <li>3 - row-X (SX)</li> <li>4 - share (S)</li> <li>5 - S/Row-X (SSX)</li> <li>6 - exclusive (X)</li> </ul>                                                                                                                                                                                                                                                                                            |

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REQUEST | NUMBER   | Lock mode in which the process requests the lock: <ul style="list-style-type: none"> <li>• 0 - none</li> <li>• 1 - null (NULL)</li> <li>• 2 - row-S (SS)</li> <li>• 3 - row-X (SX)</li> <li>• 4 - share (S)</li> <li>• 5 - S/Row-X (SSX)</li> <li>• 6 - exclusive (X)</li> </ul>                                                                                                                                                                                                                                                     |
| CTIME   | NUMBER   | Time since current mode was granted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BLOCK   | NUMBER   | Indicates whether the lock in question is blocking other processes. The possible values are: <ul style="list-style-type: none"> <li>• 0 - The lock is not blocking any other processes</li> <li>• 1 - The lock is blocking other processes</li> <li>• 2 - The lock is not blocking any blocked processes on the local node, but it may or may not be blocking processes on remote nodes. This value is used only in Oracle Real Application Clusters (Oracle RAC) configurations (not in single instance configurations).</li> </ul> |
| CON_ID  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                |

**Table 9-1 Values for the TYPE Column: System Types**

| System Type | Description                                       | System Type | Description                                   |
|-------------|---------------------------------------------------|-------------|-----------------------------------------------|
| AE          | Edition enqueue                                   | MR          | Media recovery                                |
| AT          | Lock held for the ALTER TABLE statement           | NA..NZ      | Library cache pin instance (A..Z = namespace) |
| BL          | Buffer hash table instance                        | PF          | Password File                                 |
| CF          | Control file schema global enqueue                | PI, PS      | Parallel operation                            |
| CI          | Cross-instance function invocation instance       | PR          | Process startup                               |
| CU          | Cursor bind                                       | QA..QZ      | Row cache instance (A..Z = cache)             |
| DF          | datafile instance                                 | RT          | Redo thread global enqueue                    |
| DL          | Direct loader parallel index create               | SC          | System change number instance                 |
| DM          | Mount/startup db primary/secondary instance       | SM          | SMON                                          |
| DR          | Distributed recovery process                      | SN          | Sequence number instance                      |
| DX          | Distributed transaction entry                     | SQ          | Sequence number enqueue                       |
| FS          | File set                                          | SS          | Sort segment                                  |
| HW          | Space management operations on a specific segment | ST          | Space transaction enqueue                     |
| IN          | Instance number                                   | SV          | Sequence number value                         |

Table 9-1 (Cont.) Values for the TYPE Column: System Types

| System Type | Description                                         | System Type | Description                          |
|-------------|-----------------------------------------------------|-------------|--------------------------------------|
| IR          | Instance recovery serialization global enqueue      | TA          | Generic enqueue                      |
| IS          | Instance state                                      | TS          | Temporary segment enqueue (ID2=0)    |
| IV          | Library cache invalidation instance                 | TS          | New block allocation enqueue (ID2=1) |
| JQ          | Job queue                                           | TT          | Temporary table enqueue              |
| KK          | Thread kick                                         | UN          | User name                            |
| LA . . LP   | Library cache lock instance lock (A..P = namespace) | US          | Undo segment DDL                     |
| MM          | Mount definition global enqueue                     | WL          | Being-written redo log instance      |

## 9.42 V\$LOCK\_ACTIVITY

V\$LOCK\_ACTIVITY is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 9.43 V\$LOCK\_TYPE

V\$LOCK\_TYPE describes the type of locks available.

| Column | Datatype     | Description                               |
|--------|--------------|-------------------------------------------|
| TYPE   | VARCHAR2(64) | A two-letter internal resource identifier |

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2(64)   | Resource type name. This is a short (less than 32 characters) enqueue type name.                                                                                                                                                                                                                                                                                                                                                                      |
| ID1_TAG     | VARCHAR2(64)   | Description of the enqueue type.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ID2_TAG     | VARCHAR2(64)   | Further description of the enqueue type.                                                                                                                                                                                                                                                                                                                                                                                                              |
| IS_USER     | VARCHAR2(3)    | User enqueue. These are enqueues that are acquired as a direct result of a SQL statement. Applications may get deadlocks on these enqueues. Such deadlocks are considered application errors.                                                                                                                                                                                                                                                         |
| IS_RECYCLE  | VARCHAR2(3)    | Indicates whether the enqueue requires caching of the associated resource in the DLM's resource cache.<br>Possible values: <ul style="list-style-type: none"> <li>• NO: Means the enqueue requires caching of the associated resource in the DLM's resource cache</li> <li>• YES: Means the enqueue does not require caching of the associated resource in the DLM's resource cache</li> </ul>                                                        |
| DESCRIPTION | VARCHAR2(4000) | Explanation of how or for what purpose the enqueue is used.                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.44 V\$LOCKDOWN\_RULES

V\$LOCKDOWN\_RULES displays information about lockdown profile rules that are applicable in the pluggable database (PDB) where this view is queried.

| Column        | Datatype      | Description                                                                                                                    |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| RULE_TYPE     | VARCHAR2(128) | Type of the rule: <ul style="list-style-type: none"> <li>• STATEMENT</li> <li>• FEATURE</li> <li>• OPTION</li> </ul>           |
| RULE          | VARCHAR2(128) | Rule to be enabled or disabled                                                                                                 |
| CLAUSE        | VARCHAR2(128) | Clause of the statement                                                                                                        |
| CLAUSE_OPTION | VARCHAR2(128) | Option of the clause                                                                                                           |
| STATUS        | VARCHAR2(7)   | Status of the lockdown profile: <ul style="list-style-type: none"> <li>• ENABLE</li> <li>• DISABLE</li> <li>• EMPTY</li> </ul> |
| USERS         | VARCHAR2(6)   | Type of users affected by the rule: <ul style="list-style-type: none"> <li>• ALL</li> <li>• LOCAL</li> <li>• COMMON</li> </ul> |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs</li> <li>• 1: This value is used for rows containing data that pertain to only the root.</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.45 V\$LOCKED\_OBJECT

V\$LOCKED\_OBJECT lists all locks acquired by every transaction on the system. It shows which sessions are holding DML locks (that is, TM-type enqueues) on what objects and in what mode.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XIDUSN          | NUMBER        | Undo segment number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| XIDSLOT         | NUMBER        | Slot number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| XIDSQN          | NUMBER        | Sequence number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OBJECT_ID       | NUMBER        | Object ID being locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| FIRST_TIME        | DATE     | Time of the first entry (lowest SCN) in the log                                                                                                                                                                                                                                                                                                                                                                                                 |
| NEXT_CHANGE#      | NUMBER   | Highest SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                          |
| RESETLOGS_CHANGE# | NUMBER   | Resetlogs change number of the database when the log was written                                                                                                                                                                                                                                                                                                                                                                                |
| RESETLOGS_TIME    | DATE     | Resetlogs time of the database when the log was written                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.48 V\$LOGFILE

V\$LOGFILE contains information about redo log files.

| Column | Datatype    | Description                                                                                                                                                                                                                         |
|--------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP# | NUMBER      | Redo log group identifier number                                                                                                                                                                                                    |
| STATUS | VARCHAR2(7) | Status of the log member: <ul style="list-style-type: none"> <li>INVALID - File is inaccessible</li> <li>STALE - File's contents are incomplete</li> <li>DELETED - File is no longer used</li> <li>null - File is in use</li> </ul> |
| TYPE   | VARCHAR2(7) | Type of the logfile: <ul style="list-style-type: none"> <li>ONLINE</li> <li>STANDBY</li> </ul>                                                                                                                                      |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEMBER                | VARCHAR2(513) | Redo log member name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.49 V\$LOGHIST

V\$LOGHIST contains log history information from the control file. This view is retained for historical compatibility. Oracle recommends that you use V\$LOG\_HISTORY instead.

## 9.50 V\$LOGMNR\_CONTENTS

V\$LOGMNR\_CONTENTS contains log history information. To query this view, you must have the LOGMINING privilege.

When a SELECT statement is executed against the V\$LOGMNR\_CONTENTS view, the archive redo log files are read sequentially. Translated records from the redo log files are returned as rows in the V\$LOGMNR\_CONTENTS view. This continues until either the filter criteria specified at startup (EndTime or endScn) are met or the end of the archive log file is reached.

When this view is queried from a PDB, it returns only redo generated by that PDB.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCN              | NUMBER        | System change number (SCN) when the database change was made                                                                                                                                                                                                                                                                            |
| START_SCN        | NUMBER        | System change number (SCN) when the transaction that contains this change started; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR( ) invocation, NULL otherwise. This column may also be NULL if the query is run over a time/SCN range that does not contain the start of the transaction. |
| COMMIT_SCN       | NUMBER        | System change number (SCN) when the transaction committed; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR( ) invocation                                                                                                                                                                     |
| TIMESTAMP        | DATE          | Timestamp when the database change was made                                                                                                                                                                                                                                                                                             |
| START_TIMESTAMP  | DATE          | Timestamp when the transaction that contains this change started; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR( ) invocation, NULL otherwise. This column may also be NULL if the query is run over a time/SCN range that does not contain the start of the transaction.                  |
| COMMIT_TIMESTAMP | DATE          | Timestamp when the transaction committed; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR( ) invocation                                                                                                                                                                                      |

| SEG_TYPE_NAME   | VARCHAR2(32)   | Segment type name: <ul style="list-style-type: none"> <li>INDEX</li> <li>INDEX PARTITION</li> <li>TABLE</li> <li>TABLE PARTITION</li> <li>TABLE SUBPARTITION</li> <li>UNKNOWN</li> <li>UNSUPPORTED</li> </ul>                                                                                                                                                                                                                                                      |
| TABLE_SPACE     | VARCHAR2(92)   | Name of the tablespace containing the modified data segment. This column is not populated for rows where the value of the OPERATION column is DDL. This is because DDL may operate on more than one tablespace.                                                                                                                                                                                                                                                    |
| ROW_ID          | VARCHAR2(18)   | Row ID of the row modified by the change (only meaningful if the change pertains to a DML). This will be NULL if the redo record is not associated with a DML.                                                                                                                                                                                                                                                                                                     |
| USERNAME        | VARCHAR2(384)  | Name of the user who executed the transaction                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OS_USERNAME     | VARCHAR2(4000) | Name of the operating system user                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MACHINE_NAME    | VARCHAR2(4000) | Machine from which the user connected to the database                                                                                                                                                                                                                                                                                                                                                                                                              |
| AUDIT_SESSIONID | NUMBER         | Audit session ID associated with the user session making the change                                                                                                                                                                                                                                                                                                                                                                                                |
| SESSION#        | NUMBER         | Session number of the session that made the change                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SERIAL#         | NUMBER         | Serial number of the session that made the change                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SESSION_INFO    | VARCHAR2(4000) | Information about the database session that executed the transaction. Contains process information, machine name from which the user logged in, and so on. A possible SESSION_INFO column may contain the following: <ul style="list-style-type: none"> <li>login_username = HR</li> <li>client_info =</li> <li>OS_username = jkundu</li> <li>Machine_name = nirvan</li> <li>OS_terminal = pts/31</li> <li>OS_program_name = sqlplus@nirvan (TNS V1-V3)</li> </ul> |
| THREAD#         | NUMBER         | Number of the thread that made the change to the database                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQUENCE#  | NUMBER         | Sequence number of the SQL statement within the transaction. If you are mining without the COMMITTED_DATA_ONLY option set, then this value is 1.                                                                                                                                                                                                                                                                    |
| RBASQN     | NUMBER         | Sequence# associated with the Redo Block Address (RBA) of the redo record associated with the change                                                                                                                                                                                                                                                                                                                |
| RBABLK     | NUMBER         | RBA block number within the log file                                                                                                                                                                                                                                                                                                                                                                                |
| RBABYTE    | NUMBER         | RBA byte offset within the block                                                                                                                                                                                                                                                                                                                                                                                    |
| UBAFIL     | NUMBER         | Undo Block Address (UBA) file number identifying the file containing the undo block                                                                                                                                                                                                                                                                                                                                 |
| UBABLK     | NUMBER         | UBA block number for the undo block                                                                                                                                                                                                                                                                                                                                                                                 |

| UBASQN     | NUMBER         | UBA undo block sequence number                                                                                                                                                                                                                                                                                                                                                                                      |
| ABS_FILE#  | NUMBER         | Data block absolute file number of the block changed by the transaction                                                                                                                                                                                                                                                                                                                                             |
| REL_FILE#  | NUMBER         | Data block relative file number. The file number is relative to the tablespace of the object.                                                                                                                                                                                                                                                                                                                       |
| DATA_BLK#  | NUMBER         | Data block number within the file                                                                                                                                                                                                                                                                                                                                                                                   |
| DATA_OBJ#  | NUMBER         | Data block object number identifying the object                                                                                                                                                                                                                                                                                                                                                                     |
| DATA_OBJV# | NUMBER         | Version number of the table being modified                                                                                                                                                                                                                                                                                                                                                                          |
| DATA_OBJD# | NUMBER         | Data block data object number identifying the object within the tablespace                                                                                                                                                                                                                                                                                                                                          |
| SQL_REDO   | VARCHAR2(4000) | Reconstructed SQL statement that is equivalent to the original SQL statement that made the change. Refer to <i>Oracle Database Utilities</i> before executing SQL_REDO to your database.<br><br>LogMiner does not generate SQL redo for temporary tables. In such a case, this column will contain the string "/* No SQL_REDO for temporary tables */".                                                             |
| SQL_UNDO   | VARCHAR2(4000) | Reconstructed SQL statement that can be used to undo the effect of the original statement that made the change. DDL statements have no corresponding SQL_UNDO. Refer to <i>Oracle Database Utilities</i> before executing SQL_UNDO to your database.<br><br>LogMiner does not generate SQL undo for temporary tables. In such a case, this column will contain the string "/* No SQL_UNDO for temporary tables */". |
| RS_ID      | VARCHAR2(32)   | Record set ID. The tuple (RS_ID, SSN) together uniquely identifies a logical row change. This will usually mean one row from V\$LOGMNR_CONTENTS, but could be more than one row if a single SQL statement for either the Redo or Undo would be too large to fit within the respective columns SQL_UNDO or SQL_REDO. RS_ID uniquely identifies the redo record that generated the row.                               |
| SSN        | NUMBER         | SQL sequence number. Used in conjunction with RS_ID, this uniquely identifies a logical row change, shown as one or more rows from the V\$LOGMNR_CONTENTS view.                                                                                                                                                                                                                                                     |
| CSF        | NUMBER         | Continuation SQL flag. Possible values are: <ul style="list-style-type: none"> <li>0 - Indicates SQL_REDO and SQL_UNDO is contained within the same row</li> <li>1 - Indicates that either SQL_REDO or SQL_UNDO is greater than 4000 bytes in size and is continued in the next row returned by the view</li> </ul>                                                                                                 |

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INFO            | VARCHAR2(64)  | Informational message about the row. For instance, the string "USER DDL" indicates that the DDL statement returned in the SQL_REDO column was the top-level DDL executed by the user and the string "INTERNAL DDL" indicates that the DDL statement returned in the SQL_REDO column was executed internally by the RDBMS.                                                                                                                                                                                                                                       |
| STATUS          | NUMBER        | <p>A value of 0 indicates that the reconstructed SQL statements as shown in the SQL_REDO and SQL_UNDO columns are valid executable SQL statements. Otherwise, the reconstructed SQL statements are not executable. This may be because no data dictionary was provided to LogMiner for the analysis, or that the data dictionary provided did not have the definition of the object being mined.</p> <p>A value of 5 indicates that this row is part of a change to an XMLType column or table and the XML document must be assembled before being applied.</p> |
| REDO_VALUE      | NUMBER        | Used as input to the DBMS_LOGMNR.MINE_VALUE() and DBMS_LOGMNR.COLUMN_PRESENT() functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| UNDO_VALUE      | NUMBER        | Used as input to the DBMS_LOGMNR.MINE_VALUE() and DBMS_LOGMNR.COLUMN_PRESENT() functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| INFO               | VARCHAR2(32)  | Informational/Status message<br>BAD_DATE indicates that the SCN of the dictionary file does not match the SCN range of the log files                                                                                                                                                                                                                                                                                                    |
| STATUS             | NUMBER        | A NULL indicates a valid dictionary file for the list of log files. A non-NULL value indicates further information is contained in the INFO column as a text string.                                                                                                                                                                                                                                                                    |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 9.52 V\$LOGMNR\_DICTIONARY\_LOAD

V\$LOGMNR\_DICTIONARY\_LOAD displays information about LogMiner dictionaries for all active LogMiner sessions on the system.

Each query of this view will return one row for each attached LogMiner session. This view will not show valid information for LogMiner adhoc query clients.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| LOADED            | VARCHAR2(7)   | Status of the dictionary load: <ul style="list-style-type: none"><li>• YES - dictionary has been loaded</li><li>• NO - dictionary has not been loaded</li><li>• ACTIVE - dictionary is in the process of being loaded</li></ul>                                                                                                                                                                                                                   |
| PERCENT_DONE      | NUMBER        | Percentage of the dictionary that has been loaded                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.53 V\$LOGMNR\_LATCH

V\$LOGMNR\_LATCH can be joined with the V\$LATCH and the V\$LATCH\_CHILDREN views to obtain statistics about different latches used by active LogMiner persistent sessions.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating a Replication capture.

| Column     | Datatype | Description                                          |
|------------|----------|------------------------------------------------------|
| SESSION_ID | NUMBER   | Unique identifier of the LogMiner persistent session |

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(32) | Name of the Latch: <ul style="list-style-type: none"> <li>LogMiner internal state - Identifies the latch that protects communications between the LogMiner READER, PREPARER, and BUILDER processes</li> <li>LogMiner memory allocation - Identifies the latch that protects all memory allocation and deallocation inside LogMiner</li> <li>LogMiner transaction list - Identifies the latch that protects interaction between the LogMiner layer and its clients during Data Guard SQL Apply on a logical standby database</li> </ul> |
| CHILD_ADDR | RAW(4   8)   | Address of the child latch object. This column matches the corresponding ADDR column in the V\$LATCH_CHILDREN view                                                                                                                                                                                                                                                                                                                                                                                                                     |
| STATE      | VARCHAR2(6)  | State of the Latch: <ul style="list-style-type: none"> <li>UNINIT - The latch structure is uninitialized; that is, it is not currently assigned to any LogMiner persistent session</li> <li>READY - The latch structure is being used by a persistent LogMiner session</li> </ul>                                                                                                                                                                                                                                                      |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                        |

## 9.54 V\$LOGMNR\_LOGS

V\$LOGMNR\_LOGS contains log information.

| Column         | Datatype      | Description                                                                                            |
|----------------|---------------|--------------------------------------------------------------------------------------------------------|
| LOG_ID         | NUMBER        | This column is deprecated.                                                                             |
| FILENAME       | VARCHAR2(512) | Name of the log file                                                                                   |
| LOW_TIME       | DATE          | Oldest date of any records in the file                                                                 |
| HIGH_TIME      | DATE          | Most recent date of any records in the file                                                            |
| DB_ID          | NUMBER        | Database ID                                                                                            |
| DB_NAME        | VARCHAR2(8)   | Name of the database                                                                                   |
| RESET_SCN      | NUMBER        | Resetlogs SCN of the database incarnation that generated the log file                                  |
| RESET_SCN_TIME | DATE          | Resetlogs timestamp of the database incarnation that generated the log file                            |
| COMPATIBLE     | VARCHAR2(17)  | The setting of the database COMPATIBLE initialization parameter at the time the log file was generated |

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| THREAD_ID        | NUMBER       | Thread number                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| THREAD_SEQN      | NUMBER       | Thread sequence number                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOW_SCN          | NUMBER       | SCN allocated when log switched into                                                                                                                                                                                                                                                                                                                                                                                                            |
| NEXT_SCN         | NUMBER       | SCN after this log. Low SCN of the next log.                                                                                                                                                                                                                                                                                                                                                                                                    |
| DICTIONARY_BEGIN | VARCHAR2(3)  | Indicates whether dictionary dumped to redo logs starts in this redo log (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                      |

## 9.56 V\$LOGMNR\_PROCESS

V\$LOGMNR\_PROCESS identifies all processes attached to an active LogMiner persistent session.

(A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) This view can be joined with either the V\$SESSION view or the V\$PROCESS view to gather process-specific information.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID        | NUMBER       | Unique identifier for the LogMiner persistent session                                                                                                                                                                                                                                                                                                                                                                                           |
| PID               | NUMBER       | Oracle process identifier for the SQL Apply or Replication capture process (same as the V\$PROCESS.PID)                                                                                                                                                                                                                                                                                                                                         |
| SPID              | VARCHAR2(24) | Operating system process identifier (same as the V\$PROCESS.SPID)                                                                                                                                                                                                                                                                                                                                                                               |
| ROLE              | VARCHAR2(32) | Identifies the role of the active LogMiner process: READER, PREPARER, BUILDER, COORDINATOR, or APPLY SERVER                                                                                                                                                                                                                                                                                                                                     |
| USERNAME          | VARCHAR2(15) | Operating system process user name that is connected to the database                                                                                                                                                                                                                                                                                                                                                                            |
| SID               | NUMBER       | Session identifier for the V\$SESSION.SID process                                                                                                                                                                                                                                                                                                                                                                                               |
| SERIAL#           | NUMBER       | Session serial number associated with the V\$SESSION.SERIAL process                                                                                                                                                                                                                                                                                                                                                                             |
| LATCHWAIT         | VARCHAR2(16) | Address of the latch the process is waiting for; NULL if none                                                                                                                                                                                                                                                                                                                                                                                   |
| LATCHSPIN         | VARCHAR2(16) | This column is obsolete                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WORK_MICROSEC     | VARCHAR2(21) | Microseconds spent by the process doing useful work                                                                                                                                                                                                                                                                                                                                                                                             |
| OVERHEAD_MICROSEC | VARCHAR2(21) | Microseconds spent by the process doing overhead tasks or simply waiting/idling                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.57 V\$LOGMNR\_SESSION

V\$LOGMNR\_SESSION displays information about active LogMiner persistent sessions.

(A LogMiner persistent session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) Transient LogMiner sessions (those created as a result of querying the V\$LOGMNR\_CONTENTS view) do not show up in the V\$LOGMNR\_SESSION view. The statistics shown in this view correspond to snapshots of the system and are not cumulative in nature.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_MEMORY_SIZE         | NUMBER   | Maximum amount of shared memory (in bytes) that LogMiner is allowed to consume                                                                                                                                                                                                                                                                                                                                                                  |
| USED_MEMORY_SIZE        | NUMBER   | Amount of shared memory (in bytes) actually consumed by LogMiner                                                                                                                                                                                                                                                                                                                                                                                |
| BUILDER_WORK_SIZE       | NUMBER   | Amount of redo (in bytes) in the current work unit being processed by the BUILDER process.                                                                                                                                                                                                                                                                                                                                                      |
| PREPARED_WORK_SIZE      | NUMBER   | Amount of redo (in bytes) that has been prepared by LogMiner                                                                                                                                                                                                                                                                                                                                                                                    |
| AVAILABLE_WORK_SIZE     | NUMBER   | Amount of redo records (in bytes) that are ready, but are yet to be consumed by the client                                                                                                                                                                                                                                                                                                                                                      |
| AVAILABLE_TXN           | NUMBER   | Number of transaction chunks ready for consumption                                                                                                                                                                                                                                                                                                                                                                                              |
| AVAILABLE_COMMITTED_TXN | NUMBER   | Number of committed transactions ready for consumption. This is less than, or equal to, AVAILABLE_TXN.                                                                                                                                                                                                                                                                                                                                          |
| DELIVERED_TXN           | NUMBER   | Number of transaction chunks that the client currently has in its possession                                                                                                                                                                                                                                                                                                                                                                    |
| DELIVERED_COMMITTED_TXN | NUMBER   | Number of committed transaction chunks that the client is currently working on. This is less than, or equal to, the value of the DELIVERED_TXN column.                                                                                                                                                                                                                                                                                          |
| PINNED_TXN              | NUMBER   | Number of transactions pinned (the client is actively working on)                                                                                                                                                                                                                                                                                                                                                                               |
| PINNED_COMMITTED_TXN    | NUMBER   | Number of committed transactions pinned (the client is actively working on)                                                                                                                                                                                                                                                                                                                                                                     |
| CHECKPOINT_INTERVAL     | NUMBER   | Checkpoint interval                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.58 V\$LOGMNR\_STATS

V\$LOGMNR\_STATS displays the activity currently being performed by the active LogMiner persistent sessions.

| Column     | Datatype | Description                                            |
|------------|----------|--------------------------------------------------------|
| SESSION_ID | NUMBER   | Unique identifier for the LogMiner persistent sessions |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2(64) | <p>Name of the LogMiner statistic, state, or status, including:</p> <ul style="list-style-type: none"> <li>• Bytes of Redo Processed - Cumulative count of bytes processed by SQL Apply</li> <li>• Redo Records Processed - Count of redo records processed by SQL Apply</li> <li>• Txns Delivered to Client - Count of SQL transactions processed by SQL Apply</li> <li>• DML txns delivered - Count of DML transactions processed by SQL Apply</li> <li>• DDL txns delivered - Count of DDL transactions processed by SQL Apply</li> <li>• CTAS txns delivered - Count of CREATE TABLE AS SELECT (CTAS) transactions processed by SQL Apply</li> <li>• Recursive txns delivered - Count of recursive transactions processed by SQL Apply</li> <li>• Rolled back txns seen</li> <li>• LCRs delivered to client - Number of logical change records (LCRs) processed by SQL Apply</li> <li>• Bytes paged out - Cumulative count of bytes that have been paged out. LogMiner pages out memory from the LCR cache to accommodate certain ill-behaved workloads or under-configured systems. The ratio of bytes paged out to bytes of redo processed should be low. If this ratio is high (10% or higher), try increasing the MAX_SGA allocated to SQL Apply.</li> <li>• Microsecs spent in pageout - Time spent by LogMiner paging out memory from the LCR cache</li> <li>• Bytes checkpointed - Keeps track of the amount of bytes checkpointed. The mining engine takes periodic checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions. The ratio of Bytes Checkpointed to Bytes of Redo Processed should be low. A high ratio (10% or higher) indicates an ill-behaved workload.</li> <li>• Microsecs spent in checkpoint - Time spent by the mining engine taking checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions.</li> <li>• Bytes rolled back - Cumulative value of the number of bytes rolled back by LogMiner. There are times that LogMiner needs to backtrack and reprocess a section of the redo stream. In this case, it will roll back work it has already done. The ratio of Bytes Rolled Back to Bytes of Redo Processed should be low. If this ratio is high (10% or higher), reduce the number of PREPARER processes allocated to SQL Apply.</li> <li>• Microsecs spent in rollback - Time spent rolling back transactions already applied to the logical standby database</li> </ul> |
| VALUE  | VARCHAR2(64) | The corresponding metric value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 9.60 V\$LOGSTDBY\_PROCESS

V\$LOGSTDBY\_PROCESS displays dynamic information about what is happening to the Data Guard log apply services.

This view is helpful when diagnosing performance problems during the logical application of archived redo logs to the standby database, and it can be helpful for other problems. This view is for logical standby databases only.

| Column      | Datatype     | Description                                                                                                                      |
|-------------|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| SID         | NUMBER       | Session id of the associated session. This matches the SID column of the corresponding row in the V\$SESSION view.               |
| SERIAL#     | NUMBER       | Serial number of the associated session. Together, (SID,SERIAL#) uniquely identify the session in the current database instance. |
| LOGSTDBY_ID | NUMBER       | Parallel query worker ID                                                                                                         |
| SPID        | VARCHAR2(24) | This corresponds to the SPID value of the row corresponding to this process in the V\$PROCESS view                               |

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| HIGH_SCN    | NUMBER        | Identifies the highest redo record/LCR processed by this process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 9.61 V\$LOGSTDBY\_PROGRESS

V\$LOGSTDBY\_PROGRESS displays the progress of log apply services on the logical standby database. This view is for logical standby databases only.

| Column       | Datatype | Description                                                                            |
|--------------|----------|----------------------------------------------------------------------------------------|
| APPLIED_SCN  | NUMBER   | All the transactions with COMMIT SCN lower than or equal to this SCN have been applied |
| APPLIED_TIME | DATE     | The time and date of APPLIED_SCN                                                       |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESTART_SCN  | NUMBER   | During an apply restart, LogMiner does not read any log file with a NEXT_CHANGE# lower than this SCN.                                                                                                                                                                                                                                                                                                                                                  |
| RESTART_TIME | DATE     | The time and date of RESTART_SCN                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LATEST_SCN   | NUMBER   | The highest SCN of all redo records that Logical Standby has encountered                                                                                                                                                                                                                                                                                                                                                                               |
| LATEST_TIME  | DATE     | The time and date of LATEST_SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MINING_SCN   | NUMBER   | The SCN of the latest redo record processed by the builder process                                                                                                                                                                                                                                                                                                                                                                                     |
| MINING_TIME  | DATE     | The time and date of MINING_SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| RESETLOGS_ID | NUMBER   | A redo branch is identified by resetlogs SCN and resetlogs timestamp. The RESETLOGS_ID column contents are the same as resetlogs timestamp converted to a number.                                                                                                                                                                                                                                                                                      |
| CON_ID       | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.62 V\$LOGSTDBY\_STATE

V\$LOGSTDBY\_STATE provides consolidated information from V\$LOGSTDBY and V\$LOGSTDBY\_STATS about the running state of Logical Standby.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIMARY_DBID     | NUMBER       | Database ID (DBID) of the primary database                                                                                                                                                                                                                                                                                                                                                 |
| PRIMARY_CON_DBID | NUMBER       | This column indicates the DBID of the source database or source PDB corresponding to the database (or CDB) from which this column is queried. For a non-CDB and the root of a CDB, this column matches the PRIMARY_DBID column. For a maintained PDB, this column indicates the DBID for the corresponding PDB at the source. For a skipped PDB or a local PDB, this column would be NULL. |
| SESSION_ID       | NUMBER       | LogMiner session ID allocated to SQL Apply.                                                                                                                                                                                                                                                                                                                                                |
| REALTIME_APPLY   | VARCHAR2(64) | Y indicates that SQL Apply is running in real-time apply mode. If a standby redo log is configured, SQL Apply applies changes as they are written to the standby redo log files. N indicates that SQL Apply applies changes as each archived redo log file is received.                                                                                                                    |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE  | VARCHAR2(64) | <ul style="list-style-type: none"><li>INITIALIZING: LogMiner session has been created and coordinator has attached to it</li><li>LOADING DICTIONARY: SQL Apply is loading the LogMiner dictionary</li><li>WAITING ON GAP: SQL Apply is waiting for a log file to be sent from the primary database</li><li>APPLYING: SQL Apply is actively mining or applying transactions</li><li>WAITING FOR DICTIONARY LOGS: SQL Apply is waiting for the archived logs containing the LogMiner dictionary to be shipped from the primary database</li><li>IDLE: SQL Apply has applied all changes available at the logical standby, and is caught up with the primary database</li></ul> |
| CON_ID | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                                                                                                                                                                                                                           |

## 9.63 V\$LOGSTDBY\_STATS

V\$LOGSTDBY\_STATS displays statistics, current state, and status information related to SQL Apply.

No rows are returned from this view when SQL Apply is not running. This view is only meaningful in the context of a logical standby database.

All statistics shown in this view are reinitialized at each SQL Apply start.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

- <sup>1</sup> In case SQL Apply is not running in real time mode, this may not reflect time spent in gap resolution, but simply the time spent waiting for the most recent archived log to show up at the logical standby.
- <sup>2</sup> In case SQL Apply is not running in real time mode, this will include time that SQL Apply spent every time it finished processing all archived logs registered with it, and waited for the next log to be archived.

## 9.64 V\$LOGSTDBY\_TRANSACTION

V\$LOGSTDBY\_TRANSACTION displays all transactions that are actively being processed by SQL Apply.

The transaction identifiers shown in this view are those mined from the redo stream and correspond to transaction identifiers assigned at the primary database, and do not correspond to the transactions that are active at the logical standby database. For information regarding transactions active in the logical standby database, including those created as part of SQL Apply, query the V\$TRANSACTION view at the logical standby database.

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 9.65 V\$MANAGED\_STANDBY

V\$MANAGED\_STANDBY displays current status information for some Oracle Database processes related to physical standby databases in the Data Guard environment. This view does not persist after an instance shutdown.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 9.66 V\$MAP\_COMP\_LIST

V\$MAP\_COMP\_LIST displays supplementary information for all element mapping structures.

| Column     | Datatype      | Description                         |
|------------|---------------|-------------------------------------|
| ELEM_IDX   | NUMBER        | Index corresponding to the element  |
| NUM_COMP   | NUMBER        | Number of components (maximum is 5) |
| COMP1_NAME | VARCHAR2(256) | Name of the first component         |
| COMP1_VAL  | VARCHAR2(256) | Value of the first component        |
| COMP2_NAME | VARCHAR2(256) | Name of the second component        |
| COMP2_VAL  | VARCHAR2(256) | Value of the second component       |
| COMP3_NAME | VARCHAR2(256) | Name of the third component         |
| COMP3_VAL  | VARCHAR2(256) | Value of the third component        |
| COMP4_NAME | VARCHAR2(256) | Name of the fourth component        |
| COMP4_VAL  | VARCHAR2(256) | Value of the fourth component       |
| COMP5_NAME | VARCHAR2(256) | Name of the fifth component         |

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMP5_VAL | VARCHAR2(256) | Value of the fifth component                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.67 V\$MAP\_ELEMENT

V\$MAP\_ELEMENT displays a list of all element mapping structures in the SGA of the instance.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| ATTRB5_VAL  | VARCHAR2(256) | Value of the fifth attribute                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.69 V\$MAP\_FILE

V\$MAP\_FILE displays a list of all file mapping structures in the shared memory of the instance.

| Column         | Datatype      | Description                                                                                                                                                                  |
|----------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_MAP_IDX   | NUMBER        | Index corresponding to the file                                                                                                                                              |
| FILE_CFGID     | VARCHAR2(256) | Configuration ID (N/A if configuration ID is not supported)                                                                                                                  |
| FILE_STATUS    | VARCHAR2(7)   | Status of the mapping information: <ul style="list-style-type: none"> <li>VALID - File mapping information is latest</li> <li>INVALID - Mapping must be refreshed</li> </ul> |
| FILE_NAME      | VARCHAR2(256) | Absolute file name                                                                                                                                                           |
| FILE_TYPE      | VARCHAR2(11)  | File type: <ul style="list-style-type: none"> <li>DATAFILE</li> <li>SPFILE</li> <li>TEMPFILE</li> <li>CONTROLFILE</li> <li>LOGFILE</li> <li>ARCHIVEFILE</li> </ul>           |
| FILE_STRUCTURE | VARCHAR2(9)   | File structure: <ul style="list-style-type: none"> <li>FILE</li> <li>RAWVOLUME</li> <li>RAWDEVICE</li> <li>NONE</li> </ul>                                                   |
| FILE_SIZE      | NUMBER        | File size in HKB (half KB)                                                                                                                                                   |

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NEXTS | NUMBER   | Number of file extents in the file (not necessarily the same as the number of file extents mapped)                                                                                                                                                                                                                                                                                                                                              |
| LIB_IDX    | NUMBER   | Index of mapping library claiming ownership of the file                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.70 V\$MAP\_FILE\_EXTENT

V\$MAP\_FILE\_EXTENT displays a list of all file extent mapping structures in the shared memory of the instance.

| Column       | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_MAP_IDX | NUMBER      | File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE)                                                                                                                                                                                                                                                                                                                                                                                         |
| EXT_NUM      | NUMBER      | File extent number                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXT_ELEM_OFF | NUMBER      | Element offset in HKB                                                                                                                                                                                                                                                                                                                                                                                                                           |
| EXT_SIZE     | NUMBER      | File extent size in HKB                                                                                                                                                                                                                                                                                                                                                                                                                         |
| EXT_FILE_OFF | NUMBER      | File Offset in HKB                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXT_TYPE     | VARCHAR2(6) | File Extent Type: <ul style="list-style-type: none"> <li>DATA</li> <li>PARITY</li> <li>NONE</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| ELEM_IDX     | NUMBER      | Index in V\$MAP_ELEMENT corresponding to the element where the file extent resides                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID       | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.71 V\$MAP\_FILE\_IO\_STACK

V\$MAP\_FILE\_IO\_STACK displays the hierarchical arrangement of storage containers for files. Each row in the view represents a level in the hierarchy.

| Column       | Datatype | Description                                             |
|--------------|----------|---------------------------------------------------------|
| FILE_MAP_IDX | NUMBER   | File index (corresponds to FILE_MAP_IDX in V\$MAP_FILE) |
| DEPTH        | NUMBER   | Element depth within the I/O stack                      |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELEM_IDX      | NUMBER       | Index corresponding to the element                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CU_SIZE       | NUMBER       | Contiguous set of logical blocks of the file (in HKB units) that is resident contiguously on the element                                                                                                                                                                                                                                                                                                                                              |
| STRIDE        | NUMBER       | Number of HKB between contiguous units (CU) in the file that are contiguous on this element. Used in RAID5 and striped files.                                                                                                                                                                                                                                                                                                                         |
| NUM_CU        | NUMBER       | Number of contiguous units that are adjacent to each other on this element that are separated by STRIDE HKB in the file. In RAID5, the number of contiguous units also include the parity stripes.                                                                                                                                                                                                                                                    |
| ELEM_OFFSET   | NUMBER       | Element offset in HKB units                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FILE_OFFSET   | NUMBER       | Offset in HKB units from the start of the file to the first byte of the contiguous units                                                                                                                                                                                                                                                                                                                                                              |
| DATA_TYPE     | VARCHAR2(15) | Datatype: <ul style="list-style-type: none"> <li>• DATA</li> <li>• PARITY</li> <li>• DATA AND PARITY</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| PARITY_POS    | NUMBER       | Position of the parity. Only for RAID5. This column is needed to distinguish the parity from the data part.                                                                                                                                                                                                                                                                                                                                           |
| PARITY_PERIOD | NUMBER       | Parity period. Only for RAID5.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ID            | NUMBER       | Unique identifier                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PARENT_ID     | NUMBER       | Parent identifier                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.72 V\$MAP\_LIBRARY

V\$MAP\_LIBRARY displays a list of all mapping libraries dynamically loaded by the external process.

| Column       | Datatype       | Description                                                                                                                                                           |
|--------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LIB_IDX      | NUMBER         | Index corresponding to the library                                                                                                                                    |
| LIB_NAME     | VARCHAR2(256)  | Absolute library name                                                                                                                                                 |
| VENDOR_NAME  | VARCHAR2(64)   | Name of the vendor implementing the library                                                                                                                           |
| PROTOCOL_NUM | NUMBER         | Mapping protocol that the library supports                                                                                                                            |
| VERSION_NUM  | VARCHAR2(32)   | Version number                                                                                                                                                        |
| PATH_NAME    | VARCHAR2(4000) | Path name                                                                                                                                                             |
| MAP_FILE     | VARCHAR2(1)    | Indicates whether the library supports mapping files (Y) or not (N)                                                                                                   |
| FILE_CFGID   | VARCHAR2(13)   | Type of configuration ID supported for files: <ul style="list-style-type: none"> <li>• NONE - Not supported</li> <li>• PERSISTENT</li> <li>• NONPERSISTENT</li> </ul> |

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAP_ELEM   | VARCHAR2(1)  | Indicates whether the library supports mapping elements (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                          |
| ELEM_CFGID | VARCHAR2(13) | Type of configuration id supported for elements: <ul style="list-style-type: none"> <li>NONE - Not supported</li> <li>PERSISTENT</li> <li>NONPERSISTENT</li> </ul>                                                                                                                                                                                                                                                                              |
| MAP_SYNC   | VARCHAR2(1)  | Indicates whether the library needs to be explicitly synchronized so that future mappings reflect the most recent changes (Y) or not (N). Note that configuration IDs cannot be supported if the library needs to be explicitly synced.                                                                                                                                                                                                         |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.73 V\$MAP\_SUBELEMENT

V\$MAP\_SUBELEMENT displays a list of all subelement mapping structures in the shared memory of the instance.

| Column      | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHILD_IDX   | NUMBER   | Index in V\$MAP_ELEMENT corresponding to the child element                                                                                                                                                                                                                                                                                                                                                                                      |
| PARENT_IDX  | NUMBER   | Index in V\$MAP_ELEMENT corresponding to the parent element                                                                                                                                                                                                                                                                                                                                                                                     |
| SUB_NUM     | NUMBER   | Subelement number                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SUB_SIZE    | NUMBER   | Subelement size in HKB                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ELEM_OFFSET | NUMBER   | Offset in HKB on the child element                                                                                                                                                                                                                                                                                                                                                                                                              |
| SUB_FLAGS   | NUMBER   | Subelement flags (currently unused)                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID      | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.74 V\$MAPPED\_SQL

V\$MAPPED\_SQL lists the SQL statements that are translated and mapped in memory to a different SQL statement for execution.

| Column   | Datatype       | Description                                    |
|----------|----------------|------------------------------------------------|
| SQL_TEXT | VARCHAR2(1000) | First 1000 characters of the original SQL text |

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_FULLTEXT               | CLOB           | Full text for the original SQL statement                                                                                                                                                                                                                                                                                                                                                                                                        |
| SQL_ID                     | VARCHAR2(13)   | SQL identifier of the original SQL statement                                                                                                                                                                                                                                                                                                                                                                                                    |
| HASH_VALUE                 | NUMBER         | Hash value of the original SQL statement                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAPPED_SQL_TEXT            | VARCHAR2(1000) | First 1000 characters of the mapped SQL text                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAPPED_SQL_FULLTEXT        | CLOB           | Full text for the mapped SQL statement                                                                                                                                                                                                                                                                                                                                                                                                          |
| MAPPED_SQL_ID              | VARCHAR2(13)   | SQL identifier of the mapped SQL statement                                                                                                                                                                                                                                                                                                                                                                                                      |
| MAPPED_HASH_VALUE          | NUMBER         | Hash value of the mapped SQL statement                                                                                                                                                                                                                                                                                                                                                                                                          |
| SQL_TRANSLATION_PROFILE_ID | NUMBER         | A non-NULL value specifies the object ID of the SQL translation profile used to translate the SQL statement into the mapped SQL statement                                                                                                                                                                                                                                                                                                       |
| CON_ID                     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TRANSLATION_TIMESTAMP      | DATE           | Time this SQL statement was translated                                                                                                                                                                                                                                                                                                                                                                                                          |
| TRANSLATION_CPU_TIME       | NUMBER         | CPU time used to translate this SQL statement                                                                                                                                                                                                                                                                                                                                                                                                   |
| TRANSLATION_ELAPSED_TIME   | NUMBER         | Elapsed time used to translate this SQL statement                                                                                                                                                                                                                                                                                                                                                                                               |
| TRANSLATION_METHOD         | VARCHAR2(10)   | Method used to translate this SQL statement                                                                                                                                                                                                                                                                                                                                                                                                     |
| DICTIONARY_SQL_ID          | VARCHAR2(13)   | SQL ID of SQL text in custom translation dictionary used to translate this SQL statement                                                                                                                                                                                                                                                                                                                                                        |
| USE_COUNT                  | NUMBER         | Number of times this translation has been used                                                                                                                                                                                                                                                                                                                                                                                                  |

## 9.75 V\$MEMOPTIMIZE\_WRITE\_AREA

V\$MEMOPTIMIZE\_WRITE\_AREA displays information about fast ingest data in the large pool.

| Column      | Datatype | Description                                                                                                        |
|-------------|----------|--------------------------------------------------------------------------------------------------------------------|
| TOTAL_SIZE  | NUMBER   | Total amount of memory allocated for fast ingest data in the large pool (in bytes)                                 |
| USED_SPACE  | NUMBER   | Total amount of memory currently used by fast ingest data in the large pool (in bytes)                             |
| FREE_SPACE  | NUMBER   | Total amount of memory currently free for storing fast ingest data in the large pool (in bytes)                    |
| NUM_WRITES  | NUMBER   | Number of fast ingest insert operations for which data is still in the large pool and is yet to be written to disk |
| NUM_WRITERS | NUMBER   | Number of clients currently using fast ingest for inserting data into the database                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.76 V\$MEMORY\_CURRENT\_RESIZE\_OPS

V\$MEMORY\_CURRENT\_RESIZE\_OPS displays information about memory resize operations (both automatic and manual) which are currently in progress.

An operation can be a grow or a shrink of a dynamic memory component. All sizes are expressed in bytes.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT        | VARCHAR2(64) | Component name                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| PARAMETER        | VARCHAR2(80) | Name of the parameter for the resize operation                                                                                                                                                                                                                                                                                                                                                                                                               |
| INITIAL_SIZE     | NUMBER       | Parameter value at the start of the operation                                                                                                                                                                                                                                                                                                                                                                                                                |
| TARGET_SIZE      | NUMBER       | Desired value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                              |
| CURRENT_SIZE     | NUMBER       | Current value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                               |
| START_TIME       | DATE         | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LAST_UPDATE_TIME | DATE         | Last time progress was made for the operation                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID           | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.77 V\$MEMORY\_DYNAMIC\_COMPONENTS

V\$MEMORY\_DYNAMIC\_COMPONENTS displays information about the dynamic SGA components.

This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

| Column              | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT           | VARCHAR2(64) | Component name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CURRENT_SIZE        | NUMBER       | Current size of the component                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MIN_SIZE            | NUMBER       | Minimum size of the component since instance startup                                                                                                                                                                                                                                                                                                                                                                                              |
| MAX_SIZE            | NUMBER       | Maximum size of the component since instance startup                                                                                                                                                                                                                                                                                                                                                                                              |
| USER_SPECIFIED_SIZE | NUMBER       | Value of the user parameter for the component                                                                                                                                                                                                                                                                                                                                                                                                     |

| LAST_OPER_TIME      | DATE         | Start time of the last completed operation                                                                                                                                                                                                                                                                                                                                                                                                        |
| GRANULE_SIZE        | NUMBER       | Granularity of the GROW or SHRINK operation                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID              | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.78 V\$MEMORY\_RESIZE\_OPS

V\$MEMORY\_RESIZE\_OPS displays information about the last 800 completed memory resize operations (both automatic and manual). This does not include in-progress operations. All sizes are expressed in bytes.

| Column    | Datatype     | Description    |
|-----------|--------------|----------------|
| COMPONENT | VARCHAR2(64) | Component name |

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPER_TYPE    | VARCHAR2(13) | Operation type: <ul style="list-style-type: none"> <li>• STATIC</li> <li>• INITIALIZING</li> <li>• DISABLED</li> <li>• GROW</li> <li>• SHRINK</li> <li>• SHRINK_CANCEL</li> </ul>                                                                                                                                                                                                                                                                     |

| PARAMETER    | VARCHAR2(80) | Name of the parameter for the resize operation                                                                                                                                                                                                                                                                                                                                                                                                        |
| INITIAL_SIZE | NUMBER       | Parameter value at the start of the operation                                                                                                                                                                                                                                                                                                                                                                                                         |
| TARGET_SIZE  | NUMBER       | Requested value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                     |
| FINAL_SIZE   | NUMBER       | Real value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATUS       | VARCHAR2(9)  | Completion status of the operation: <ul style="list-style-type: none"> <li>• INACTIVE</li> <li>• PENDING</li> <li>• COMPLETE</li> <li>• CANCELLED</li> <li>• ERROR</li> </ul>                                                                                                                                                                                                                                                                         |
| START_TIME   | DATE         | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                           |
| END_TIME     | DATE         | End time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.79 V\$MEMORY\_TARGET\_ADVICE

V\$MEMORY\_TARGET\_ADVICE provides information about how the MEMORY\_TARGET parameter should be sized based on current sizing and satisfaction metrics.

| Column             | Datatype | Description                                                                                                                                                                                                                                                                                     |
|--------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEMORY_SIZE        | NUMBER   | If the MEMORY_SIZE_FACTOR column has a value of 1, then this column shows the current size of memory, as set by the MEMORY_TARGET initialization parameter.<br><br>If the value of the MEMORY_SIZE_FACTOR column is less than or greater than 1, then this column shows a proposed memory size. |
| MEMORY_SIZE_FACTOR | NUMBER   | A multiplier for the current memory size. Possible values are 0.25, 0.5, 0.75, 1, 1.5, 1.75, and 2. This multiplier times the current memory size equals the value of the MEMORY_SIZE column.                                                                                                   |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_DB_TIME        | NUMBER   | For current memory size (MEMORY_SIZE_FACTOR = 1), the amount of database time required to complete the current workload. For a proposed memory size, the estimated amount of database time that would be required if the MEMORY_TARGET parameter were changed to the proposed size.                                                                                                                                                             |
| ESTD_DB_TIME_FACTOR | NUMBER   | For a proposed memory size, ratio of estimated database time to current database time                                                                                                                                                                                                                                                                                                                                                           |
| VERSION             | NUMBER   | Version number of this recommendation (this snapshot of the V\$MEMORY_TARGET_ADVICE view)                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

[Table 9-2](#) shows how the information provided in V\$MEMORY\_TARGET\_ADVICE could be used to improve performance. The data indicates that if current memory size is 380M, and you were to increase it to 760M (2x), the current workload would take 80525 units of DBtime as opposed to 115475 units of DBtime, which is a significant improvement in performance.

**Table 9-2 Example of Using V\$MEMORY\_TARGET\_ADVICE**

| MEMORY_SIZE | MEMORY_SIZE_FACTOR<br>OR | ESTD_DB_TIME | ESTD_DB_TIME_FACTOR<br>OR | VERSION |
|-------------|--------------------------|--------------|---------------------------|---------|
| 380         | 1                        | 115475       | 1                         | 3       |
| 95          | .25                      | 200500       | 1.7                       | 3       |
| 190         | .5                       | 125600       | 1.1                       | 3       |
| 760         | 2                        | 80525        | 0.7                       | 3       |

## 9.80 V\$METRIC

V\$METRIC displays the most recent statistic values for the complete set of metrics captured by the Automatic Workload Repository (AWR) infrastructure.

| Column       | Datatype | Description                               |
|--------------|----------|-------------------------------------------|
| BEGIN_TIME   | DATE     | Begin time of the interval                |
| END_TIME     | DATE     | End time of the interval                  |
| INTSIZE_CSEC | NUMBER   | Interval size (in hundredths of a second) |

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_ID        | NUMBER       | Metric Group ID. Refer to the V\$METRICNAME view for the name of the group.                                                                                                                                                                                                                                                                                                                                                                     |
| ENTITY_ID       | NUMBER       | Entity ID for the metric in question. The value of the Entity ID depends upon the metric group. (See the following table for an explanation of possible values.)                                                                                                                                                                                                                                                                                |
| ENTITY_SEQUENCE | NUMBER       | Entity Sequence number for the metric in question. The value of the Entity Sequence depends upon the metric group. (See the following table for an explanation of possible values.)                                                                                                                                                                                                                                                             |
| METRIC_ID       | NUMBER       | Metric ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| METRIC_NAME     | VARCHAR2(64) | Metric Name. This is the statistic that is captured for the entity.                                                                                                                                                                                                                                                                                                                                                                             |
| VALUE           | NUMBER       | Value of the statistic between BEGIN_TIME and END_TIME                                                                                                                                                                                                                                                                                                                                                                                          |
| METRIC_UNIT     | VARCHAR2(64) | Unit for the VALUE                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

The following table describes what the ENTITY\_ID and ENTITY\_SEQUENCE are for each metric group:

| GID | Group NAME                       | Entity ID     | Entity Sequence  |
|-----|----------------------------------|---------------|------------------|
| 0   | Event Metrics                    | Event#        | N/A              |
| 1   | Event Class Metrics              | Wait Class ID | N/A              |
| 2   | System Metrics Long Duration     | N/A           | N/A              |
| 3   | System Metrics Short Duration    | N/A           | N/A              |
| 4   | Session Metrics Long Duration    | Session ID    | Serial#          |
| 5   | Session Metrics Short Duration   | Session ID    | Serial#          |
| 6   | Service Metrics                  | N/A           | Service Hash     |
| 7   | File Metrics Long Duration       | File#         | Creation Change# |
| 9   | Tablespace Metrics Long Duration | Tablespace#   | N/A              |
| 10  | Service Metrics (Short)          | N/A           | Service Hash     |

## 9.81 V\$METRICGROUP

V\$METRICGROUP displays information about the metric group for each of the four major Replication components: capture, propagation, apply, and queue.

| Column   | Datatype     | Description                            |
|----------|--------------|----------------------------------------|
| GROUP_ID | NUMBER       | Internal ID associated with each group |
| NAME     | VARCHAR2(64) | External name of the group             |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INTERVAL_SIZE | NUMBER   | How often to collect statistics                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MAX_INTERVAL  | NUMBER   | Total number of intervals over which statistics should be collected                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.82 V\$METRIC\_HISTORY

V\$METRIC\_HISTORY displays all the available statistic values for the complete set of metrics captured by the Automatic Workload Repository (AWR) infrastructure.

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME      | DATE         | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME        | DATE         | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC    | NUMBER       | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| GROUP_ID        | NUMBER       | Metric Group ID. Refer to the V\$METRICNAME view for the name of the group.                                                                                                                                                                                                                                                                                                                                                                     |
| ENTITY_ID       | NUMBER       | Entity ID for the metric in question. The value of the Entity ID depends upon the metric group. (See the table in the description of V\$METRIC for an explanation of possible values.)                                                                                                                                                                                                                                                          |
| ENTITY_SEQUENCE | NUMBER       | Entity Sequence number for the metric in question. The value of the Entity Sequence depends upon the metric group. (See the table in the description of V\$METRIC for an explanation of possible values.)                                                                                                                                                                                                                                       |
| METRIC_ID       | NUMBER       | Metric ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| METRIC_NAME     | VARCHAR2(64) | Metric Name. This is the statistic that is captured for the entity.                                                                                                                                                                                                                                                                                                                                                                             |
| VALUE           | NUMBER       | Value of the statistic between BEGIN_TIME and END_TIME                                                                                                                                                                                                                                                                                                                                                                                          |
| METRIC_UNIT     | VARCHAR2(64) | Unit for the VALUE                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.83 V\$METRICNAME

V\$METRICNAME displays the mapping of the name of metrics to their metric ID.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_ID    | NUMBER       | Metric group ID                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| GROUP_NAME  | VARCHAR2(64) | Metric group name                                                                                                                                                                                                                                                                                                                                                                                                                               |
| METRIC_ID   | NUMBER       | Metric ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| METRIC_NAME | VARCHAR2(64) | Metric name                                                                                                                                                                                                                                                                                                                                                                                                                                     |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.84 V\$MTTR\_TARGET\_ADVICE

V\$MTTR\_TARGET\_ADVICE displays rows that predict the number of physical I/Os for the MTTR corresponding to each row.

The rows also compute a physical I/O factor, which is the ratio of the number of estimated I/Os to the number of I/Os actually performed by the current MTTR setting during the measurement interval.

The content of the view is empty if MTTR advisory has not been turned on since database startup. Otherwise, it returns the advisory information collected. If advisory is currently off, then this information comes from the last time MTTR advisory was on. FAST\_START\_MTTR\_TARGET must be set to a nonzero value if the STATISTICS\_LEVEL parameter is dynamically modified to turn MTTR advisory on.

If the FAST\_START\_MTTR\_TARGET parameter is changed while MTTR advisory is on, then MTTR advisory is temporarily turned off until the new FAST\_START\_MTTR\_TARGET setting takes effect. During this transition period, the contents of V\$MTTR\_TARGET\_ADVICE reflect the simulation result for the old MTTR setting.

| Column                   | Datatype    | Description                                                                                                                                                                 |
|--------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTTR_TARGET_FOR_ESTIMATE | NUMBER      | MTTR setting being simulated. Equal to the current MTTR setting if this is the first row of the view.                                                                       |
| ADVICE_STATUS            | VARCHAR2(5) | Current status of MTTR simulation: <ul style="list-style-type: none"> <li>ON</li> <li>READY</li> <li>OFF</li> </ul>                                                         |
| DIRTY_LIMIT              | NUMBER      | Dirty buffer limit derived from the MTTR being simulated                                                                                                                    |
| ESTD_CACHE_WRITES        | NUMBER      | Estimated number of cache physical writes under this MTTR                                                                                                                   |
| ESTD_CACHE_WRITE_FACTOR  | NUMBER      | Estimated cache physical write ratio under this MTTR. It is the ratio of the estimated number of cache writes to the number of cache writes under the current MTTR setting. |
| ESTD_TOTAL_WRITES        | NUMBER      | Estimated total number of physical writes under this MTTR                                                                                                                   |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_TOTAL_WRITE_FACTOR | NUMBER   | Estimated total physical write ratio under this MTTR. It is the ratio of the estimated total number of physical writes to the total number of physical writes under the current MTTR setting.                                                                                                                                                                                                                                                   |
| ESTD_TOTAL_IOS          | NUMBER   | Estimated total number of I/Os under this MTTR                                                                                                                                                                                                                                                                                                                                                                                                  |
| ESTD_TOTAL_IO_FACTOR    | NUMBER   | Estimated total I/O ratio under this MTTR. It is the ratio of the estimated total number of I/Os to the total number of I/Os under the current MTTR setting.                                                                                                                                                                                                                                                                                    |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.85 V\$MUTEX\_SLEEP

V\$MUTEX\_SLEEP shows the wait time, and the number of sleeps for each combination of mutex type and location.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MUTEX_TYPE | VARCHAR2(32) | Type of action/object the mutex protects                                                                                                                                                                                                                                                                                                                                                                                                        |
| LOCATION   | VARCHAR2(40) | The code location where the waiter slept for the mutex                                                                                                                                                                                                                                                                                                                                                                                          |
| SLEEPS     | NUMBER       | Number of sleeps for this MUTEX_TYPE and LOCATION                                                                                                                                                                                                                                                                                                                                                                                               |
| WAIT_TIME  | NUMBER       | Wait time in microseconds                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.86 V\$MUTEX\_SLEEP\_HISTORY

V\$MUTEX\_SLEEP\_HISTORY displays time-series data.

Each row in this view is for a specific time, mutex type, location, requesting session and blocking session combination. That is, it shows data related to a specific session (requesting

session) that slept while requesting a specific mutex type and location, because it was being held by a specific blocking session. The data in this view is contained within a circular buffer, with the most recent sleeps shown.

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MUTEX_IDENTIFIER   | NUMBER       | Mutex ID                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SLEEP_TIMESTAMP    | TIMESTAMP(6) | The last date/time this MUTEX_TYPE and LOCATION was slept for by the REQUESTING_SESSION, while being held by the BLOCKING_SESSION.                                                                                                                                                                                                                                                                                                              |
| MUTEX_TYPE         | VARCHAR2(32) | Type of action/object the mutex protects                                                                                                                                                                                                                                                                                                                                                                                                        |
| GETS               | NUMBER       | The total number of gets since the mutex was created and up until the time of the wait (and from all sessions past and present)                                                                                                                                                                                                                                                                                                                 |
| SLEEPS             | NUMBER       | The number of times the requester had to sleep before obtaining the mutex                                                                                                                                                                                                                                                                                                                                                                       |
| REQUESTING_SESSION | NUMBER       | The SID of a session requesting the mutex                                                                                                                                                                                                                                                                                                                                                                                                       |
| BLOCKING_SESSION   | NUMBER       | The SID of a session holding the mutex                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOCATION           | VARCHAR2(40) | The code location where the waiter slept for the mutex                                                                                                                                                                                                                                                                                                                                                                                          |
| MUTEX_VALUE        | RAW(4   8)   | If the mutex is held in exclusive (X) mode, this column shows the SID of the blocking session, else it shows the number of sessions referencing the mutex in S mode.                                                                                                                                                                                                                                                                            |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.87 V\$MVREFRESH

V\$MVREFRESH displays information about the materialized views currently being refreshed.

| Column      | Datatype     | Description                                                                                                                                                                                                                                      |
|-------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID         | NUMBER       | Session identifier                                                                                                                                                                                                                               |
| SERIAL#     | NUMBER       | Session serial number, which is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends with, and another session begins with, the same session ID. |
| CURRMVOWNER | VARCHAR2(31) | Owner of the materialized view currently being refreshed. The materialized view resides in this user's schema.                                                                                                                                   |
| CURRMVNAME  | VARCHAR2(31) | Name of the materialized view currently being refreshed                                                                                                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.88 V\$MYSTAT

V\$MYSTAT contains statistics on the current session.

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID        | NUMBER   | ID of the current session                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATISTIC# | NUMBER   | Number of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE      | NUMBER   | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.89 V\$NFS\_CLIENTS

V\$NFS\_CLIENTS displays information about NFS clients currently connected to the XML DB NFS Server.

| Column                 | Datatype       | Description                                                               |
|------------------------|----------------|---------------------------------------------------------------------------|
| CLIENTID               | NUMBER         | A number identifying the client                                           |
| PRINCIPAL              | VARCHAR2(2000) | User string denoting the principal that set the client ID (SetClientId)   |
| CLIENTOPAQUEIDENTIFIER | VARCHAR2(1000) | Opaque string presented as identification by the client to the NFS server |
| VERIFIER               | RAW(8)         | Verifier presented by the client                                          |
| LEASEEXPIRY            | NUMBER         | Number of seconds in which the lease expires for the client               |
| CLIENTADDR             | VARCHAR2(2000) | Address of the client                                                     |
| CONFIRMED              | VARCHAR2(5)    | TRUE if the client is confirmed; otherwise FALSE                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.90 V\$NFS\_LOCKS

V\$NFS\_LOCKS displays information about byte range locks held on different files by NFS clients.

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPENSTATEID    | RAW(16)        | Open state ID of the open owner                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OPENSEQUENCEID | NUMBER         | Open Sequence ID of the open owner                                                                                                                                                                                                                                                                                                                                                                                                              |
| LOCKSTATEID    | RAW(16)        | Lock state ID of the lock owner                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LOCKSEQUENCEID | NUMBER         | Lock sequence ID of the lock owner                                                                                                                                                                                                                                                                                                                                                                                                              |
| LOCKOWNER      | VARCHAR2(2000) | Opaque string presented as identification by the lock owner to the NFS server                                                                                                                                                                                                                                                                                                                                                                   |
| OFFSET         | NUMBER         | Byte Offset from which lock starts                                                                                                                                                                                                                                                                                                                                                                                                              |
| LENGTH         | NUMBER         | Length of the lock                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LOCKTYPE       | VARCHAR2(20)   | Type of the lock                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.91 V\$NFS\_OPEN\_FILES

V\$NFS\_OPEN\_FILES displays information about all the files currently opened by clients at the NFS server.

| Column          | Datatype       | Description                                                    |
|-----------------|----------------|----------------------------------------------------------------|
| CLIENTID        | NUMBER         | Number identifying the client                                  |
| OPENOWNEROPAQUE | VARCHAR2(2000) | All the files currently opened by clients at the NFS server    |
| OPENSTATEID     | RAW(16)        | Open state ID of the open owner                                |
| FILEHANDLE      | RAW(32)        | FileHandle of the file that has been opened                    |
| OPENSEQUENCEID  | NUMBER         | Open sequence ID of open owner                                 |
| OPENREAD        | VARCHAR2(5)    | TRUE if the file is open for READ operations; otherwise FALSE  |
| OPENWRITE       | VARCHAR2(5)    | TRUE if the file is open for WRITE operations; otherwise FALSE |

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHAREACCESS | VARCHAR2(15) | Sharing mode of the file (SharedReadWrite, SharedRead, SharedWrite)                                                                                                                                                                                                                                                                                                                                                                             |
| SHAREDENY   | VARCHAR2(13) | Deny mode of the file (DenyReadWrite, DenyRead, DenyWrite)                                                                                                                                                                                                                                                                                                                                                                                      |
| CONFIRMED   | VARCHAR2(5)  | TRUE if open is confirmed; otherwise FALSE                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.92 V\$NLS\_PARAMETERS

V\$NLS\_PARAMETERS contains current values of NLS parameters.

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER | VARCHAR2(64) | Parameter names are as follows: NLS_CALENDAR, NLS_CHARACTERSET, NLS_COMP, NLS_CURRENCY, NLS_DATE_FORMAT, NLS_DATE_LANGUAGE, NLS_DUAL_CURRENCY, NLS_ISO_CURRENCY, NLS_LANGUAGE, NLS_LENGTH_SEMANTICS, NLS_NCHAR_CHARACTERSET, NLS_NCHAR_CONV_EXCP, NLS_NUMERIC_CHARACTERS, NLS_SORT, NLS_TERRITORY, NLS_TIMESTAMP_FORMAT, and NLS_TIMESTAMP_TZ_FORMAT.<br><br>Two additional parameters, NLS_TIME_FORMAT and NLS_TIME_TZ_FORMAT, are currently used for internal purposes only. |
| VALUE     | VARCHAR2(64) | NLS parameter value                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                |

## 9.93 V\$NLS\_VALID\_VALUES

V\$NLS\_VALID\_VALUES lists all valid values for NLS parameters.

| Column       | Datatype     | Description                                                               |
|--------------|--------------|---------------------------------------------------------------------------|
| PARAMETER    | VARCHAR2(64) | Parameter name (LANGUAGE   SORT   TERRITORY   CHARACTERSET)               |
| VALUE        | VARCHAR2(64) | NLS parameter value                                                       |
| ISDEPRECATED | VARCHAR2(5)  | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE) |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.94 V\$NONLOGGED\_BLOCK

V\$NONLOGGED\_BLOCK displays ranges of nonlogged datafile blocks recorded in the control file.

Prior to Oracle Database 12c, the presence of any nonlogged blocks in a data file was recorded in the file header via the FIRST\_NONLOGGED\_SCN column of the V\$DATAFILE view. Now with 12c, in addition to the file header data, the ranges themselves are recorded in the control file. A control file range is a superset of the actual nonlogged blocks, meaning that small ranges can be merged to form larger ranges, even when there are some valid blocks between the smaller ranges.

The information in the view is maintained by RMAN VALIDATE, RMAN RESTORE, RMAN RECOVER, and Flashback Database and Media Recovery. A non RMAN-based restore will cause the data to become invalid, and it will be purged the next time any of those tasks are invoked and involve the file. As a result of space reuse, it is possible for ranges to no longer contain any nonlogged blocks. An RMAN VALIDATE command can be used to synchronize the ranges with the actual nonlogged blocks found from a scan of the data file.

| Column                  | Datatype     | Description                                                                                                                                                                                                            |
|-------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#                   | NUMBER       | Absolute file number of the data file that contains the nonlogged blocks                                                                                                                                               |
| BLOCK#                  | NUMBER       | Block number of the first nonlogged block in the range of nologged blocks                                                                                                                                              |
| BLOCKS                  | NUMBER       | Number of nonlogged blocks found starting with BLOCK#                                                                                                                                                                  |
| NONLOGGED_START_CHANGE# | NUMBER       | The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.                                                                                                                             |
| NONLOGGED_START_TIME    | DATE         | The time that corresponds to NONLOGGED_START_CHANGE#. NULL if unknown.                                                                                                                                                 |
| NONLOGGED_END_CHANGE#   | NUMBER       | The largest SCN on which any block in this block range became nonlogged. NULL if unknown.                                                                                                                              |
| NONLOGGED_END_TIME      | DATE         | The time that corresponds to NONLOGGED_END_CHANGE#. NULL if unknown.                                                                                                                                                   |
| RESETLOGS_CHANGE#       | NUMBER       | The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.                                                                                                         |
| RESETLOGS_TIME          | DATE         | The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.                                                                                                         |
| OBJECT#                 | VARCHAR2(40) | The object ID this range belongs to. If this field is NULL, the object number is unknown.                                                                                                                              |
| REASON                  | VARCHAR2(9)  | The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN. |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.95 V\$OBJECT\_DEPENDENCY

V\$OBJECT\_DEPENDENCY displays the objects depended on by a package, procedure, or cursor that is currently loaded in the shared pool. For example, together with V\$SESSION and V\$SQL, this view can be used to determine which tables are used in the SQL statement that a user is currently executing.

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FROM_ADDRESS | RAW(4   8)     | Address of a procedure, package, or cursor that is currently loaded in the shared pool                                                                                                                                                                                                                                                                                                                                                                 |
| FROM_HASH    | NUMBER         | Hash value of a procedure, package, or cursor that is currently loaded in the shared pool                                                                                                                                                                                                                                                                                                                                                              |
| TO_OWNER     | VARCHAR2(64)   | Owner of the object that is depended on                                                                                                                                                                                                                                                                                                                                                                                                                |
| TO_NAME      | VARCHAR2(1000) | Name of the object that is depended on                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TO_ADDRESS   | RAW(4   8)     | Address of the object that is depended on. These can be used to look up more information on the object in V\$DB_OBJECT_CACHE.                                                                                                                                                                                                                                                                                                                          |
| TO_HASH      | NUMBER         | Hash value of the object that is depended on. These can be used to look up more information on the object in V\$DB_OBJECT_CACHE.                                                                                                                                                                                                                                                                                                                       |
| TO_TYPE      | NUMBER         | Type of the object that is depended on                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID       | NUMBER         | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.96 V\$OBJECT\_PRIVILEGE

V\$OBJECT\_PRIVILEGE displays information about privileges associated with an object.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_TYPE_NAME | VARCHAR2(64) | Name of the object type                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBJECT_TYPE_ID   | NUMBER       | ID of the object type                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PRIVILEGE_ID     | NUMBER       | ID of the privilege                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PRIVILEGE_NAME   | VARCHAR2(64) | Name of the privilege                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.97 V\$OBsolete\_BACKUP\_FILES

V\$OBsolete\_BACKUP\_FILES displays all obsolete backups, copies, and archived logs according to the current retention policy.

This view requires that the database is set using the DBMS\_RCVMAN.SETDATABASE procedure.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKEY         | NUMBER       | Primary key for the backup                                                                                                                                                                                                                                                                                                                        |
| BACKUP_TYPE  | VARCHAR2(32) | Type of the backup: <ul style="list-style-type: none"> <li>• BACKUP SET</li> <li>• COPY</li> <li>• PROXY COPY</li> </ul>                                                                                                                                                                                                                          |
| FILE_TYPE    | VARCHAR2(32) | Type of the file: <ul style="list-style-type: none"> <li>• DATAFILE</li> <li>• CONTROLFILE</li> <li>• SPFILE</li> <li>• REDO LOG</li> <li>• PIECE</li> </ul>                                                                                                                                                                                      |
| KEEP         | VARCHAR2(3)  | Indicates whether the backup has a retention policy different from the value for CONFIGURE RETENTION POLICY (YES) or not (NO)                                                                                                                                                                                                                     |
| KEEP_UNTIL   | DATE         | If the KEEP UNTIL TIME clause of the BACKUP command was specified, then this column shows the date after which the backup becomes obsolete. If the column is null and KEEP_OPTIONS is not null, the backup never becomes obsolete.                                                                                                                |
| KEEP_OPTIONS | VARCHAR2(13) | KEEP options for the backup: <ul style="list-style-type: none"> <li>• LOGS - RMAN keeps the logs needed to recover the backup</li> <li>• NOLOGS - RMAN does not keep the logs needed to recover the backup</li> </ul> <p>If this column is null, then the backup has no KEEP options and will be made obsolete based on the retention policy.</p> |

| Column                | Datatype       | Description                                                                                                                                              |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                | VARCHAR2(16)   | Status of the backup: <ul style="list-style-type: none"> <li>• AVAILABLE</li> <li>• UNAVAILABLE</li> <li>• EXPIRED</li> <li>• OTHER</li> </ul>           |
| FNAME                 | VARCHAR2(1024) | Name of the file                                                                                                                                         |
| TAG                   | VARCHAR2(32)   | Tag of the piece, copy, or proxy copy                                                                                                                    |
| MEDIA                 | VARCHAR2(80)   | Media ID of the piece or proxy copy                                                                                                                      |
| RECID                 | NUMBER         | Recid of the record in the controlfile                                                                                                                   |
| STAMP                 | NUMBER         | Stamp of the record in the controlfile                                                                                                                   |
| DEVICE_TYPE           | VARCHAR2(255)  | Type of media device that stores the backup                                                                                                              |
| BLOCK_SIZE            | NUMBER         | Block size for the backup (in bytes)                                                                                                                     |
| COMPLETION_TIME       | DATE           | Time when the backup completed                                                                                                                           |
| BS_KEY                | NUMBER         | Primary key of the backup set (valid only when BACKUP_TYPE is BACKUP SET)                                                                                |
| BS_COUNT              | NUMBER         | Count of the backup set from the controlfile record (valid only when BACKUP_TYPE is BACKUP SET)                                                          |
| BS_STAMP              | NUMBER         | Stamp of the backup set from the controlfile record (valid only when BACKUP_TYPE is BACKUP SET)                                                          |
| BS_TYPE               | VARCHAR2(32)   | Type of the backup set (valid only when BACKUP_TYPE is BACKUP SET): <ul style="list-style-type: none"> <li>• DATAFILE</li> <li>• ARCHIVED LOG</li> </ul> |
| BS_INCR_TYPE          | VARCHAR2(32)   | Incremental level of the backup set (valid only when BACKUP_TYPE is BACKUP SET)                                                                          |
| BS_PIECES             | NUMBER         | Number of backup pieces in the backup set (valid only when BACKUP_TYPE is BACKUP SET)                                                                    |
| BS_COMPLETION_TIME    | DATE           | Completion time of the backup set (valid only when BACKUP_TYPE is BACKUP SET)                                                                            |
| BP_PIECE#             | NUMBER         | Number of the backup piece (valid only when FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP SET)                                                            |
| BP_COPY#              | NUMBER         | Copy number of the backup piece (valid only when FILE_TYPE is PIECE and BACKUP_TYPE is BACKUP SET)                                                       |
| DF_FILE#              | NUMBER         | Absolute file number of the datafile (valid only when FILE_TYPE is DATAFILE)                                                                             |
| DF_RESETLOGS_CHANGE#  | NUMBER         | System change number (SCN) of the most recent RESETLOGS when the control file or datafile was created (valid only when FILE_TYPE is DATAFILE)            |
| DF_CREATION_CHANGE#   | NUMBER         | Creation SCN of the control file or datafile (valid only when FILE_TYPE is DATAFILE)                                                                     |
| DF_CHECKPOINT_CHANGE# | NUMBER         | System change number (SCN) of the most recent control file or datafile checkpoint (valid only when FILE_TYPE is DATAFILE)                                |
| DF_CKP_MOD_TIME       | DATE           | Modification time in case of SPFILE, otherwise time when the control file or datafile was checkpointed (valid only when FILE_TYPE is DATAFILE)           |
| RL_THREAD#            | NUMBER         | Number of the redo thread (valid only when FILE_TYPE is REDO LOG)                                                                                        |
| RL_SEQUENCE#          | NUMBER         | Log sequence number (valid only when FILE_TYPE is REDO LOG)                                                                                              |

| Column               | Datatype | Description                                                                                                                 |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------|
| RL_RESETLOGS_CHANGE# | NUMBER   | System change number (SCN) of the most recent RESETLOGS when the record was created (valid only when FILE_TYPE is REDO LOG) |
| RL_FIRST_CHANGE#     | NUMBER   | First SCN of the redo log (valid only when FILE_TYPE is REDO LOG)                                                           |
| RL_FIRST_TIME        | DATE     | Time when Oracle switched into the redo log (valid only when FILE_TYPE is REDO LOG)                                         |
| RL_NEXT_CHANGE#      | NUMBER   | First SCN of the next redo log in the thread (valid only when FILE_TYPE is REDO LOG)                                        |
| RL_NEXT_TIME         | DATE     | First timestamp of the next redo log in the thread (valid only when FILE_TYPE is REDO LOG)                                  |

## 9.98 V\$OBsolete\_PARAMETER

V\$OBsolete\_PARAMETER displays information about obsolete initialization parameters. If any row of the view contains TRUE in the ISSPECIFIED column, then you should examine why.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2(64) | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ISSPECIFIED | VARCHAR2(5)  | Indicates whether the parameter was specified in the parameter file (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.99 V\$OFFLINE\_RANGE

V\$OFFLINE\_RANGE displays datafile offline information from the control file.

Note that the last offline range of each datafile is kept in the DATAFILE record.

An offline range is created for a datafile when its tablespace is first altered to be OFFLINE NORMAL or READ ONLY, and then subsequently altered to be ONLINE or read/write. Note that no offline range is created if the datafile itself is altered to be OFFLINE or if the tablespace is altered to be OFFLINE IMMEDIATE.

## 9.100 V\$OFS\_STATS

V\$OFS\_STATS displays performance statistics for various Oracle File System operations. These statistics are maintained at per mount level.

| Column       | Datatype        | Description                           |
|--------------|-----------------|---------------------------------------|
| OFS_MNTPNT   | VARCHAR2 (4096) | Mount point                           |
| OFS_LOOKUP   | NUMBER          | Number of lookup operations performed |
| OFS_FORGET   | NUMBER          | Number of forget operations performed |
| OFS_GETATTR  | NUMBER          | Number of getattr operations          |
| OFS_SETATTR  | NUMBER          | Number of setattr operations          |
| OFS_READLINK | NUMBER          | Number of readlink operations         |
| OFS_SYMLINK  | NUMBER          | Number of symlink operations          |
| OFS_MKNOD    | NUMBER          | Number of mknod operations            |
| OFS_MKDIR    | NUMBER          | Number of mkdir operations            |
| OFS_UNLINK   | NUMBER          | Number of remove file operations      |
| OFS_RMDIR    | NUMBER          | Number of remove directory operations |
| OFS_RENAME   | NUMBER          | Number of file rename operations      |
| OFS_LINK     | NUMBER          | Number of hard link operations        |
| OFS_OPEN     | NUMBER          | Number of file open operations        |
| OFS_READ     | NUMBER          | Number of file read operations        |

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OFS_WRITE         | NUMBER   | Number of file write operations                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OFS_STATFS        | NUMBER   | Number of statfs operations performed                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 9.101 V\$OFSMOUNT

V\$OFSMOUNT provides information about the file systems that are mounted by Oracle File System.

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OFS_MNTPATH  | VARCHAR2(1024) | Mount path where the file system is mounted                                                                                                                                                                                                                                                                                                                                                                                                 |
| OFS_FSPATH   | VARCHAR2(1024) | File system path                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OFS_MNTOPTS  | VARCHAR2(1024) | Mount options used to mount the file system                                                                                                                                                                                                                                                                                                                                                                                                 |
| OFS_MNTFLAGS | VARCHAR2(7)    | Flags to specify if the file system is mounted. A value of 1 indicates that the file system is mounted.                                                                                                                                                                                                                                                                                                                                     |
| CON_ID       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| OFS_NODENM   | VARCHAR2(255)  | Node name                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OFS_FSID     | NUMBER         | Unique ID that identifies the mounted file system                                                                                                                                                                                                                                                                                                                                                                                           |
| OFS_FSTYPE   | VARCHAR2(255)  | Oracle file system type. This is the value that is passed to the <code>dbms_fs.mount_oracle_fs()</code> procedure. Some of the expected values are <code>dbfs</code> and <code>ofs</code> .                                                                                                                                                                                                                                                 |

The table resides in this user's schema.                                                                                                                                                                                                                                                                                                                                                  |
| ORIGINAL_TABLE_NAME      | VARCHAR2(129)  | Name of the original table                                                                                                                                                                                                                                                                                                                                                                                                              |
| INTERIM_TABLE_NAME       | VARCHAR2(1024) | Interim table currently being redefined                                                                                                                                                                                                                                                                                                                                                                                                 |
| PARTITION_NAME           | VARCHAR2(1024) | Partition of the table currently being redefined. The table resides in this user's schema.                                                                                                                                                                                                                                                                                                                                              |
| OPERATION                | VARCHAR2(128)  | Operations during the redefining process: <ul style="list-style-type: none"> <li>• start_redef_table</li> <li>• sync_interim_table</li> <li>• copy_table_dependents</li> <li>• finish_redef_table</li> <li>• abort_redef_table</li> </ul>                                                                                                                                                                                               |
| SUBOPERATION             | VARCHAR2(128)  | Sub operation during the redefining process                                                                                                                                                                                                                                                                                                                                                                                             |
| DETAILED_MESSAGE         | VARCHAR2(1024) | Details of operations during redefining process. This can include details such as the number of DML being processed, execution start_time, and partition_name                                                                                                                                                                                                                                                                           |
| PROGRESS                 | VARCHAR2(128)  | Percentage of completion of each operation                                                                                                                                                                                                                                                                                                                                                                                              |
| REFRESH_STATEMENT_SQL_ID | VARCHAR2(128)  | The SQL ID for the statement in the REFRESH_STATEMENT column                                                                                                                                                                                                                                                                                                                                                                            |
| REFRESH_STATEMENT        | VARCHAR2(4000) | A refresh statement executed during a refresh operation in some online redefinition procedures. When refresh is a sub operation in the SUBOPERATION column, there will be a refresh statement in this REFRESH_STATEMENT column.                                                                                                                                                                                                         |
| CON_ID                   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 9.103 V\$OPEN\_CURSOR

V\$OPEN\_CURSOR lists cursors that each user session currently has opened and parsed, or cached.

| Column     | Datatype      | Description                                                                               |
|------------|---------------|-------------------------------------------------------------------------------------------|
| SADDR      | RAW(4   8)    | Session address                                                                           |
| SID        | NUMBER        | Session identifier                                                                        |
| USER_NAME  | VARCHAR2(128) | User that is logged in to the session                                                     |
| ADDRESS    | RAW(4   8)    | Used with HASH_VALUE to uniquely identify the SQL statement being executed in the session |
| HASH_VALUE | NUMBER        | Used with ADDRESS to uniquely identify the SQL statement being executed in the session    |
| SQL_ID     | VARCHAR2(13)  | SQL identifier of the SQL statement being executed in the session                         |

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT             | VARCHAR2(60) | First 60 characters of the SQL statement that is parsed into the open cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_SQL_ACTIVE_TIME | DATE         | Time when this cursor was last executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SQL_EXEC_ID          | NUMBER       | If the open cursor is executing, then the SQL execution identifier for that execution (see V\$SQL_MONITOR)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CURSOR_TYPE          | VARCHAR2(64) | Type of cursor: <ul style="list-style-type: none"> <li>• OPEN PL/SQL - Open PL/SQL cursors</li> <li>• OPEN - Other open cursors</li> <li>• SESSION CURSOR CACHED - Cursors cached in the generic session cursor cache</li> <li>• OPEN-RECURSIVE - Open recursive cursors</li> <li>• DICTIONARY LOOKUP CURSOR CACHED - Cursors cached in the dictionary lookup cursor cache</li> <li>• BUNDLE DICTIONARY LOOKUP CACHED - Cursors cached in the bundled dictionary lookup cursor cache</li> <li>• JAVA NAME TRANSLATION CURSOR CACHED - Cursors cached in the Java name translation cursor cache</li> <li>• REPLICATION TRIGGER CURSOR CACHED - Cursors cached in the replication trigger cursor cache</li> <li>• CONSTRAINTS CURSOR CACHED - Cursors cached in the constraints cursor cache</li> <li>• PL/SQL CURSOR CACHED - Cursors cached in the PL/SQL cursor cache</li> </ul> |
| CHILD_ADDRESS        | RAW(4   8)   | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 9.104 V\$OPTIMIZER\_PROCESSING\_RATE

V\$OPTIMIZER\_PROCESSING\_RATE displays the processing rates used by the optimizer to compute degree of parallelism.

### ① Note

You can manipulate these rates using these procedures for the DBMS\_STATS package:

- SET\_PROCESSING\_RATE
- DELETE\_PROCESSING\_RATE
- GATHER\_PROCESSING\_RATE

See *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_STATS package.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS           | RAW(4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| OPERATION_NAME    | VARCHAR2(64) | Name of the operation. The possible values are AGGR, ALL, CPU, CPU_ACCESS, CPU_AGGR, CPU_BYTES_PER_SEC, CPU_FILTER, CPU_GBY, CPU_HASH_JOIN, CPU_JOIN, CPU_NL_JOIN, CPU_RANDOM_ACCESS, CPU_ROWS_PER_SEC, CPU_SEQUENTIAL_ACCESS, CPU_SM_JOIN, CPU_SORT, HASH, IO, IO_ACCESS, IO_BYTES_PER_SEC, IO_RANDOM_ACCESS, IO_ROWS_PER_SEC, IO_SEQUENTIAL_ACCESS, MEMCMP, MEMCPY                                                                            |
| MANUAL_VALUE      | VARCHAR2(10) | Value of the operation set manually by the user                                                                                                                                                                                                                                                                                                                                                                                                 |
| CALIBRATION_VALUE | VARCHAR2(10) | Value of the operation obtained from calibration (by running the GATHER_PROCESSING_RATE procedure)                                                                                                                                                                                                                                                                                                                                              |
| DEFAULT_VALUE     | VARCHAR2(10) | Default value of the operation                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.105 V\$OPTION

V\$OPTION displays Oracle Database options and features.

Typically, although not always, options must be separately licensed, whereas features come with the product and are enabled based on the product that is running (for example, Enterprise Edition).

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER | VARCHAR2(64) | Name of the option (or feature)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| VALUE     | VARCHAR2(64) | Indicates whether the option (or feature) is installed (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.106 V\$OSSTAT

V\$OSSTAT displays system utilization statistics from the operating system. One row is returned for each system statistic.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_NAME  | VARCHAR2(64) | Name of the statistic (see <a href="#">Table 9-3</a> )                                                                                                                                                                                                                                                                                                                                                                                          |
| VALUE      | NUMBER       | Instantaneous statistic value                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OSSTAT_ID  | NUMBER       | Statistic ID                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMMENTS   | VARCHAR2(64) | Any additional operating system-specific clarifications for the statistic                                                                                                                                                                                                                                                                                                                                                                       |
| CUMULATIVE | VARCHAR2(3)  | Indicates whether the statistic is cumulative (that is, accumulates over time) (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Table 9-3 V\$OSSTAT Statistics**

| Statistic Name  | Description                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| NUM_CPUS        | Number of CPUs or processors available                                                                                         |
| IDLE_TIME       | Number of hundredths of a second that a processor has been idle, totalled over all processors                                  |
| BUSY_TIME       | Number of hundredths of a second that a processor has been busy executing user or kernel code, totalled over all processors    |
| USER_TIME       | Number of hundredths of a second that a processor has been busy executing user code, totalled over all processors              |
| SYS_TIME        | Number of hundredths of a second that a processor has been busy executing kernel code, totalled over all processors            |
| IOWAIT_TIME     | Number of hundredths of a second that a processor has been waiting for I/O to complete, totalled over all processors           |
| NICE_TIME       | Number of hundredths of a second that a processor has been busy executing low-priority user code, totalled over all processors |
| AVG_IDLE_TIME   | Number of hundredths of a second that a processor has been idle, averaged over all processors                                  |
| AVG_BUSY_TIME   | Number of hundredths of a second that a processor has been busy executing user or kernel code, averaged over all processors    |
| AVG_USER_TIME   | Number of hundredths of a second that a processor has been busy executing user code, averaged over all processors              |
| AVG_SYS_TIME    | Number of hundredths of a second that a processor has been busy executing kernel code, averaged over all processors            |
| AVG_IOWAIT_TIME | Number of hundredths of a second that a processor has been waiting for I/O to complete, averaged over all processors           |

Table 9-3 (Cont.) V\$OSSTAT Statistics

| Statistic Name           | Description                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_NICE_TIME            | Number of hundredths of a second that a processor has been busy executing low-priority user code, averaged over all processors                                                                                                |
| OS_CPU_WAIT_TIME         | Total number of hundredths of a second that processes have been in a ready state, waiting to be selected by the operating system scheduler to run                                                                             |
| RSRC_MGR_CPU_WAIT_TIME   | Total number of hundredths of a second that Oracle processes have been in a ready state, waiting for CPU to be available for their consumer group in the currently active resource plan                                       |
| VM_IN_BYTES              | Total number of bytes of data that have been paged in due to virtual memory paging                                                                                                                                            |
| VM_OUT_BYTES             | Total number of bytes of data that have been paged out due to virtual memory paging                                                                                                                                           |
| PHYSICAL_MEMORY_BYTES    | Total number of bytes of physical memory                                                                                                                                                                                      |
| LOAD                     | Current number of processes that are either running or in the ready state, waiting to be selected by the operating-system scheduler to run. On many platforms, this statistic reflects the average load over the past minute. |
| NUM_CPU_CORES            | Number of CPU cores available (includes subcores of multicore CPUs as well as single-core CPUs)                                                                                                                               |
| NUM_CPU_SOCKETS          | Number of CPU sockets available (represents an absolute count of CPU chips on the system, regardless of multithreading or multi-core architectures)                                                                           |
| NUM_VCPUS                | Number of virtual CPUs available                                                                                                                                                                                              |
| NUM_LCPUS                | Number of logical CPUs available (includes hardware threads if hardware threading is turned on)                                                                                                                               |
| TCP_SEND_SIZE_MIN        | Minimum size of the TCP send buffer                                                                                                                                                                                           |
| TCP_SEND_SIZE_DEFAULT    | Default size of the TCP send buffer                                                                                                                                                                                           |
| TCP_SEND_SIZE_MAX        | Maximum size of the TCP send buffer                                                                                                                                                                                           |
| TCP_RECEIVE_SIZE_MIN     | Minimum size of the TCP receive buffer                                                                                                                                                                                        |
| TCP_RECEIVE_SIZE_DEFAULT | Default size of the TCP receive buffer                                                                                                                                                                                        |
| TCP_RECEIVE_SIZE_MAX     | Maximum size of the TCP receive buffer                                                                                                                                                                                        |
| GLOBAL_SEND_SIZE_MAX     | Maximum size of the global send buffer                                                                                                                                                                                        |
| GLOBAL_RECEIVE_SIZE_MAX  | Maximum size of the global receive buffer                                                                                                                                                                                     |

**Note**

The availability of all statistics except for NUM\_CPUS and RSRC\_MGR\_CPU\_WAIT\_TIME is subject to the operating system platform on which the Oracle Database is running.

## 9.107 V\$PARALLEL\_DEGREE\_LIMIT\_MTH

V\$PARALLEL\_DEGREE\_LIMIT\_MTH displays all available parallel degree limit resource allocation methods.

| Column | Datatype     | Description                                                  |
|--------|--------------|--------------------------------------------------------------|
| NAME   | VARCHAR2(40) | Name of the parallel degree limit resource allocation method |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.108 V\$PARAMETER

V\$PARAMETER displays information about the initialization parameters that are currently in effect for the session. A new session inherits parameter values from the instance-wide values displayed by the V\$SYSTEM\_PARAMETER view.

| Column           | Datatype       | Description                                                                                                                                                                                                                                                                                               |
|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM              | NUMBER         | Parameter number                                                                                                                                                                                                                                                                                          |
| NAME             | VARCHAR2(80)   | Name of the parameter                                                                                                                                                                                                                                                                                     |
| TYPE             | NUMBER         | <p>Parameter type:</p> <ul style="list-style-type: none"> <li>• 1 - Boolean</li> <li>• 2 - String</li> <li>• 3 - Integer</li> <li>• 4 - Parameter file</li> <li>• 5 - Reserved</li> <li>• 6 - Big integer</li> </ul>                                                                                      |
| VALUE            | VARCHAR2(4000) | Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value                                                                                                                                                                                            |
| DISPLAY_VALUE    | VARCHAR2(4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                   |
| DEFAULT_VALUE    | VARCHAR2(255)  | The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.                                                                                                                                                                        |
| ISDEFAULT        | VARCHAR2(9)    | <p>Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE).</p> <p>The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).</p> |
| ISSES_MODIFIABLE | VARCHAR2(5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                   |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISSYS_MODIFIABLE      | VARCHAR2(9)   | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2(5)   | Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ISINSTANCE_MODIFIABLE | VARCHAR2(5)   | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                                                                                                                                                                                                                                                                          |
| ISMODIFIED            | VARCHAR2(10)  | Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> <li>MODIFIED - Parameter has been modified with ALTER SESSION</li> <li>SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified)</li> <li>FALSE - Parameter has not been modified after instance startup</li> </ul>                                                                                                                                                                                                                                                                             |
| ISADJUSTED            | VARCHAR2(5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ISDEPRECATED          | VARCHAR2(5)   | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ISBASIC               | VARCHAR2(5)   | Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DESCRIPTION           | VARCHAR2(255) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| UPDATE_COMMENT        | VARCHAR2(255) | Comments associated with the most recent update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| HASH                  | NUMBER        | Hash value for the parameter name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                          |

### Examples

The following query returns the default value for the ALLOW\_GLOBAL\_DBLINKS initialization parameter:

```
SQL> SELECT name, default_value FROM v$parameter
2 WHERE name = 'allow_global_dblinks';
```

```
NAME

DEFAULT_VALUE

allow_global_dblinks
FALSE

SQL>
```

The following query shows that the ALLOW\_GLOBAL\_DBLINKS initialization parameter is not modifiable in a PDB:

```
SQL> SELECT name, ispdb_modifiable FROM v$parameter
 2 WHERE name = 'allow_global_dblinks';

NAME

ISPD

allow_global_dblinks
FALSE

SQL>
```

## 9.109 V\$PARAMETER\_VALID\_VALUES

V\$PARAMETER\_VALID\_VALUES displays a list of valid values for list parameters.

| Column    | Datatype      | Description                                                                      |
|-----------|---------------|----------------------------------------------------------------------------------|
| NUM       | NUMBER        | Parameter number                                                                 |
| NAME      | VARCHAR2(64)  | Parameter name                                                                   |
| ORDINAL   | NUMBER        | Ordinal number in the list (1-based)                                             |
| VALUE     | VARCHAR2(255) | Parameter value at ordinal                                                       |
| ISDEFAULT | VARCHAR2(64)  | Indicates whether the given ordinal value is the default value for the parameter |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.110 V\$PARAMETER2

V\$PARAMETER2 displays information about the initialization parameters that are currently in effect for the session, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values displayed in the V\$SYSTEM\_PARAMETER2 view.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is *a*, *b*, then the V\$PARAMETER view does not tell you if the parameter has two values (both *a* and *b*) or one value (*a*, *b*). V\$PARAMETER2 makes the distinction between the list parameter values clear.

| Column           | Datatype       | Description                                                                                                                                                                                                          |
|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM              | NUMBER         | Parameter number                                                                                                                                                                                                     |
| NAME             | VARCHAR2(80)   | Name of the parameter                                                                                                                                                                                                |
| TYPE             | NUMBER         | <p>Parameter type:</p> <ul style="list-style-type: none"> <li>• 1 - Boolean</li> <li>• 2 - String</li> <li>• 3 - Integer</li> <li>• 4 - Parameter file</li> <li>• 5 - Reserved</li> <li>• 6 - Big integer</li> </ul> |
| VALUE            | VARCHAR2(4000) | Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value                                                                                                       |
| DISPLAY_VALUE    | VARCHAR2(4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                              |
| ISDEFAULT        | VARCHAR2(6)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)                                                                                |
| ISSES_MODIFIABLE | VARCHAR2(5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                              |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISSYS_MODIFIABLE      | VARCHAR2(9)   | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2(5)   | Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE).<br>In a non-CDB, the value of this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ISINSTANCE_MODIFIABLE | VARCHAR2(5)   | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                                                                                                                                                                                                                                                                          |
| ISMODIFIED            | VARCHAR2(10)  | Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> <li>MODIFIED - Parameter has been modified with ALTER SESSION</li> <li>SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified)</li> <li>FALSE - Parameter has not been modified after instance startup</li> </ul>                                                                                                                                                                                                                                                                             |
| ISADJUSTED            | VARCHAR2(5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ISDEPRECATED          | VARCHAR2(5)   | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ISBASIC               | VARCHAR2(5)   | Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DESCRIPTION           | VARCHAR2(255) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ORDINAL               | NUMBER        | Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| UPDATE_COMMENT        | VARCHAR2(255) | Comments associated with the most recent update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                          |

## 9.111 V\$PASSWORDFILE\_INFO

V\$PASSWORDFILE\_INFO provides information about the database password file.

This view can be queried from the root or from a pluggable database (PDB) in a multitenant container database (CDB). When queried, this view always returns one row.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                   |
|---------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME           | VARCHAR2(513) | Fully qualified password file name/location.                                                                                                                                                                                                                                                  |
| FORMAT              | VARCHAR2(6)   | Shows the format of the password file: <ul style="list-style-type: none"><li>• LEGACY</li><li>• 12</li><li>• 12.2</li></ul>                                                                                                                                                                   |
| IS_ASM              | VARCHAR2(5)   | Indicates whether the password file is stored in Oracle ASM. Possible values: <ul style="list-style-type: none"><li>• TRUE: The password file is stored in Oracle ASM.</li><li>• FALSE: The password file is stored in Oracle Exascale or in the operating system file system.</li></ul>      |
| IS_EXC <sup>1</sup> | VARCHAR2(5)   | Indicates whether the password file is stored in Oracle Exascale. Possible values: <ul style="list-style-type: none"><li>• TRUE: The password file is stored in Oracle Exascale.</li><li>• FALSE: The password file is stored in Oracle ASM or in the operating system file system.</li></ul> |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Because there is only one password file for a CDB that is common for the entire CDB, the only value possible for CON_ID is 0 for this view.                                                                                               |

<sup>1</sup> This column is available starting with Oracle Database 21c.

**① Note**

If the database password file name or location was recently changed, and you do not see the change reflected in this view, you can run the following SQL statement:

```
SQL> ALTER SYSTEM FLUSH PASSWORDFILE_METADATA_CACHE;
```

This statement flushes the metadata cache and updates the database to use the new password file. It also updates this view with the current password file information.

## 9.112 V\$PATCHES

V\$PATCHES shows the patches applied on an Oracle ASM instance and the list of patches applied to an Oracle Grid infrastructure home directory.

### Note

If this view is queried in an RDBMS instance, no patch information is returned.

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATCH_ID | NUMBER   | Patch identifier                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.113 V\$PDB\_INCARNATION

V\$PDB\_INCARNATION displays information about all PDB incarnations. Oracle creates a new PDB incarnation whenever a PDB is opened with the RESETLOGS option.

| Column                     | Datatype     | Description                                                                                                                                                                                          |
|----------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_INCARNATION#            | NUMBER       | Database incarnation number                                                                                                                                                                          |
| PDB_INCARNATION#           | NUMBER       | PDB incarnation number                                                                                                                                                                               |
| STATUS                     | VARCHAR2(7)  | Incarnation status: <ul style="list-style-type: none"> <li>ORPHAN: Orphan incarnation</li> <li>CURRENT: Current incarnation of the PDB</li> <li>PARENT: Parent of the current incarnation</li> </ul> |
| INCARNATION_SCN            | NUMBER       | The SCN to flashback or recover to for this PDB incarnation                                                                                                                                          |
| INCARNATION_TIME           | DATE         | The point in time recovered to for this PDB incarnation                                                                                                                                              |
| BEGIN_RESETLOGS_SCN        | NUMBER       | The SCN at the beginning of PDB resetlogs                                                                                                                                                            |
| BEGIN_RESETLOGS_TIME       | DATE         | The time at the beginning of PDB resetlogs                                                                                                                                                           |
| END_RESETLOGS_SCN          | NUMBER       | The SCN at the end of PDB resetlogs                                                                                                                                                                  |
| END_RESETLOGS_TIME         | DATE         | The time at the end of PDB resetlogs                                                                                                                                                                 |
| PRIOR_DB_INCARNATION#      | NUMBER       | Parent database incarnation number                                                                                                                                                                   |
| PRIOR_PDB_INCARNATION#     | VARCHAR2(40) | Parent PDB incarnation number                                                                                                                                                                        |
| FLASHBACK_DATABASE_ALLOWED | VARCHAR2(3)  | Indicates whether the PDB can be flashbacked to this incarnation as part of a flashback database operation for the CDB                                                                               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.114 V\$PDBS

V\$PDBS displays information about PDBs associated with the current instance.

| Column     | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID     | NUMBER                      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| DBID       | NUMBER                      | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB                                                                                                                                                                                                                                                                                                                                               |
| CON_UID    | NUMBER                      | Unique identifier associated with the PDB                                                                                                                                                                                                                                                                                                                                                                                                              |
| GUID       | RAW(16)                     | Globally unique identifier (GUID) of this PDB                                                                                                                                                                                                                                                                                                                                                                                                          |
| NAME       | VARCHAR2(128)               | Name of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPEN_MODE  | VARCHAR2(10)                | <p>Open mode information. Possible values:</p> <ul style="list-style-type: none"> <li>MOUNTED</li> <li>READ WRITE</li> <li>READ ONLY</li> <li>MIGRATE</li> </ul>                                                                                                                                                                                                                                                                                       |
| RESTRICTED | VARCHAR2(3)                 | <p>Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB. Possible values:</p> <ul style="list-style-type: none"> <li>YES</li> <li>NO</li> <li>NULL</li> </ul>                                                                                                                                                                                                                                                   |
| OPEN_TIME  | TIMESTAMP(3) WITH TIME_ZONE | Date and time when the database was last opened                                                                                                                                                                                                                                                                                                                                                                                                        |
| CREATE_SCN | NUMBER                      | System change number (SCN) for the creation of this PDB                                                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_SIZE | NUMBER                      | Shows the disk space (in bytes) used by the PDB, including both data and temp files.                                                                                                                                                                                                                                                                                                                                                                   |
| BLOCK_SIZE | NUMBER                      | The current block size for the PDB                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_STATUS         | VARCHAR2(26) | Shows the recovery status for the PDB. Possible values: <ul style="list-style-type: none"> <li>DISABLED: The PDB is offline. This is similar to all files belonging to this PDB being offline, except that all files to be added to this PDB in the future will also be offline to begin with.</li> <li>DISABLED AUTOMATIC RECOVER: Same as DISABLED, except that standby Active Data Guard recovery will automatically attempt to spawn PDB recovery isolation for the PDB and transition the PDB into ENABLED.</li> <li>ENABLED: The PDB is not offline at the PDB level. Individual files in the PDB may be online or offline at the file level.</li> </ul> |
| SNAPSHOT_PARENT_CON_ID  | NUMBER       | This column shows the container ID of the PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| APPLICATION_ROOT        | VARCHAR2(3)  | Indicates whether the PDB is an application root                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| APPLICATION_PDB         | VARCHAR2(3)  | Indicates whether the PDB is an application PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| APPLICATION_SEED        | VARCHAR2(3)  | Indicates whether the PDB is an application seed (an application seed is also an application PDB)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| APPLICATION_ROOT_CON_ID | NUMBER       | If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs.<br>If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs.<br>Otherwise, NULL.                                                                                                                                                                                                                                                                                                                                                                                       |
| APPLICATION_ROOT_CLONE  | VARCHAR2(3)  | Indicates whether this PDB is an application root clone (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PROXY_PDB               | VARCHAR2(3)  | Indicates whether this PDB is a proxy PDB (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LOCAL_UNDO              | NUMBER       | Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none"> <li>1 – PDB is in local undo mode</li> <li>0 – PDB is in shared undo mode</li> </ul> This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| UNDO_SCN                | NUMBER       | System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| UNDO_TIMESTAMP          | DATE         | Date and time at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CREATION_TIME           | DATE         | Date and time at which the PDB was created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DIAGNOSTICS_SIZE        | NUMBER       | Shows the current disk space usage (in bytes) of the diagnostic traces generated in the PDB, which is represented by the CON_ID column of the row                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PDB_COUNT               | NUMBER       | The number of user-created PDBs belonging to a given application root or CDB\$ROOT. For all other containers, its value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AUDIT_FILES_SIZE        | NUMBER       | Shows the current disk space usage (in bytes) by Unified Audit files (.bin format) in the current PDB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MAX_SIZE                | NUMBER       | Shows the maximum amount of disk space (in bytes) that can be used by data and temp files in the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MAX_DIAGNOSTICS_SIZE    | NUMBER       | Shows the maximum amount of disk space (in bytes) that can be used by diagnostic traces generated in the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MAX_AUDIT_SIZE          | NUMBER       | Shows the maximum amount of disk space (in bytes) that can be used by Unified Audit files (.bin format) in the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Column                                        | Datatype                    | Description                                                                                                                                          |
|-----------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_CHANGED_BY                               | VARCHAR2(11)                | Indicates what type of user last changed the PDB. Possible values: <ul style="list-style-type: none"> <li>COMMON USER</li> <li>LOCAL USER</li> </ul> |
| TEMPLATE                                      | VARCHAR2(3)                 | For internal use only                                                                                                                                |
| TENANT_ID                                     | VARCHAR2(256)               | Pluggable database tenant key                                                                                                                        |
| UPGRADE_LEVEL                                 | NUMBER                      | For internal use only                                                                                                                                |
| GUID_BASE64                                   | VARCHAR2(30)                | The GUID of the PDB, encoded in base64                                                                                                               |
| RECOVERY_TARGET_PDB_INCARNATION# <sup>1</sup> | NUMBER                      | The incarnation number to which all datafiles belonging to the PDB would be recovered by the RECOVER PLUGGABLE DATABASE command                      |
| CLOUD_IDENTITY <sup>1</sup>                   | VARCHAR2(4000)              | Cloud identifier for the PDB                                                                                                                         |
| CLOSE_TIME <sup>1</sup>                       | TIMESTAMP(3) WITH TIME ZONE | Date and time when the database was last closed                                                                                                      |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 9.115 V\$PERSISTENT\_PUBLISHERS

V\$PERSISTENT\_PUBLISHERS displays information about all active publishers of the persistent queues in the database. There is one row per instance per queue per publisher. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID             | NUMBER         | Identifier for the queue                                                                                                                                                                                                                                                                                                                                                                                                                        |
| QUEUE_SCHEMA         | VARCHAR2(128)  | Owner of the queue                                                                                                                                                                                                                                                                                                                                                                                                                              |
| QUEUE_NAME           | VARCHAR2(128)  | Name of the queue                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PUBLISHER_NAME       | VARCHAR2(128)  | Name of the agent enqueueing the message                                                                                                                                                                                                                                                                                                                                                                                                        |
| PUBLISHER_ADDRESS    | VARCHAR2(1024) | Address of the publisher agent                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PROTOCOL             | NUMBER         | Protocol used by the publisher's address                                                                                                                                                                                                                                                                                                                                                                                                        |
| ENQUEUED_MSGS        | NUMBER         | Number of messages that have been enqueued                                                                                                                                                                                                                                                                                                                                                                                                      |
| ELAPSED_ENQUEUE_TIME | NUMBER         | Total time spent doing enqueue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                      |
| ENQUEUE_CPU_TIME     | NUMBER         | Total CPU time for enqueue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_ENQUEUE_TIME    | TIMESTAMP(6)   | Last enqueue message timestamp                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ENQUEUE_TRANSACTIONS | NUMBER         | Number of enqueue transactions                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.116 V\$PERSISTENT\_QMN\_CACHE

V\$PERSISTENT\_QMN\_CACHE displays detailed information and statistics about the background activities for all queue tables in the system. There is one row per queue table. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                         | Datatype                    | Description                                                                    |
|--------------------------------|-----------------------------|--------------------------------------------------------------------------------|
| QUEUE_TABLE_ID                 | NUMBER                      | Queue table object ID                                                          |
| TYPE                           | VARCHAR2(32)                | Type of the queue table's queue monitor cache                                  |
| STATUS                         | NUMBER                      | Status of the queue table's queue monitor cache                                |
| NEXT_SERVICE_TIME              | TIMESTAMP(3) WITH TIME ZONE | Time when the queue table should be serviced by QMON servers                   |
| WINDOW_END_TIME                | TIMESTAMP(3) WITH TIME ZONE | Time manager activity period for non-owner queue table operations              |
| TOTAL_RUNS                     | NUMBER                      | Total number of times this queue table is served                               |
| TOTAL_LATENCY                  | NUMBER                      | Cumulative latency in serving the queue table (in hundredths of a second)      |
| TOTAL_ELAPSED_TIME             | NUMBER                      | Total time spent in processing this queue table (in seconds)                   |
| TOTAL_CPU_TIME                 | NUMBER                      | Cumulative CPU time for serving the queue table (in hundredths of a second)    |
| TMGR_ROWS_PROCESSED            | NUMBER                      | Number of time manager entries processed                                       |
| TMGR_ELAPSED_TIME              | NUMBER                      | Cumulative time for time management activities (in hundredths of a second)     |
| TMGR_CPU_TIME                  | NUMBER                      | Cumulative CPU time for time management activities (in hundredths of a second) |
| LAST_TMGR_PROCESSING_TIME      | TIMESTAMP(3) WITH TIME ZONE | Last timer manager processing time                                             |
| DEQLOG_ROWS_PROCESSED          | NUMBER                      | Number of dequeue log entries processed                                        |
| DEQLOG_PROCESSING_ELAPSED_TIME | NUMBER                      | Total time for processing dequeue log entries (in hundredths of a second)      |
| DEQLOG_PROCESSING_CPU_TIME     | NUMBER                      | Total CPU time for processing dequeue log entries (in hundredths of a second)  |
| LAST_DEQLOG_PROCESSING_TIME    | TIMESTAMP(3) WITH TIME ZONE | Last dequeue log processing time                                               |
| DEQUEUE_INDEX_BLOCKS_FREED     | NUMBER                      | Number of dequeue index blocks freed                                           |
| HISTORY_INDEX_BLOCKS_FREED     | NUMBER                      | Number of history index blocks freed                                           |
| TIME_INDEX_BLOCKS_FREED        | NUMBER                      | Number of time manager index blocks freed                                      |
| INDEX_CLEANUP_COUNT            | NUMBER                      | Number of times index block cleanup was attempted                              |
| INDEX_CLEANUP_ELAPSED_TIME     | NUMBER                      | Total time for index block cleanup (in hundredths of a second)                 |
| INDEX_CLEANUP_CPU_TIME         | NUMBER                      | Total CPU time for index block cleanup (in hundredths of a second)             |
| LAST_INDEX_CLEANUP_TIME        | TIMESTAMP(3) WITH TIME ZONE | Last index block cleanup time                                                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.117 V\$PERSISTENT\_QUEUES

V\$PERSISTENT\_QUEUES displays information about all active persistent queues in the database since the queues' first activity time. There is one row per queue. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                       | Datatype      | Description                                                                                                                                                                            |
|------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID                     | NUMBER        | Identifier for the queue                                                                                                                                                               |

| DEQUEUE_TRANSACTIONS                       | NUMBER       | Number of dequeue transactions                                                                                                                                                                                                                                                                                                                                                                                               |
| EXECUTION_COUNT                            | NUMBER       | Number of executions of the dequeue cursor                                                                                                                                                                                                                                                                                                                                                                                   |
| OLDEST_MSGID                               | RAW(16)      | Message ID of the oldest message in the queue                                                                                                                                                                                                                                                                                                                                                                                |
| OLDEST_MSG_ENQTM                           | TIMESTAMP(6) | Enqueue time of the oldest message in the queue                                                                                                                                                                                                                                                                                                                                                                              |
| MANDATORY_AFF_SWITCHES_OUT                 | NUMBER       | An affinity switch is a change in dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this queue. |
| OPTIONAL_AFF_SWITCHES_OUT                  | NUMBER       | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this queue.                                                                                         |
| AFF_SWITCHES_BACK_IN                       | NUMBER       | The number of times dequeue affinities have come back from other instances to this instance. (MANDATORY_AFF_SWITCHES_OUT + OPTIONAL_AFF_SWITCHES_OUT - AFF_SWITCHES_BACK_IN) is the number of cross instance affinities present across all shard-subscriber pair for shards owned by this instance for this queue.                                                                                                           |
| CROSS_STREAM_JOBS                          | NUMBER       | The number of times a shard is being forwarded to another instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                             |
| RESTORE_BITMAP_JOBS                        | NUMBER       | The number of times subscribers used existing shard forwarding to have cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                                |
| SHADOW_AFF_SWITCHES_IN                     | NUMBER       | The number of affinity switches for this queue where this instance is the dequeue instance for a shard-subscriber pair where the shard is being enqueued at another instance                                                                                                                                                                                                                                                 |
| SHADOW_AFF_SWITCHES_OUT                    | NUMBER       | The number of affinity switches for this queue where shadow affinity is switched back to source instance of the shard. (SHADOW_AFF_SWITCHES_IN - SHADOW_AFF_SWITCHES_OUT) is the number of dequeue affinities which are performing cross instance dequeues from non-local shards.                                                                                                                                            |
| SHADOW_SHARDS_RECEIVED                     | NUMBER       | The number of times a shard is being forwarded from another instance to this instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                          |
| SHADOW_SHARDS_FREED                        | NUMBER       | The number of times a forwarded shard to this instance was stopped due to removal of cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                  |
| SHADOW_EVENT_STREAMS_RECEIVED <sup>1</sup> | NUMBER       | The number of times an event stream is being forwarded from another instance to this instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                  |
| SHADOW_EVENT_STREAMS_FREED <sup>1</sup>    | NUMBER       | The number of times a forwarded event stream to this instance was stopped due to removal of cross instance dequeues for this queue                                                                                                                                                                                                                                                                                           |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database 21c.

#### Note

For sharded queues, only the following columns in this view contain accurate information: FIRST\_ACTIVITY\_TIME, BROWSED\_MSGS, LAST\_ENQUEUE\_TIME, LAST\_DEQUEUE\_TIME, ENQUEUE\_TRANSACTIONS, and DEQUEUE\_TRANSACTIONS. The rest of the columns in this view should be ignored when querying information about sharded queues.

## 9.118 V\$PERSISTENT\_SUBSCRIBERS

V\$PERSISTENT\_SUBSCRIBERS displays information about all active subscribers of the persistent queues in the database.

There is one row per instance per queue per subscriber. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

#### Note

This view does not display information about sharded queues. For information about sharded queues, refer to the "[V\\$AQ\\_SHARDED\\_SUBSCRIBER\\_STAT](#)" view.

| Column              | Datatype       | Description                                                                                                                                                                     |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.119 V\$PGA\_TARGET\_ADVICE

V\$PGA\_TARGET\_ADVICE predicts how the cache hit percentage and over allocation count statistics displayed by the V\$PGASTAT performance view would be impacted if the value of the PGA\_AGGREGATE\_TARGET parameter is changed.

The prediction is performed for various values of the PGA\_AGGREGATE\_TARGET parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGA\_AGGREGATE\_TARGET is not set. In addition, the content of this view is not updated if the STATISTICS\_LEVEL parameter is set to BASIC. Base statistics for this view are reset at instance startup and when the value of the PGA\_AGGREGATE\_TARGET initialization parameter is dynamically modified.

| Column                  | Datatype | Description                                                  |
|-------------------------|----------|--------------------------------------------------------------|
| PGA_TARGET_FOR_ESTIMATE | NUMBER   | Value of PGA_AGGREGATE_TARGET for this prediction (in bytes) |

| Column                        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PGA_TARGET_FACTOR             | NUMBER      | PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter                                                                                                                                                                                                                                                                                                                                                               |
| ADVICE_STATUS                 | VARCHAR2(3) | Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter                                                                                                                                                                                                                                                                                                                         |
| BYTES_PROCESSED               | NUMBER      | Total bytes processed by all the work areas considered by this advice (in bytes)                                                                                                                                                                                                                                                                                                                                                                |
| ESTD_TIME                     | NUMBER      | Time (in seconds) required to process the bytes                                                                                                                                                                                                                                                                                                                                                                                                 |
| ESTD_EXTRA_BYTES_RW           | NUMBER      | Estimated number of extra bytes which would be read or written if PGA_AGGREGATE_TARGET was set to the value of the PGA_TARGET_FOR_ESTIMATE column. This number is derived from the estimated number and size of work areas which would run in one-pass (or multi-pass) for that value of PGA_AGGREGATE_TARGET.                                                                                                                                  |
| ESTD_PGA_CACHE_HIT_PERCENTAGE | NUMBER      | Estimated value of the cache hit percentage statistic when PGA_AGGREGATE_TARGET equals PGA_TARGET_FOR_ESTIMATE. This column is derived from the above two columns and is equal to $\text{BYTES\_PROCESSED} / (\text{BYTES\_PROCESSED} + \text{ESTD\_EXTRA\_BYTES\_RW})$                                                                                                                                                                         |
| ESTD_OVERALLOC_COUNT          | NUMBER      | Estimated number of PGA memory over-allocations if the value of PGA_AGGREGATE_TARGET is set to PGA_TARGET_FOR_ESTIMATE. A nonzero value means that PGA_TARGET_FOR_ESTIMATE is not large enough to run the work area workload. Hence, the DBA should not set PGA_AGGREGATE_TARGET to PGA_TARGET_FOR_ESTIMATE since Oracle will not be able to honor that target.                                                                                 |
| CON_ID                        | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.120 V\$PGA\_TARGET\_ADVICE\_HISTOGRAM

V\$PGA\_TARGET\_ADVICE\_HISTOGRAM predicts how statistics displayed by the V\$SQL\_WORKAREA\_HISTOGRAM dynamic view would be impacted if the value of the PGA\_AGGREGATE\_TARGET parameter is changed.

This prediction is performed for various values of the PGA\_AGGREGATE\_TARGET parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGA\_AGGREGATE\_TARGET is not set. In addition, the content of this view is not updated when the STATISTICS\_LEVEL initialization parameter is set to BASIC. Base statistics for this view are reset at instance startup or when the value of the PGA\_AGGREGATE\_TARGET initialization parameter is dynamically modified.

| Column                      | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| PGA_TARGET_FACTOR           | NUMBER      | PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter                                                                                                                                                                                                                                                                                                                                                               |
| ADVICE_STATUS               | VARCHAR2(3) | Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter                                                                                                                                                                                                                                                                                                                         |
| LOW_OPTIMAL_SIZE            | NUMBER      | Lower bound for the optimal memory requirement of work areas included in this row (in bytes)                                                                                                                                                                                                                                                                                                                                                    |
| HIGH_OPTIMAL_SIZE           | NUMBER      | Upper bound for the optimal memory requirement of work areas included in this row (in bytes)                                                                                                                                                                                                                                                                                                                                                    |
| ESTD_OPTIMAL_EXECUTIONS     | NUMBER      | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run optimal given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE                                                                                                                                                                                                                      |
| ESTD_ONEPASS_EXECUTIONS     | NUMBER      | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run one-pass given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE                                                                                                                                                                                                                     |
| ESTD_MULTIPASSES_EXECUTIONS | NUMBER      | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which are predicted to run multi-pass given a value of PGA_AGGREGATE_TARGET equal to PGA_TARGET_FOR_ESTIMATE                                                                                                                                                                                                                   |
| ESTD_TOTAL_EXECUTIONS       | NUMBER      | Sum of ESTD_OPTIMAL_EXECUTIONS, ESTD_ONEPASS_EXECUTIONS, and ESTD_MULTIPASSES_EXECUTIONS                                                                                                                                                                                                                                                                                                                                                        |
| IGNORED_WORKAREAS_COUNT     | NUMBER      | Number of work areas with optimal memory requirement between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE ignored in the advice generation due to memory and CPU constraints                                                                                                                                                                                                                                                                          |
| CON_ID                      | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.121 V\$PGASTAT

V\$PGASTAT displays PGA memory usage statistics as well as statistics about the automatic PGA memory manager when it is enabled (that is, when PGA\_AGGREGATE\_TARGET is set). Cumulative values in V\$PGASTAT are accumulated since instance startup.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 9-4 V\$PGASTAT Statistics**

| Statistic Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aggregate PGA auto target      | Amount of PGA memory the Oracle Database can use for work areas running in automatic mode. This amount is dynamically derived from the value of the PGA_AGGREGATE_TARGET initialization parameter and the current work area workload, and continuously adjusted by the Oracle Database.<br><br>If this value is small compared to the value of PGA_AGGREGATE_TARGET, then a large amount of PGA memory is used by other components of the system (for example, PL/SQL or Java memory) and little is left for work areas. The DBA must ensure that enough PGA memory is left for work areas running in automatic mode. |
| aggregate PGA target parameter | Current value of the PGA_AGGREGATE_TARGET initialization parameter. If this parameter is not set, then its value is 0 and automatic management of PGA memory is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| bytes processed                | Number of bytes processed by memory intensive SQL operators, cumulated since instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| cache hit percentage           | A metric computed by the Oracle Database to reflect the performance of the PGA memory component, cumulative since instance startup. A value of 100% means that all work areas executed by the system since instance startup have used an optimal amount of PGA memory.<br><br>When a work area cannot run optimal, one or more extra passes is performed over the input data. This will reduce the cache hit percentage in proportion to the size of the input data and the number of extra passes performed.                                                                                                         |
| extra bytes read/written       | Number of bytes processed during extra passes of the input data, cumulated since instance startup. When a work area cannot run optimal, one or more of these extra passes is performed.                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 9-4 (Cont.) V\$PGASTAT Statistics**

| Statistic Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| global memory bound                   | Maximum size of a work area executed in automatic mode. This value is continuously adjusted by the Oracle Database to reflect the current state of the work area workload. The global memory bound generally decreases when the number of active work areas is increasing in the system.<br><br>If the value of the global bound decreases below 1 MB, then the value of PGA_AGGREGATE_TARGET should be increased.                 |
| max processes count                   | Maximum number of processes active at any one time since instance startup.                                                                                                                                                                                                                                                                                                                                                         |
| maximum PGA allocated                 | Maximum number of bytes of PGA memory allocated at one time since instance startup.                                                                                                                                                                                                                                                                                                                                                |
| maximum PGA used for auto workareas   | Maximum amount of PGA memory consumed at one time by work areas running under the automatic memory management mode since instance startup.                                                                                                                                                                                                                                                                                         |
| maximum PGA used for manual workareas | Maximum amount of PGA memory consumed at one time by work areas running under the manual memory management mode since instance startup.                                                                                                                                                                                                                                                                                            |
| over allocation count                 | This statistic is cumulative since instance startup. Over allocating PGA memory can happen if the value of PGA_AGGREGATE_TARGET is too small. When this happens, the Oracle Database cannot honor the value of PGA_AGGREGATE_TARGET and extra PGA memory needs to be allocated.<br><br>If over allocation occurs, then increase the value of PGA_AGGREGATE_TARGET using the information provided by the V\$PGA_TARGET_ADVICE view. |
| PGA memory freed back to OS           | Number of bytes of PGA memory freed back to the operating system, cumulated since instance startup.                                                                                                                                                                                                                                                                                                                                |
| process count                         | Number of processes active within up to the last 3 seconds.                                                                                                                                                                                                                                                                                                                                                                        |
| recompute count (total)               | Number of times the instance bound, which is a cap on the maximum size of each active work area, has been recomputed since instance startup. Generally, the instance bound is recomputed in the background every 3 seconds, but it could be recomputed by a foreground process when the number of work areas changes rapidly in a short period of time.                                                                            |
| total freeable PGA memory             | Number of bytes of PGA memory in all processes that could be freed back to the operating system.                                                                                                                                                                                                                                                                                                                                   |
| total PGA allocated                   | Current amount of PGA memory allocated by the instance. The Oracle Database attempts to keep this number below the value of the PGA_AGGREGATE_TARGET initialization parameter. However, it is possible for the PGA allocated to exceed that value by a small percentage and for a short period of time when the work area workload is increasing very rapidly or when PGA_AGGREGATE_TARGET is set to a small value.                |
| total PGA inuse                       | Indicates how much PGA memory is currently consumed by work areas. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).                                                                                                                                                                                                                            |
| total PGA used for auto workareas     | Indicates how much PGA memory is currently consumed by work areas running under the automatic memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).                                                                                                                                                                         |
| total PGA used for manual workareas   | Indicates how much PGA memory is currently consumed by work areas running under the manual memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).                                                                                                                                                                            |

## 9.122 V\$PKCS11\_PATH

V\$PKCS11\_PATH displays all processes that are using a PKCS#11 library for Transparent Data Encryption (TDE).

The SQL command ADMINISTER KEY MANAGEMENT SWITCHOVER TO LIBRARY instructs the database to switch over from the current PKCS#11 library to a new PKCS#11 library, without incurring system downtime. After you issue this command, foreground and background processes are gradually switched over to the new library. You can use this view to monitor the PKCS#11 library being used by each process. When you determine that all processes have switched over to the new library, you can safely remove the old library from disk.

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID             | NUMBER         | ID of the process                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PNAME           | VARCHAR2(5)    | Name of the process                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PKCS11_LIB_PATH | VARCHAR2(4000) | Full operating system path for the PKCS#11 library being used by the process                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.123 V\$PLSQL\_DEBUGGABLE\_SESSIONS

V\$PLSQL\_DEBUGGABLE\_SESSIONS shows the current sessions of all users that the current user has privileges to debug with a PL/SQL debugger.

| Column     | Datatype      | Description                       |
|------------|---------------|-----------------------------------|
| SID        | NUMBER        | Session identifier                |
| SERIAL#    | NUMBER        | Session serial number             |
| LOGON_TIME | DATE          | Time of logon                     |
| USER#      | NUMBER        | Oracle user identifier            |
| USERNAME   | VARCHAR2(128) | Oracle user name                  |
| OSUSER     | VARCHAR2(128) | Operating system client user name |

| Column                   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROCESS                  | VARCHAR2(24) | Operating system client process ID                                                                                                                                                                                                                                                                                                                                                                                                              |
| MACHINE                  | VARCHAR2(64) | Operating system client machine name                                                                                                                                                                                                                                                                                                                                                                                                            |
| PORT                     | NUMBER       | Operating system client port number                                                                                                                                                                                                                                                                                                                                                                                                             |
| TERMINAL                 | VARCHAR2(30) | Operating system client terminal name                                                                                                                                                                                                                                                                                                                                                                                                           |
| PROGRAM                  | VARCHAR2(84) | Operating system client program name                                                                                                                                                                                                                                                                                                                                                                                                            |
| TYPE                     | VARCHAR2(10) | Session type                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SERVICE_NAME             | VARCHAR2(64) | Service name of the session                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PLSQL_DEBUGGER_CONNECTED | VARCHAR2(5)  | Indicates whether the session is connected to a PL/SQL debugger.<br>Possible values: <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul>                                                                                                                                                                                                                                                                                      |
| CON_ID                   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.124 V\$PMEM\_FILESTORE

V\$PMEM\_FILESTORE displays information about Persistent Memory Filestores (PMEM Filestores).

| Column          | Datatype      | Description                                                                                                                                                                                             |
|-----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME            | VARCHAR2(65)  | PMEM Filestore name                                                                                                                                                                                     |
| MOUNT_POINT     | VARCHAR2(513) | Operating system directory path for the mount point of the PMEM Filestore                                                                                                                               |
| BACKING_FILE    | VARCHAR2(513) | Operating system file path for the backing file of the PMEM Filestore                                                                                                                                   |
| BLOCK_SIZE      | NUMBER        | Block size of the PMEM Filestore (in bytes)                                                                                                                                                             |
| TOTAL_BYTES     | NUMBER        | Current size of the PMEM Filestore (in bytes)                                                                                                                                                           |
| AUTOEXTENSIBLE  | VARCHAR2(4)   | Indicates whether the PMEM Filestore is autoextensible (YES) or not (NO)                                                                                                                                |
| INCREMENT_BY    | NUMBER        | If the PMEM Filestore is autoextensible, then this column displays the size of an autoextension increment (in bytes)<br>If the PMEM Filestore is not autoextensible, then the value of this column is 0 |
| MAX_BYTES       | NUMBER        | Maximum autoextend size (in bytes)                                                                                                                                                                      |
| AVAILABLE_BYTES | NUMBER        | Amount of free space currently available in the PMEM Filestore (in bytes)                                                                                                                               |
| USED_BYTES      | NUMBER        | Amount of space currently allocated to data and metadata in the PMEM Filestore (in bytes)                                                                                                               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.125 V\$PQ\_SESSTAT

V\$PQ\_SESSTAT lists session statistics for parallel queries. After you have run a query or DML operation, you can use the information derived from V\$PQ\_SESSTAT to view the number of worker processes used, and other information for the session and system.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC     | VARCHAR2(30) | <p>Name of the statistic:</p> <ul style="list-style-type: none"> <li>• Allocation Height - Requested number of servers per instance</li> <li>• Allocation Width - Requested number of instances</li> <li>• DDL Parallelized - Number of DDL operations run in parallel</li> <li>• DFO Trees - Number of executed DFO trees</li> <li>• DML Parallelized - Number of DML operations run in parallel</li> <li>• DOP - Degree of parallelism used for the last statement</li> <li>• Distr Msgs Recv'd - Number of remote (inter-instance) messages received</li> <li>• Distr Msgs Sent - Number of remote (inter-instance) messages sent</li> <li>• Local Msgs Recv'd - Number of local (intra-instance) messages received</li> <li>• Local Msgs Sent - Number of local (intra-instance) messages sent</li> <li>• Queries Parallelized - Number of queries run in parallel</li> <li>• Server Threads - Number of PX servers used</li> <li>• Slave Sets - Total number of worker sets used for the last statement. For multiple parallelizers in the parallel plan, it is the cumulative count.</li> </ul> |
| LAST_QUERY    | NUMBER       | Value of the statistic for the last operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SESSION_TOTAL | NUMBER       | <p>Value of the statistic for the entire session to this point in time.</p> <p>The value of the statistic for the entire session to this point in time is not maintained for the DOP, Server Threads, Allocation Height, Allocation Width, and Slave Set statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.126 V\$PQ\_SLAVE

V\$PQ\_SLAVE lists statistics for each of the active parallel execution servers on an instance.

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLAVE_NAME      | VARCHAR2(4) | Name of the parallel execution server                                                                                                                                                                                                                                                                                                                                                                                                                 |

This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.127 V\$PQ\_SYSSTAT

V\$PQ\_SYSSTAT lists system statistics for parallel queries.

After you have run a query or DML operation, you can use the information derived from V\$PQ\_SYSSTAT to view the number of PX (Parallel Execution) servers used, and other information for the system.

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 9.128 V\$PQ\_TQSTAT

V\$PQ\_TQSTAT contains statistics on parallel execution operations. The statistics are compiled after the query completes and only remain for the duration of the session. It displays the number of rows processed through each parallel execution server at each stage of the execution tree. This view can help determine skew problems in a query's execution. (Note that for PDML, information from V\$PQ\_TQSTAT is available only after a commit or rollback operation.)

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| DFO_NUMBER  | NUMBER       | Data flow operator (DFO) tree number to differentiate queries                                                                                                                                                                                                                                                                                                                                                                                   |
| TQ_ID       | NUMBER       | Table queue ID within the query, which represents the connection between two DFO nodes in the query execution tree                                                                                                                                                                                                                                                                                                                              |
| SERVER_TYPE | VARCHAR2(10) | The role in table queue - producer/consumer/ranger                                                                                                                                                                                                                                                                                                                                                                                              |
| NUM_ROWS    | NUMBER       | The number of rows produced/consumed                                                                                                                                                                                                                                                                                                                                                                                                            |
| BYTES       | NUMBER       | The number of bytes produced/consumed                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPEN_TIME   | NUMBER       | Time (seconds) the table queue remained open                                                                                                                                                                                                                                                                                                                                                                                                    |
| AVG_LATENCY | NUMBER       | Time (minutes) for a message to be dequeued after it enters the queue                                                                                                                                                                                                                                                                                                                                                                           |
| WAITS       | NUMBER       | The number of waits encountered during dequeue                                                                                                                                                                                                                                                                                                                                                                                                  |
| TIMEOUTS    | NUMBER       | The number of timeouts when waiting for a message                                                                                                                                                                                                                                                                                                                                                                                               |
| PROCESS     | VARCHAR2(6)  | Process ID                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| INSTANCE    | NUMBER       | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.129 V\$PROCESS

V\$PROCESS displays information about the currently active processes.

| Column | Datatype     | Description                                                                                                                                        |
|--------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR   | RAW(4   8)   | Address of the process state object                                                                                                                |
| PID    | NUMBER       | Oracle process identifier                                                                                                                          |
| SOSID  | VARCHAR2(24) | Operating system (process, thread) identifier.<br>This identifier is unique whether the Oracle multiprocess/multithread feature is enabled or not. |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPID             | VARCHAR2(24)  | Operating system process identifier.<br>The Oracle multiprocess/multithread feature is available for UNIX systems.<br>When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the SPID identifier is not unique for RDBMS processes.<br>When the Oracle multiprocess/multithread feature is not enabled on UNIX systems, the SPID identifier is unique for RDBMS processes. |
| STID             | VARCHAR2(24)  | Operating system thread identifier.<br>The Oracle multiprocess/multithread feature is available for UNIX systems.<br>When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the SPID and STID together uniquely identify an RDBMS process.<br>The STID is not unique on Solaris. The STID is unique on Linux, AIX, and Microsoft Windows.                                  |
| EXECUTION_TYPE   | VARCHAR2(10)  | Operating system execution type                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PNAME            | VARCHAR2(5)   | Name of this process                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| USERNAME         | VARCHAR2(15)  | Operating system process username                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SERIAL#          | NUMBER        | Process serial number                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TERMINAL         | VARCHAR2(30)  | Operating system terminal identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |

| PGA_ALLOC_MEM    | NUMBER        | PGA memory currently allocated by the process (including free PGA memory not yet released to the operating system by the server process), in bytes                                                                                                                                                                                                                                                                                                                |
| PGA_FREEABLE_MEM | NUMBER        | Allocated PGA memory which can be freed (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                |
| PGA_MAX_MEM      | NUMBER        | Maximum PGA memory ever allocated by the process (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                       |
| NUMA_DEFAULT     | NUMBER        | The NUMA processor group of this process at initialization time                                                                                                                                                                                                                                                                                                                                                                                                   |
| NUMA_CURR        | NUMBER        | The NUMA processor group of this process currently                                                                                                                                                                                                                                                                                                                                                                                                                |
| CPU_USED         | NUMBER        | Tracks the CPU used by this process (in microseconds) from the time it was spawned                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                   |

## 9.130 V\$PROCESS\_MEMORY

V\$PROCESS\_MEMORY displays dynamic PGA memory usage by named component categories for each process.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID           | NUMBER       | Oracle process identifier                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SERIAL#       | NUMBER       | Oracle process serial number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CATEGORY      | VARCHAR2(15) | Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories.                                                                                                              |
| ALLOCATED     | NUMBER       | Bytes of PGA memory allocated by the process for the category. For the "Freeable" category, it is the amount of free PGA memory eligible to be released to the operating system.                                                                                                                                                                                                                                                                |
| USED          | NUMBER       | Bytes of PGA memory used by the process for the category. For "Freeable", the value is zero. For "Other", the value is NULL for performance reasons.                                                                                                                                                                                                                                                                                            |
| MAX_ALLOCATED | NUMBER       | Maximum bytes of PGA memory ever allocated by the process for the category.                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.131 V\$PROCESS\_MEMORY\_DETAIL

V\$PROCESS\_MEMORY\_DETAIL provides detailed information on dynamic PGA memory usage for each automatically captured snapshot.

| Column    | Datatype     | Description                                                                                                                                                           |
|-----------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID       | NUMBER       | Oracle process identifier                                                                                                                                             |
| SERIAL#   | NUMBER       | Oracle process serial number                                                                                                                                          |
| TIMESTAMP | DATE         | Time at which the snapshot was taken                                                                                                                                  |
| SQL_ID    | VARCHAR2(13) | Identifier for the relevant SQL statement                                                                                                                             |
| TOTAL_MB  | NUMBER       | Total number of megabytes of PGA memory allocated at the time of the snapshot                                                                                         |
| CATEGORY  | VARCHAR2(15) | Category name. Categories include: <ul style="list-style-type: none"> <li>SQL</li> <li>PL/SQL</li> <li>OLAP</li> <li>JAVA</li> <li>Freeable</li> <li>Other</li> </ul> |

| Column                 | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                   | VARCHAR2(26) | PGA memory allocation comment. Small allocations may be grouped together with NAME set to Miscellaneous for performance reasons.                                                                                                                                                                                                                                                                                                                |
| HEAP_NAME              | VARCHAR2(15) | Name of heap or heaps (if same name) containing the allocations                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES                  | NUMBER       | Bytes of PGA memory allocated in the process from heaps with the given heap name and with the given allocation comment                                                                                                                                                                                                                                                                                                                          |
| ALLOCATION_COUNT       | NUMBER       | Number of allocations with the comment found in the process inside heaps with the given heap name                                                                                                                                                                                                                                                                                                                                               |
| HEAP_DESCRIPTOR        | RAW(4   8)   | If all the allocations are from one heap, then this is the address of the heap descriptor for that heap. Otherwise, this column is NULL.                                                                                                                                                                                                                                                                                                        |
| PARENT_HEAP_DESCRIPTOR | RAW(4   8)   | If all the allocations are from one heap, then this is the address of the parent heap descriptor for that heap. Otherwise, this column is NULL. If the heap has no parent, the value is zero.                                                                                                                                                                                                                                                   |
| MOST_RECENT            | NUMBER       | Oracle process identifier (PID) for most recent snapshot                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                 | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.132 V\$PROCESS\_POOL

V\$PROCESS\_POOL provides information about process pools.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL_NAME   | VARCHAR2(512) | Pool name                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ENABLED     | VARCHAR2(5)   | Indicates whether the pool is active (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                    |
| MIN_COUNT   | NUMBER        | The default or configured minimum value                                                                                                                                                                                                                                                                                                                                                                                                       |
| BATCH_COUNT | NUMBER        | The default or configured batch count                                                                                                                                                                                                                                                                                                                                                                                                         |
| INIT_COUNT  | NUMBER        | The default or configured initial count                                                                                                                                                                                                                                                                                                                                                                                                       |
| CUR_COUNT   | NUMBER        | The number of spawned processes available in this pool                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_COUNT   | NUMBER        | When INIT_COUNT is set, MAX_COUNT shows the number of processes yet to be spawned. Note that the current process count (CUR_COUNT) cannot reach INIT_COUNT in cases where processes are consumed during the spawn.                                                                                                                                                                                                                            |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.133 V\$PROPAGATION\_RECEIVER

V\$PROPAGATION\_RECEIVER displays information about buffer queue propagation schedules on the receiving (destination) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SRC_QUEUE_SCHEMA           | VARCHAR2(128) | Name of the source schema                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| ELAPSED_UNPICKLE_TIME      | NUMBER        | Elapsed unpickle time                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ELAPSED_RULE_TIME          | NUMBER        | Elapsed rule time                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ELAPSED_ENQUEUE_TIME       | NUMBER        | Elapsed enqueue time                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SESSION_ID                 | NUMBER        | Session ID of the propagation receiver                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SERIAL#                    | NUMBER        | Serial number of the propagation receiver                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SPID                       | VARCHAR2(24)  | Process identification number of the propagation receiver                                                                                                                                                                                                                                                                                                                                                                                                        |
| PROPAGATION_NAME           | VARCHAR2(128) | Name of the propagation on the source database                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATE                      | VARCHAR2(43)  | State of the propagation receiver: <ul style="list-style-type: none"> <li>• Initializing</li> <li>• Sending unapplied txns</li> <li>• Waiting for message from client</li> <li>• Receiving LCRs</li> <li>• Evaluating rules</li> <li>• Enqueueing LCRs</li> <li>• Waiting for memory</li> <li>• Waiting for apply to read</li> <li>• Waiting for message from propagation sender</li> </ul> When the propagation schedule is not optimized, the state is Normal. |
| LAST_RECEIVED_MSG_POSITION | RAW(64)       | Last received message position. Corresponds to LAST_RECEIVED_MSG, except the value is in position rather than SCN. Position is used by XStream to determine ordering.                                                                                                                                                                                                                                                                                            |
| ACKNOWLEDGEMENT_POSITION   | RAW(64)       | Acknowledgement position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN. Position is used by XStream to determine ordering.                                                                                                                                                                                                                                                           |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.134 V\$PROPAGATION\_SENDER

V\$PROPAGATION\_SENDER displays information about buffer queue propagation schedules on the sending (source) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

| Column                    | Datatype      | Description                                                                                                                                                      |
|---------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID                  | NUMBER        | Queue identifier of the queue                                                                                                                                    |
| QUEUE_SCHEMA              | VARCHAR2(128) | Schema of the queue                                                                                                                                              |
| QUEUE_NAME                | VARCHAR2(128) | Name of the queue                                                                                                                                                |
| DST_QUEUE_SCHEMA          | VARCHAR2(128) | Destination schema of the queue                                                                                                                                  |
| DST_QUEUE_NAME            | VARCHAR2(128) | Name of the destination queue                                                                                                                                    |
| STARTUP_TIME              | DATE          | Time at which the propagation started                                                                                                                            |
| DBLINK                    | VARCHAR2(395) | Name of the destination database link                                                                                                                            |
| HIGH_WATER_MARK           | NUMBER        | High watermark of the messages sent                                                                                                                              |
| ACKNOWLEDGEMENT           | NUMBER        | Acknowledgement of the messages received by the receiver                                                                                                         |
| SCHEDULE_STATUS           | VARCHAR2(128) | Status of the propagation schedule                                                                                                                               |
| TOTAL_MSGS                | NUMBER        | Total messages propagated                                                                                                                                        |
| TOTAL_BYTES               | NUMBER        | Total bytes propagated                                                                                                                                           |
| ELAPSED_DEQUEUE_TIME      | NUMBER        | Elapsed dequeue time (in hundredths of a second)                                                                                                                 |
| ELAPSED_PICKLE_TIME       | NUMBER        | Elapsed pickle time (time taken to linearize a logical change record (LCR) into a stream of bytes that can be sent over the network) (in hundredths of a second) |
| ELAPSED_PROPAGATION_TIME  | NUMBER        | Elapsed propagation time (in hundredths of a second)                                                                                                             |
| ELAPSED_RULE_TIME         | NUMBER        | Elapsed rule time (in hundredths of a second)                                                                                                                    |
| MAX_NUM_PER_WIN           | NUMBER        | Maximum bytes per window                                                                                                                                         |
| MAX_SIZE                  | NUMBER        | Maximum bytes sent per window                                                                                                                                    |
| LAST_MSG_LATENCY          | NUMBER        | Last propagated message latency                                                                                                                                  |
| LAST_MSG_ENQUEUE_TIME     | TIMESTAMP(6)  | Last propagated message enqueue time                                                                                                                             |
| LAST_MSG_PROPAGATION_TIME | TIMESTAMP(6)  | Last time when the message was propagated                                                                                                                        |

| STATE                     | VARCHAR2(128) | State of the propagation sender process: <ul style="list-style-type: none"> <li>• Initializing</li> <li>• Initializing propagation receiver</li> <li>• Browsing LCRs</li> <li>• Evaluating rules</li> <li>• Dequeueing LCRs</li> <li>• Sending LCRs</li> <li>• Waiting for apply to be enabled</li> <li>• Waiting for apply database to start</li> <li>• Waiting for propagation to be enabled</li> <li>• Waiting for capture to terminate</li> <li>• Waiting for a subscriber to be added</li> <li>• Suspended due to a dropped subscriber</li> <li>• Suspended for auto split/merge</li> <li>• Waiting on empty queue</li> </ul> When the SCHEDULE_STATUS column is not SCHEDULE_OPTIMIZED, the state is the value of the SCHEDULE_STATUS column. |
| CON_ID                    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                               |

## 9.135 V\$PROXY\_ARCHIVEDLOG

V\$PROXY\_ARCHIVEDLOG contains descriptions of archived log backups that were taken using the proxy copy functionality.

In a proxy copy, the media manager takes over the operations of backing up and restoring data. Each row represents a backup of one control file.

| Column      | Datatype      | Description                                     |
|-------------|---------------|-------------------------------------------------|
| RECID       | NUMBER        | Proxy copy record identifier                    |
| STAMP       | NUMBER        | Proxy copy stamp                                |
| DEVICE_TYPE | VARCHAR2(17)  | Type of media device that stores the proxy copy |
| HANDLE      | VARCHAR2(513) | Name or "handle" for the proxy copy             |
| COMMENTS    | VARCHAR2(81)  | Comments about the proxy copy                   |

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEDIA             | VARCHAR2(65) | A comment that contains further information about the media manager that created this backup                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| COPY_KEY             | NUMBER        | Copy identifier                                                                                                                                |
| THREAD#              | NUMBER        | Redo thread number                                                                                                                             |
| SEQUENCE#            | NUMBER        | Redo log sequence number                                                                                                                       |
| RESETLOGS_CHANGE#    | NUMBER        | Resetlogs change number of the database when this log was written                                                                              |
| RESETLOGS_TIME       | DATE          | Resetlogs time of the database when this log was written                                                                                       |
| HANDLE               | VARCHAR2(513) | Proxy copy handle identifies the copy for restore                                                                                              |
| MEDIA                | VARCHAR2(65)  | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                                   |
| MEDIA_POOL           | NUMBER        | Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.      |
| TAG                  | VARCHAR2(32)  | Proxy copy tag                                                                                                                                 |
| FIRST_CHANGE#        | NUMBER        | First change number in the archived log                                                                                                        |
| NEXT_CHANGE#         | NUMBER        | First change number in the next log                                                                                                            |
| FIRST_TIME           | DATE          | Timestamp of the first change                                                                                                                  |
| NEXT_TIME            | DATE          | Timestamp of the next change                                                                                                                   |
| OUTPUT_BYTES         | NUMBER        | Total output bytes written                                                                                                                     |
| COMPLETION_TIME      | DATE          | Completion time                                                                                                                                |
| OUTPUT_BYTES_DISPLAY | VARCHAR2(3)   | Displayable format for output bytes                                                                                                            |
| KEEP                 | DATE          | Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO) |
| KEEP_UNTIL           | VARCHAR2(11)  | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.            |

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEEP_OPTIONS | VARCHAR2(4000) | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>NOLOGS - Indicates a consistent backup made when the database was mounted</li> <li>NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| CON_ID       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                        |

## 9.137 V\$PROXY\_ARCHIVELOG\_SUMMARY

V\$PROXY\_ARCHIVELOG\_SUMMARY provides summary information about the output proxy archive log file.

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER         | Number of archived log files backed up                                                                                                                                                                                                                                                                                                                                                                                                          |
| NUM_DISTINCT_FILES_BACKED | NUMBER         | Number of distinct archived log files backed up                                                                                                                                                                                                                                                                                                                                                                                                 |
| MIN_FIRST_CHANGE#         | NUMBER         | Minimum first change SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_NEXT_CHANGE#          | NUMBER         | Maximum first change SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MIN_FIRST_TIME            | DATE           | Minimum first change time. Forms the redo range, along with MAX_NEXT_TIME.                                                                                                                                                                                                                                                                                                                                                                      |
| MAX_NEXT_TIME             | DATE           | Maximum next change time                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OUTPUT_BYTES              | NUMBER         | Total output size, in bytes                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.138 V\$PROXY\_COPY\_DETAILS

V\$PROXY\_COPY\_DETAILS contains information about all available control file and datafile proxy copies.

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY          | NUMBER         | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SESSION_RECID        | NUMBER         | Session recid                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SESSION_STAMP        | NUMBER         | Session stamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| KEEP_UNTIL           | DATE           | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.                                                                                                                                                                                                                                                                                                                                                                                                             |
| KEEP_OPTIONS         | VARCHAR2(11)   | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>• LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>• BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>• NOLOGS - Indicates a consistent backup made when the database was mounted.</li> <li>• NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                           |

## 9.139 V\$PROXY\_COPY\_SUMMARY

V\$PROXY\_COPY\_SUMMARY provides summary information about the output proxy datafile and control file.

| Column                 | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_COPIES             | NUMBER         | Number of copies created                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NUM_DISTINCT_COPIES    | NUMBER         | Number of distinct copies (that contain datafiles with different checkpoints)                                                                                                                                                                                                                                                                                                                                                                   |
| MIN_CHECKPOINT_CHANGE# | NUMBER         | Minimum checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MAX_CHECKPOINT_CHANGE# | NUMBER         | Maximum checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MIN_CHECKPOINT_TIME    | DATE           | Minimum checkpoint change time                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAX_CHECKPOINT_TIME    | DATE           | Maximum checkpoint change time                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OUTPUT_BYTES           | NUMBER         | Total output bytes                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OUTPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                 | NUMBER         | The ID of the container to which the data pertains. ## 9.140 V\$PROXY\_DATAFILE

V\$PROXY\_DATAFILE contains descriptions of datafile and control file backups that are taken with Proxy Copy. Each row represents a backup of one database file.

| Column      | Datatype      | Description                                                                                                                              |
|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| RECID       | NUMBER        | Proxy copy record ID                                                                                                                     |
| STAMP       | NUMBER        | Proxy copy record stamp                                                                                                                  |
| DEVICE_TYPE | VARCHAR2(17)  | Type of the device on which the copy resides                                                                                             |
| HANDLE      | VARCHAR2(513) | Proxy copy handle identifies the copy for restore                                                                                        |
| COMMENTS    | VARCHAR2(81)  | Comment returned by the operating system or storage subsystem. This value is informational only. It is not needed for restore.           |
| MEDIA       | VARCHAR2(65)  | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                             |
| MEDIA_POOL  | NUMBER        | Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command |
| TAG         | VARCHAR2(32)  | Proxy copy tag                                                                                                                           |

| Column                 | Datatype    | Description                                                                                                                                                                                                                                                                                                    |
|------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                 | VARCHAR2(1) | Status of the backup set: <ul style="list-style-type: none"> <li>• A - Available</li> <li>• U - Unavailable</li> <li>• X - Expired</li> <li>• D - Deleted</li> </ul>                                                                                                                                           |
| DELETED                | VARCHAR2(3) | Indicates whether this record has been deleted (YES) or not (NO)                                                                                                                                                                                                                                               |
| FILE#                  | NUMBER      | Absolute datafile number, or 0 if this is a control file backup                                                                                                                                                                                                                                                |
| CREATION_CHANGE#       | NUMBER      | Datafile creation change number                                                                                                                                                                                                                                                                                |

| ABSOLUTE_FUZZY_CHANGE# | NUMBER      | Highest change in any block of the file, if known                                                                                                                                                                                                                                                              |
| RECOVERY_FUZZY_CHANGE# | NUMBER      | Highest change written to the file by media recovery                                                                                                                                                                                                                                                           |
| RECOVERY_FUZZY_TIME    | DATE        | Timestamp of the highest change written to the file by media recovery                                                                                                                                                                                                                                          |
| INCREMENTAL_LEVEL      | NUMBER      | If this backup is part of an incremental backup strategy, then 0. Otherwise null.                                                                                                                                                                                                                              |
| ONLINE_FUZZY           | VARCHAR2(3) | Indicates whether this copy was made after a crash or offline immediate (or is a copy of a copy which was taken improperly while the database was open) (YES) or not (NO). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.                              |
| BACKUP_FUZZY           | VARCHAR2(3) | Indicates whether this is a copy taken using the BEGIN BACKUP   END BACKUP technique (YES) or not (NO). The BEGIN BACKUP   END BACKUP technique is used internally when proxy copies of open files are created. Recovery will need to apply all redo up to the end backup marker to make this copy consistent. |
| BLOCKS                 | NUMBER      | Size of the copy (in blocks). Also the size of the datafile when the copy was made.                                                                                                                                                                                                                            |
| BLOCK_SIZE             | NUMBER      | Block size of the datafile                                                                                                                                                                                                                                                                                     |
| OLDEST_OFFLINE_RANGE   | NUMBER      | If the file number is 0 (that is, this is a control file backup), the RECID of the oldest offline range record in this control file copy. 0 for datafile copies.                                                                                                                                               |
| START_TIME             | DATE        | Starting time                                                                                                                                                                                                                                                                                                  |

| KEEP_OPTIONS             | VARCHAR2(11) | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>NOLOGS - Indicates a consistent backup made when the database was mounted.</li> <li>NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| RMAN_STATUS_RECID        | NUMBER       | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| RMAN_STATUS_STAMP        | NUMBER       | Owning V\$RMAN_STATUS stamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FOREIGN_DBID             | NUMBER       | Foreign DBID of the database from which this datafile was transported. The value is 0 if the file backed up is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                                             |
| PLUGGED_READONLY         | VARCHAR2(3)  | Indicates whether this is a proxy copy of a transported read-only foreign file (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PLUGIN_CHANGE#           | NUMBER       | SCN at which the foreign datafile was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                                                        |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER       | SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                            |
| PLUGIN_RESETLOGS_TIME    | DATE         | Time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                         |
| BACKED_BY_PDB            | VARCHAR2(3)  | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>YES: The backup was taken when connected to the PDB</li> <li>NO: The backup was taken when connected to the root container</li> </ul>                                                                                                                                                                                                                         |
| GUID                     | RAW(16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                                                                                                                   |

## 9.141 V\$PROXY\_PDB\_TARGETS

V\$PROXY\_PDB\_TARGETS provides information about the target of a proxy PDB.

| Column      | Datatype | Description                                                                                                                                                                                |
|-------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID      | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li><i>n</i>: Where <i>n</i> is the container ID of a proxy PDB</li> </ul> |
| TARGET_PORT | NUMBER   | Port number that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target                                            |

| Column         | Datatype      | Description                                                                                                                                      |
|----------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| TARGET_HOST    | VARCHAR2(128) | Host name where the target of the proxy PDB is running, and which will be used by the proxy PDB to connect to the target                         |
| TARGET_SERVICE | VARCHAR2(128) | Service name that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target |
| TARGET_USER    | VARCHAR2(128) | User name used by the proxy PDB to connect to the target of the proxy PDB. If null, the name of the connected user will be used.                 |

## 9.142 V\$PWFILERS\_USERS

V\$PWFILERS\_USERS lists all users in the password file, and indicates whether the user has been granted the SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, and SYSKM privileges.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                        |
|------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME         | VARCHAR2(128) | Name of the user that is contained in the password file                                                                                                                                                                                                                            |
| SYSDBA           | VARCHAR2(5)   | Indicates whether the user can connect with SYSDBA privileges (TRUE) or not (FALSE)                                                                                                                                                                                                |
| SYSOPER          | VARCHAR2(5)   | Indicates whether the user can connect with SYSOPER privileges (TRUE) or not (FALSE)                                                                                                                                                                                               |
| SYSASM           | VARCHAR2(5)   | Indicates whether the user can connect with SYSASM privileges (TRUE) or not (FALSE)                                                                                                                                                                                                |
| SYSBACKUP        | VARCHAR2(5)   | Indicates whether the user can connect with SYSBACKUP privileges (TRUE) or not (FALSE)                                                                                                                                                                                             |
| SYSDG            | VARCHAR2(5)   | Indicates whether the user can connect with SYSDG privileges (TRUE) or not (FALSE)                                                                                                                                                                                                 |
| SYSKM            | VARCHAR2(5)   | Indicates whether the user can connect with SYSKM privileges (TRUE) or not (FALSE)                                                                                                                                                                                                 |
| ACCOUNT_STATUS   | VARCHAR2(30)  | Account status: <ul style="list-style-type: none"> <li>• OPEN</li> <li>• EXPIRED</li> <li>• EXPIRED (GRACE)</li> <li>• LOCKED (TIMED)</li> <li>• LOCKED</li> <li>• EXPIRED &amp; LOCKED (TIMED)</li> <li>• EXPIRED &amp; LOCKED</li> <li>• EXPIRED (GRACE) &amp; LOCKED</li> </ul> |
| PASSWORD_PROFILE | VARCHAR2(128) | Password profile name                                                                                                                                                                                                                                                              |

| Column                         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_LOGIN                     | TIMESTAMP(9) WITH TIME ZONE | The time of the last user login<br><br>This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM   SYSBACKUP   SYSDBA   SYSDG   SYSOPER   SYSRAC   SYSKM }. The exception is as follows: If a user connects to the database with administrative privileges from a <i>remote</i> session, and the database password file format is 12.2 (V\$PASSWORDFILE_INFO.FORMAT = 12.2), then this column is populated.                                                        |
| LOCK_DATE                      | DATE                        | Date the account was locked if account status was LOCKED                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EXPIRY_DATE                    | DATE                        | Date of expiration of the account                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| EXTERNAL_NAME                  | VARCHAR2(1024)              | Shows Certificate DN or Principal Name of externally authenticated users                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AUTHENTICATION_TYPE            | VARCHAR2(8)                 | Indicates the authentication mechanism for the user: <ul style="list-style-type: none"> <li>EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY;</li> <li>GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY;</li> <li>PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;</li> </ul>                                                                                                                                                                                                                   |
| COMMON                         | VARCHAR2(3)                 | This column has a value of YES if an administrative privilege (for example, SYSDBA) was granted with CONTAINER=ALL. Otherwise, the column has a value of NO.                                                                                                                                                                                                                                                                                                                                                                    |
| PASSWORD_VERSIONS <sup>1</sup> | VARCHAR2(12)                | Shows the list of versions of the password hashes (also known as "verifiers") existing for the account.<br><br>The values for this column can include: <ul style="list-style-type: none"> <li>10G: If an old case-insensitive ORCL hash exists</li> <li>11G: If a SHA-1 hash exists</li> <li>12C: If a de-optimized PBKDF2-based hash exists</li> </ul> For more information about the 12C verifier, see <i>Oracle Database Concepts</i> .<br><br>Note that any combination of these verifiers can exist for any given account. |
| CON_ID                         | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                 |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 9.143 V\$PX\_INSTANCE\_GROUP

V\$PX\_INSTANCE\_GROUP provides information about the instance groups being used for parallel operations by the current session.

| Column            | Datatype     | Description                                                                                                       |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------|
| QC_INSTANCE_GROUP | VARCHAR2(64) | The instance group being used by this session for parallel operations. This value repeats for every row returned. |

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WHY             | VARCHAR2(23) | Where the current instance group name comes from, as follows:<br>SERVICE - the instance group being used is from the session's service name<br>PARALLEL_INSTANCE_GROUP - the instance group being used is being used because the PARALLEL_INSTANCE_GROUP initialization parameter has been set.<br>The value repeats for every row returned.                                                                                                    |
| INSTANCE_NUMBER | NUMBER       | Instance number of the instance providing this instance group. There will be one row for each instance in the instance group that the Query Coordinator is using.                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| QCINST_ID    | NUMBER     | Instance number on which the parallel coordinator is running                                                                                                                                                                                                                                                                                                                                                                                          |
| SERVER_GROUP | NUMBER     | The logical group of servers to which this cluster database process belongs                                                                                                                                                                                                                                                                                                                                                                           |
| SERVER_SET   | NUMBER     | The logical set of servers to which this cluster database process belongs. A single server group will have at most two server sets.                                                                                                                                                                                                                                                                                                                   |
| SERVER#      | NUMBER     | The logical number of the cluster database process within a server set                                                                                                                                                                                                                                                                                                                                                                                |
| DEGREE       | NUMBER     | The degree of parallelism being used by the server set                                                                                                                                                                                                                                                                                                                                                                                                |
| REQ_DEGREE   | NUMBER     | The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER     | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.147 V\$PX\_SESSTAT

V\$PX\_SESSTAT contains information about the sessions running parallel execution.

| Column       | Datatype   | Description                                                                                                                        |
|--------------|------------|------------------------------------------------------------------------------------------------------------------------------------|
| SADDR        | RAW(4   8) | Session address                                                                                                                    |
| SID          | NUMBER     | Session identifier                                                                                                                 |
| SERIAL#      | NUMBER     | Session serial number                                                                                                              |
| QCSID        | NUMBER     | Session identifier of the parallel coordinator                                                                                     |
| QCSERIAL#    | NUMBER     | Session serial number of the parallel coordinator                                                                                  |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.148 V\$QMON\_COORDINATOR\_STATS

V\$QMON\_COORDINATOR\_STATS displays statistics of the non-sharded queue primary process. There is one row per instance. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                 | Datatype                    | Description                                                                                                                                                                               |
|------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QMNC_PID               | VARCHAR2(24)                | Non-sharded queue primary process ID                                                                                                                                                      |
| STATUS                 | VARCHAR2(24)                | Current status of the coordinator: <ul style="list-style-type: none"> <li>DEAD</li> <li>INITIALIZING</li> <li>RUNNING TASK COORDINATOR</li> <li>WAITING</li> <li>ADDING SERVER</li> </ul> |
| NUM_SERVERS            | NUMBER                      | Number of QMON servers currently running                                                                                                                                                  |
| LAST_SERVER_START_TIME | TIMESTAMP(3) WITH TIME ZONE | Last server startup time                                                                                                                                                                  |
| LAST_SERVER_PID        | VARCHAR2(24)                | Process ID of the last server process (Qnnn) created                                                                                                                                      |
| NEXT_WAKEUP_TIME       | TIMESTAMP(3) WITH TIME ZONE | Next wakeup time of the coordinator                                                                                                                                                       |
| NEXT_READY_TIME        | TIMESTAMP(3) WITH TIME ZONE | Ready time of the first delayed task                                                                                                                                                      |
| NEXT_EXPIRY_TIME       | TIMESTAMP(3) WITH TIME ZONE | Expiry time of the next ready task                                                                                                                                                        |
| LAST_WAIT_TIME         | TIMESTAMP(3) WITH TIME ZONE | Time when the coordinator went to sleep                                                                                                                                                   |
| LAST_FAILURE           | VARCHAR2(32)                | Last failure encountered                                                                                                                                                                  |
| LAST_FAILURE_TIME      | TIMESTAMP(3) WITH TIME ZONE | Last failure time                                                                                                                                                                         |
| MAX_TASK_LATENCY       | VARCHAR2(40)                | Maximum task latency across all the servers (in seconds)                                                                                                                                  |
| MIN_TASK_LATENCY       | VARCHAR2(40)                | Minimum task latency across all the servers (in seconds)                                                                                                                                  |

| Column               | Datatype | Description                                                                                                                                          |
|----------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_TASK_LATENCY   | NUMBER   | Cumulative latency across all the tasks (in seconds)                                                                                                 |
| TOTAL_TASKS_EXECUTED | NUMBER   | Cumulative number of tasks serviced by all the servers                                                                                               |
| MAX_SERVERS          | NUMBER   | Maximum number of servers present at any point of time                                                                                               |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.149 V\$QMON\_SERVER\_STATS

V\$QMON\_SERVER\_STATS displays information and statistics about the active queue monitor server processes. There is one row per live queue monitor server process. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype                    | Description                                                                                                                                                              |
|----------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QMNC_PID             | VARCHAR2(24)                | Non-sharded queue primary process ID                                                                                                                                     |

## 9.150 V\$QMON\_TASK\_STATS

V\$QMON\_TASK\_STATS displays information and statistics based on different queue monitor tasks in the system (spilling, time manager activity, and so on). There is one row per kind of task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype                    | Description                                                                                                                                          |

| TOTAL_TASK_FAILURES  | NUMBER                      | Cumulative failures                                                                                                                                  |
| METRIC_TYPE          | VARCHAR2(50)                | Type of metric gathered for this task type                                                                                                           |
| METRIC_VALUE         | NUMBER                      | Value of this metric                                                                                                                                 |
| LAST_FAILURE         | VARCHAR2(32)                | Last failure encountered while executing this type of task                                                                                           |
| LAST_FAILURE_TIME    | TIMESTAMP(3) WITH TIME ZONE | Time when the last failure occurred                                                                                                                  |
| LAST_FAILURE_TASKNUM | NUMBER                      | Task number of the last failed task for this task                                                                                                    |
| REMARK               | VARCHAR2(64)                | Remarks about the task                                                                                                                               |
| CON_ID               | NUMBER                      | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.151 V\$QMON\_TASKS

V\$QMON\_TASKS displays information and statistics about all queue background tasks in the system, which would be served by queue monitor servers. There is one row per task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column           | Datatype                    | Description                               |
|------------------|-----------------------------|-------------------------------------------|
| TASK_NAME        | VARCHAR2(32)                | Task name                                 |
| TASK_NUMBER      | NUMBER                      | Unique task number                        |
| TASK_TYPE        | VARCHAR2(40)                | Task type                                 |
| TASK_SUBMIT_TIME | TIMESTAMP(3) WITH TIME ZONE | Task submit time                          |
| TASK_READY_TIME  | TIMESTAMP(3) WITH TIME ZONE | Task ready time                           |
| TASK_EXPIRY_TIME | TIMESTAMP(3) WITH TIME ZONE | Time when this task expires               |
| TASK_START_TIME  | TIMESTAMP(3) WITH TIME ZONE | Last actual start time for the task       |
| TASK_STATUS      | VARCHAR2(32)                | Status of the task                        |
| SERVER_NAME      | VARCHAR2(48)                | Name of the QMON server running this task |

| Column       | Datatype | Description                                                                                                                                          |
|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_RETRIES  | NUMBER   | Maximum retry count for the task                                                                                                                     |
| NUM_RUNS     | NUMBER   | Number of runs of the task if repeatable                                                                                                             |
| NUM_FAILURES | NUMBER   | Number of failures encountered while running the task                                                                                                |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.152 V\$QUARANTINE

V\$QUARANTINE provides information about quarantined objects.

| Column    | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT    | VARCHAR2(64)                | Type of quarantined object (description of the memory)                                                                                                                                                                                                                                                                                                                                                                                          |
| ADDRESS   | RAW(8)                      | Address of the object                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BYTES     | NUMBER                      | Amount of memory used by the object (this is the minimum amount; the actual amount may be unknown)                                                                                                                                                                                                                                                                                                                                              |
| ERROR     | VARCHAR2(128)               | Oracle error causing quarantine                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TIMESTAMP | TIMESTAMP(6) WITH TIME ZONE | Time the object was quarantined                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID    | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.153 V\$QUARANTINE\_SUMMARY

V\$QUARANTINE\_SUMMARY provides a summary of quarantine for each pluggable database (PDB).

| Column       | Datatype | Description                                                                              |
|--------------|----------|------------------------------------------------------------------------------------------|
| OBJECT_COUNT | NUMBER   | Number of objects in quarantine                                                          |
| OBJECT_LIMIT | NUMBER   | Limit on the number of objects that can be in quarantine before a termination will occur |
| MEMORY_TOTAL | NUMBER   | Number of bytes in quarantine                                                            |
| MEMORY_LIMIT | NUMBER   | Limit on the amount of memory that can be in quarantine before a termination will occur  |
| RECENT_COUNT | NUMBER   | Number of objects recently placed in quarantine (within the last hour)                   |
| RECENT_LIMIT | NUMBER   | Limit on the number of recently quarantined objects before a termination will occur      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

["V\\$QUARANTINE"](#) for additional details on objects recently placed into quarantine

## 9.154 V\$QUEUE

V\$QUEUE contains information on the shared server message queues.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADDR  | RAW(4   8)   | Address of the process that owns the queue                                                                                                                                                                                                                                                                                                                                                                                                        |
| TYPE   | VARCHAR2(10) | Type of queue: <ul style="list-style-type: none"><li>• COMMON - Processed by servers</li><li>• DISPATCHER</li></ul>                                                                                                                                                                                                                                                                                                                               |
| QUEUED | NUMBER       | Number of items in the queue                                                                                                                                                                                                                                                                                                                                                                                                                      |
| WAIT   | NUMBER       | Total time that all items in this queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item.                                                                                                                                                                                                                                                                                                                      |
| TOTALQ | NUMBER       | Total number of items that have ever been in the queue                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.155 V\$QUEUEING\_MTH

V\$QUEUEING\_MTH displays all available queuing resource allocation methods.

| Column | Datatype     | Description                                    |
|--------|--------------|------------------------------------------------|
| NAME   | VARCHAR2(40) | Name of the queuing resource allocation method |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.156 V\$RECOVER\_FILE

V\$RECOVER\_FILE displays the status of files needing media recovery.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#         | NUMBER       | File identifier number                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ONLINE        | VARCHAR2(7)  | This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ONLINE_STATUS.                                                                                                                                                                                                                                                                                                      |
| ONLINE_STATUS | VARCHAR2(7)  | Online status (ONLINE, OFFLINE)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ERROR         | VARCHAR2(18) | Why the file must be recovered: NULL if reason unknown, or OFFLINE NORMAL if recovery not needed                                                                                                                                                                                                                                                                                                                                                |
| CHANGE#       | NUMBER       | SCN where recovery must start                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TIME          | DATE         | Time of SCN when recovery must start                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.157 V\$RECOVERY\_AREA\_USAGE

V\$RECOVERY\_AREA\_USAGE displays usage information about recovery areas.

| Column                    | Datatype     | Description                                                                                                                                                                                                     |
|---------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_TYPE                 | VARCHAR2(23) | File type: <ul style="list-style-type: none"> <li>CONTROL FILE</li> <li>REDO LOG</li> <li>ARCHIVED LOG</li> <li>BACKUP PIECE</li> <li>IMAGE COPY</li> <li>FLASHBACK LOG</li> <li>REMOTE ARCHIVED LOG</li> </ul> |
| PERCENT_SPACE_USED        | NUMBER       | Percent of the recovery area that is in use                                                                                                                                                                     |
| PERCENT_SPACE_RECLAIMABLE | NUMBER       | Percent of the recovery area that is reclaimable                                                                                                                                                                |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUMBER_OF_FILES | NUMBER   | Number of files in the recovery area                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.158 V\$RECOVERY\_FILE\_DEST

V\$RECOVERY\_FILE\_DEST displays information about the disk quota and current disk usage in the fast recovery area.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2(513) | Location name. This is the value specified in the DB_RECOVERY_FILE_DEST initialization parameter.                                                                                                                                                                                                                                                                                                                                               |
| SPACE_LIMIT       | NUMBER        | Maximum amount of disk space (in bytes) that the database can use for the fast recovery area. This is the value specified in the DB_RECOVERY_FILE_DEST_SIZE initialization parameter.                                                                                                                                                                                                                                                           |
| SPACE_USED        | NUMBER        | Amount of disk space (in bytes) used by fast recovery area files created in current and all previous fast recovery areas. Changing fast recovery areas does not reset SPACE_USED to 0.                                                                                                                                                                                                                                                          |
| SPACE_RECLAIMABLE | NUMBER        | Total amount of disk space (in bytes) that can be created by deleting obsolete, redundant, and other low priority files from the fast recovery area                                                                                                                                                                                                                                                                                             |
| NUMBER_OF_FILES   | NUMBER        | Number of files in the fast recovery area                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.159 V\$RECOVERY\_FILE\_STATUS

V\$RECOVERY\_FILE\_STATUS contains one row for each datafile for each RECOVER statement. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can

view the relevant information in this view. V\$RECOVERY\_FILE\_STATUS will be empty to all other Oracle users.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 9.160 V\$RECOVERY\_LOG

V\$RECOVERY\_LOG lists information about archived logs that are needed to complete media recovery. This information is derived from the log history view, V\$LOG\_HISTORY.

V\$RECOVERY\_LOG contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY\_LOG will be empty to all other Oracle users.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# 9.161 V\$RECOVERY\_PROGRESS

V\$RECOVERY\_PROGRESS can be used to track database recovery operations to ensure that they are not stalled, and also to estimate the time required to complete the operation in progress.

On non-coordinator instances, V\$RECOVERY\_PROGRESS is not populated.

On the coordinator instance (the instance where MRP0 was started to start recovery), V\$RECOVERY\_PROGRESS has the same set of rows as before, except the following rows in the ITEM column are always 0 (not used) with Multi-Instance Redo Apply:

- Active Apply
- Maximum Apply Rate
- Apply Time per Log
- Checkpoint Time per Log
- Recovery ID

V\$RECOVERY\_PROGRESS is a subview of V\$SESSION\_LONGOPS.

① **Note**

This view is populated on the instance where the MRP0 process is started if recovery is running in Multi-Instance Redo Apply mode. Not all the columns will be populated.

| Column     | Datatype     | Description                                                                                                                                                           |

## 9.162 V\$RECOVERY\_SLAVE

V\$RECOVERY\_SLAVE is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 9.163 V\$RECOVERY\_STATUS

V\$RECOVERY\_STATUS contains statistics of the current recovery process. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY\_STATUS will be empty to all other Oracle users.

|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_CHECKPOINT | DATE          | Point in time to which the recovery has occurred. If no logs have been applied, this is the point in time the recovery starts.                                                                                                                                                                                                                                                                                                                  |
| THREAD              | NUMBER        | Number of the redo thread currently being processed                                                                                                                                                                                                                                                                                                                                                                                             |
| SEQUENCE_NEEDED     | NUMBER        | Log sequence number of the log needed by the recovery process. The value is 0 if no log is needed.                                                                                                                                                                                                                                                                                                                                              |
| SCN_NEEDED          | VARCHAR2(16)  | Low SCN of the log needed by recovery. The value is 0 if unknown or no log is needed.                                                                                                                                                                                                                                                                                                                                                           |
| TIME_NEEDED         | DATE          | Time when the log was created. The value is midnight on 1/1/88 if the time is unknown or if no log is needed.                                                                                                                                                                                                                                                                                                                                   |
| PREVIOUS_LOG_NAME   | VARCHAR2(513) | Filename of the log                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PREVIOUS_LOG_STATUS | VARCHAR2(13)  | Status of the previous log. Contains one of the following values: RELEASE; WRONG NAME; MISSING NAME; UNNEEDED NAME; NONE                                                                                                                                                                                                                                                                                                                        |
| REASON              | VARCHAR2(13)  | Reason recovery is returning control to the user (NEED LOG LOG REUSED THREAD DISABLED)                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.164 V\$REDO\_DEST\_RESP\_HISTOGRAM

V\$REDO\_DEST\_RESP\_HISTOGRAM provides statistical information for each redo transport destination.

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEST_ID   | NUMBER       | A nonnegative integer value representing a SYNC standby destination                                                                                                                                                                                                                                                                                                                                                                                         |
| TIME      | VARCHAR2(20) | A text string that shows the last wall-clock time that a bucket was hit                                                                                                                                                                                                                                                                                                                                                                                     |
| DURATION  | NUMBER       | A positive integer value that represents a bucket of seconds, 1, 2, 3, up to 300 seconds, followed by 5 additional buckets that represent 600, 1200, 2400, 4800, and 9600 ( $\geq 4801$ ) seconds                                                                                                                                                                                                                                                           |
| FREQUENCY | NUMBER       | A nonnegative integer that shows the number of times a particular bucket was hit by the destination specified by DEST_ID                                                                                                                                                                                                                                                                                                                                    |
| CON_ID    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul> |

## 9.165 V\$REQDIST

V\$REQDIST lists statistics for the histogram of shared server dispatcher request times, divided into 12 buckets, or ranges of time. The time ranges grow exponentially as a function of the bucket number.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUCKET | NUMBER   | Bucket number: 0 - 11; the maximum time for each bucket is $(4 * 2^N) / 100$ seconds                                                                                                                                                                                                                                                                                                                                                                        |
| COUNT  | NUMBER   | Count of requests whose total time to complete (excluding wait time) falls in this range                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul> |

## 9.166 V\$RESERVED\_WORDS

V\$RESERVED\_WORDS displays a list of all SQL keywords. To determine whether a particular keyword is reserved in any way, check the RESERVED, RES\_TYPE, RES\_ATTR, and RES\_SEMI columns.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEYWORD   | VARCHAR2(128) | Name of the keyword                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LENGTH    | NUMBER        | Length of the keyword                                                                                                                                                                                                                                                                                                                                                                                                                           |
| RESERVED  | VARCHAR2(1)   | Indicates whether the keyword cannot be used as an identifier (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                    |
| RES_TYPE  | VARCHAR2(1)   | Indicates whether the keyword cannot be used as a type name (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                      |
| RES_ATTR  | VARCHAR2(1)   | Indicates whether the keyword cannot be used as an attribute name (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                |
| RES_SEMI  | VARCHAR2(1)   | Indicates whether the keyword is not allowed as an identifier in certain situations, such as in DML (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                              |
| DUPLICATE | VARCHAR2(1)   | Indicates whether the keyword is a duplicate of another keyword (Y) or whether the keyword is not a duplicate (N)                                                                                                                                                                                                                                                                                                                               |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.167 V\$RESOURCE

V\$RESOURCE contains resource name and address information.

| Column | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR   | RAW(4   8)  | Address of the resource object                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE   | VARCHAR2(2) | Resource type; the resource types are listed in <a href="#">Table 9-1</a>                                                                                                                                                                                                                                                                                                                                                                       |
| ID1    | NUMBER      | Resource identifier #1                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ID2    | NUMBER      | Resource identifier #2                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.168 V\$RESOURCE\_LIMIT

V\$RESOURCE\_LIMIT displays information about global resource use for some of the system resources. Use this view to monitor the consumption of resources so that you can take corrective action, if necessary. Many of the resources correspond to initialization parameters listed in [Table 9-5](#).

Some resources, those used by DLM for example, have an initial allocation (soft limit), and the hard limit, which is theoretically infinite (although in practice it is limited by SGA size). During SGA reservation/initialization, a place is reserved in SGA for the INITIAL\_ALLOCATION of resources, but if this allocation is exceeded, additional resources are allocated up to the value indicated by LIMIT\_VALUE. The CURRENT\_UTILIZATION column indicates whether the initial allocation has been exceeded. When the initial allocation value is exceeded, the additional required resources are allocated from the shared pool, where they must compete for space with other resources.

A good choice for the value of INITIAL\_ALLOCATION will avoid the contention for space. For most resources, the value for INITIAL\_ALLOCATION is the same as the LIMIT\_VALUE. Exceeding LIMIT\_VALUE results in an error.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESOURCE_NAME       | VARCHAR2(128) | Name of the resource (see <a href="#">Table 9-5</a> )                                                                                                                                                                                                                                                                                                                                                                                           |
| CURRENT_UTILIZATION | NUMBER        | Number of (resources, locks, or processes) currently being used                                                                                                                                                                                                                                                                                                                                                                                 |
| MAX_UTILIZATION     | NUMBER        | Maximum consumption of this resource since the last instance start-up                                                                                                                                                                                                                                                                                                                                                                           |
| INITIAL_ALLOCATION  | VARCHAR2(40)  | Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation).                                                                                                                                                                                                                                                                                        |
| LIMIT_VALUE         | VARCHAR2(40)  | Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).                                                                                                                                                                                                                                                                                                                        |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.169 V\$RESTORE\_POINT

V\$RESTORE\_POINT displays information about restore points.

| Column                           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCN                              | NUMBER        | Database SCN when the restore point was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DATABASE_INCARNATION#            | NUMBER        | Database incarnation number when the restore point was created                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| GUARANTEE_FLASHBACK_DATA<br>BASE | VARCHAR2(3)   | Indicates whether flashback log files will be kept to ensure a flashback to this point (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                              |
| STORAGE_SIZE                     | NUMBER        | Approximate number of bytes of disk space currently tied up supporting this restore point, and which would no longer be tied up if this restore point is the oldest restore point and it is dropped. This will always be zero for non-guaranteed restore points.                                                                                                                                                                                                                                                      |
| TIME                             | TIMESTAMP(9)  | Wall-clock time when the restore point was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| RESTORE_POINT_TIME               | TIMESTAMP(9)  | Time that was specified when the restore point was created. If a time was not specified, this value is NULL.                                                                                                                                                                                                                                                                                                                                                                                                          |
| PRESERVED                        | VARCHAR2(3)   | Indicates whether the restore point must be explicitly deleted (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NAME                             | VARCHAR2(128) | Name of the restore point                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PDB_RESTORE_POINT                | VARCHAR2(3)   | Indicates whether there is a PDB restore point for this PDB (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CLEAN_PDB_RESTORE_POINT          | VARCHAR2(3)   | Indicates whether there is a clean PDB restore point for this PDB (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PDB_INCARNATION#                 | NUMBER        | Pluggable database (PDB) incarnation number. This value is meaningful only for PDB restore points.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| REPLICATED                       | VARCHAR2(3)   | This column is useful in Oracle Data Guard environments. It indicates the method by which a restore point was created. Possible values: <ul style="list-style-type: none"> <li>• YES - The restore point was automatically replicated from the primary database to this database when this database was a standby database. The string _PRIMARY is appended to the name of such a restore point.</li> <li>• NO - The restore point was created by a user and was not replicated from the primary database.</li> </ul> |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.170 V\$RESULT\_CACHE\_DEPENDENCY

V\$RESULT\_CACHE\_DEPENDENCY displays the depends-on relationship between cached results and dependencies.

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESULT_ID | NUMBER   | Cached result                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DEPEND_ID | NUMBER   | Dependency object                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBJECT_NO | NUMBER   | Dictionary object number of the dependency object                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.171 V\$RESULT\_CACHE\_MEMORY

V\$RESULT\_CACHE\_MEMORY displays all the memory blocks and their status.

| Column                   | Datatype    | Description                                                                                                                    |
|--------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| ID                       | NUMBER      | Unique block identifier (that is, the block number)                                                                            |
| CHUNK                    | NUMBER      | Chunk to which the block belongs, relative to the subcache in which the memory object resides (the upper 27 bits of the ID)    |
| OFFSET                   | NUMBER      | Offset of the block within its chunk, relative to the subcache in which the memory object resides (the lower 5 bits of the ID) |
| SUBCACHE_ID <sup>1</sup> | NUMBER      | Subcache ID                                                                                                                    |
| FREE                     | VARCHAR2(3) | Indicates whether the block is free (YES) or not (NO)                                                                          |
| OBJECT_ID                | NUMBER      | Cache object to which the memory block belongs; NULL if the memory block is not allocated to a cache object (FREE = YES)       |
| POSITION                 | NUMBER      | Position of the block in the cached object; NULL if the memory block is not allocated to a cache object (FREE = YES)           |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 9.172 V\$RESULT\_CACHE\_OBJECTS

V\$RESULT\_CACHE\_OBJECTS displays all the objects (both cached results and dependencies) and their attributes.

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                        | NUMBER        | Identifier for the cache object (also the ID of the first block)                                                                                                                                                                                                                                                                               |
| TYPE                      | VARCHAR2(10)  | Type of the cache object: <ul style="list-style-type: none"> <li>• Dependency</li> <li>• Result</li> <li>• Temp</li> </ul>                                                                                                                                                                                                                     |
| STATUS                    | VARCHAR2(9)   | Status of the object: <ul style="list-style-type: none"> <li>• New - Result is still under construction</li> <li>• Published - Result is available for use</li> <li>• Bypass - Result will be bypassed from use</li> <li>• Expired - Result has exceeded expiration time</li> <li>• Invalid - Result is no longer available for use</li> </ul> |
| BUCKET_NO                 | NUMBER        | Internal hash bucket for the object                                                                                                                                                                                                                                                                                                            |
| HASH                      | NUMBER        | Hash value for the object                                                                                                                                                                                                                                                                                                                      |
| NAME                      | VARCHAR2(387) | Name (for example, SQL prefix or PL/SQL function name)                                                                                                                                                                                                                                                                                         |
| NAMESPACE                 | VARCHAR2(10)  | Namespace: <ul style="list-style-type: none"> <li>• SQL</li> <li>• PLSQL</li> <li>• KEY VECTOR</li> </ul>                                                                                                                                                                                                                                      |
| CREATION_TIMESTAMP        | DATE          | Time when the object was created                                                                                                                                                                                                                                                                                                               |
| CREATOR_UID               | NUMBER        | UID that created the object                                                                                                                                                                                                                                                                                                                    |
| DEPEND_COUNT              | NUMBER        | Number of dependencies (TYPE = Result) or dependents (TYPE = Dependency)                                                                                                                                                                                                                                                                       |
| BLOCK_COUNT               | NUMBER        | Total number of blocks in the cached object                                                                                                                                                                                                                                                                                                    |
| SCN                       | NUMBER        | Build SCN (TYPE = Result) or invalidation SCN (TYPE = Dependency)                                                                                                                                                                                                                                                                              |
| COLUMN_COUNT <sup>1</sup> | NUMBER        | Number of columns in the cached result                                                                                                                                                                                                                                                                                                         |
| PIN_COUNT <sup>1</sup>    | NUMBER        | Number of active scans on this result                                                                                                                                                                                                                                                                                                          |

## 9.173 V\$RESULT\_CACHE\_STATISTICS

V\$RESULT\_CACHE\_STATISTICS displays various result cache settings and usage statistics.

| Column | Datatype | Description      |
|--------|----------|------------------|
| ID     | NUMBER   | Statistic number |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2(128) | Name of the statistic (see <a href="#">Table 9-6</a> )                                                                                                                                                                                                                                                                                                                                                                                          |
| VALUE  | VARCHAR2(81)  | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Table 9-6 V\$RESULT\_CACHE\_STATISTICS and V\$RESULT\_SUBCACHE\_STATISTICS Statistics**

| Statistic Name               | Description                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Block Count Current          | Number of memory blocks currently allocated                                                                                             |
| Block Count Maximum          | Maximum number of memory blocks allowed                                                                                                 |
| Block Size (Bytes)           | Size of each memory block                                                                                                               |
| Create Count Failure         | Number of cache results that failed to create                                                                                           |
| Create Count Success         | Number of cache results successfully created                                                                                            |
| Delete Count Invalid         | Number of invalid cached results deleted                                                                                                |
| Delete Count Valid           | Number of valid cached results deleted                                                                                                  |
| Find Copy Count              | Number of results copied directly out of the cache                                                                                      |
| Find Count                   | Number of cached results that were successfully found                                                                                   |
| Global Load Rate             | Rate at which cached results were fetched from remote instances (in bytes per 10 milliseconds)                                          |
| Global Prune By Self Count   | Number of times this instance did not provide a cached result to a remote instance because this instance deemed it inefficient to do so |
| Global Prune Count           | Number of times this instance did not fetch a cached result from a remote instance because it was deemed inefficient to do so           |
| Hash Chain Length            | Average length of items in the hash chain                                                                                               |
| Invalidation Count           | Total number of invalidations                                                                                                           |
| Result Size Maximum (Blocks) | Maximum number of blocks allowed for a single result                                                                                    |
| Subcache Count               | Number of subcaches in the result cache                                                                                                 |

## 9.175 V\$RMAN\_BACKUP\_JOB\_DETAILS

V\$RMAN\_BACKUP\_JOB\_DETAILS displays details about backup jobs.

| Column        | Datatype     | Description                                                                                            |
|---------------|--------------|--------------------------------------------------------------------------------------------------------|
| SESSION_KEY   | NUMBER       | Session identifier                                                                                     |
| SESSION_RECID | NUMBER       | Together, with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT |
| SESSION_STAMP | NUMBER       | Together, with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT |
| COMMAND_ID    | VARCHAR2(33) | Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN                        |
| START_TIME    | DATE         | Start time of the first BACKUP command in the job                                                      |
| END_TIME      | DATE         | End time of the last BACKUP command in the job                                                         |

| Column                       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INPUT_BYTES                  | NUMBER         | Sum of all input file sizes backed up by this job                                                                                                                                                                                                                                                                                                               |
| OUTPUT_BYTES                 | NUMBER         | Output size of all pieces generated by this job                                                                                                                                                                                                                                                                                                                 |
| STATUS_WEIGHT                | NUMBER         | Used internally by Enterprise Manager                                                                                                                                                                                                                                                                                                                           |
| OPTIMIZED_WEIGHT             | NUMBER         | Used internally by Enterprise Manager                                                                                                                                                                                                                                                                                                                           |
| OBJECT_TYPE_WEIGHT           | NUMBER         | Used internally by Enterprise Manager                                                                                                                                                                                                                                                                                                                           |
| OUTPUT_DEVICE_TYPE           | VARCHAR2(17)   | Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).                                                                                                                                                                                                                                                            |
| AUTOBACKUP_COUNT             | NUMBER         | Number of autobackups performed by this job                                                                                                                                                                                                                                                                                                                     |
| BACKED_BY_OSB                | VARCHAR2(3)    | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                                                                                                                                                                       |
| AUTOBACKUP_DONE              | VARCHAR2(3)    | YES or NO, depending upon whether or not a control file autobackup was done as part of this backup job                                                                                                                                                                                                                                                          |
| STATUS                       | VARCHAR2(23)   | One of the following values: <ul style="list-style-type: none"> <li>RUNNING WITH WARNINGS</li> <li>RUNNING WITH ERRORS</li> <li>COMPLETED</li> <li>COMPLETED WITH WARNINGS</li> <li>COMPLETED WITH ERRORS</li> <li>FAILED</li> </ul>                                                                                                                            |
| INPUT_TYPE                   | VARCHAR2(13)   | Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> <li>DB FULL</li> <li>RECV AREA</li> <li>DB INCR</li> <li>DATAFILE FULL</li> <li>DATAFILE INCR</li> <li>ARCHIVELOG</li> <li>CONTROLFILE</li> <li>SPFILE</li> </ul> |
| OPTIMIZED                    | VARCHAR2(3)    | YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.                                                                                                                                                                                                                                                                       |
| ELAPSED_SECONDS              | NUMBER         | Number of elapsed seconds                                                                                                                                                                                                                                                                                                                                       |
| COMPRESSION_RATIO            | NUMBER         | Compression ratio                                                                                                                                                                                                                                                                                                                                               |
| INPUT_BYTES_PER_SEC          | NUMBER         | Input read-rate-per-second                                                                                                                                                                                                                                                                                                                                      |
| OUTPUT_BYTES_PER_SEC         | NUMBER         | Output write-rate-per-second                                                                                                                                                                                                                                                                                                                                    |
| INPUT_BYTES_DISPLAY          | VARCHAR2(4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                               |
| OUTPUT_BYTES_DISPLAY         | VARCHAR2(4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on                                                                                                                                                                                                                                                                |
| INPUT_BYTES_PER_SEC_DISPLAY  | VARCHAR2(4000) | Input read-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                         |
| OUTPUT_BYTES_PER_SEC_DISPLAY | VARCHAR2(4000) | Output write-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                       |
| TIME_TAKEN_DISPLAY           | VARCHAR2(4000) | Time taken, shown in user-displayable format <nn>h:<nn>m:<nn>s                                                                                                                                                                                                                                                                                                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.176 V\$RMAN\_BACKUP\_SUBJOB\_DETAILS

V\$RMAN\_BACKUP\_SUBJOB\_DETAILS merges similar operations within an RMAN session into a single row. For example, if there are four BACKUP DATAFILE <n> commands, three RECOVERY COPY OF DATAFILE commands, and one BACKUP RECOVERY AREA command, this view will contain three rows - one each for BACKUP, ROLLFORWARD, and COPY\_DISK\_TO\_TAPE operation.

| Column             | Datatype     | Description                                                                                                                              |
|--------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY        | NUMBER       | Session identifier                                                                                                                       |
| SESSION_RECID      | NUMBER       | Together with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT                                    |
| SESSION_STAMP      | NUMBER       | Together with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT                                    |
| OPERATION          | VARCHAR2(33) | Can be BACKUP, ROLLFORWARD, VALIDATE, or COPY_DISK_TO_TAPE. A row for each suboperation type for the session will be in the output view. |
| COMMAND_ID         | VARCHAR2(33) | Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN                                                          |
| START_TIME         | DATE         | Start time of the first BACKUP command in the job                                                                                        |
| END_TIME           | DATE         | End time of the last BACKUP command in the job                                                                                           |
| INPUT_BYTES        | NUMBER       | Sum of all input file sizes backed up by this job                                                                                        |
| OUTPUT_BYTES       | NUMBER       | Output size of all pieces generated by this job                                                                                          |
| STATUS_WEIGHT      | NUMBER       | Used internally by Enterprise Manager                                                                                                    |
| OBJECT_TYPE_WEIGHT | NUMBER       | Used internally by Enterprise Manager                                                                                                    |
| OPTIMIZED_WEIGHT   | NUMBER       | Used internally by Enterprise Manager                                                                                                    |
| OUTPUT_DEVICE_TYPE | VARCHAR2(17) | Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).                                     |
| BACKED_BY_OSB      | VARCHAR2(3)  | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                |
| AUTOBACKUP_DONE    | VARCHAR2(3)  | YES or NO, depending upon whether or not a control file autobackup was done as part of this job                                          |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS               | VARCHAR2(23)   | One of the following values: <ul style="list-style-type: none"> <li>• RUNNING WITH WARNINGS</li> <li>• RUNNING WITH ERRORS</li> <li>• COMPLETED</li> <li>• COMPLETED WITH WARNINGS</li> <li>• COMPLETED WITH ERRORS</li> <li>• FAILED</li> </ul>                                                                                                                                                                                                      |
| INPUT_TYPE           | VARCHAR2(13)   | Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> <li>• DB FULL</li> <li>• RECVR AREA</li> <li>• DB INCR</li> <li>• DATAFILE FULL</li> <li>• DATAFILE INCR</li> <li>• ARCHIVELOG</li> <li>• CONTROLFILE</li> <li>• SPFILE</li> </ul>                                                                      |
| OPTIMIZED            | VARCHAR2(3)    | YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.                                                                                                                                                                                                                                                                                                                                                             |
| AUTOBACKUP_COUNT     | NUMBER         | Number of autobackups performed by this job                                                                                                                                                                                                                                                                                                                                                                                                           |
| COMPRESSION_RATIO    | NUMBER         | Compression ratio                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| INPUT_BYTES_DISPLAY  | VARCHAR2(4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.177 V\$RMAN\_BACKUP\_TYPE

V\$RMAN\_BACKUP\_TYPE displays information about RMAN backup types.

| Column     | Datatype     | Description                                                                    |
|------------|--------------|--------------------------------------------------------------------------------|
| WEIGHT     | NUMBER       | Used to set precedence order of different backup types in reports.             |
| INPUT_TYPE | VARCHAR2(13) | Used to represent possible filters used in creating various reporting screens. |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.178 V\$RMAN\_COMPRESSION\_ALGORITHM

V\$RMAN\_COMPRESSION\_ALGORITHM provides descriptions of supported compression algorithms. It is used by the RMAN client.

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALGORITHM_ID            | NUMBER       | Algorithm ID                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ALGORITHM_NAME          | VARCHAR2(64) | Name of the algorithm (for example, LOW, MEDIUM, DEFAULT, or HIGH)                                                                                                                                                                                                                                                                                                                                                                                     |
| INITIAL_RELEASE         | VARCHAR2(18) | First Oracle Database release when this compression algorithm was available                                                                                                                                                                                                                                                                                                                                                                            |
| TERMINAL_RELEASE        | VARCHAR2(18) | Last Oracle Database release that supported using this compression algorithm to create new backups. Existing backups can always be restored, even if they use a deprecated compression algorithm.                                                                                                                                                                                                                                                      |
| ALGORITHM_DESCRIPTION   | VARCHAR2(64) | Description of the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ALGORITHM_COMPATIBILITY | VARCHAR2(18) | Required database compatibility level for the algorithm (for example, 11.2.0 for DEFAULT)                                                                                                                                                                                                                                                                                                                                                              |
| IS_VALID                | VARCHAR2(3)  | Indicates whether the algorithm is valid with regard to the compatibility setting (YES) or not (NO). The value is YES if ALGORITHM_COMPATIBILITY <= DATABASE_COMPATIBILITY.                                                                                                                                                                                                                                                                            |
| REQUIRES_ACO            | VARCHAR2(3)  | Indicates whether the algorithm requires the Advanced Compression Option (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                             |
| IS_DEFAULT              | VARCHAR2(3)  | Indicates whether the algorithm is the default compression algorithm that RMAN uses to create compressed backup sets (YES) or not (NO)                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.179 V\$RMAN\_CONFIGURATION

V\$RMAN\_CONFIGURATION lists information about RMAN persistent configuration settings.

| Column | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONF#  | NUMBER         | A unique key identifying this configuration record within the target database that owns it.                                                                                                                                                                                                                                                                                                                                                     |
| NAME   | VARCHAR2(65)   | The type of configuration. All options of the CONFIGURE command are valid types except: <ul style="list-style-type: none"> <li>CONFIGURE EXCLUDE (described in RC_TABLESPACE)</li> <li>CONFIGURE AUXNAME (described in RC_DATAFILE)</li> <li>CONFIGURE SNAPSHOT CONTROLFILE (stored only in control file)</li> </ul>                                                                                                                            |
| VALUE  | VARCHAR2(1025) | The CONFIGURE command setting. Example: RETENTION POLICY TO RECOVERY WINDOW OF 10 DAYS                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.180 V\$RMAN\_ENCRYPTION\_ALGORITHMS

V\$RMAN\_ENCRYPTION\_ALGORITHMS displays supported encryption algorithms. It is used by the RMAN client to validate user-requested algorithms. This view will list AES128, AES192, and AES256 encryption algorithms for the current release. The default algorithm is AES128.

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALGORITHM_ID          | NUMBER       | Number to identify the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                |
| ALGORITHM_NAME        | VARCHAR2(64) | Name of the algorithm (for example, AES128, AES192, or AES256)                                                                                                                                                                                                                                                                                                                                                                                  |
| ALGORITHM_DESCRIPTION | VARCHAR2(64) | Description of the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IS_DEFAULT            | VARCHAR2(3)  | Indicates whether this is the default encryption algorithm (YES) or not (NO). This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).                                                                                                                                                                                                                           |
| RESTORE_ONLY          | VARCHAR2(3)  | Indicates whether this algorithm can be used for restore only (YES) or not (NO). If the value is NO, then the algorithm is also allowed for backup. This column is useful in determining whether an encryption algorithm is deprecated for backup purpose.                                                                                                                                                                                      |
| CON_ID                | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.181 V\$RMAN\_OUTPUT

V\$RMAN\_OUTPUT displays messages reported by RMAN.

This is an in-memory view and is not recorded in the controlfile. The view can hold 32768 rows.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID               | NUMBER        | Session ID of the session which is running this RMAN operation                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RECID             | NUMBER        | Record ID of the corresponding V\$RMAN_STATUS row                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| STAMP             | NUMBER        | Timestamp of the corresponding V\$RMAN_STATUS row                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SESSION_RECID     | NUMBER        | Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)                                                                                                                                                                                                                                                                                                                                                                                                                   |

| SESSION_KEY       | NUMBER        | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| GUID              | NUMBER        | The guid of the pluggable database (PDB) that did the RMAN operation. V\$RMAN_OUTPUT captures the rman output.<br><br>If a PDB sysdba did the backup, the guid of the PDB is displayed in V\$RMAN_OUTPUT. If root did the backup, then guid of the root is displayed in V\$RMAN_OUTPUT. Root<br><br>A root user can see all of V\$RMAN_OUTPUT rows (that is, the rows owned by all PDBs), but a PDB user can only see that PDB's V\$RMAN_OUTPUT rows (that is, no rows from root or other PDBs). |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                          |

## 9.182 V\$RMAN\_STATUS

V\$RMAN\_STATUS displays the finished and on-going RMAN jobs. For on-going jobs, this view displays progress and status. The jobs which are in progress are stored only in memory while the finished jobs are stored in the controlfile.

| Column       | Datatype | Description                                                                                               |
|--------------|----------|-----------------------------------------------------------------------------------------------------------|
| SID          | NUMBER   | Session ID of the session which is running this RMAN operation                                            |
| RECID        | NUMBER   | Record ID of the row in the controlfile                                                                   |
| STAMP        | NUMBER   | Timestamp of the row (RECID + STAMP is unique)                                                            |
| PARENT_RECID | NUMBER   | Record ID of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1) |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARENT_STAMP       | NUMBER       | Timestamp of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)                                                                                                                                                                                                                                                                                                                               |
| SESSION_RECID      | NUMBER       | Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_STAMP      | NUMBER       | Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)                                                                                                                                                                                                                                                                                                                                                          |
| ROW_LEVEL          | NUMBER       | Level of the row. The session has level 0.                                                                                                                                                                                                                                                                                                                                                                                              |
| ROW_TYPE           | VARCHAR2(19) | Type of the row: <ul style="list-style-type: none"> <li>• SESSION</li> <li>• COMMAND</li> <li>• RECURSIVE OPERATION</li> </ul>                                                                                                                                                                                                                                                                                                          |
| COMMAND_ID         | VARCHAR2(33) | Command ID set by the RMAN SET COMMAND ID command. If not set, then RMAN will create a unique number.                                                                                                                                                                                                                                                                                                                                   |
| OPERATION          | VARCHAR2(33) | Name of the command in the execution explained by this row                                                                                                                                                                                                                                                                                                                                                                              |

| OPTIMIZED          | VARCHAR2(3)  | YES, if backup optimization was applied during the backup job. Otherwise, NO.                                                                                                                                                                                                                                                                                                                                                           |
| OBJECT_TYPE        | VARCHAR2(13) | Identifies types of objects backed up                                                                                                                                                                                                                                                                                                                                                                                                   |
| OUTPUT_DEVICE_TYPE | VARCHAR2(17) | DISK, SBT_TAPE, or *. An * indicates that output was written to more than one device type.                                                                                                                                                                                                                                                                                                                                              |
| OSB_ALLOCATED      | VARCHAR2(3)  | A value of YES means an Oracle Secure Backup channel was allocated during the specified operation identified by the V\$RMAN_STATUS view.                                                                                                                                                                                                                                                                                                |
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 9.183 V\$RO\_USER\_ACCOUNT

V\$RO\_USER\_ACCOUNT is populated only on Oracle databases that are open in read-only mode. When a database is read-only, security data cannot be stored in normal catalogue tables. Instead, the security data is stored in an in-memory table that is queried through this view. In an Oracle Data Guard environment, some of the security information for user accounts on the standby is inherited from the primary server. For example, if the account is locked out unlimited on the primary, then it will be locked on the standby database(s). The information stored on the standby is volatile information that user actions on the standby database(s) can affect, such as the number of failed logins, and the time the account was locked on the standby due to failed access attempts. Note that failed login attempts on standbys do not affect the account status on primaries.

If this view is queried from the root in a multitenant container database (CDB), then only common users and the SYS user are returned.

If this view is queried from a pluggable database (PDB), only rows that pertain to the current PDB are returned.

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| PASSW_IN_GRACE         | NUMBER        | Indicates whether the account is in grace (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PASSW_LOCKED           | NUMBER        | Indicates whether the account is locked (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PASSW_LOCK_UNLIM       | NUMBER        | Indicates whether the account is locked for an unlimited time (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FAILED_LOGINS          | NUMBER        | The number of failed login attempts. The count is not cumulative; it is reset upon successful login to the account                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXPIRATION_AFTER_GRACE | TIMESTAMP(3)  | The expiration time after grace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PASSW_LOCK_TIME        | TIMESTAMP(3)  | The time the account was locked out                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                 | NUMBER        | The ID of the container where the failed login occurred.<br>For users that are not common users, the CON_ID is the PDB ID where the failed login attempt occurred.<br>For common users, the CON_ID is 0.<br>The login attempts that occurred on a PDB are not displayed when you query V\$RO_USER_ACCOUNT from another PDB. You only see the failed login attempts of any users (that are not common users) if those failed login attempts occurred on the same PDB from which you are querying V\$RO_USER_ACCOUNT.<br>The failed login attempts of common users (and of the SYS user) are only displayed when V\$RO_USER_ACCOUNT is queried from the root of a CDB, not when it is queried from a PDB.<br>In a non-CDB, the value is always 0. |
| USERNAME               | VARCHAR2(128) | User name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 9.184 V\$ROLLNAME

V\$ROLLNAME lists the names of all online rollback segments. It can only be accessed when the database is open.

| Column | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|--------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USN    | NUMBER       |          | Rollback (undo) segment number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NAME   | VARCHAR2(30) | NOT NULL | Rollback segment name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID | NUMBER       |          | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.185 V\$ROLLSTAT

V\$ROLLSTAT contains rollback segment statistics.

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                            |
|-----------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USN       | NUMBER       | Rollback segment number                                                                                                                                                                                                                                                                                |
| LATCH     | NUMBER       | Latch for the rollback segment                                                                                                                                                                                                                                                                         |
| EXTENTS   | NUMBER       | Number of extents in the rollback segment                                                                                                                                                                                                                                                              |
| RSSIZE    | NUMBER       | Size (in bytes) of the rollback segment. This value differs by the number of bytes in one database block from the value of the BYTES column of the *_SEGMENTS view.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i> for more information about space management for rollback segments |
| WRITES    | NUMBER       | Number of bytes written to the rollback segment                                                                                                                                                                                                                                                        |
| XACTS     | NUMBER       | Number of active transactions                                                                                                                                                                                                                                                                          |
| GETS      | NUMBER       | Number of header gets                                                                                                                                                                                                                                                                                  |
| WAITS     | NUMBER       | Number of header waits                                                                                                                                                                                                                                                                                 |
| OPTSIZE   | NUMBER       | Optimal size of the rollback segment                                                                                                                                                                                                                                                                   |
| HWMSIZE   | NUMBER       | High watermark of the rollback segment size                                                                                                                                                                                                                                                            |
| SHRINKS   | NUMBER       | Number of times the size of a rollback segment decreases                                                                                                                                                                                                                                               |
| WRAPS     | NUMBER       | Number of times rollback segment is wrapped                                                                                                                                                                                                                                                            |
| EXTENDS   | NUMBER       | Number of times rollback segment size is extended                                                                                                                                                                                                                                                      |
| AVESHRINK | NUMBER       | Average shrink size                                                                                                                                                                                                                                                                                    |
| AVEACTIVE | NUMBER       | Current size of active extents, averaged over time.                                                                                                                                                                                                                                                    |
| STATUS    | VARCHAR2(15) | Rollback segment status: <ul style="list-style-type: none"> <li>• ONLINE</li> <li>• PENDING OFFLINE</li> <li>• OFFLINE</li> <li>• FULL</li> </ul>                                                                                                                                                      |
| CUREXT    | NUMBER       | Current extent                                                                                                                                                                                                                                                                                         |
| CURBLK    | NUMBER       | Current block                                                                                                                                                                                                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.186 V\$ROWCACHE

V\$ROWCACHE displays statistics for data dictionary activity. Each row contains statistics for one data dictionary cache.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CACHE#        | NUMBER       | Row cache ID number                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TYPE          | VARCHAR2(11) | Parent or subordinate row cache type                                                                                                                                                                                                                                                                                                                                                                                                            |
| SUBORDINATE#  | NUMBER       | Subordinate set number                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARAMETER     | VARCHAR2(32) | Name of the initialization parameter that determines the number of entries in the data dictionary cache                                                                                                                                                                                                                                                                                                                                         |
| COUNT         | NUMBER       | Total number of entries in the cache                                                                                                                                                                                                                                                                                                                                                                                                            |
| USAGE         | NUMBER       | Number of cache entries that contain valid data                                                                                                                                                                                                                                                                                                                                                                                                 |
| FIXED         | NUMBER       | Number of fixed entries in the cache                                                                                                                                                                                                                                                                                                                                                                                                            |
| GETS          | NUMBER       | Total number of requests for information on the data object                                                                                                                                                                                                                                                                                                                                                                                     |

| DLM_RELEASES  | NUMBER       | Number of DLM releases<br>This column is obsolete and is maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.187 V\$ROWCACHE\_PARENT

V\$ROWCACHE\_PARENT displays information for parent objects in the data dictionary. There is one row per lock owner, and one waiter for each object. This row shows the mode held or requested. For objects with no owners or waiters, a single row is displayed.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

This column is only relevant for Real Application Clusters.                                                                                                                                                                                                                                                                                                                                               |
| INST_LOCK_ID2     | RAW(4)       | ID associated with the instance lock. This column is only relevant for Real Application Clusters.                                                                                                                                                                                                                                                                                                                                               |
| KEY               | RAW(100)     | Contents of the key. This column is only relevant for Real Application Clusters.                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.188 V\$ROWCACHE\_SUBORDINATE

V\$ROWCACHE\_SUBORDINATE displays information for subordinate objects in the data dictionary.

| Column  | Datatype   | Description                       |
|---------|------------|-----------------------------------|
| INDX    | NUMBER     | The index                         |
| HASH    | NUMBER     | The hash value                    |
| ADDRESS | RAW(4   8) | Address of the subordinate object |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SUBCACHE#     | NUMBER       | The subcache ID                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SUBCACHE_NAME | VARCHAR2(64) | The subcache name                                                                                                                                                                                                                                                                                                                                                                                                                               |
| EXISTENT      | VARCHAR2(1)  | Whether the object is an existing object                                                                                                                                                                                                                                                                                                                                                                                                        |
| PARENT        | RAW(4   8)   | Address of the parent object                                                                                                                                                                                                                                                                                                                                                                                                                    |
| KEY           | RAW(100)     | The contents of the key                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.189 V\$RSRC\_CONS\_GROUP\_HISTORY

V\$RSRC\_CONS\_GROUP\_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC\_PLAN\_HISTORY that has a non-NULL plan.

When the STATISTICS\_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC\_CON\_GROUP\_HISTORY when a pluggable database (PDB) changes its resource plan. The plan windows inside a PDB are not impacted by a multitenant container database (CDB) resource plan change.

Since PDB plans can be set independently across different PDBs, V\$RSRC\_CON\_GROUP\_HISTORY will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                        |
|---------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQUENCE#     | NUMBER       | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                                                           |
| ID            | NUMBER       | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                                                                                                                                      |
| NAME          | VARCHAR2(30) | Name of the consumer group                                                                                                                                                                                                                                                                                         |
| REQUESTS      | NUMBER       | Cumulative number of requests that were executed in the consumer group                                                                                                                                                                                                                                             |
| CPU_WAIT_TIME | NUMBER       | Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                 |
|---------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_WAITS                 | NUMBER   | Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| CONSUMED_CPU_TIME         | NUMBER   | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                                                                                                                                              |
| YIELDS                    | NUMBER   | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.                                                                                                              |
| CPU_DECISIONS             | NUMBER   | Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                         |
| CPU_DECISIONS_EXCLUSIVE   | NUMBER   | Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                             |
| CPU_DECISIONS_WON         | NUMBER   | Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                                  |
| ACTIVE_SESS_LIMIT_HIT     | NUMBER   | Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit                                                                                                                                                                                                 |
| UNDO_LIMIT_HIT            | NUMBER   | Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit                                                                                                                                                                                                     |
| SWITCHES_IN_CPU_TIME      | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                         |
| SWITCHES_OUT_CPU_TIME     | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                       |
| SWITCHES_IN_IO_MEGABYTES  | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                                 |
| SWITCHES_OUT_IO_MEGABYTES | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                               |
| SWITCHES_IN_IO_REQUESTS   | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                                                                                                                      |
| SWITCHES_OUT_IO_REQUESTS  | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                                                                                                                    |
| SWITCHES_IN_IO_LOGICAL    | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                                                                                                                   |
| SWITCHES_OUT_IO_LOGICAL   | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                                                                                                                 |
| SWITCHES_IN_ELAPSED_TIME  | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                                                                                                                 |
| SWITCHES_OUT_ELAPSED_TIME | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                                                                                                               |
| SQL_CANCELED              | NUMBER   | Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP                                                                                              |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVE_SESS_KILLED        | NUMBER   | Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP                                                                                                                                                                                                                   |
| IDLE_SESS_KILLED          | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)                                                                                                                                                                                                                                                                                                                 |
| IDLE_BLK_R_SESS_KILLED    | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions                                                                                                                                                                                                                                                                            |
| QUEUED_TIME               | NUMBER   | Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)                                                                                                                                                                                                                                                                                                   |
| QUEUE_TIME_OUTS           | NUMBER   | Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)                                                                                                                                                                                                                                                                                                         |
| IO_SERVICE_TIME           | NUMBER   | Cumulative I/O wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                      |
| IO_SERVICE_WAITS          | NUMBER   | Total number of wait requests                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SMALL_READ_MEGABYTES      | NUMBER   | Number of single block megabytes read                                                                                                                                                                                                                                                                                                                                                                                                           |
| SMALL_WRITE_MEGABYTES     | NUMBER   | Number of single block megabytes written                                                                                                                                                                                                                                                                                                                                                                                                        |
