| OBJECT_NAME     | VARCHAR2(100)  |      | Full name of the object (including schema)                                                                   |
| ATTR_NAME       | VARCHAR2(30)   |      | Name of the attribute being set (if this is a batch set attribute call); NULL otherwise                      |
| ERROR_CODE      | NUMBER         |      | Top level error code                                                                                         |
| ERROR_MESSAGE   | VARCHAR2(4000) |      | Complete error stack                                                                                         |
| ADDITIONAL_INFO | VARCHAR2(4000) |      | Additional information (currently unused)                                                                    |

## 7.241 SCHEMA\_EXPORT\_OBJECTS

SCHEMA\_EXPORT\_OBJECTS lists simple path names for some of the object types belonging to a Data Pump schema export, which is invoked using the SCHEMAS parameter on the expdp command.

Users of the Data Pump Export and Import utilities can query this view to determine valid values for the EXCLUDE and INCLUDE parameters.

| Column      | Datatype       | NULL     | Description                                                                                                                                       |
|-------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_PATH | VARCHAR2(200)  | NOT NULL | Simple path name for the object type                                                                                                              |
| COMMENTS    | VARCHAR2(2000) |          | Comment on the object type                                                                                                                        |
| NAMED       | CHAR(1)        |          | Do objects of this type have names? If yes (Y), then the name can be specified in the optional name_clause on the EXCLUDE and INCLUDE parameters. |

## 7.242 SEQ

SEQ is a synonym for USER\_SEQUENCES.

### See Also

["USER\\_SEQUENCES"](#)

## 7.243 SESSION\_CONTEXT

SESSION\_CONTEXT describes the context attributes and their values set for the current session.

| Column    | Datatype       | NULL | Description                               |
|-----------|----------------|------|-------------------------------------------|
| NAMESPACE | VARCHAR2(128)  |      | Namespace that the active attribute is in |
| ATTRIBUTE | VARCHAR2(128)  |      | Name of the active attribute              |
| VALUE     | VARCHAR2(4000) |      | Value of the active attribute             |

## 7.244 SESSION\_PRIVS

SESSION\_PRIVS describes the system privileges that are currently available to the user.

| Column    | Datatype     | NULL     | Description           |
|-----------|--------------|----------|-----------------------|
| PRIVILEGE | VARCHAR2(40) | NOT NULL | Name of the privilege |

## 7.245 SESSION\_ROLES

SESSION\_ROLES describes the roles that are currently enabled to the user.

| Column | Datatype      | NULL     | Description      |
|--------|---------------|----------|------------------|
| ROLE   | VARCHAR2(128) | NOT NULL | Name of the role |

## 7.246 SOURCE\_SIZE

Oracle accesses this view to create views about object size.

### See Also

["DBA\\_OBJECT\\_SIZE"](#) and ["USER\\_OBJECT\\_SIZE"](#)

## 7.247 STMT\_AUDIT\_OPTION\_MAP

STMT\_AUDIT\_OPTION\_MAP describes auditing option type codes. This table can be used to map auditing option type numbers to type names.

### Note

This view is populated in any Oracle Database where auditing is enabled, regardless of whether pre-Oracle Database 12c auditing or unified auditing is enabled for the database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

### Note

The mapping explained in this view is valid for audit configuration from the DBA\_STMT\_AUDIT\_OPTS view only, and such audit configurations can be made when unified auditing is not enabled.

| Column   | Datatype     | NULL     | Description                          |
|----------|--------------|----------|--------------------------------------|
| OPTION#  | NUMBER       | NOT NULL | Numeric auditing option type code    |
| NAME     | VARCHAR2(40) | NOT NULL | Name of the type of auditing option  |
| PROPERTY | NUMBER       | NOT NULL | Property flag of the auditing option |

### See Also

["DBA\\_STMT\\_AUDIT\\_OPTS"](#)

## 7.248 SYN

SYN is a synonym for USER\_SYNONYMS.

### See Also

["ALL\\_SYNONYMS"](#)

## 7.249 SYNONYMS

SYNONYMS is included for compatibility. Oracle recommends that you do not use this view.

## 7.250 SYS\_OBJECTS

SYS\_OBJECTS maps object IDs to object types and segment data block addresses.

| Column          | Datatype     | NULL | Description                                                                           |
|-----------------|--------------|------|---------------------------------------------------------------------------------------|
| OBJECT_TYPE     | VARCHAR2(18) |      | Type of the object                                                                    |
| OBJECT_TYPE_ID  | NUMBER       |      | Type ID of the object                                                                 |
| SEGMENT_TYPE_ID | NUMBER       |      | Type of segment: TABLE, CLUSTER, INDEX, ROLLBACK, DEFERRED ROLLBACK, TEMPORARY, CACHE |
| OBJECT_ID       | NUMBER       |      | Object identifier                                                                     |
| HEADER_FILE     | NUMBER       |      | ID of the file containing the segment header                                          |
| HEADER_BLOCK    | NUMBER       |      | ID of the block containing the segment header                                         |
| TS_NUMBER       | NUMBER       |      | The tablespace number                                                                 |

## 7.251 SYSCATALOG

SYSCATALOG is included for compatibility.

Oracle recommends that you do not use this view.

## 7.252 SYSFILES

SYSFILES is included for compatibility.

Oracle recommends that you do not use this view.

## 7.253 SYSSEGOBJ

SYSSEGOBJ is included for compatibility.

Oracle recommends that you do not use this view.

## 7.254 SYSTEM\_PRIVILEGE\_MAP

SYSTEM\_PRIVILEGE\_MAP describes privilege (auditing option) type codes.

This table can be used to map privilege (auditing option) type numbers to type names.

| Column    | Datatype     | NULL     | Description                                                                                                                                                                                                                                                     |
|-----------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIVILEGE | NUMBER       | NOT NULL | Numeric privilege (auditing option) type code                                                                                                                                                                                                                   |
| NAME      | VARCHAR2(40) | NOT NULL | Name of the type of privilege (auditing option).<br>See <i>Oracle Database SQL Language Reference</i> for a list of valid system privileges.                                                                                                                    |
| PROPERTY  | NUMBER       | NOT NULL | Property flag of the privilege (auditing option): <ul style="list-style-type: none"> <li>0 - Indicates a privilege that can be granted with a SQL GRANT statement</li> <li>1 - Indicates a privilege that can only be granted using a PL/SQL package</li> </ul> |

## 7.255 TAB

TAB is included for compatibility.

Oracle recommends that you do not use this view.

## 7.256 TABLE\_EXPORT\_OBJECTS

TABLE\_EXPORT\_OBJECTS lists simple path names for some of the object types belonging to a Data Pump schema export, which is invoked using the TABLES parameter on the expdp command.

Users of the Data Pump Export and Import utilities can query this view to determine valid values for the EXCLUDE and INCLUDE parameters.

| Column      | Datatype       | NULL     | Description                                                                                                                                       |
|-------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_PATH | VARCHAR2(200)  | NOT NULL | Simple path name for the object type                                                                                                              |
| COMMENTS    | VARCHAR2(2000) |          | Comment on the object type                                                                                                                        |
| NAMED       | CHAR(1)        |          | Do objects of this type have names? If yes (Y), then the name can be specified in the optional name_clause on the EXCLUDE and INCLUDE parameters. |

## 7.257 TABLE\_PRIVILEGE\_MAP

TABLE\_PRIVILEGE\_MAP describes privilege (auditing option) type codes.

This table can be used to map privilege (auditing option) type numbers to type names.

| Column    | Datatype     | NULL     | Description                                     |
|-----------|--------------|----------|-------------------------------------------------|
| PRIVILEGE | NUMBER       | NOT NULL | Numeric privilege (auditing option) type code   |
| NAME      | VARCHAR2(40) | NOT NULL | Name of the type of privilege (auditing option) |

## 7.258 TABQUOTAS

TABQUOTAS is included for compatibility.

Oracle recommends that you do not use this view.

## 7.259 TABS

TABS is a synonym for USER\_TABLES.

### ① See Also

["USER\\_TABLES"](#)

## 7.260 TRUSTED\_SERVERS

TRUSTED\_SERVERS displays whether a server is trusted or untrusted.

| Column | Datatype      | NULL | Description                                                                                                                                     |
|--------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| TRUST  | VARCHAR2(9)   |      | Trustedness of the server listed. Values can be TRUSTED or UNTRUSTED servers which are not listed in the NAME column have opposite trustedness. |
| NAME   | VARCHAR2(128) |      | Server name. Can be a specific server name or ALL for all servers.                                                                              |

[Table 7-1](#) shows examples of the values returned depending on the status of the servers.

**Table 7-1 TRUSTED\_SERVERS Values**

| Condition (If . . . )                    | TRUSTED column | NAME column |
|------------------------------------------|----------------|-------------|
| ... all servers are trusted              | Trusted        | ALL         |
| ... no servers are trusted               | Untrusted      | ALL         |
| ... all servers except DB1 are trusted   | Untrusted      | DB1         |
| ... all servers except DB1 are untrusted | Trusted        | DB1         |

## 7.261 TS\_PITR\_CHECK

This view, created by `catpitr.sql`, provides information on any dependencies or restrictions that might prevent tablespace point-in-time recovery from proceeding.

This view applies only to the tablespace point-in-time recovery feature.

| Column          | Datatype      | NULL | Description                                                                                                                                      |
|-----------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJ1_OWNER      | VARCHAR2(128) |      | The owner of the object preventing tablespace point-in-time recovery. See the REASON column for details.                                         |
| OBJ1_NAME       | VARCHAR2(128) |      | The name of the object preventing tablespace point-in-time recovery                                                                              |
| OBJ1_SUBNAME    | VARCHAR2(128) |      | Subordinate to OBJ1_NAME                                                                                                                         |
| OBJ1_TYPE       | VARCHAR2(16)  |      | The object type for the object preventing tablespace point-in-time recovery                                                                      |
| TS1_NAME        | VARCHAR2(30)  |      | Name of the tablespace containing the object preventing tablespace point-in-time recovery                                                        |
| OBJ2_NAME       | VARCHAR2(128) |      | The name of a second object which may be preventing tablespace point-in-time recovery. If NULL, object 1 is the only object preventing recovery. |
| OBJ2_SUBNAME    | VARCHAR2(128) |      | Subordinate to OBJ2_NAME                                                                                                                         |
| OBJ2_TYPE       | VARCHAR2(15)  |      | The object type for the second object (will be NULL if OBJ2_NAME is NULL)                                                                        |
| OBJ2_OWNER      | VARCHAR2(128) |      | The owner of the second object (will be NULL if OBJ2_NAME is NULL)                                                                               |
| TS2_NAME        | VARCHAR2(30)  |      | Name of the tablespace containing second object which may be preventing tablespace point-in-time recovery (-1 indicates not applicable)          |
| CONSTRAINT_NAME | VARCHAR2(128) |      | Name of the constraint                                                                                                                           |
| REASON          | VARCHAR2(81)  |      | Reason why tablespace point-in-time recovery cannot proceed                                                                                      |

 **See Also**

*Oracle Database Backup and Recovery User's Guide* for more information about tablespace point-in-time recovery

## 7.262 TS\_PITR\_OBJECTS\_TO\_BE\_DROPPED

TS\_PITR\_OBJECTS\_TO\_BE\_DROPPED lists all objects lost as a result of performing tablespace point-in-time recovery.

This view applies only to the tablespace point-in-time recovery feature.

| Column          | Datatype      | NULL     | Description                                                                                          |
|-----------------|---------------|----------|------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2(128) | NOT NULL | The owner of the object                                                                              |
| NAME            | VARCHAR2(128) | NOT NULL | The name of the object that will be lost as a result of undergoing tablespace point-in-time recovery |
| CREATION_TIME   | DATE          | NOT NULL | Creation timestamp of the object                                                                     |
| TABLESPACE_NAME | VARCHAR2(30)  |          | Name of the tablespace containing the object                                                         |

**① See Also**

*Oracle Database Backup and Recovery User's Guide* for more information about tablespace point-in-time recovery

## 7.263 UNI\_PLUGGABLE\_SET\_CHECK

UNI\_PLUGGABLE\_SET\_CHECK contains pluggable check information.

| Column          | Datatype      | NULL | Description                          |
|-----------------|---------------|------|--------------------------------------|
| OBJ1_OWNER      | VARCHAR2(128) |      | Owner of object                      |
| OBJ1_NAME       | VARCHAR2(128) |      | Object 1                             |
| OBJ1_SUBNAME    | VARCHAR2(128) |      | SubObject1Name                       |
| OBJ1_TYPE       | VARCHAR2(18)  |      | Object Type                          |
| TS1_NAME        | VARCHAR2(30)  |      | Tablespace containing Object 1       |
| OBJ2_NAME       | VARCHAR2(128) |      | Object Name                          |
| OBJ2_SUBNAME    | VARCHAR2(128) |      | SubObject2Name                       |
| OBJ2_TYPE       | VARCHAR2(18)  |      | Object Type                          |
| OBJ2_OWNER      | VARCHAR2(128) |      | Object owner of second object        |
| TS2_NAME        | VARCHAR2(30)  |      | Tablespace containing Object 1       |
| CONSTRAINT_NAME | VARCHAR2(128) |      | Name of dependent constraint         |
| REASON          | VARCHAR2(86)  |      | Reason for Pluggable check violation |
| MESG_ID         | NUMBER        |      | The message ID                       |

## 7.264 UNIFIED\_AUDIT\_TRAIL

When unified auditing is enabled in Oracle Database, the audit records are populated in this new audit trail.

This view displays audit records in tabular form by retrieving the audit records from the audit trail.

**① Note**

This view is populated only in an Oracle Database where unified auditing is enabled.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

| Column              | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                 |
|---------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIT_TYPE          | VARCHAR2(64)   |      | Type of auditing: <ul style="list-style-type: none"> <li>• Database Vault</li> <li>• Datapump</li> <li>• Direct path API</li> <li>• FineGrainedAudit</li> <li>• KACL_AUDIT</li> <li>• Label Security</li> <li>• Protocol</li> <li>• RMAN_AUDIT</li> <li>• Standard</li> <li>• XS</li> </ul> |
| SESSIONID           | NUMBER         |      | Audit session identifier                                                                                                                                                                                                                                                                    |

| OS_USERNAME         | VARCHAR2(128)  |      | Name of the operating system user for the database session                                                                                                                                                                                                                                  |
| USERHOST            | VARCHAR2(128)  |      | Name of the host machine from which the session was spawned                                                                                                                                                                                                                                 |
| TERMINAL            | VARCHAR2(30)   |      | The operating system terminal of the user session                                                                                                                                                                                                                                           |
| INSTANCE_ID         | NUMBER         |      | Instance number as specified in the initialization parameter file, init.ora                                                                                                                                                                                                                 |
| DBID                | NUMBER         |      | Database identifier of the audited database                                                                                                                                                                                                                                                 |
| AUTHENTICATION_TYPE | VARCHAR2(1024) |      | Authentication information for the session user<br><b>See:</b> <a href="#">"AUTHENTICATION_TYPE Description"</a>                                                                                                                                                                            |
| DBUSERNAME          | VARCHAR2(128)  |      | Database user name of the user whose actions were audited                                                                                                                                                                                                                                   |
| DBPROXY_USERNAME    | VARCHAR2(128)  |      | Proxying user name, in the case of proxy authentication                                                                                                                                                                                                                                     |
| EXTERNAL_USERID     | VARCHAR2(1024) |      | External user name, in the case of network or external authentication                                                                                                                                                                                                                       |
| GLOBAL_USERID       | VARCHAR2(32)   |      | Global user identifier for the user, for a user logged in as an enterprise user                                                                                                                                                                                                             |
| CLIENT_PROGRAM_NAME | VARCHAR2(84)   |      | Name of the program used for the database session                                                                                                                                                                                                                                           |
| DBLINK_INFO         | VARCHAR2(4000) |      | Value of SYS_CONTEXT( 'USERENV', 'DBLINK_INFO' ). Valid if the connection was via a database link.                                                                                                                                                                                          |
| XS_USER_NAME        | VARCHAR2(128)  |      | Name of the Real Application Security user                                                                                                                                                                                                                                                  |
| XS_SESSIONID        | RAW(33)        |      | Identifier of the Real Application Security session                                                                                                                                                                                                                                         |
| ENTRY_ID            | NUMBER         |      | Numeric ID for each audit trail entry in the session                                                                                                                                                                                                                                        |
| STATEMENT_ID        | NUMBER         |      | Numeric ID for each statement run (a statement may cause many actions)                                                                                                                                                                                                                      |
| EVENT_TIMESTAMP     | TIMESTAMP(6)   |      | Timestamp of the creation of the audit trail entry in the local time zone                                                                                                                                                                                                                   |
| EVENT_TIMESTAMP_UTC | TIMESTAMP(6)   |      | Timestamp of the creation of the audit trail entry in UTC (Coordinated Universal Time)                                                                                                                                                                                                      |
| ACTION_NAME         | VARCHAR2(64)   |      | Name of the action executed by the user. The name should be read in conjunction with the AUDIT_TYPE to understand the real action.                                                                                                                                                          |

| Column                | Datatype       | NULL | Description                                                                                                                                   |
|-----------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| RETURN_CODE           | NUMBER         |      | Oracle error code generated by the action. Zero if the action succeeded                                                                       |
| OS_PROCESS            | VARCHAR2(16)   |      | Operating system process identifier of the Oracle database process                                                                            |
| TRANSACTION_ID        | RAW(8)         |      | Transaction identifier of the transaction in which the object is modified                                                                     |
| SCN                   | NUMBER         |      | System change number (SCN) of the creation of the audit trail entry                                                                           |
| EXECUTION_ID          | VARCHAR2(64)   |      | Execution context identifier for each action                                                                                                  |
| OBJECT_SCHEMA         | VARCHAR2(128)  |      | Schema name of object affected by the action                                                                                                  |
| OBJECT_NAME           | VARCHAR2(128)  |      | Name of the object affected by the action                                                                                                     |
| SQL_TEXT              | CLOB           |      | SQL associated with the event                                                                                                                 |
| SQL_BINDS             | CLOB           |      | List of bind variables, if any, associated with SQL_TEXT                                                                                      |
| APPLICATION_CONTEXTS  | VARCHAR2(4000) |      | Semicolon-separated list of Application Context Namespace, Attribute, Value information in (APPCTX_NAMESPACE,APPCTX_ATTRIBUTE=<value>) format |
| CLIENT_IDENTIFIER     | VARCHAR2(64)   |      | Client identifier in each Oracle session                                                                                                      |
| NEW_SCHEMA            | VARCHAR2(128)  |      | The schema of the object named in the NEW_NAME column<br>This column is populated only when AUDIT_TYPE = Standard.                            |
| NEW_NAME              | VARCHAR2(128)  |      | New name of object after RENAME, or name of underlying object (for example, CREATE INDEX owner.obj_name ON new_owner.new_name)                |
| OBJECT_EDITION        | VARCHAR2(128)  |      | Name of the edition containing the audited object                                                                                             |
| SYSTEM_PRIVILEGE_USED | VARCHAR2(1024) |      | Comma-separated list of system privileges used to execute the action<br>This column is populated only when AUDIT_TYPE = Standard.             |
| SYSTEM_PRIVILEGE      | VARCHAR2(40)   |      | System privilege granted/revoked by a GRANT/REVOKE statement<br>This column is populated only when AUDIT_TYPE = Standard.                     |
| AUDIT_OPTION          | VARCHAR2(40)   |      | AUDIT/NOAUDIT SQL command<br>This column is populated only when AUDIT_TYPE = Standard.                                                        |

| OLS_NEW_VALUE            | VARCHAR2(4000) |      | New value for OLS ALTER events<br>This column is populated only when AUDIT_TYPE = Label Security.                                                                                                                                                                      |
| RMAN_SESSION_RECID       | NUMBER         |      | RMAN session identifier. Together with RMAN_SESSION_STAMP uniquely identifies an RMAN job (note that this is not same as user session ID; the value is a recid in controlfile that identifies RMAN job)<br>This column is populated only when AUDIT_TYPE = RMAN_AUDIT. |
| RMAN_SESSION_STAMP       | NUMBER         |      | Timestamp for the session<br>This column is populated only when AUDIT_TYPE = RMAN_AUDIT.                                                                                                                                                                               |
| RMAN_OPERATION           | VARCHAR2(20)   |      | The RMAN operation executed by the job. One row will be added for each distinct operation within an RMAN session. For example, a backup job would contain BACKUP in the RMAN_OPERATION column.<br>This column is populated only when AUDIT_TYPE = RMAN_AUDIT.          |

| Column              | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 7-2 Data Pump Text Parameter Descriptions**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACCESS METHOD     | <p>The method used to load the data. Settings can be:</p> <ul style="list-style-type: none"> <li>AUTOMATIC: Enables Oracle Data Pump to determine the optimal load method</li> <li>DIRECT_PATH : Uses the direct path API to pass the data to be loaded.</li> <li>EXTERNAL_TABLE: Loads data using the external tables option.</li> <li>CONVENTIONAL: Loads the data using SQL INSERT statements</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |
| DATA OPTIONS      | <p>Indicates how certain types of data were handled during import operations. Settings are in bit-mask format, which are as follows:</p> <ul style="list-style-type: none"> <li>1 (SKIP_CONSTRAINT_ERRORS): Specifies that the import operation proceeded even if non-deferred constraint violations were encountered.</li> <li>8 (DISABLE_APPEND_HINT): The import operation did not use the APPEND hint while loading a data object.</li> <li>16 (REJECT_ROWS_WITH_REPL_CHAR): Warnings are issued when the replacement character may be used and an option was added to reject data rows where the replacement character was used during a Data Pump import. This situation can occur if different character sets are used for the export/import process</li> </ul> |
| DUMPER DIRECTORY  | Not in use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| JOB_TYPE          | Is either EXPORT or IMPORT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| JOB VERSION       | Specifies the version of database objects that were imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MASTER TABLE      | <p>Indicates the name of the control job table. By default, it appears as follows for export operations:</p> <p><i>schema_name</i>.SYS_EXPORT_TABLE_<i>n</i></p> <p>For import operations, it appears as follows:</p> <p><i>schema_name</i>.SYS_IMPORT_TABLE_<i>n</i></p> <p>The <i>n</i> represents a numeric value of 01. If 01 is in use, the number is incremented with 02, 03, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| METADATA_JOB_MODE | Type of export or import operation. For example a table export would be TABLE_EXPORT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PARTITION OPTIONS | <p>Indicates how table partitions were created during an import operation. Settings can be:</p> <ul style="list-style-type: none"> <li>NONE: The tables were created as they existed on the system from which the export operation was performed.</li> <li>DEPARTITION: Each partition or subpartition was promoted to a new individual table.</li> <li>MERGE: All partitions and subpartitions were merged into one table</li> </ul>                                                                                                                                                                                                                                                                                                                                  |
| REMOTE LINK       | Indicates that the export was performed from a (source) database identified by a valid database link. The data from the source database instance was written to a dump file set on the connected database instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TABLE EXISTS      | <p>Indicates the action that was taken on an import operation when the target table already existed. The values are as follows:</p> <ul style="list-style-type: none"> <li>REPLACE</li> <li>TRUNCATE</li> <li>SKIP</li> <li>APPEND</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## AUTHENTICATION\_TYPE Description

The AUTHENTICATION\_TYPE column of UNIFIED\_AUDIT\_TRAIL displays authentication information for the session user.

The value of this column is a string with the following syntax:

```
(TYPE=(auth_string));(CLIENT ADDRESS=((PROTOCOL=protocol)
(HOST=client_ip_address)(PORT=client_port_number)));
[(LOGON_INFO=((VERIFIER=%s-%s)(CLIENT_CAPABILITIES=%s)));]
```

- (TYPE=(auth\_string));

Indicates the type of authentication for the session user.

Possible values for *auth\_string*:

- DATABASE - Username/password authentication
- DIRECTORY PASSWORD - Directory-based user authentication
- NETWORK SERVICE - Authentication was performed by Oracle Net Services or strong authentication
- OS - Operating system external user authentication
- PROXY - OCI proxy connection authentication

- (CLIENT ADDRESS=((PROTOCOL=protocol)(HOST=client\_ip\_address)
(PORT=client\_port\_number)));

Displays the protocol used by the client, such as ipc, sdp, tcp, or tcps, the client IP address, and the client port number.

- (LOGON\_INFO=((VERIFIER=version-rollover\_state)
(CLIENT\_CAPABILITIES=capability\_list)));

This syntax is displayed only if authentication was completed during gradual database password rollover.

The value of VERIFIER comprises the following two values, separated by a hyphen:

- *version* - Indicates the password version (11G or 12C)
- *rollover\_state* - Indicates whether the user was authenticated with the OLD password or the NEW password

For CLIENT\_CAPABILITIES, the value of *capability\_list* is a comma-separated list of one or more of the following client capabilities: 05L\_NP, 07L\_MR, or 08L\_LI. See *Oracle Database Net Services Reference* for more information about client capabilities.

## 7.265 USABLE\_EDITIONS

USABLE\_EDITIONS describes the usable editions of the current user.

| Column              | Datatype      | NULL     | Description                                 |
|---------------------|---------------|----------|---------------------------------------------|
| EDITION_NAME        | VARCHAR2(128) | NOT NULL | Name of the edition                         |
| PARENT_EDITION_NAME | VARCHAR2(128) |          | Name of the parent edition for this edition |

### ① See Also

*Oracle Database Development Guide* for more information about editions

## 7.266 USER\_ADDM\_FDG\_BREAKDOWN

USER\_ADDM\_FDG\_BREAKDOWN describes the contribution for each finding from the different instances owned by the current user. Its columns are the same as those in DBA\_ADDM\_FDG\_BREAKDOWN.

### ① See Also

["DBA\\_ADDM\\_FDG\\_BREAKDOWN"](#)

## 7.267 USER\_ADDM\_FINDINGS

USER\_ADDM\_FINDINGS displays the ADDM findings discovered by the advisors owned by the current user.

Each row for ADDM tasks in the related USER\_ADVISOR\_FINDINGS view has a corresponding row in this view. Its columns (except for OWNER) are the same as those in DBA\_ADDM\_FINDINGS.

### ① See Also

["DBA\\_ADDM\\_FINDINGS"](#)

## 7.268 USER\_ADDM\_INSTANCES

USER\_ADDM\_INSTANCES provides instance-level information for ADDM tasks that finished executing in all instances owned by the current user. Its columns are the same as those in DBA\_ADDM\_INSTANCES.

### ① See Also

["DBA\\_ADDM\\_INSTANCES"](#)

## 7.269 USER\_ADDM\_TASK\_DIRECTIVES

USER\_ADDM\_TASK\_DIRECTIVES displays information about ADDM task directives owned by the current user. Its columns (except for USERNAME and SEQ\_ID) are the same as those in DBA\_ADDM\_TASK\_DIRECTIVES.

### ① See Also

["DBA\\_ADDM\\_TASK\\_DIRECTIVES"](#)

## 7.270 USER\_ADDM\_TASKS

USER\_ADDM\_TASKS displays information about the ADDM tasks owned by the current user.

The view contains one row for each row in the related USER\_ADVISOR\_TASKS view that has ADVISOR\_NAME=ADDM and STATUS=COMPLETED. Its columns (except for OWNER) are the same as those in DBA\_ADDM\_TASKS.

### ① See Also

["DBA\\_ADDM\\_TASKS"](#)

## 7.271 USER\_ADVISOR\_ACTIONS

USER\_ADVISOR\_ACTIONS displays information about the actions associated with the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_ACTIONS.

### ① See Also

["DBA\\_ADVISOR\\_ACTIONS"](#)

## 7.272 USER\_ADVISOR\_DIR\_TASK\_INST

USER\_ADVISOR\_DIR\_TASK\_INST displays information about all task directive instances owned by the current user. Its columns (except for SEQ\_ID and USERNAME) are the same as those in DBA\_ADVISOR\_DIR\_TASK\_INST.

### ① See Also

["DBA\\_ADVISOR\\_DIR\\_TASK\\_INST"](#)

## 7.273 USER\_ADVISOR\_EXEC\_PARAMETERS

USER\_ADVISOR\_EXEC\_PARAMETERS displays the parameter values used for past executions of tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_EXEC\_PARAMETERS.

### ① See Also

["DBA\\_ADVISOR\\_EXEC\\_PARAMETERS"](#)

## 7.274 USER\_ADVISOR\_EXECUTIONS

USER\_ADVISOR\_EXECUTIONS displays metadata information for tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_EXECUTIONS.

### ① See Also

["DBA\\_ADVISOR\\_EXECUTIONS"](#)

## 7.275 USER\_ADVISOR\_FDG\_BREAKDOWN

USER\_ADVISOR\_FDG\_BREAKDOWN describes the contribution from the different instances to the findings for each ADDM task owned by the current user. Its columns are the same as those in DBA\_ADVISOR\_FDG\_BREAKDOWN.

### ① See Also

["DBA\\_ADVISOR\\_FDG\\_BREAKDOWN"](#)

## 7.276 USER\_ADVISOR\_FINDINGS

USER\_ADVISOR\_FINDINGS displays the findings discovered by the advisors owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_FINDINGS.

### ① See Also

["DBA\\_ADVISOR\\_FINDINGS"](#)

## 7.277 USER\_ADVISOR\_JOURNAL

USER\_ADVISOR\_JOURNAL displays the journal entries for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_JOURNAL.

### ① See Also

["DBA\\_ADVISOR\\_JOURNAL"](#)

## 7.278 USER\_ADVISOR\_LOG

USER\_ADVISOR\_LOG displays information about the current state of the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_LOG.

### ① See Also

["DBA\\_ADVISOR\\_LOG"](#)

## 7.279 USER\_ADVISOR\_OBJECTS

USER\_ADVISOR\_OBJECTS displays information about the objects currently referenced by the advisors owned by the current user. Its columns (except for OWNER, ATTR21, and ATTR22) are the same as those in DBA\_ADVISOR\_OBJECTS.

### ① See Also

["DBA\\_ADVISOR\\_OBJECTS"](#)

## 7.280 USER\_ADVISOR\_PARAMETERS

USER\_ADVISOR\_PARAMETERS displays the task parameters and their current values for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_PARAMETERS.

### ① See Also

["DBA\\_ADVISOR\\_PARAMETERS"](#)

## 7.281 USER\_ADVISOR\_RATIONALE

USER\_ADVISOR\_RATIONALE displays information about the rationales for the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_RATIONALE.

### ① See Also

["DBA\\_ADVISOR\\_RATIONALE"](#)

## 7.282 USER\_ADVISOR\_RECOMMENDATIONS

USER\_ADVISOR\_RECOMMENDATIONS displays the results of an analysis of the recommendations owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_RECOMMENDATIONS.

### ① See Also

["DBA\\_ADVISOR\\_RECOMMENDATIONS"](#)

## 7.283 USER\_ADVISOR\_SQLA\_REC\_SUM

USER\_ADVISOR\_SQLA\_REC\_SUM displays recommendation rollup information for the workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLA\_REC\_SUM.

### ① See Also

["DBA\\_ADVISOR\\_SQLA\\_REC\\_SUM"](#)

## 7.284 USER\_ADVISOR\_SQLA\_TABLES

USER\_ADVISOR\_SQLA\_TABLES displays cross references between the workload statements and the tables referenced in the statement for the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLA\_TABLES.

### ① See Also

["DBA\\_ADVISOR\\_SQLA\\_TABLES"](#)

## 7.285 USER\_ADVISOR\_SQLA\_WK\_MAP

USER\_ADVISOR\_SQLA\_WK\_MAP displays the workload references for the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLA\_WK\_MAP.

### ① See Also

["DBA\\_ADVISOR\\_SQLA\\_WK\\_MAP"](#)

## 7.286 USER\_ADVISOR\_SQLA\_WK\_STMTS

USER\_ADVISOR\_SQLA\_WK\_STMTS displays information about the workload objects owned by the current user after an Access Advisor analysis operation. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLA\_WK\_STMTS.

### ① See Also

["DBA\\_ADVISOR\\_SQLA\\_WK\\_STMTS"](#)

## 7.287 USER\_ADVISOR\_SQLPLANS

USER\_ADVISOR\_SQLPLANS displays the different SQL execution plans owned by the current user generated as part of an advisor analysis. Its columns are the same as those in DBA\_ADVISOR\_SQLPLANS.

### ① See Also

["DBA\\_ADVISOR\\_SQLPLANS"](#)

## 7.288 USER\_ADVISOR\_SQLSTATS

USER\_ADVISOR\_SQLSTATS displays execution statistics owned by the current user for the test-execution of different SQL plans during the advisor analysis. Its columns are the same as those in DBA\_ADVISOR\_SQLSTATS.

### ① See Also

["DBA\\_ADVISOR\\_SQLSTATS"](#)

## 7.289 USER\_ADVISOR\_SQLW\_JOURNAL

USER\_ADVISOR\_SQLW\_JOURNAL displays the journal entries for the workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_JOURNAL.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_JOURNAL"](#)

## 7.290 USER\_ADVISOR\_SQLW\_PARAMETERS

USER\_ADVISOR\_SQLW\_PARAMETERS displays the workload parameters and their current values owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_PARAMETERS.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_PARAMETERS"](#)

## 7.291 USER\_ADVISOR\_SQLW\_STMTS

USER\_ADVISOR\_SQLW\_STMTS displays rows that correspond to the statements in the workload owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_STMTS.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_STMTS"](#)

## 7.292 USER\_ADVISOR\_SQLW\_SUM

USER\_ADVISOR\_SQLW\_SUM displays an aggregated picture of the SQLWkld workload objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_SUM.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_SUM"](#)

## 7.293 USER\_ADVISOR\_SQLW\_TABLES

USER\_ADVISOR\_SQLW\_TABLES displays cross references between the workload statements and the tables referenced in the statement. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_TABLES.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_TABLES"](#)

## 7.294 USER\_ADVISOR\_SQLW\_TEMPLATES

USER\_ADVISOR\_SQLW\_TEMPLATES displays an aggregated picture of the SQLWkld template objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_SQLW\_TEMPLATES.

### ① See Also

["DBA\\_ADVISOR\\_SQLW\\_TEMPLATES"](#)

## 7.295 USER\_ADVISOR\_TASKS

USER\_ADVISOR\_TASKS displays information about the tasks owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_TASKS.

### ① See Also

["DBA\\_ADVISOR\\_TASKS"](#)

## 7.296 USER\_ADVISOR\_TEMPLATES

USER\_ADVISOR\_TEMPLATES displays information about the templates owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_ADVISOR\_TEMPLATES.

### ① See Also

["DBA\\_ADVISOR\\_TEMPLATES"](#)

## 7.297 USER\_ALL\_TABLES

USER\_ALL\_TABLES describes the object tables and relational tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ALL\_TABLES.

### ① See Also

["ALL\\_ALL\\_TABLES"](#)

## 7.298 USER\_ANALYTIC\_VIEW\_AGGR\_DIMS

USER\_ANALYTIC\_VIEW\_AGGR\_DIMS describes the aggregation function dimensions of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_AGGR\_DIMS.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_AGGR\\_DIMS"](#)

## 7.299 USER\_ANALYTIC\_VIEW\_AGGR\_FNS

USER\_ANALYTIC\_VIEW\_AGGR\_FNS describes the aggregation functions of the analytic views owned by the current user. Its columns (except for OWNER and ORIGIN\_CON\_ID) are the same as those in ALL\_ANALYTIC\_VIEW\_AGGR\_FNS.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_AGGR\\_FNS"](#)

## 7.300 USER\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE

USER\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE describes the aggregation functions of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER and ORIGIN\_CON\_ID) are the same as those in ALL\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_AGGR\\_FNS\\_AE"](#)

## 7.301 USER\_ANALYTIC\_VIEW\_AGR\_DIMS

USER\_ANALYTIC\_VIEW\_AGR\_DIMS describes the aggregation function dimensions of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_AGR\_DIMS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_AGR\\_DIMS"](#)

## 7.302 USER\_ANALYTIC\_VIEW\_AGR\_DIMS\_AE

USER\_ANALYTIC\_VIEW\_AGR\_DIMS\_AE describes the aggregation function dimensions of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_AGR\_DIMS\_AE.

**① Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_AGR\\_DIMS\\_AE"](#)

## 7.303 USER\_ANALYTIC\_VIEW\_ATTR\_CLASS

USER\_ANALYTIC\_VIEW\_ATTR\_CLASS describes the attribute classifications of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_ATTR\_CLASS.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_ATTR\\_CLASS"](#)

## 7.304 USER\_ANALYTIC\_VIEW\_ATTR\_CLS

USER\_ANALYTIC\_VIEW\_ATTR\_CLS is identical to USER\_ANALYTIC\_VIEW\_ATTR\_CLASS.

**① Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["USER\\_ANALYTIC\\_VIEW\\_ATTR\\_CLASS"](#)

## 7.305 USER\_ANALYTIC\_VIEW\_ATTR\_CLS\_AE

USER\_ANALYTIC\_VIEW\_ATTR\_CLS\_AE describes the attribute classifications of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_ATTR\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_ATTR\\_CLS\\_AE"](#)

## 7.306 USER\_ANALYTIC\_VIEW\_BAS\_MEAS

USER\_ANALYTIC\_VIEW\_BAS\_MEAS is identical to USER\_ANALYTIC\_VIEW\_BASE\_MEAS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_BASE\\_MEAS"](#)

## 7.307 USER\_ANALYTIC\_VIEW\_BAS\_MEAS\_AE

USER\_ANALYTIC\_VIEW\_BAS\_MEAS\_AE describes the base measures in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_BAS\_MEAS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_BAS\\_MEAS\\_AE"](#)

## 7.308 USER\_ANALYTIC\_VIEW\_BASE\_MEAS

USER\_ANALYTIC\_VIEW\_BASE\_MEAS describes the base measures in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_BASE\_MEAS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_BASE\\_MEAS"](#)

## 7.309 USER\_ANALYTIC\_VIEW\_CALC\_MEAS

USER\_ANALYTIC\_VIEW\_CALC\_MEAS describes the calculated measures in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_CALC\_MEAS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_CALC\\_MEAS"](#)

## 7.310 USER\_ANALYTIC\_VIEW\_CLASS

USER\_ANALYTIC\_VIEW\_CLASS describes the classifications of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in USER\_ANALYTIC\_VIEW\_CLASS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_CLASS"](#)

## 7.311 USER\_ANALYTIC\_VIEW\_CLASS\_AE

USER\_ANALYTIC\_VIEW\_CLASS\_AE describes the classifications of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_CLASS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_CLASS\\_AE"](#)

## 7.312 USER\_ANALYTIC\_VIEW\_CLC\_MEAS

USER\_ANALYTIC\_VIEW\_CLC\_MEAS is identical to USER\_ANALYTIC\_VIEW\_CALC\_MEAS.

**① Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["USER\\_ANALYTIC\\_VIEW\\_CALC\\_MEAS"](#)

## 7.313 USER\_ANALYTIC\_VIEW\_CLC\_MEAS\_AE

USER\_ANALYTIC\_VIEW\_CLC\_MEAS\_AE describes the calculated measures in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_CLC\_MEAS\_AE.

**① Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_CLC\\_MEAS\\_AE"](#)

## 7.314 USER\_ANALYTIC\_VIEW\_COLUMNS

USER\_ANALYTIC\_VIEW\_COLUMNS describes the columns of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_COLUMNS.

**① See Also**

["ALL\\_ANALYTIC\\_VIEW\\_COLUMNS"](#)

## 7.315 USER\_ANALYTIC\_VIEW\_COLUMNS\_AE

USER\_ANALYTIC\_VIEW\_COLUMNS\_AE describes the columns of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_COLUMNS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_COLUMNS\\_AE"](#)

## 7.316 USER\_ANALYTIC\_VIEW\_DIM\_ATTRS

USER\_ANALYTIC\_VIEW\_DIM\_ATTRS is identical to USER\_ANALYTIC\_VIEW\_DIM\_ATTRS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_DIM\\_ATTRS"](#)

## 7.317 USER\_ANALYTIC\_VIEW\_DIM\_ATTRS\_AE

USER\_ANALYTIC\_VIEW\_DIM\_ATTRS\_AE describes the attributes of the attribute dimensions in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIM\_ATTRS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIM\\_ATTRS\\_AE"](#)

## 7.318 USER\_ANALYTIC\_VIEW\_DIM\_ATTRS

USER\_ANALYTIC\_VIEW\_DIM\_ATTRS describes the attributes of the attribute dimensions in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIM\_ATTRS.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIM\\_ATTRS"](#)

## 7.319 USER\_ANALYTIC\_VIEW\_DIM\_CLASS

USER\_ANALYTIC\_VIEW\_DIM\_CLASS describes the classifications of the attribute dimensions in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIM\_CLASS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIM\\_CLASS"](#)

## 7.320 USER\_ANALYTIC\_VIEW\_DIM\_CLS

USER\_ANALYTIC\_VIEW\_DIM\_CLS is identical to USER\_ANALYTIC\_VIEW\_DIM\_CLASS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_DIM\\_CLASS"](#)

## 7.321 USER\_ANALYTIC\_VIEW\_DIM\_CLS\_AE

USER\_ANALYTIC\_VIEW\_DIM\_CLS\_AE describes the classifications of the attribute dimensions in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIM\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIM\\_CLS\\_AE"](#)

## 7.322 USER\_ANALYTIC\_VIEW\_DIMENSIONS

USER\_ANALYTIC\_VIEW\_DIMENSIONS describes the attribute dimensions in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIMENSIONS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIMENSIONS"](#)

## 7.323 USER\_ANALYTIC\_VIEW\_DIMS

USER\_ANALYTIC\_VIEW\_DIMS is identical to USER\_ANALYTIC\_VIEW\_DIMENSIONS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_DIMENSIONS"](#)

## 7.324 USER\_ANALYTIC\_VIEW\_DIMS\_AE

USER\_ANALYTIC\_VIEW\_DIMS\_AE describes the attribute dimensions in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_DIMS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_DIMS\\_AE"](#)

## 7.325 USER\_ANALYTIC\_VIEW\_FACT\_COLS

USER\_ANALYTIC\_VIEW\_FACT\_COLS describes the fact columns of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_FACT\_COLS.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_FACT\\_COLS"](#)

## 7.326 USER\_ANALYTIC\_VIEW\_FCT\_COLS

USER\_ANALYTIC\_VIEW\_FCT\_COLS is identical to USER\_ANALYTIC\_VIEW\_FACT\_COLS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_FACT\\_COLS"](#)

## 7.327 USER\_ANALYTIC\_VIEW\_FCT\_COLS\_AE

USER\_ANALYTIC\_VIEW\_FCT\_COLS\_AE describes the fact columns of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_FCT\_COLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_FCT\\_COLS\\_AE"](#)

## 7.328 USER\_ANALYTIC\_VIEW\_HIER\_CLASS

USER\_ANALYTIC\_VIEW\_HIER\_CLASS describes the classifications of the hierarchies in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_HIER\_CLASS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_HIER\\_CLASS"](#)

## 7.329 USER\_ANALYTIC\_VIEW\_HIER\_CLS

USER\_ANALYTIC\_VIEW\_HIER\_CLS is identical to USER\_ANALYTIC\_VIEW\_HIER\_CLASS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_HIER\\_CLASS"](#)

## 7.330 USER\_ANALYTIC\_VIEW\_HIER\_CLS\_AE

USER\_ANALYTIC\_VIEW\_HIER\_CLS\_AE describes the classifications of the hierarchies in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_HIER\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

"[ALL\\_ANALYTIC\\_VIEW\\_HIER\\_CLS\\_AE](#)"

## 7.331 USER\_ANALYTIC\_VIEW\_HIERS

USER\_ANALYTIC\_VIEW\_HIERS describes the hierarchies in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_HIERS.

### ① See Also

"[ALL\\_ANALYTIC\\_VIEW\\_HIERS](#)"

## 7.332 USER\_ANALYTIC\_VIEW\_HIERS\_AE

USER\_ANALYTIC\_VIEW\_HIERS\_AE describes the hierarchies in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_HIERS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

"[ALL\\_ANALYTIC\\_VIEW\\_HIERS\\_AE](#)"

## 7.333 USER\_ANALYTIC\_VIEW\_KEYS

USER\_ANALYTIC\_VIEW\_KEYS describes the key columns of the attribute dimensions in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_KEYS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_KEYS"](#)

## 7.334 USER\_ANALYTIC\_VIEW\_KEYS\_AE

USER\_ANALYTIC\_VIEW\_KEYS\_AE describes the key columns of the attribute dimensions in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_KEYS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_KEYS\\_AE"](#)

## 7.335 USER\_ANALYTIC\_VIEW\_LEVEL\_CLASS

USER\_ANALYTIC\_VIEW\_LEVEL\_CLASS describes the level classifications of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LEVEL\_CLASS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LEVEL\\_CLASS"](#)

## 7.336 USER\_ANALYTIC\_VIEW\_LEVELS

USER\_ANALYTIC\_VIEW\_LEVELS describes the levels in the hierarchies in the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LEVELS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LEVELS"](#)

## 7.337 USER\_ANALYTIC\_VIEW\_LEVELS\_AE

USER\_ANALYTIC\_VIEW\_LEVELS\_AE describes the levels in the hierarchies in the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LEVELS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LEVELS\\_AE"](#)

## 7.338 USER\_ANALYTIC\_VIEW\_LVL\_CLS

USER\_ANALYTIC\_VIEW\_LVL\_CLS is identical to USER\_ANALYTIC\_VIEW\_LEVEL\_CLASS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_LEVEL\\_CLASS"](#)

## 7.339 USER\_ANALYTIC\_VIEW\_LVL\_CLS\_AE

USER\_ANALYTIC\_VIEW\_LVL\_CLS\_AE describes the level classifications of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LVL\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LVL\\_CLS\\_AE"](#)

## 7.340 USER\_ANALYTIC\_VIEW\_LVLGRPS

USER\_ANALYTIC\_VIEW\_LVLGRPS describes the analytic view measure and level groups of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LVLGRPS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LVLGRPS"](#)

## 7.341 USER\_ANALYTIC\_VIEW\_LVLGRPS\_AE

USER\_ANALYTIC\_VIEW\_LVLGRPS\_AE describes the analytic view measure and level groups of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_LVLGRPS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_LVLGRPS\\_AE"](#)

## 7.342 USER\_ANALYTIC\_VIEW\_MEAS\_CLASS

USER\_ANALYTIC\_VIEW\_MEAS\_CLASS describes the classifications of the measures of the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_MEAS\_CLASS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_MEAS\\_CLASS"](#)

## 7.343 USER\_ANALYTIC\_VIEW\_MEAS\_CLS

USER\_ANALYTIC\_VIEW\_MEAS\_CLS is identical to USER\_ANALYTIC\_VIEW\_MEAS\_CLASS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ANALYTIC\\_VIEW\\_MEAS\\_CLASS"](#)

## 7.344 USER\_ANALYTIC\_VIEW\_MEAS\_CLS\_AE

USER\_ANALYTIC\_VIEW\_MEAS\_CLS\_AE describes the classifications of the measures of the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEW\_MEAS\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEW\\_MEAS\\_CLS\\_AE"](#)

## 7.345 USER\_ANALYTIC\_VIEWS

USER\_ANALYTIC\_VIEWS describes the analytic views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEWS.

### ① See Also

["ALL\\_ANALYTIC\\_VIEWS"](#)

## 7.346 USER\_ANALYTIC\_VIEWS\_AE

USER\_ANALYTIC\_VIEWS\_AE describes the analytic views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ANALYTIC\_VIEWS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ANALYTIC\\_VIEWS\\_AE"](#)

## 7.347 USER\_APPLICATION\_ROLES

USER\_APPLICATION\_ROLES describes all the roles for the current user that have authorization policy functions defined.

Its columns are the same as those in DBA\_APPLICATION\_ROLES.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

["DBA\\_APPLICATION\\_ROLES"](#)

## 7.348 USER\_APPLY\_ERROR

USER\_APPLY\_ERROR displays information about the error transactions generated by apply processes visible to the current user. Its columns (except for SOURCE\_ROOT\_NAME) are the same as those in ALL\_APPLY\_ERROR.

### ① See Also

["ALL\\_APPLY\\_ERROR"](#)

## 7.349 USER\_AQ\_AGENT\_PRIVS

USER\_AQ\_AGENT\_PRIVS displays information about the registered AQ agents that are mapped to the current user. Its columns (except for DB\_USERNAME) are the same as those in DBA\_AQ\_AGENT\_PRIVS.

### ① See Also

["DBA\\_AQ\\_AGENT\\_PRIVS"](#)

## 7.350 USER\_ARGUMENTS

USER\_ARGUMENTS lists the arguments of the functions and procedures that are owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ARGUMENTS.

### ① See Also

- ["ALL\\_ARGUMENTS"](#)
- ["USER\\_PROCEDURES"](#) for information about the functions and procedures that are owned by the current user

## 7.351 USER\_ASSEMBLIES

USER\_ASSEMBLIES provides information about all assemblies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ASSEMBLIES.

### ① See Also

["ALL\\_ASSEMBLIES"](#)

## 7.352 USER\_ASSOCIATIONS

USER\_ASSOCIATIONS describes user-defined statistics associated with objects owned by the current user. Its columns are the same as those in ALL\_ASSOCIATIONS.

### ① See Also

["ALL\\_ASSOCIATIONS"](#)

## 7.353 USER\_ATTRIBUTE\_DIM\_ATTR\_CLASS

USER\_ATTRIBUTE\_DIM\_ATTR\_CLASS describes the attribute classifications of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ATTR\_CLASS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_ATTR\\_CLASS"](#)

## 7.354 USER\_ATTRIBUTE\_DIM\_ATTR\_CLS

USER\_ATTRIBUTE\_DIM\_ATTR\_CLS is identical to USER\_ATTRIBUTE\_DIM\_ATTR\_CLASS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ATTRIBUTE\\_DIM\\_ATTR\\_CLASS"](#)

## 7.355 USER\_ATTRIBUTE\_DIM\_ATTR\_CLS\_AE

USER\_ATTRIBUTE\_DIM\_ATTR\_CLS\_AE describes the attribute classifications of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ATTR\_CLS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ATTRIBUTE\\_DIM\\_ATTR\\_CLS\\_AE"](#)

## 7.356 USER\_ATTRIBUTE\_DIM\_ATTRS

USER\_ATTRIBUTE\_DIM\_ATTRS describes the attributes of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ATTRS.

**① See Also**

["ALL\\_ATTRIBUTE\\_DIM\\_ATTRS"](#)

## 7.357 USER\_ATTRIBUTE\_DIM\_ATTRS\_AE

USER\_ATTRIBUTE\_DIM\_ATTRS\_AE describes the attributes of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ATTRS\_AE.

**① Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_ATTRIBUTE\\_DIM\\_ATTRS\\_AE"](#)

## 7.358 USER\_ATTRIBUTE\_DIM\_CLASS

USER\_ATTRIBUTE\_DIM\_CLASS describes the classifications of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_CLASS.

**① See Also**

["ALL\\_ATTRIBUTE\\_DIM\\_CLASS"](#)

## 7.359 USER\_ATTRIBUTE\_DIM\_CLASS\_AE

USER\_ATTRIBUTE\_DIM\_CLASS\_AE describes the classifications of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_CLASS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_CLASS\\_AE"](#)

## 7.360 USER\_ATTRIBUTE\_DIM\_JN\_PTHS

USER\_ATTRIBUTE\_DIM\_JN\_PTHS is identical to USER\_ATTRIBUTE\_DIM\_JOIN\_PATHS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ATTRIBUTE\\_DIM\\_JOIN\\_PATHS"](#)

## 7.361 USER\_ATTRIBUTE\_DIM\_JN\_PTHS\_AE

USER\_ATTRIBUTE\_DIM\_JN\_PTHS\_AE describes the join paths for the attribute dimensions (across all editions) owned by the current user. Its columns are the same as those in ALL\_ATTRIBUTE\_DIM\_JN\_PTHS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_JN\\_PTHS\\_AE"](#)

## 7.362 USER\_ATTRIBUTE\_DIM\_JOIN\_PATHS

USER\_ATTRIBUTE\_DIM\_JOIN\_PATHS describes the join paths for the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_JOIN\_PATHS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_JOIN\\_PATHS"](#)

## 7.363 USER\_ATTRIBUTE\_DIM\_KEYS

USER\_ATTRIBUTE\_DIM\_KEYS describes the keys of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_KEYS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_KEYS"](#)

## 7.364 USER\_ATTRIBUTE\_DIM\_KEYS\_AE

USER\_ATTRIBUTE\_DIM\_KEYS\_AE describes the keys of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_KEYS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_KEYS\\_AE"](#)

## 7.365 USER\_ATTRIBUTE\_DIM\_LEVEL\_ATTRS

USER\_ATTRIBUTE\_DIM\_LEVEL\_ATTRS describes the attributes of the levels of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LEVEL\_ATTRS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_LEVEL\\_ATTRS"](#)

## 7.366 USER\_ATTRIBUTE\_DIM\_LEVELS

USER\_ATTRIBUTE\_DIM\_LEVELS describes the levels of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LEVELS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_LEVELS"](#)

## 7.367 USER\_ATTRIBUTE\_DIM\_LEVELS\_AE

USER\_ATTRIBUTE\_DIM\_LEVELS\_AE describes the levels of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LEVELS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_LEVELS\\_AE"](#)

## 7.368 USER\_ATTRIBUTE\_DIM\_LVL\_ATTRS

USER\_ATTRIBUTE\_DIM\_LVL\_ATTRS is identical to USER\_ATTRIBUTE\_DIM\_LEVEL\_ATTRS.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["USER\\_ATTRIBUTE\\_DIM\\_LEVEL\\_ATTRS"](#)

## 7.369 USER\_ATTRIBUTE\_DIM\_LVL\_ATTRS\_AE

USER\_ATTRIBUTE\_DIM\_LVL\_ATTRS\_AE describes the attributes of the levels of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LVL\_ATTRS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_LVL\\_ATTRS\\_AE"](#)

## 7.370 USER\_ATTRIBUTE\_DIM\_LVL\_CLASS

USER\_ATTRIBUTE\_DIM\_LVL\_CLASS describes the level classifications of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LVL\_CLASS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_LVL\\_CLASS"](#)

## 7.371 USER\_ATTRIBUTE\_DIM\_LVL\_CLS

USER\_ATTRIBUTE\_DIM\_LVL\_CLS is identical to USER\_ATTRIBUTE\_DIM\_LVL\_CLASS.

### **Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

### **See Also**

["USER\\_ATTRIBUTE\\_DIM\\_LVL\\_CLASS"](#)

## 7.372 USER\_ATTRIBUTE\_DIM\_LVL\_CLS\_AE

USER\_ATTRIBUTE\_DIM\_LVL\_CLS\_AE describes the level classifications of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_LVL\_CLS\_AE.

### **Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

### **See Also**

["ALL\\_ATTRIBUTE\\_DIM\\_LVL\\_CLS\\_AE"](#)

## 7.373 USER\_ATTRIBUTE\_DIM\_ORD\_ATTRS

USER\_ATTRIBUTE\_DIM\_ORD\_ATTRS is identical to USER\_ATTRIBUTE\_DIM\_ORDER\_ATTRS.

### **Note**

This view is available starting with Oracle Database 21c, Release Update 21.5.

### **See Also**

["USER\\_ATTRIBUTE\\_DIM\\_ORDER\\_ATTRS"](#)

## 7.374 USER\_ATTRIBUTE\_DIM\_ORD\_ATTRS\_AE

USER\_ATTRIBUTE\_DIM\_ORD\_ATTRS\_AE describes the order attributes of the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ORD\_ATTRS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_ORD\\_ATTRS\\_AE"](#)

## 7.375 USER\_ATTRIBUTE\_DIM\_ORDER\_ATTRS

USER\_ATTRIBUTE\_DIM\_ORDER\_ATTRS describes the order attributes of the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_ORDER\_ATTRS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_ORDER\\_ATTRS"](#)

## 7.376 USER\_ATTRIBUTE\_DIM\_TABLES

USER\_ATTRIBUTE\_DIM\_TABLES describes the tables used by the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_TABLES.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_TABLES"](#)

## 7.377 USER\_ATTRIBUTE\_DIM\_TABLES\_AE

USER\_ATTRIBUTE\_DIM\_TABLES\_AE describes the tables used by the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIM\_TABLES\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIM\\_TABLES\\_AE"](#)

## 7.378 USER\_ATTRIBUTE\_DIMENSIONS

USER\_ATTRIBUTE\_DIMENSIONS describes the attribute dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIMENSIONS.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIMENSIONS"](#)

## 7.379 USER\_ATTRIBUTE\_DIMENSIONS\_AE

USER\_ATTRIBUTE\_DIMENSIONS\_AE describes the attribute dimensions (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_DIMENSIONS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_ATTRIBUTE\\_DIMENSIONS\\_AE"](#)

## 7.380 USER\_ATTRIBUTE\_TRANSFORMATIONS

USER\_ATTRIBUTE\_TRANSFORMATIONS describes the transformation functions for the transformations owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ATTRIBUTE\_TRANSFORMATIONS.

### ① See Also

["ALL\\_ATTRIBUTE\\_TRANSFORMATIONS"](#)

## 7.381 USER\_AUDIT\_OBJECT

USER\_AUDIT\_OBJECT displays audit trail records for the objects accessible to the current user. Its columns are the same as those in DBA\_AUDIT\_OBJECT.

### ① Note

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- ["DBA\\_AUDIT\\_OBJECT"](#)
- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

## 7.382 USER\_AUDIT\_POLICIES

USER\_AUDIT\_POLICIES describes the fine-grained auditing policies on the tables and views owned by the current user. Its columns (except for OBJECT\_SCHEMA) are the same as those in ALL\_AUDIT\_POLICIES.

### ① See Also

["ALL\\_AUDIT\\_POLICIES"](#)

## 7.383 USER\_AUDIT\_POLICY\_COLUMNS

USER\_AUDIT\_POLICY\_COLUMNS describes the fine-grained auditing policy columns on the tables and views owned by the current user. Its columns are the same as those in ALL\_AUDIT\_POLICY\_COLUMNS.

### ① See Also

["ALL\\_AUDIT\\_POLICY\\_COLUMNS"](#)

## 7.384 USER\_AUDIT\_SESSION

USER\_AUDIT\_SESSION displays the audit trail records concerning connections and disconnections of the current user. Its columns are the same as those in DBA\_AUDIT\_SESSION.

### ① Note

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- ["DBA\\_AUDIT\\_SESSION"](#)
- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

## 7.385 USER\_AUDIT\_STATEMENT

USER\_AUDIT\_STATEMENT displays audit trail entries for the GRANT, REVOKE, AUDIT, NOAUDIT, and ALTER SYSTEM statements issued by the current user.

Its columns are the same as those in ["DBA\\_AUDIT\\_STATEMENT"](#).

**Note**

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

## 7.386 USER\_AUDIT\_TRAIL

USER\_AUDIT\_TRAIL displays the standard audit trail entries related to the current user.

Its columns are the same as those in ["DBA\\_AUDIT\\_TRAIL"](#).

The view displays audit records generated by actions performed by the user and audit records generated by actions performed on the user's schema objects.

**Note**

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

## 7.387 USER\_AW\_PS

USER\_AW\_PS describes the page spaces in the analytic workspaces owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_AW\_PS.

**See Also**

["ALL\\_AW\\_PS"](#)

## 7.388 USER\_AWS

USER\_AWS describes the analytic workspaces owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_AWS.

 **See Also**

["ALL\\_AWS"](#)

## 7.389 USER\_BASE\_TABLE\_MVIEWS

USER\_BASE\_TABLE\_MVIEWS describes the materialized views using materialized view logs owned by the current user. Its columns are the same as those in ALL\_BASE\_TABLE\_MVIEWS.

 **See Also**

["ALL\\_BASE\\_TABLE\\_MVIEWS"](#)

## 7.390 USER\_BLOCKCHAIN\_TABLES

USER\_BLOCKCHAIN\_TABLES describes the blockchain tables owned by the current user. Its columns (except for SCHEMA\_NAME) are the same as those in ALL\_BLOCKCHAIN\_TABLES.

 **See Also**

["ALL\\_BLOCKCHAIN\\_TABLES"](#)

## 7.391 USER\_CATALOG

USER\_CATALOG lists tables, views, clusters, synonyms, and sequences owned by the current user. Its columns are the same as those in ALL\_CATALOG.

 **See Also**

["ALL\\_CATALOG"](#)

## 7.392 USER\_CERTIFICATES

USER\_CERTIFICATES displays the certificates added by the current user which are used for signature verification for blockchain tables. Its columns (except USER\_NAME) are the same as those in ALL\_CERTIFICATES.

### **Note**

This view is available starting with Oracle Database 21c.

### **See Also**

"[ALL\\_CERTIFICATES](#)"

## 7.393 USER\_CHANGE\_NOTIFICATION\_REGS

USER\_CHANGE\_NOTIFICATION\_REGS describes the change notification registrations owned by the current user. Its columns (except for USERNAME) are the same as those in DBA\_CHANGE\_NOTIFICATION\_REGS.

### **See Also**

"[DBA\\_CHANGE\\_NOTIFICATION\\_REGS](#)"

## 7.394 USER\_CLU\_COLUMNS

USER\_CLU\_COLUMNS maps columns in the current user's tables to cluster columns. Its columns are the same as those in DBA\_CLU\_COLUMNS.

### **See Also**

"[DBA\\_CLU\\_COLUMNS](#)"

## 7.395 USER\_CLUSTER\_HASH\_EXPRESSIONS

USER\_CLUSTER\_HASH\_EXPRESSIONS lists hash functions for the hash clusters owned by the current user. Its columns are the same as those in ALL\_CLUSTER\_HASH\_EXPRESSIONS.

### ① See Also

["ALL\\_CLUSTER\\_HASH\\_EXPRESSIONS"](#)

## 7.396 USER\_CLUSTERING\_DIMENSIONS

USER\_CLUSTERING\_DIMENSIONS describes dimension tables associated with tables with an attribute clustering clause owned by the user. Its columns (except for OWNER) are the same as those in ALL\_CLUSTERING\_DIMENSIONS.

### ① See Also

- ["ALL\\_CLUSTERING\\_DIMENSIONS"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

## 7.397 USER\_CLUSTERING\_JOINS

USER\_CLUSTERING\_JOINS describes joins to the dimension tables associated with tables with an attribute clustering clause owned by the user. Its columns (except for OWNER) are the same as those in ALL\_CLUSTERING\_JOINS.

### ① See Also

- ["ALL\\_CLUSTERING\\_JOINS"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

## 7.398 USER\_CLUSTERING\_KEYS

USER\_CLUSTERING\_KEYS describes clustering keys for tables with an attribute clustering clause owned by the user. Its columns are the same as those in ALL\_CLUSTERING\_KEYS.

### ① See Also

- ["ALL\\_CLUSTERING\\_KEYS"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

## 7.399 USER\_CLUSTERING\_TABLES

USER\_CLUSTERING\_TABLES describes the tables with an attribute clustering clause owned by the user. Its columns are the same as those in ALL\_CLUSTERING\_TABLES.

### ① See Also

- ["ALL\\_CLUSTERING\\_TABLES"](#)
- *Oracle Database Data Warehousing Guide* for information about attribute clustering with zone maps

## 7.400 USER\_CLUSTERS

USER\_CLUSTERS describes all the clusters owned by the current user. Its columns are the same as those in ALL\_CLUSTERS.

### ① See Also

- ["ALL\\_CLUSTERS"](#)

## 7.401 USER\_CODE\_ROLE\_PRIVS

USER\_CODE\_ROLE\_PRIVS describes all the roles that are associated with program units owned by current user. Its columns (except for OWNER) are the same as those in ALL\_CODE\_ROLE\_PRIVS.

### ① See Also

- ["ALL\\_CODE\\_ROLE\\_PRIVS"](#)

## 7.402 USER\_COL\_COMMENTS

USER\_COL\_COMMENTS displays comments on the columns of the tables and views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_COL\_COMMENTS.

 **See Also**

["ALL\\_COL\\_COMMENTS"](#)

## 7.403 USER\_COL\_PENDING\_STATS

USER\_COL\_PENDING\_STATS describes the pending statistics of the columns owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_COL\_PENDING\_STATS.

 **See Also**

["ALL\\_COL\\_PENDING\\_STATS"](#)

## 7.404 USER\_COL\_PRIVS

USER\_COL\_PRIVS describes the column object grants for which the current user is the object owner, grantor, or grantee. Its columns are the same as those in DBA\_COL\_PRIVS.

 **See Also**

["DBA\\_COL\\_PRIVS"](#)

## 7.405 USER\_COL\_PRIVS\_MADE

USER\_COL\_PRIVS\_MADE describes the column object grants for which the current user is the object owner. Its columns (except for OWNER) are the same as those in ALL\_COL\_PRIVS\_MADE.

 **See Also**

["ALL\\_COL\\_PRIVS\\_MADE"](#)

## 7.406 USER\_COL\_PRIVS\_RECD

USER\_COL\_PRIVS\_RECD describes the column object grants for which the current user is the grantee. Its columns (except for GRANTEE) are the same as those in ALL\_COL\_PRIVS\_RECD.

### ① See Also

["ALL\\_COL\\_PRIVS\\_RECD"](#)

## 7.407 USER\_COLL\_TYPES

USER\_COLL\_TYPES describes named collection types (VARRAYs, nested tables, object tables, and so on) in the current user's schema. Its columns are the same as those in ALL\_COLL\_TYPES.

### ① See Also

["ALL\\_COLL\\_TYPES"](#)

## 7.408 USER\_COMPARISON

USER\_COMPARISON displays information about the comparison objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_COMPARISON.

### ① See Also

["DBA\\_COMPARISON"](#)

## 7.409 USER\_COMPARISON\_COLUMNS

USER\_COMPARISON\_COLUMNS displays information about the columns for the comparison objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_COMPARISON\_COLUMNS.

### ① See Also

["DBA\\_COMPARISON\\_COLUMNS"](#)

## 7.410 USER\_COMPARISON\_ROW\_DIF

USER\_COMPARISON\_ROW\_DIF displays information about the differing rows in the comparison scans owned by the current user. Its columns are the same as those in DBA\_COMPARISON\_ROW\_DIF.

### ① See Also

["DBA\\_COMPARISON\\_ROW\\_DIF"](#)

## 7.411 USER\_COMPARISON\_SCAN

USER\_COMPARISON\_SCAN displays information about the comparison scans owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_COMPARISON\_SCAN.

### ① See Also

["DBA\\_COMPARISON\\_SCAN"](#)

## 7.412 USER\_COMPARISON\_SCAN\_VALUES

USER\_COMPARISON\_SCAN\_VALUES displays information about the values for the comparison scans owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_COMPARISON\_SCAN\_VALUES.

### ① See Also

["DBA\\_COMPARISON\\_SCAN\\_VALUES"](#)

## 7.413 USER\_CONS\_COLUMNS

USER\_CONS\_COLUMNS describes columns that are owned by the current user and that are specified in constraint definitions. Its columns are the same as those in ALL\_CONS\_COLUMNS.

### ① See Also

["ALL\\_CONS\\_COLUMNS"](#)

## 7.414 USER\_CONS\_OBJ\_COLUMNS

USER\_CONS\_OBJ\_COLUMNS displays information about the types that object columns (or attributes) or collection elements have been constrained to, in the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CONS\_OBJ\_COLUMNS.

### ① See Also

["ALL\\_CONS\\_OBJ\\_COLUMNS"](#)

## 7.415 USER\_CONSTRAINTS

USER\_CONSTRAINTS describes all constraint definitions on tables owned by the current user. Its columns are the same as those in ALL\_CONSTRAINTS.

### ① See Also

["ALL\\_CONSTRAINTS"](#)

## 7.416 USER\_CQ\_NOTIFICATION\_QUERIES

USER\_CQ\_NOTIFICATION\_QUERIES describes the registered queries for the CQ notifications owned by the current user. Its columns (except for USERNAME) are the same as those in DBA\_CQ\_NOTIFICATION\_QUERIES.

### ① See Also

["DBA\\_CQ\\_NOTIFICATION\\_QUERIES"](#)

## 7.417 USER\_CREDENTIALS

USER\_CREDENTIALS displays credentials owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CREDENTIALS.

### ① See Also

["ALL\\_CREDENTIALS"](#)

## 7.418 USER\_CUBE\_ATTR\_VISIBILITY

USER\_CUBE\_ATTR\_VISIBILITY describes the OLAP attributes visible for the dimensions, hierarchies, and levels owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_ATTR\_VISIBILITY.

### ① See Also

["ALL\\_CUBE\\_ATTR\\_VISIBILITY"](#)

## 7.419 USER\_CUBE\_ATTRIBUTES

USER\_CUBE\_ATTRIBUTES describes the attributes for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_ATTRIBUTES.

### ① See Also

["ALL\\_CUBE\\_ATTRIBUTES"](#)

## 7.420 USER\_CUBE\_BUILD\_PROCESSES

USER\_CUBE\_BUILD\_PROCESSES describes the OLAP build processes and maintenance scripts owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_BUILD\_PROCESSES.

### ① See Also

["ALL\\_CUBE\\_BUILD\\_PROCESSES"](#)

## 7.421 USER\_CUBE\_CALCULATED\_MEMBERS

USER\_CUBE\_CALCULATED\_MEMBERS describes the calculated members for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_CALCULATED\_MEMBERS.

### ① See Also

["ALL\\_CUBE\\_CALCULATED\\_MEMBERS"](#)

## 7.422 USER\_CUBE\_DIM\_LEVELS

USER\_CUBE\_DIM\_LEVELS describes the OLAP dimension levels owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIM\_LEVELS.

### ① See Also

["ALL\\_CUBE\\_DIM\\_LEVELS"](#)

## 7.423 USER\_CUBE\_DIM\_MODELS

USER\_CUBE\_DIM\_MODELS describes the models for the OLAP dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIM\_MODELS.

### ① See Also

["ALL\\_CUBE\\_DIM\\_MODELS"](#)

## 7.424 USER\_CUBE\_DIM\_VIEW\_COLUMNS

USER\_CUBE\_DIM\_VIEW\_COLUMNS describes the columns of the relational views of the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIM\_VIEW\_COLUMNS.

### ① See Also

["ALL\\_CUBE\\_DIM\\_VIEW\\_COLUMNS"](#)

## 7.425 USER\_CUBE\_DIM\_VIEWS

USER\_CUBE\_DIM\_VIEWS describes the relational views of the OLAP dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIM\_VIEWS.

### ① See Also

["ALL\\_CUBE\\_DIM\\_VIEWS"](#)

## 7.426 USER\_CUBE\_DIMENSIONALITY

USER\_CUBE\_DIMENSIONALITY describes the dimension order for the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIMENSIONALITY.

### ① See Also

["ALL\\_CUBE\\_DIMENSIONALITY"](#)

## 7.427 USER\_CUBE\_DIMENSIONS

USER\_CUBE\_DIMENSIONS describes the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_DIMENSIONS.

### ① See Also

["ALL\\_CUBE\\_DIMENSIONS"](#)

## 7.428 USER\_CUBE\_HIER\_LEVELS

USER\_CUBE\_HIER\_LEVELS describes the hierarchy levels for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_HIER\_LEVELS.

### ① See Also

["ALL\\_CUBE\\_HIER\\_LEVELS"](#)

## 7.429 USER\_CUBE\_HIER\_VIEW\_COLUMNS

USER\_CUBE\_HIER\_VIEW\_COLUMNS describes the columns of the relational hierarchy views of the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_HIER\_VIEW\_COLUMNS.

### ① See Also

["ALL\\_CUBE\\_HIER\\_VIEW\\_COLUMNS"](#)

## 7.430 USER\_CUBE\_HIER\_VIEWS

USER\_CUBE\_HIER\_VIEWS describes the hierarchies for the OLAP cube dimensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_HIER\_VIEWS.

### ① See Also

["ALL\\_CUBE\\_HIER\\_VIEWS"](#)

## 7.431 USER\_CUBE\_HIERARCHIES

USER\_CUBE\_HIERARCHIES describes the OLAP dimension hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_HIERARCHIES.

### ① See Also

["ALL\\_CUBE\\_HIERARCHIES"](#)

## 7.432 USER\_CUBE\_MEASURES

USER\_CUBE\_MEASURES describes the measures for the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_MEASURES.

### ① See Also

["ALL\\_CUBE\\_MEASURES"](#)

## 7.433 USER\_CUBE\_NAMED\_BUILD\_SPECS

USER\_CUBE\_NAMED\_BUILD\_SPECS describes the OLAP cube named build specifications in the database that are owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_NAMED\_BUILD\_SPECS.

### ① See Also

["ALL\\_CUBE\\_NAMED\\_BUILD\\_SPECS"](#)

## 7.434 USER\_CUBE\_SUB\_PARTITION\_LEVELS

USER\_CUBE\_SUB\_PARTITION\_LEVELS describes the OLAP secondary partition levels in the database that are owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_SUB\_PARTITION\_LEVELS.

### ① See Also

["ALL\\_CUBE\\_SUB\\_PARTITION\\_LEVELS"](#)

## 7.435 USER\_CUBE\_VIEW\_COLUMNS

USER\_CUBE\_VIEW\_COLUMNS describes the columns of relational views of OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_VIEW\_COLUMNS.

### ① See Also

["ALL\\_CUBE\\_VIEW\\_COLUMNS"](#)

## 7.436 USER\_CUBE\_VIEWS

USER\_CUBE\_VIEWS describes the relational views of the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBE\_VIEWS.

### ① See Also

["ALL\\_CUBE\\_VIEWS"](#)

## 7.437 USER\_CUBES

USER\_CUBES describes the OLAP cubes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_CUBES.

### ① See Also

["ALL\\_CUBES"](#)

## 7.438 USER\_DATAPUMP\_JOBS

USER\_DATAPUMP\_JOBS displays the Data Pump jobs owned by the current user. Its columns (except for OWNER\_NAME) are the same as those in DBA\_DATAPUMP\_JOBS.

### ① See Also

["DBA\\_DATAPUMP\\_JOBS"](#)

## 7.439 USER\_DB\_LINKS

USER\_DB\_LINKS describes the database links owned by the current user. Its columns are the same as those in ALL\_DB\_LINKS except that it does not have the OWNER column.

It also displays an additional column, PASSWORD, which is no longer used and for which nothing is returned. The PASSWORD column is maintained for backward compatibility only.

### ① See Also

["ALL\\_DB\\_LINKS"](#)

## 7.440 USER\_DBFS\_HS

USER\_DBFS\_HS shows all Database File System (DBFS) hierarchical stores owned by the current user. Its columns (except for STOREOWNER) are the same as those in DBA\_DBFS\_HS.

### ① See Also

["DBA\\_DBFS\\_HS"](#)

## 7.441 USER\_DBFS\_HS\_COMMANDS

USER\_DBFS\_HS\_COMMANDS shows all the registered store commands for all Database File system (DBFS) hierarchical stores owned by current user. Its columns (except for STOREOWNER) are the same as those in DBA\_DBFS\_HS\_COMMANDS.

### ① See Also

["DBA\\_DBFS\\_HS\\_COMMANDS"](#)

## 7.442 USER\_DBFS\_HS\_FILES

USER\_DBFS\_HS\_FILES displays files in the Database File System (DBFS) hierarchical store owned by the current user and their location on the back-end device.

| Column         | Datatype       | NULL | Description                                       |
|----------------|----------------|------|---------------------------------------------------|
| PATH           | VARCHAR2(1024) |      | Path name of the file                             |
| SEQUENCENUMBER | NUMBER         |      | Sequence number of this piece of the file         |
| STARTOFFSET    | NUMBER         |      | Begin offset of this piece in the tarball         |
| ENDOFFSET      | NUMBER         |      | End offset of this piece in the tarball           |
| TARBALLID      | NUMBER         |      | Tarball ID                                        |
| BACKUPFILENAME | VARCHAR2(256)  |      | File on back end in which this tarball is located |
| TARSTARTOFFSET | NUMBER         |      | Begin offset of this tarball in the backup file   |
| TARENDOFFSET   | NUMBER         |      | End offset of this tarball in the backup file     |

## 7.443 USER\_DBFS\_HS\_FIXED\_PROPERTIES

USER\_DBFS\_HS\_FIXED\_PROPERTIES shows non-modifiable properties of all Database File System (DBFS) hierarchical stores owned by current user. Its columns (except for STORE\_OWNER) are the same as those in DBA\_DBFS\_HS\_FIXED\_PROPERTIES.

### ① See Also

["DBA\\_DBFS\\_HS\\_FIXED\\_PROPERTIES"](#)

## 7.444 USER\_DBFS\_HS\_PROPERTIES

USER\_DBFS\_HS\_PROPERTIES shows modifiable properties of all Database File System (DBFS) hierarchical stores owned by current user. Its columns (except for STOREOWNER) are the same as those in DBA\_DBFS\_HS\_PROPERTIES.

### ① See Also

["DBA\\_DBFS\\_HS\\_PROPERTIES"](#)

## 7.445 USER\_DEPENDENCIES

USER\_DEPENDENCIES describes dependencies between procedures, packages, functions, package bodies, and triggers owned by the current user, including dependencies on views created without any database links. Its columns are the same as those in ALL\_DEPENDENCIES.

### ① See Also

"[ALL\\_DEPENDENCIES](#)"

## 7.446 USER\_DIM\_ATTRIBUTES

USER\_DIM\_ATTRIBUTES describes the relationship between dimension levels and functionally dependent columns in the current user's schema.

The level columns and the dependent column must be in the same table. This view's columns are the same as those in ALL\_DIM\_ATTRIBUTES.

### ① See Also

"[ALL\\_DIM\\_ATTRIBUTES](#)"

## 7.447 USER\_DIM\_CHILD\_OF

USER\_DIM\_CHILD\_OF describes a hierarchical relationship of 1 to  $n$  between pairs of levels in dimensions owned by the current user. Its columns are the same as those in ALL\_DIM\_CHILD\_OF.

### ① See Also

"[ALL\\_DIM\\_CHILD\\_OF](#)"

## 7.448 USER\_DIM\_HIERARCHIES

USER\_DIM\_HIERARCHIES describes the dimension hierarchies owned by the current user. Its columns are the same as those in ALL\_DIM\_HIERARCHIES.

### ① See Also

"[ALL\\_DIM\\_HIERARCHIES](#)"

## 7.449 USER\_DIM\_JOIN\_KEY

USER\_DIM\_JOIN\_KEY describes the join between two dimension tables owned by the current user. The join is always specified between a parent dimension level column and a child column. This view's columns are the same as those in ALL\_DIM\_JOIN\_KEY.

### ① See Also

["ALL\\_DIM\\_JOIN\\_KEY"](#)

## 7.450 USER\_DIM\_LEVEL\_KEY

USER\_DIM\_LEVEL\_KEY describes columns of dimension levels owned by the current user. This view's columns are the same as those in ALL\_DIM\_LEVEL\_KEY.

### ① See Also

["ALL\\_DIM\\_LEVEL\\_KEY"](#)

## 7.451 USER\_DIM\_LEVELS

USER\_DIM\_LEVELS describes the levels of dimensions owned by the current user. All columns of a dimension level must come from the same relation. This view's columns are the same as those in ALL\_DIM\_LEVELS.

### ① See Also

["ALL\\_DIM\\_LEVELS"](#)

## 7.452 USER\_DIMENSIONS

USER\_DIMENSIONS describes dimension objects in the user's schema. Its columns are the same as those in ALL\_DIMENSIONS.

### ① See Also

["ALL\\_DIMENSIONS"](#)

## 7.453 USER\_EDITED\_TYPES

USER\_EDITED\_TYPES lists the types that are edited by default for the current user. Its columns (except for SCHEMA) are the same as those in DBA\_EDITED\_TYPES.

### ① See Also

["DBA\\_EDITED\\_TYPES"](#)

## 7.454 USER\_EDITING\_VIEW\_COLS

USER\_EDITING\_VIEW\_COLS describes the relationship between the columns of the editing views owned by the current user and the table columns to which they map. Its columns (except for OWNER) are the same as those in ALL\_EDITING\_VIEW\_COLS.

### ① See Also

["ALL\\_EDITING\\_VIEW\\_COLS"](#)

## 7.455 USER\_EDITING\_VIEW\_COLS\_AE

USER\_EDITING\_VIEW\_COLS\_AE describes the relationship between the columns of the editing views (across all editions) owned by the current user and the table columns to which they map. Its columns (except for OWNER) are the same as those in ALL\_EDITING\_VIEW\_COLS\_AE.

### ① See Also

["ALL\\_EDITING\\_VIEW\\_COLS\\_AE"](#)

## 7.456 USER\_EDITING\_VIEWS

USER\_EDITING\_VIEWS describes the editing views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_EDITING\_VIEWS.

### ① See Also

["ALL\\_EDITING\\_VIEWS"](#)

## 7.457 USER\_EDITIONING\_VIEWS\_AE

USER\_EDITIONING\_VIEWS\_AE describes the editioning views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_EDITIONING\_VIEWS\_AE.

### ① See Also

["ALL\\_EDITIONING\\_VIEWS\\_AE"](#)

## 7.458 USER\_ENCRYPTED\_COLUMNS

USER\_ENCRYPTED\_COLUMNS maintains encryption algorithm information for all encrypted columns in all tables in the user's schema. Its columns (except for OWNER) are the same as those in ALL\_ENCRYPTED\_COLUMNS.

### ① See Also

["ALL\\_ENCRYPTED\\_COLUMNS"](#)

## 7.459 USER\_EPG\_DAD\_AUTHORIZATION

USER\_EPG\_DAD\_AUTHORIZATION describes the DADs that are authorized to use the user's privileges. Its columns (except for USERNAME) are the same as those in DBA\_EPG\_DAD\_AUTHORIZATION.

### ① See Also

["DBA\\_EPG\\_DAD\\_AUTHORIZATION"](#)

## 7.460 USER\_ERROR\_TRANSLATIONS

USER\_ERROR\_TRANSLATIONS describes all error translations owned by the user. Its columns (except for OWNER) are the same as those in ALL\_ERROR\_TRANSLATIONS.

### ① See Also

["ALL\\_ERROR\\_TRANSLATIONS"](#)

## 7.461 USER\_ERRORS

USER\_ERRORS describes the current errors on the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ERRORS.

### ① See Also

["ALL\\_ERRORS"](#)

## 7.462 USER\_ERRORS\_AE

USER\_ERRORS\_AE describes the current errors on the stored objects (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_ERRORS\_AE.

### ① See Also

["ALL\\_ERRORS\\_AE"](#)

## 7.463 USER\_EVALUATION\_CONTEXT\_TABLES

USER\_EVALUATION\_CONTEXT\_TABLES describes the tables in the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION\_CONTEXT\_OWNER) are the same as those in ALL\_EVALUATION\_CONTEXT\_TABLES.

### ① See Also

["ALL\\_EVALUATION\\_CONTEXT\\_TABLES"](#)

## 7.464 USER\_EVALUATION\_CONTEXT\_VARS

USER\_EVALUATION\_CONTEXT\_VARS describes the variables in the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION\_CONTEXT\_OWNER) are the same as those in ALL\_EVALUATION\_CONTEXT\_VARS.

### ① See Also

["ALL\\_EVALUATION\\_CONTEXT\\_VARS"](#)

## 7.465 USER\_EVALUATION\_CONTEXTS

USER\_EVALUATION\_CONTEXTS describes the rule evaluation contexts owned by the current user. Its columns (except for EVALUATION\_CONTEXT\_OWNER) are the same as those in ALL\_EVALUATION\_CONTEXTS.

### ① See Also

["ALL\\_EVALUATION\\_CONTEXTS"](#)

## 7.466 USER\_EXPRESSION\_STATISTICS

USER\_EXPRESSION\_STATISTICS provides expression usage tracking statistics for tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_EXPRESSION\_STATISTICS.

### ① See Also

["ALL\\_EXPRESSION\\_STATISTICS"](#)

## 7.467 USER\_EXTENTS

USER\_EXTENTS describes the extents comprising the segments owned by the current user's objects. Its columns (except for OWNER, FILE\_ID, BLOCK\_ID, and RELATIVE\_FNO) are the same as those in DBA\_EXTENTS.

### ① See Also

["DBA\\_EXTENTS"](#)

## 7.468 USER\_EXTERNAL\_LOCATIONS

USER\_EXTERNAL\_LOCATIONS describes the locations (data sources) of the external tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_EXTERNAL\_LOCATIONS.

### ① See Also

["ALL\\_EXTERNAL\\_LOCATIONS"](#)

## 7.469 USER\_EXTERNAL\_TABLES

USER\_EXTERNAL\_TABLES describes the external tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_EXTERNAL\_TABLES.

### ① See Also

["ALL\\_EXTERNAL\\_TABLES"](#)

## 7.470 USER\_FILE\_GROUP\_EXPORT\_INFO

USER\_FILE\_GROUP\_EXPORT\_INFO shows export-related information for all file groups that the current user can manage. Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUP\_EXPORT\_INFO.

### ① See Also

["ALL\\_FILE\\_GROUP\\_EXPORT\\_INFO"](#)

## 7.471 USER\_FILE\_GROUP\_FILES

USER\_FILE\_GROUP\_FILES shows the file set for each versioned group owned by the current user. Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUP\_FILES.

### ① See Also

["ALL\\_FILE\\_GROUP\\_FILES"](#)

## 7.472 USER\_FILE\_GROUP\_TABLES

USER\_FILE\_GROUP\_TABLES shows information about tables owned by the current user that can be imported using the file set. Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUP\_TABLES.

### ① See Also

["ALL\\_FILE\\_GROUP\\_TABLES"](#)

## 7.473 USER\_FILE\_GROUP\_TABLESPACES

USER\_FILE\_GROUP\_TABLESPACES shows information about the transportable tablespaces present (partially or completely) in the file set owned by the current user (when the file set contains dump files). Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUP\_TABLESPACES.

### ① See Also

["ALL\\_FILE\\_GROUP\\_TABLESPACES"](#)

## 7.474 USER\_FILE\_GROUP\_VERSIONS

USER\_FILE\_GROUP\_VERSIONS shows top-level version information for all file groups owned by the current user. Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUP\_VERSIONS.

### ① See Also

["ALL\\_FILE\\_GROUP\\_VERSIONS"](#)

## 7.475 USER\_FILE\_GROUPS

USER\_FILE\_GROUPS shows top-level metadata about file groups owned by the current user. Its columns (except for FILE\_GROUP\_OWNER) are the same as those in ALL\_FILE\_GROUPS.

### ① See Also

["ALL\\_FILE\\_GROUPS"](#).

## 7.476 USER\_FLASHBACK\_ARCHIVE

USER\_FLASHBACK\_ARCHIVE describes flashback data archives, which consist of multiple tablespaces and historic data from all transactions against tracked tables.

The content of this view depends on the privileges of the user who queries it, as follows:

- If the user has the FLASHBACK ARCHIVE ADMINISTER system privilege, then USER\_FLASHBACK\_ARCHIVE describes the flashback archives for all users who have been granted the FLASHBACK ARCHIVE object privilege.
- If the user does not have the FLASHBACK ARCHIVE ADMINISTER system privilege, then USER\_FLASHBACK\_ARCHIVE describes flashback archives for which the current user has been granted the FLASHBACK ARCHIVE object privilege.

The columns of the USER\_FLASHBACK\_ARCHIVE view are the same as those in DBA\_FLASHBACK\_ARCHIVE.

**See Also**

["DBA\\_FLASHBACK\\_ARCHIVE"](#)

## 7.477 USER\_FLASHBACK\_ARCHIVE\_TABLES

USER\_FLASHBACK\_ARCHIVE\_TABLES displays information about the tables owned by the current user that are enabled for Flashback Archive. Its columns are the same as those in DBA\_FLASHBACK\_ARCHIVE\_TABLES.

**See Also**

["DBA\\_FLASHBACK\\_ARCHIVE\\_TABLES"](#)

## 7.478 USER\_FLASHBACK\_TXN\_REPORT

USER\_FLASHBACK\_TXN\_REPORT displays information about the compensating transactions owned by the current user that have been committed in the database. Its columns (except for USERNAME) are the same as those in DBA\_FLASHBACK\_TXN\_REPORT.

**See Also**

["DBA\\_FLASHBACK\\_TXN\\_REPORT"](#)

## 7.479 USER\_FLASHBACK\_TXN\_STATE

USER\_FLASHBACK\_TXN\_STATE displays information about the compensating status of the transactions owned by the current user. Its columns (except for USERNAME) are the same as those in DBA\_FLASHBACK\_TXN\_STATE.

**See Also**

["DBA\\_FLASHBACK\\_TXN\\_STATE"](#)

## 7.480 USER\_FREE\_SPACE

USER\_FREE\_SPACE describes the free extents in the tablespaces accessible to the current user. Its columns are the same as those in DBA\_FREE\_SPACE.

### ① See Also

["DBA\\_FREE\\_SPACE"](#)

## 7.481 USER\_GOLDENGATE\_PRIVILEGES

USER\_GOLDENGATE\_PRIVILEGES displays details about Oracle GoldenGate privileges. Its columns (except for USERNAME) are the same as those in ALL\_GOLDENGATE\_PRIVILEGES.

### ① See Also

["ALL\\_GOLDENGATE\\_PRIVILEGES"](#)

## 7.482 USER\_HEAT\_MAP\_SEG\_HISTOGRAM

USER\_HEAT\_MAP\_SEG\_HISTOGRAM displays segment access information for segments owned by the user. Its columns (except for OWNER) are the same as those in ALL\_HEAT\_MAP\_SEG\_HISTOGRAM.

### ① See Also

["ALL\\_HEAT\\_MAP\\_SEG\\_HISTOGRAM"](#)

## 7.483 USER\_HEAT\_MAP\_SEGMENT

USER\_HEAT\_MAP\_SEGMENT displays the latest segment access time for all segments owned by the user. Its columns (except for OWNER) are the same as those in ALL\_HEAT\_MAP\_SEGMENT.

### ① See Also

["ALL\\_HEAT\\_MAP\\_SEGMENT"](#)

## 7.484 USER\_HIER\_CLASS

USER\_HIER\_CLASS describes the classifications of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_CLASS.

### ① See Also

["ALL\\_HIER\\_CLASS"](#)

## 7.485 USER\_HIER\_CLASS\_AE

USER\_HIER\_CLASS\_AE describes the classifications of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_CLASS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_CLASS\\_AE"](#)

## 7.486 USER\_HIER\_COLUMNS

USER\_HIER\_COLUMNS describes the columns of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_COLUMNS.

### ① See Also

["ALL\\_HIER\\_COLUMNS"](#)

## 7.487 USER\_HIER\_COLUMNS\_AE

USER\_HIER\_COLUMNS\_AE describes the columns of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_COLUMNS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_COLUMNS\\_AE"](#)

## 7.488 USER\_HIER\_HIER\_ATTR\_CLASS

USER\_HIER\_HIER\_ATTR\_CLASS describes the classifications of the hierarchical attributes of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_HIER\_ATTR\_CLASS.

### ① See Also

["ALL\\_HIER\\_HIER\\_ATTR\\_CLASS"](#)

## 7.489 USER\_HIER\_HIER\_ATTR\_CLASS\_AE

USER\_HIER\_HIER\_ATTR\_CLASS\_AE describes the classifications of the hierarchical attributes of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_HIER\_ATTR\_CLASS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_HIER\\_ATTR\\_CLASS\\_AE"](#)

## 7.490 USER\_HIER\_HIER\_ATTRIBUTES

USER\_HIER\_HIER\_ATTRIBUTES describes the hierarchical attributes of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_HIER\_ATTRIBUTES.

### ① See Also

["ALL\\_HIER\\_HIER\\_ATTRIBUTES"](#)

## 7.491 USER\_HIER\_HIER\_ATTRIBUTES\_AE

USER\_HIER\_HIER\_ATTRIBUTES\_AE describes the hierarchical attributes of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_HIER\_ATTRIBUTES\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_HIER\\_ATTRIBUTES\\_AE"](#)

## 7.492 USER\_HIER\_JOIN\_PATHS

USER\_HIER\_JOIN\_PATHS describes the join paths for the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_JOIN\_PATHS.

### ① See Also

["ALL\\_HIER\\_JOIN\\_PATHS"](#)

## 7.493 USER\_HIER\_JOIN\_PATHS\_AE

USER\_HIER\_JOIN\_PATHS\_AE describes the join paths for the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_JOIN\_PATHS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_JOIN\\_PATHS\\_AE"](#)

## 7.494 USER\_HIER\_LEVEL\_ID\_ATTRS

USER\_HIER\_LEVEL\_ID\_ATTRS describes the attributes that uniquely identify members of the levels of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_LEVEL\_ID\_ATTRS.

### ① See Also

["ALL\\_HIER\\_LEVEL\\_ID\\_ATTRS"](#)

## 7.495 USER\_HIER\_LEVEL\_ID\_ATTRS\_AE

USER\_HIER\_LEVEL\_ID\_ATTRS\_AE describes the attributes that uniquely identify members of the levels of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_LEVEL\_ID\_ATTRS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_LEVEL\\_ID\\_ATTRS\\_AE"](#)

## 7.496 USER\_HIER\_LEVELS

USER\_HIER\_LEVELS describes the levels of the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_LEVELS.

### ① See Also

["ALL\\_HIER\\_LEVELS"](#)

## 7.497 USER\_HIER\_LEVELS\_AE

USER\_HIER\_LEVELS\_AE describes the levels of the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIER\_LEVELS\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

### ① See Also

["ALL\\_HIER\\_LEVELS\\_AE"](#)

## 7.498 USER\_HIERARCHIES

USER\_HIERARCHIES describes the hierarchies owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIERARCHIES.

### ① See Also

["ALL\\_HIERARCHIES"](#)

## 7.499 USER\_HIERARCHIES\_AE

USER\_HIERARCHIES\_AE describes the hierarchies (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_HIERARCHIES\_AE.

### ① Note

This view is available starting with Oracle Database 21c, Release Update 21.5.

**① See Also**

["ALL\\_HIERARCHIES\\_AE"](#)

## 7.500 USER\_HISTOGRAMS

USER\_HISTOGRAMS is a synonym for USER\_TAB\_HISTOGRAMS.

**① See Also**

["USER\\_TAB\\_HISTOGRAMS"](#)

## 7.501 USER\_HIVE\_COLUMNS

USER\_HIVE\_COLUMNS describes all Hive columns owned by the current user in a Hive metastore. Its columns are the same as those in ALL\_HIVE\_COLUMNS.

**① See Also**

["ALL\\_HIVE\\_COLUMNS"](#)

## 7.502 USER\_HIVE\_DATABASES

USER\_HIVE\_DATABASES describes all the Hive schemas owned by the current user in a Hadoop cluster. Its columns are the same as those in ALL\_HIVE\_DATABASES.

**① See Also**

["ALL\\_HIVE\\_DATABASES"](#)

## 7.503 USER\_HIVE\_PART\_KEY\_COLUMNS

USER\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns owned by the current user in the database. Its columns are the same as those in ALL\_HIVE\_PART\_KEY\_COLUMNS.

**① See Also**

["ALL\\_HIVE\\_PART\\_KEY\\_COLUMNS"](#)

## 7.504 USER\_HIVE\_TAB\_PARTITIONS

USER\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions owned by the current user in the database. Its columns are the same as those in ALL\_HIVE\_TAB\_PARTITIONS.

### ① See Also

["ALL\\_HIVE\\_TAB\\_PARTITIONS"](#)

## 7.505 USER\_HIVE\_TABLES

USER\_HIVE\_TABLES provides information about all the Hive tables owned by the current user in the Hive metastore. Its columns are the same as those in ALL\_HIVE\_TABLES.

### ① See Also

["ALL\\_HIVE\\_TABLES"](#)

## 7.506 USER\_HOST\_ACES

USER\_HOST\_ACES describes the status of access control entries for the current user to access network hosts through PL/SQL network utility packages.

Its columns (except for ACE\_ORDER, START\_DATE, END\_DATE, GRANT\_TYPE, INVERTED\_PRINCIPAL, PRINCIPAL, PRINCIPAL\_TYPE, and STATUS) are the same as those in DBA\_HOST\_ACES.

### ① See Also

["DBA\\_HOST\\_ACES"](#)

## 7.507 USER\_IDENTIFIERS

USER\_IDENTIFIERS displays information about the identifiers in the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_IDENTIFIERS.

### ① See Also

["ALL\\_IDENTIFIERS"](#)

## 7.508 USER\_ILMDATAMOVEMENTPOLICIES

USER\_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy for a user. Its columns are the same as those in DBA\_ILMDATAMOVEMENTPOLICIES.

### Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

### See Also

["DBA\\_ILMDATAMOVEMENTPOLICIES"](#)

## 7.509 USER\_ILMEVALUATIONDETAILS

USER\_ILMEVALUATIONDETAILS displays details on evaluation of Automatic Data Optimization policies considered for Automatic Data Optimization tasks for a user.

It also shows the job name that executes the policy, in case the policy was selected for execution. If the policy was not selected for execution, this view provides a reason. Its columns are the same as those in DBA\_ILMEVALUATIONDETAILS.

### Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

### See Also

["DBA\\_ILMEVALUATIONDETAILS"](#)

## 7.510 USER\_ILMOBJECTS

USER\_ILMOBJECTS displays all the Automatic Data Optimization policies and objects for a user.

Many objects inherit policies via their parent objects or because they were created in a particular tablespace. This view provides a mapping between the policies and objects and indicates whether a policy is inherited by an object or is directly specified on it. Its columns are the same as those in DBA\_ILMOBJECTS.

**Note**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

**See Also**

["DBA\\_ILMOBJECTS"](#)

## 7.511 USER\_ILMPOLICIES

USER\_ILMPOLICIES displays details about Automatic Data Optimization policies owned by the user.

The view contains common details relevant to all types of Automatic Data Optimization policies, not just details relevant to the data movement-related Automatic Data Optimization policies. Its columns are the same as those in DBA\_ILMPOLICIES.

**Note**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

**See Also**

["DBA\\_ILMPOLICIES"](#)

## 7.512 USER\_ILMRESULTS

USER\_ILMRESULTS displays information on data movement-related Automatic Data Optimization jobs for tasks created by the user.

Its columns are the same as those in DBA\_ILMRESULTS.

**Note**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

**See Also**

["DBA\\_ILMRESULTS"](#)

## 7.513 USER\_ILMTASKS

USER\_ILMTASKS displays information on Automatic Data Optimization tasks created by a user. Its columns are the same as those in DBA\_ILMTASKS.

### ① Note

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

### ① See Also

["DBA\\_ILMTASKS"](#)

## 7.514 USER\_IM\_EXPRESSIONS

USER\_IM\_EXPRESSIONS provides information about the list of expressions (SYS\_IME virtual columns) that are currently enabled for in-memory storage in schemas owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_IM\_EXPRESSIONS.

Typically, you can query this view after invoking the DBMS\_INMEMORY\_ADMIN.IME\_CAPTURE\_EXPRESSIONS PL/SQL procedure to see the list of hot expressions added to tables owned by you across the database.

Based on this view, you can:

- Populate expressions on a particular table immediately
- Drop certain expressions that are marked for in-memory but not desired by you

### ① See Also

["DBA\\_IM\\_EXPRESSIONS"](#)

## 7.515 USER\_IMMUTABLE\_TABLES

USER\_IMMUTABLE\_TABLES describes the immutable tables owned by the current user. Its columns (except for SCHEMA\_NAME) are the same as those in ALL\_IMMUTABLE\_TABLES.

### ① See Also

["ALL\\_IMMUTABLE\\_TABLES"](#)

## 7.516 USER\_IND\_COLUMNS

USER\_IND\_COLUMNS describes the columns of the indexes owned by the current user and columns of indexes on tables owned by the current user.

Its columns (except for INDEX\_OWNER and TABLE\_OWNER) are the same as those in ["ALL\\_IND\\_COLUMNS"](#).

## 7.517 USER\_IND\_EXPRESSIONS

USER\_IND\_EXPRESSIONS describes expressions of function-based indexes on tables owned by the current user. Its columns (except for INDEX\_OWNER and TABLE\_OWNER) are the same as those in ALL\_IND\_EXPRESSIONS.

### ① See Also

["ALL\\_IND\\_EXPRESSIONS"](#)

## 7.518 USER\_IND\_PARTITIONS

USER\_IND\_PARTITIONS displays, for each index partition owned by the current user, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics generated by the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_PARTITIONS.

### ① See Also

["ALL\\_IND\\_PARTITIONS"](#)

## 7.519 USER\_IND\_PENDING\_STATS

USER\_IND\_PENDING\_STATS describes pending statistics for all tables, partitions, and subpartitions owned by the current user and collected using the DBMS\_STATS package. Its columns (except for OWNER) are the same as those in ALL\_IND\_PENDING\_STATS.

### ① See Also

["ALL\\_IND\\_PENDING\\_STATS"](#)

## 7.520 USER\_IND\_STATISTICS

USER\_IND\_STATISTICS displays optimizer statistics for the indexes on the tables owned by the current user and collected using the DBMS\_STATS package. Its columns (except for OWNER) are the same as those in ALL\_IND\_STATISTICS.

### ① See Also

["ALL\\_IND\\_STATISTICS"](#)

## 7.521 USER\_IND\_SUBPARTITIONS

USER\_IND\_SUBPARTITIONS displays, for each index subpartition owned by the current user, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the DBMS\_STATS package.

Its columns are the same as those in ["ALL\\_IND\\_SUBPARTITIONS"](#).

## 7.522 USER\_INDEXES

USER\_INDEXES describes indexes owned by the current user. To gather statistics for this view, use the DBMS\_STATS package. This view supports parallel partitioned index scans. Its columns (except for OWNER and TABLE\_TYPE) are the same as those in ALL\_INDEXES.

### ① See Also

["ALL\\_INDEXES"](#)

## 7.523 USER\_INDEXTYPE\_ARRAYTYPES

USER\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by the indextypes owned by the current user. Its columns are the same as those in ALL\_INDEXTYPE\_ARRAYTYPES.

### ① See Also

["ALL\\_INDEXTYPE\\_ARRAYTYPES"](#)

## 7.524 USER\_INDEXTYPE\_COMMENTS

USER\_INDEXTYPE\_COMMENTS displays comments for the user-defined indextypes owned by the current user. Its columns are the same as those in ALL\_INDEXTYPE\_COMMENTS.

 **See Also**

["ALL\\_INDEXTYPE\\_COMMENTS"](#)

## 7.525 USER\_INDEXTYPE\_OPERATORS

USER\_INDEXTYPE\_OPERATORS lists all the operators supported by indextypes owned by the current user. Its columns are the same as those in ALL\_INDEXTYPE\_OPERATORS.

 **See Also**

["ALL\\_INDEXTYPE\\_OPERATORS"](#)

## 7.526 USER\_INDEXTYPES

USER\_INDEXTYPES describes the indextypes owned by the current user. Its columns are the same as those in ALL\_INDEXTYPES.

 **See Also**

["ALL\\_INDEXTYPES"](#)

## 7.527 USER\_INTERNAL\_TRIGGERS

USER\_INTERNAL\_TRIGGERS describes the internal triggers on all tables owned by the current user. Its columns are the same as those in ALL\_INTERNAL\_TRIGGERS.

 **See Also**

["ALL\\_INTERNAL\\_TRIGGERS"](#).

## 7.528 USER\_JAVA\_ARGUMENTS

USER\_JAVA\_ARGUMENTS displays argument information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_ARGUMENTS.

### ① See Also

["ALL\\_JAVA\\_ARGUMENTS"](#)

## 7.529 USER\_JAVA\_CLASSES

USER\_JAVA\_CLASSES displays class level information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_CLASSES.

### ① See Also

["ALL\\_JAVA\\_CLASSES"](#)

## 7.530 USER\_JAVA\_COMPILER\_OPTIONS

USER\_JAVA\_COMPILER\_OPTIONS displays information about the native compiler options owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_COMPILER\_OPTIONS.

### ① See Also

["ALL\\_JAVA\\_COMPILER\\_OPTIONS"](#)

## 7.531 USER\_JAVA\_DERIVATIONS

USER\_JAVA\_DERIVATIONS displays mapping information about Java source objects and their derived Java class objects and Java resource objects for the Java classes owned by the current user.

Its columns (except for OWNER) are the same as those in ALL\_JAVA\_DERIVATIONS.

### ① See Also

["ALL\\_JAVA\\_DERIVATIONS"](#)

## 7.532 USER\_JAVA\_FIELDS

USER\_JAVA\_FIELDS displays field information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_FIELDS.

### ① See Also

["ALL\\_JAVA\\_FIELDS"](#)

## 7.533 USER\_JAVA\_IMPLEMENTES

USER\_JAVA\_IMPLEMENTES describes interfaces implemented by the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_IMPLEMENTES.

### ① See Also

["ALL\\_JAVA\\_IMPLEMENTES"](#)

## 7.534 USER\_JAVA\_INNERS

USER\_JAVA\_INNERS displays information about inner classes referred to by the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_INNERS.

### ① See Also

["ALL\\_JAVA\\_INNERS"](#)

## 7.535 USER\_JAVA\_LAYOUTS

USER\_JAVA\_LAYOUTS displays class layout information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_LAYOUTS.

### ① See Also

["ALL\\_JAVA\\_LAYOUTS"](#)

## 7.536 USER\_JAVA\_METHODS

USER\_JAVA\_METHODS displays method information about the stored Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_METHODS.

### ① See Also

["ALL\\_JAVA\\_METHODS"](#)

## 7.537 USER\_JAVA\_NCOMPS

USER\_JAVA\_NCOMPS displays ncomp-related information about the Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_NCOMPS.

### ① See Also

["ALL\\_JAVA\\_NCOMPS"](#)

## 7.538 USER\_JAVA\_POLICY

USER\_JAVA\_POLICY describes Java security permissions for the current user. Its columns are the same as those in DBA\_JAVA\_POLICY.

### ① See Also

["DBA\\_JAVA\\_POLICY"](#)

## 7.539 USER\_JAVA\_RESOLVERS

USER\_JAVA\_RESOLVERS displays information about resolvers of the Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_RESOLVERS.

### ① See Also

["ALL\\_JAVA\\_RESOLVERS"](#)

## 7.540 USER\_JAVA\_THROWS

USER\_JAVA\_THROWS displays information about exceptions thrown from methods of the Java classes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_JAVA\_THROWS.

### ① See Also

["ALL\\_JAVA\\_THROWS"](#)

## 7.541 USER\_JOBS

USER\_JOBS describes the jobs owned by the current user. Its columns are the same as those in DBA\_JOBS.

### ① See Also

["DBA\\_JOBS"](#)

## 7.542 USER\_JOIN\_IND\_COLUMNS

USER\_JOIN\_IND\_COLUMNS describes all join conditions owned by the current user. Its columns are the same as those in ALL\_JOIN\_IND\_COLUMNS.

### ① See Also

["ALL\\_JOIN\\_IND\\_COLUMNS"](#)

## 7.543 USER\_JOININGROUPS

USER\_JOININGROUPS describes join groups belonging to the user. A join group is a user-created object that consists of two or more columns that can be meaningfully joined. The maximum number of columns that can be included in a join group is 255. The USER\_JOININGROUPS columns (except for JOINGROUP\_OWNER) are the same as those in DBA\_JOININGROUPS.

In certain queries, join groups enable the database to eliminate the performance overhead of decompressing and hashing column values. Join groups require an In-Memory column store (IM column store).

**① See Also**

- ["DBA\\_JOINGROUPS"](#)
- *Oracle Database In-Memory Guide* for an introduction to join groups
- *Oracle Database SQL Language Reference* for information about creating a join group using the `CREATE INMEMORY JOIN GROUP` statement

## 7.544 USER\_JSON\_COLUMNS

USER\_JSON\_COLUMNS provides information on the JavaScript Object Notation (JSON) columns for which the user is the owner. Its columns (except for OWNER) are the same as those in ALL\_JSON\_COLUMNS.

**① See Also**

- ["ALL\\_JSON\\_COLUMNS"](#)
- *Oracle Database JSON Developer's Guide* for more information about using JSON with Oracle Database

## 7.545 USER\_JSON\_DATAGUIDE\_FIELDS

USER\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from all the data guides in the current user's schema, which are the data guides returned to the user by the USER\_JSON\_DATAGUIDE view. Its columns (except for OWNER) are the same as those in ALL\_JSON\_DATAGUIDE\_FIELDS.

**① See Also**

["ALL\\_JSON\\_DATAGUIDE\\_FIELDS"](#)

## 7.546 USER\_JSON\_DATAGUIDES

USER\_JSON\_DATAGUIDES provides information on the JavaScript Object Notation (JSON) columns owned by the current user that have data guide enabled. Its columns (except for OWNER) are the same as those in ALL\_JSON\_DATAGUIDES.

**① See Also**

["ALL\\_JSON\\_DATAGUIDES"](#)

## 7.547 USER\_LIBRARIES

USER\_LIBRARIES describes the libraries owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_LIBRARIES.

### ① See Also

["ALL\\_LIBRARIES"](#)

## 7.548 USER\_LOB\_PARTITIONS

USER\_LOB\_PARTITIONS displays the LOB partitions contained in the tables owned by the current user. Its columns are the same as those in ALL\_LOB\_PARTITIONS.

### ① See Also

["ALL\\_LOB\\_PARTITIONS"](#)

## 7.549 USER\_LOB\_SUBPARTITIONS

USER\_LOB\_SUBPARTITIONS displays partition-level attributes of the LOB data subpartitions owned by the current user. Its columns are the same as those in ALL\_LOB\_SUBPARTITIONS.

DBA\_LOB\_TEMPLATES describes all LOB subpartition templates in the database.

### ① See Also

["ALL\\_LOB\\_SUBPARTITIONS"](#)

## 7.550 USER\_LOB\_TEMPLATES

USER\_LOB\_TEMPLATES describes the LOB subpartition templates owned by the current user. Its columns (except for USER\_NAME) are the same as those in ALL\_LOB\_TEMPLATES.

### ① See Also

["ALL\\_LOB\\_TEMPLATES"](#)

## 7.551 USER\_LOBS

USER\_LOBS displays the user's CLOBs and BLOBs contained in the user's tables. BFILEs are stored outside the database, so they are not described by this view. This view's columns are the same as those in ALL\_LOBS.

### ① See Also

["ALL\\_LOBS"](#)

## 7.552 USER\_LOG\_GROUP\_COLUMNS

USER\_LOG\_GROUP\_COLUMNS describes columns that are owned by the current user and that are specified in log groups. Its columns are the same as those in ALL\_LOG\_GROUP\_COLUMNS.

### ① See Also

["ALL\\_LOG\\_GROUP\\_COLUMNS"](#)

## 7.553 USER\_LOG\_GROUPS

USER\_LOG\_GROUPS describes log group definitions on tables owned by the current user. Its columns are the same as those in ALL\_LOG\_GROUPS.

### ① See Also

["ALL\\_LOG\\_GROUPS"](#)

## 7.554 USER\_MEASURE\_FOLDER\_CONTENTS

USER\_MEASURE\_FOLDER\_CONTENTS describes the contents of the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MEASURE\_FOLDER\_CONTENTS.

### ① See Also

["ALL\\_MEASURE\\_FOLDER\\_CONTENTS"](#)

## 7.555 USER\_MEASURE\_FOLDER\_SUBFOLDERS

USER\_MEASURE\_FOLDER\_SUBFOLDERS describes the OLAP measure folders contained within the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MEASURE\_FOLDER\_SUBFOLDERS.

### ① See Also

["ALL\\_MEASURE\\_FOLDER\\_SUBFOLDERS"](#)

## 7.556 USER\_MEASURE\_FOLDERS

USER\_MEASURE\_FOLDERS describes the OLAP measure folders owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MEASURE\_FOLDERS.

### ① See Also

["ALL\\_MEASURE\\_FOLDERS"](#)

## 7.557 USER\_METADATA\_PROPERTIES

USER\_METADATA\_PROPERTIES describes OLAP metadata properties in the current user's schema. Its columns (except for OWNER) are the same as those in ALL\_METADATA\_PROPERTIES.

### ① See Also

["ALL\\_METADATA\\_PROPERTIES"](#)

## 7.558 USER\_METHOD\_PARAMS

USER\_METHOD\_PARAMS describes the method parameters of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_METHOD\_PARAMS.

### ① See Also

["ALL\\_METHOD\\_PARAMS"](#)

## 7.559 USER\_METHOD\_RESULTS

USER\_METHOD\_RESULTS describes the method results of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_METHOD\_RESULTS.

### 📘 See Also

["ALL\\_METHOD\\_RESULTS"](#)

## 7.560 USER\_MINING\_MODEL\_ATTRIBUTES

USER\_MINING\_MODEL\_ATTRIBUTES describes the machine learning model attributes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MINING\_MODEL\_ATTRIBUTES.

### 📘 See Also

["ALL\\_MINING\\_MODEL\\_ATTRIBUTES"](#)

## 7.561 USER\_MINING\_MODEL\_PARTITIONS

USER\_MINING\_MODEL\_PARTITIONS describes the user's own model partitions. Its columns (except OWNER) are the same as those in ALL\_MINING\_MODEL\_PARTITIONS.

### 📘 Note

The USER\_MINING\_MODEL\_PARTITIONS view is available in Oracle Database 12c Release 2 and later.

### 📘 See Also

["ALL\\_MINING\\_MODEL\\_PARTITIONS"](#)

## 7.562 USER\_MINING\_MODEL\_SETTINGS

USER\_MINING\_MODEL\_SETTINGS describes the machine learning model settings owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MINING\_MODEL\_SETTINGS.

### ① See Also

["ALL\\_MINING\\_MODEL\\_SETTINGS"](#)

## 7.563 USER\_MINING\_MODEL\_VIEWS

USER\_MINING\_MODEL\_VIEWS describes the user's own model views. Its columns (except OWNER) are the same as those in ALL\_MINING\_MODEL\_VIEWS.

### ① See Also

["ALL\\_MINING\\_MODEL\\_VIEWS"](#)

## 7.564 USER\_MINING\_MODEL\_XFORMS

USER\_MINING\_MODEL\_XFORMS describes the user-specified transformations embedded with the user's own models. Its columns (except OWNER) are the same as those in ALL\_MINING\_MODEL\_XFORMS.

### ① See Also

["ALL\\_MINING\\_MODEL\\_XFORMS"](#)

## 7.565 USER\_MINING\_MODELS

USER\_MINING\_MODELS describes the machine learning models owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MINING\_MODELS.

### ① See Also

["ALL\\_MINING\\_MODELS"](#)

## 7.566 USER\_MVIEW\_AGGREGATES

USER\_MVIEW\_AGGREGATES describes the grouping functions (aggregated measures) that appear in the SELECT list of aggregated materialized views owned by the current user. Its columns are the same as those in ALL\_MVIEW\_AGGREGATES.

### ① See Also

["ALL\\_MVIEW\\_AGGREGATES"](#)

## 7.567 USER\_MVIEW\_ANALYSIS

USER\_MVIEW\_ANALYSIS describes all materialized views owned by the current user that potentially support query rewrite and that provide additional information for analysis by applications. Its columns are the same as those in ALL\_MVIEW\_ANALYSIS.

### ① Note

This view excludes materialized views that reference remote tables or that include references to non-static values such as SYSDATE or USER. This view also excludes materialized views that were created as snapshots before Oracle8i and that were never altered to enable query rewrite.

### ① See Also

["ALL\\_MVIEW\\_ANALYSIS"](#)

## 7.568 USER\_MVIEW\_COMMENTS

USER\_MVIEW\_COMMENTS displays comments on the materialized views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_MVIEW\_COMMENTS.

### ① See Also

["ALL\\_MVIEW\\_COMMENTS"](#)

## 7.569 USER\_MVIEW\_DETAIL\_PARTITION

USER\_MVIEW\_DETAIL\_PARTITION displays freshness information, with respect to partition change tracking (PCT) detail partitions, for the materialized views owned by the current user. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_PARTITION.

### ① See Also

["ALL\\_MVIEW\\_DETAIL\\_PARTITION"](#)

## 7.570 USER\_MVIEW\_DETAIL\_RELATIONS

USER\_MVIEW\_DETAIL\_RELATIONS represents the named detail relations that are either in the FROM list of a materialized view, or that are indirectly referenced through views in the FROM list. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_RELATIONS.

### ① See Also

["ALL\\_MVIEW\\_DETAIL\\_RELATIONS"](#)

## 7.571 USER\_MVIEW\_DETAIL\_SUBPARTITION

USER\_MVIEW\_DETAIL\_SUBPARTITION displays freshness information, with respect to partition change tracking (PCT) detail subpartitions, for the materialized views owned by the current user. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_SUBPARTITION.

### ① See Also

["ALL\\_MVIEW\\_DETAIL\\_SUBPARTITION"](#)

## 7.572 USER\_MVIEW\_JOINS

USER\_MVIEW\_JOINS describes a join between two columns in the WHERE clause of a subquery that defines a materialized view. Its columns are the same as those in ALL\_MVIEW\_JOINS.

### ① See Also

["ALL\\_MVIEW\\_JOINS"](#)

## 7.573 USER\_MVIEW\_KEYS

USER\_MVIEW\_KEYS describes the columns or expressions in the SELECT list upon which materialized views in the current user's schema are based. Its columns are the same as those in ALL\_MVIEW\_KEYS.

### ① See Also

["ALL\\_MVIEW\\_KEYS"](#)

## 7.574 USER\_MVIEW\_LOGS

USER\_MVIEW\_LOGS describes all materialized view logs owned by the current user. Its columns are the same as those in ALL\_MVIEW\_LOGS.

### ① See Also

["ALL\\_MVIEW\\_LOGS"](#)

## 7.575 USER\_MVIEW\_REFRESH\_TIMES

USER\_MVIEW\_REFRESH\_TIMES describes refresh times of the materialized views owned by the current user. Its columns are the same as those in ALL\_MVIEW\_REFRESH\_TIMES.

### ① See Also

["ALL\\_MVIEW\\_REFRESH\\_TIMES"](#)

## 7.576 USER\_MVIEWS

USER\_MVIEWS describes all materialized views owned by the current user. Its columns are the same as those in ALL\_MVIEWS.

### ① See Also

["ALL\\_MVIEWS"](#)

## 7.577 USER\_MVREF\_CHANGE\_STATS

USER\_MVREF\_CHANGE\_STATS displays the change data load information on the master tables associated with a refresh run for all the materialized views in the database that are accessible to the current user. Its columns are the same as those in DBA\_MVREF\_CHANGE\_STATS.

### ① See Also

["DBA\\_MVREF\\_CHANGE\\_STATS"](#)

## 7.578 USER\_MVREF\_RUN\_STATS

USER\_MVREF\_RUN\_STATS has information about each refresh run for the materialized views accessible for the current database user, with each run being identified by the REFRESH\_ID. The information includes timing statistics related to the run and the parameters specified in that run.

Its columns (except for RUN\_OWNER) are the same as those in DBA\_MVREF\_RUN\_STATS.

### ① See Also

["DBA\\_MVREF\\_RUN\\_STATS"](#)

## 7.579 USER\_MVREF\_STATS

USER\_MVREF\_STATS shows the REFRESH\_ID associated with each refresh run of each materialized view for the database that is accessible to the current user. It also provides some basic timing statistics related to that materialized view's refresh in that run.

Its columns (except for MV\_OWNER) are the same as those in DBA\_MVREF\_STATS.

### ① See Also

["DBA\\_MVREF\\_STATS"](#)

## 7.580 USER\_MVREF\_STATS\_PARAMS

USER\_MVREF\_STATS\_PARAMS displays the refresh statistics properties associated with each materialized view accessible to the current user. These properties can be modified with the DBMS\_MVIEW\_STATS.SET\_MVREF\_STATS\_PARAMS procedure.

Its columns are the same as those in DBA\_MVREF\_STATS\_PARAMS.

**① See Also**

["DBA\\_MVREF\\_STATS\\_PARAMS"](#)

## 7.581 USER\_MVREF\_STATS\_SYS\_DEFAULTS

USER\_MVREF\_STATS\_SYS\_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views accessible to the current user. These values can be altered with the SET\_SYSTEM\_DEFAULTS procedure by a database administrator.

Its columns are the same as those in DBA\_MVREF\_STATS\_SYS\_DEFAULTS.

This view contains exactly two rows corresponding to the collection-level and retention-period properties; their initial values are TYPICAL and 31 respectively.

**① See Also**

["DBA\\_MVREF\\_STATS\\_SYS\\_DEFAULTS"](#)

## 7.582 USER\_MVREF\_STMT\_STATS

USER\_MVREF\_STMT\_STATS shows information associated with each refresh statement of a materialized view accessible to the current user in a refresh run.

Its columns are the same as those in DBA\_MVREF\_STMT\_STATS.

**① See Also**

["DBA\\_MVREF\\_STMT\\_STATS"](#)

## 7.583 USER\_NESTED\_TABLE\_COLS

USER\_NESTED\_TABLE\_COLS describes the columns of the nested tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_NESTED\_TABLE\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

**① See Also**

["ALL\\_NESTED\\_TABLE\\_COLS"](#)

# 7.584 USER\_NESTED\_TABLES

USER\_NESTED\_TABLES describes the nested tables in tables owned by the current user. Its columns are the same as those in ALL\_NESTED\_TABLES.

**See Also**  
["ALL\\_NESTED\\_TABLES"](#)

# 7.585 USER\_NETWORK\_ACL\_PRIVILEGES

USER\_NETWORK\_ACL\_PRIVILEGES describes the status of the network privileges for the current user to access network hosts.

**Note**  
This USER\_NETWORK\_ACL\_PRIVILEGES view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the USER\_HOST\_ACES view, instead.

| Column     | Datatype       | NULL     | Description                                                                              |
|------------|----------------|----------|------------------------------------------------------------------------------------------|
| HOST       | VARCHAR2(1000) | NOT NULL | Network host                                                                             |
| LOWER_PORT | NUMBER(5)      |          | Lower bound of the port range                                                            |
| UPPER_PORT | NUMBER(5)      |          | Upper bound of the port range                                                            |
| PRIVILEGE  | CHAR(128)      |          | Network privilege                                                                        |
| STATUS     | VARCHAR2(7)    |          | Privilege status: <ul style="list-style-type: none"><li>DENIED</li><li>GRANTED</li></ul> |

**See Also**  
["USER\\_HOST\\_ACES"](#)

## 7.586 USER\_OBJ\_AUDIT\_OPTS

USER\_OBJ\_AUDIT\_OPTS describes auditing options on all objects owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_OBJ\_AUDIT\_OPTS.

### Note

This view is relevant when using traditional auditing. Traditional auditing is deprecated in Oracle Database 21c. Oracle recommends that you instead use unified auditing, which enables selective and more effective auditing inside Oracle Database.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

### See Also

["DBA\\_OBJ\\_AUDIT\\_OPTS"](#)

## 7.587 USER\_OBJ\_COLATTRS

USER\_OBJ\_COLATTRS describes object columns and attributes contained in the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_OBJ\_COLATTRS.

### See Also

["ALL\\_OBJ\\_COLATTRS"](#)

## 7.588 USER\_OBJECT\_SIZE

USER\_OBJECT\_SIZE lists the sizes, in bytes, of various PL/SQL objects. Its columns are the same as those in DBA\_OBJECT\_SIZE.

### See Also

["DBA\\_OBJECT\\_SIZE"](#)

## 7.589 USER\_OBJECT\_TABLES

USER\_OBJECT\_TABLES describes the object tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_OBJECT\_TABLES.

### ① See Also

["ALL\\_OBJECT\\_TABLES"](#)

## 7.590 USER\_OBJECT\_USAGE

USER\_OBJECT\_USAGE displays statistics about index usage gathered from the database for the indexes owned by the current user.

You can use this view to monitor index usage. All indexes owned by the current user that have been used at least once can be monitored and displayed in this view. Its columns (except for OWNER) are the same as those in DBA\_OBJECT\_USAGE.

### ① See Also

["DBA\\_OBJECT\\_USAGE"](#)

## 7.591 USER\_OBJECTS

USER\_OBJECTS describes all objects owned by the current user. Its columns (except for OWNER), are the same as those in ALL\_OBJECTS.

### ① See Also

["ALL\\_OBJECTS"](#)

## 7.592 USER\_OBJECTS\_AE

USER\_OBJECTS\_AE describes the objects (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_OBJECTS\_AE.

### ① See Also

["ALL\\_OBJECTS\\_AE"](#)

## 7.593 USER\_OGG\_AUTO\_CAPTURED\_TABLES

USER\_OGG\_AUTO\_CAPTURED\_TABLES describes the tables owned by the current user that are enabled for Oracle GoldenGate automatic capture. Its columns (except for OWNER) are the same as those in DBA\_OGG\_AUTO\_CAPTURED\_TABLES.

### ① Note

This view is available starting with Oracle Database 21c.

### ① See Also

"[DBA\\_OGG\\_AUTO\\_CAPTURED\\_TABLES](#)"

## 7.594 USER\_OPANCILLARY

USER\_OPANCILLARY provides ancillary information for operators owned by the current user. Its columns are the same as those in ALL\_OPANCILLARY.

### ① See Also

"[ALL\\_OPANCILLARY](#)"

## 7.595 USER\_OPARGUMENTS

USER\_OPARGUMENTS provides argument information for operator bindings owned by the current user. Its columns are the same as those in ALL\_OPARGUMENTS.

### ① See Also

"[ALL\\_OPARGUMENTS](#)"

## 7.596 USER\_OPBINDINGS

USER\_OPBINDINGS describes the binding functions and methods on the operators owned by the current user. Its columns are the same as those in ALL\_OPBINDINGS.

### ① See Also

"[ALL\\_OPBINDINGS](#)"

## 7.597 USER\_OPERATOR\_COMMENTS

USER\_OPERATOR\_COMMENTS displays comments for the user-defined operators owned by the current user. Its columns are the same as those in ALL\_OPERATOR\_COMMENTS.

 **See Also**

["ALL\\_OPERATOR\\_COMMENTS"](#)

## 7.598 USER\_OPERATORS

USER\_OPERATORS describes all operators owned by the current user. Its columns are the same as those in ALL\_OPERATORS.

 **See Also**

["ALL\\_OPERATORS"](#)

## 7.599 USER\_OUTLINE\_HINTS

USER\_OUTLINE\_HINTS describes the set of hints stored in the outlines owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_OUTLINE\_HINTS.

 **See Also**

["DBA\\_OUTLINE\\_HINTS"](#)

## 7.600 USER\_OUTLINES

USER\_OUTLINES describes the stored outlines owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_OUTLINES.

 **See Also**

["DBA\\_OUTLINES"](#)

## 7.601 USER\_PARALLEL\_EXECUTE\_CHUNKS

USER\_PARALLEL\_EXECUTE\_CHUNKS displays the chunks for tasks created by the current user. Its columns (except for TASK\_OWNER) are the same as those in DBA\_PARALLEL\_EXECUTE\_CHUNKS.

### ① See Also

["DBA\\_PARALLEL\\_EXECUTE\\_CHUNKS"](#)

## 7.602 USER\_PARALLEL\_EXECUTE\_TASKS

USER\_PARALLEL\_EXECUTE\_TASKS displays the tasks created by the current user. Its columns (except for TASK\_OWNER) are the same as those in DBA\_PARALLEL\_EXECUTE\_TASKS.

### ① See Also

["DBA\\_PARALLEL\\_EXECUTE\\_TASKS"](#)

## 7.603 USER\_PART\_COL\_STATISTICS

USER\_PART\_COL\_STATISTICS displays column statistics and histogram information for the table partitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PART\_COL\_STATISTICS.

### ① See Also

["ALL\\_PART\\_COL\\_STATISTICS"](#)

## 7.604 USER\_PART\_HISTOGRAMS

USER\_PART\_HISTOGRAMS displays the histogram data (endpoints per histogram) for the histograms on the table partitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PART\_HISTOGRAMS.

### ① See Also

["ALL\\_PART\\_HISTOGRAMS"](#)

## 7.605 USER\_PART\_INDEXES

USER\_PART\_INDEXES displays the object-level partitioning information for the partitioned indexes owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PART\_INDEXES.

### ① See Also

["ALL\\_PART\\_INDEXES"](#)

## 7.606 USER\_PART\_KEY\_COLUMNS

USER\_PART\_KEY\_COLUMNS describes the partitioning key columns for the partitioned objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PART\_KEY\_COLUMNS.

### ① See Also

["ALL\\_PART\\_KEY\\_COLUMNS"](#)

## 7.607 USER\_PART\_LOBS

USER\_PART\_LOBS displays table-level information about the partitioned LOBs owned by the current user, including default attributes for LOB data partitions. Its columns (except for TABLE\_OWNER) are the same as those in ALL\_PART\_LOBS.

### ① See Also

["ALL\\_PART\\_LOBS"](#)

## 7.608 USER\_PART\_TABLES

USER\_PART\_TABLES displays the object-level partitioning information for the partitioned tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PART\_TABLES.

### ① See Also

["ALL\\_PART\\_TABLES"](#)

## 7.609 USER\_PARTIAL\_DROP\_TABS

USER\_PARTIAL\_DROP\_TABS describes all tables in the schema of the current user that have partially completed DROP COLUMN operations. Its columns are the same as those in ALL\_PARTIAL\_DROP\_TABS.

### ① See Also

["ALL\\_PARTIAL\\_DROP\\_TABS"](#)

## 7.610 USER\_PASSWORD\_LIMITS

USER\_PASSWORD\_LIMITS describes the password profile parameters that are assigned to the user.

| Column        | Datatype     | NULL     | Description                   |
|---------------|--------------|----------|-------------------------------|
| RESOURCE_NAME | VARCHAR2(32) | NOT NULL | Name of the password resource |
| LIMIT         | VARCHAR2(40) |          | Value of the resource limit   |

## 7.611 USER\_PENDING\_CONV\_TABLES

USER\_PENDING\_CONV\_TABLES describes the pending conversion tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PENDING\_CONV\_TABLES.

### ① See Also

["ALL\\_PENDING\\_CONV\\_TABLES"](#)

## 7.612 USER\_PLSQL\_COLL\_TYPES

USER\_PLSQL\_COLL\_TYPES describes the user's own named PL/SQL collection types. Its columns (except for OWNER and CHAR\_USED) are the same as those in ALL\_PLSQL\_COLL\_TYPES.

### ① See Also

["ALL\\_PLSQL\\_COLL\\_TYPES"](#)

## 7.613 USER\_PLSQL\_OBJECT\_SETTINGS

USER\_PLSQL\_OBJECT\_SETTINGS displays information about the compiler settings for the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_PLSQL\_OBJECT\_SETTINGS.

### ① See Also

["ALL\\_PLSQL\\_OBJECT\\_SETTINGS"](#)

## 7.614 USER\_PLSQL\_TYPE\_ATTRS

USER\_PLSQL\_TYPE\_ATTRS describes the attributes of the user's own PL/SQL types. Its columns (except for OWNER and CHAR\_USED) are the same as those in ALL\_PLSQL\_TYPE\_ATTRS.

### ① See Also

["ALL\\_PLSQL\\_TYPE\\_ATTRS"](#)

## 7.615 USER\_PLSQL\_TYPES

USER\_PLSQL\_TYPES describes the user's own PL/SQL types. Its columns (except for OWNER) are the same as those in ALL\_PLSQL\_TYPES.

### ① See Also

["ALL\\_PLSQL\\_TYPES"](#)

## 7.616 USER\_POLICIES

USER\_POLICIES describes all Oracle Virtual Private Database (VPD) security policies associated with objects owned by the current user. Its columns (except for OBJECT\_OWNER) are the same as those in ALL\_POLICIES.

### ① See Also

["ALL\\_POLICIES"](#)

## 7.617 USER\_POLICY\_ATTRIBUTES

USER\_POLICY\_ATTRIBUTES lists the attribute associations {Namespaces, Attributes} of all context-sensitive and shared-context sensitive Oracle Virtual Private Database (VPD) policies for synonyms, tables, or views owned by the user.

Its columns are the same as those in ALL\_POLICY\_ATTRIBUTES.

### ① See Also

["ALL\\_POLICY\\_ATTRIBUTES"](#)

## 7.618 USER\_POLICY\_CONTEXTS

USER\_POLICY\_CONTEXTS describes the driving contexts defined for the synonyms, tables, and views owned by the current user. Its columns (except for OBJECT\_OWNER) are the same as those in ALL\_POLICY\_CONTEXTS.

### ① See Also

["ALL\\_POLICY\\_CONTEXTS"](#)

## 7.619 USER\_POLICY\_GROUPS

USER\_POLICY\_GROUPS describes the policy groups defined for the synonyms, tables, and views owned by the current user. Its columns (except for OBJECT\_OWNER) are the same as those in ALL\_POLICY\_GROUPS.

### ① See Also

["ALL\\_POLICY\\_GROUPS"](#)

## 7.620 USER\_PRIVATE\_TEMP\_TABLES

USER\_PRIVATE\_TEMP\_TABLES describes the private temporary tables in the current session. Its columns (except for INST\_ID) are the same as those in DBA\_PRIVATE\_TEMP\_TABLES.

### ① See Also

["DBA\\_PRIVATE\\_TEMP\\_TABLES"](#)

## 7.621 USER\_PRIVILEGE\_MAP

USER\_PRIVILEGE\_MAP shows privilege (auditing option) type codes for object privileges that can be granted on a user.

This table can be used to map privilege type numbers to type names.

| Column    | Datatype     | NULL     | Description                                     |
|-----------|--------------|----------|-------------------------------------------------|
| PRIVILEGE | NUMBER       | NOT NULL | A numeric privilege (auditing option) type code |
| NAME      | VARCHAR2(40) | NOT NULL | Name of the type of privilege (auditing option) |

## 7.622 USER\_PROCEDURES

USER\_PROCEDURES lists all functions and procedures that are owned by the current user, along with their associated properties. Its columns (except OWNER) are the same as those in ALL\_PROCEDURES.

### ① See Also

- "[ALL\\_PROCEDURES](#)"
- "[USER\\_ARGUMENTS](#)" for information about the arguments of the functions and procedures owned by the current user

## 7.623 USER\_PROXIES

USER\_PROXIES displays information about connections the current user is allowed to proxy. Its columns (except for PROXY) are the same as those in DBA\_PROXIES.

### ① See Also

"[DBA\\_PROXIES](#)"

## 7.624 USER\_QUEUE\_EVENT\_STREAMS

USER\_QUEUE\_EVENT\_STREAMS describes the Transactional Event Queue (TEQ) event streams owned by the current user. Its columns are the same as those in ALL\_QUEUE\_EVENT\_STREAMS.

### ① Note

This view is available starting with Oracle Database 21c.

**① See Also**

["ALL\\_QUEUE\\_EVENT\\_STREAMS"](#)

## 7.625 USER\_QUEUE\_SCHEDULES

USER\_QUEUE\_SCHEDULES describes the propagation schedules whose source queues are owned by the current user. Its columns (except for SCHEMA) are the same as those in ALL\_QUEUE\_SCHEDULES.

**① See Also**

["ALL\\_QUEUE\\_SCHEDULES"](#)

## 7.626 USER\_QUEUE\_SUBSCRIBERS

USER\_QUEUE\_SUBSCRIBERS displays the list of subscribers on queues that are under the current user's schema. Its columns (except for OWNER) are the same as those in ALL\_QUEUE\_SUBSCRIBERS.

**① See Also**

["ALL\\_QUEUE\\_SUBSCRIBERS"](#)

## 7.627 USER\_QUEUE\_TABLES

USER\_QUEUE\_TABLES describes the queues in the queue tables created in the current user's schema. Its columns (except for OWNER) are the same as those in ALL\_QUEUE\_TABLES.

**① See Also**

["ALL\\_QUEUE\\_TABLES"](#)

## 7.628 USER\_QUEUES

USER\_QUEUES describes the operational characteristics of every queue in the user's schema. Its columns (except for OWNER) are the same as those in ALL\_QUEUES.

### ① See Also

- ["ALL\\_QUEUES"](#)
- *Oracle Database Advanced Queuing User's Guide* for more information about these views and Advanced Queuing

## 7.629 USER\_RECYCLEBIN

USER\_RECYCLEBIN displays information about the recycle bin owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_RECYCLEBIN.

### ① See Also

["DBA\\_RECYCLEBIN"](#)

## 7.630 USER\_REFRESH

USER\_REFRESH describes all refresh groups owned by the current user. Its columns are the same as those in ALL\_REFRESH.

### ① See Also

["ALL\\_REFRESH"](#)

## 7.631 USER\_REFRESH\_CHILDREN

USER\_REFRESH\_CHILDREN lists all the objects in refresh groups owned by the current user. Its columns are the same as those in ALL\_REFRESH\_CHILDREN.

### ① See Also

["ALL\\_REFRESH\\_CHILDREN"](#)

## 7.632 USER\_REFS

USER\_REFS describes the REF columns and REF attributes in the object type columns of tables owned by the current user. Its columns are the same as those in ALL\_REFS.

### ① See Also

["ALL\\_REFS"](#)

## 7.633 USER\_REGISTERED\_MVIEWS

USER\_REGISTERED\_MVIEWS describes all registered materialized views (registered at a master site or a master materialized view site) owned by the current user. Its columns are the same as those in ALL\_REGISTERED\_MVIEWS.

### ① See Also

["ALL\\_REGISTERED\\_MVIEWS"](#)

## 7.634 USER\_REGISTRY

USER\_REGISTRY displays information about the components owned by the current user that are loaded into the component registry. Its columns are the same as those in DBA\_REGISTRY.

### ① See Also

["DBA\\_REGISTRY"](#)

## 7.635 USER\_RESOURCE\_LIMITS

USER\_RESOURCE\_LIMITS displays the resource limits for the current user.

| Column        | Datatype     | NULL     | Description                   |
|---------------|--------------|----------|-------------------------------|
| RESOURCE_NAME | VARCHAR2(32) | NOT NULL | Name of the resource          |
| LIMIT         | VARCHAR2(40) |          | Limit placed on this resource |

## 7.636 USER\_RESUMABLE

USER\_RESUMABLE displays the resumable statements executed by the current user. Its columns (except for USER\_ID) are the same as those in DBA\_RESUMABLE.

### ① See Also

["DBA\\_RESUMABLE"](#)

## 7.637 USER\_REWRITE\_EQUIVALENCES

USER\_REWRITE\_EQUIVALENCES describes the rewrite equivalences owned by the current user. Its columns are the same as those in ALL\_REWRITE\_EQUIVALENCES.

### ① See Also

["ALL\\_REWRITE\\_EQUIVALENCES"](#)

## 7.638 USER\_ROLE\_PRIVS

USER\_ROLE\_PRIVS describes the roles granted to the current user.

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                     |
|-----------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME        | VARCHAR2(128) |      | Name of the user, or PUBLIC                                                                                                                                                                                                                     |
| GRANTED_ROLE    | VARCHAR2(128) |      | Name of the role granted to the user                                                                                                                                                                                                            |
| ADMIN_OPTION    | VARCHAR2(3)   |      | Indicates whether the grant was with the ADMIN OPTION (YES) or not (NO)                                                                                                                                                                         |
| DELEGATE_OPTION | VARCHAR2(3)   |      | Indicates whether the grant was with the DELEGATE OPTION (YES) or not (NO)                                                                                                                                                                      |
| DEFAULT_ROLE    | VARCHAR2(3)   |      | Indicates whether the role is designated as a DEFAULT ROLE for the user (YES) or not (NO)                                                                                                                                                       |
| OS_GRANTED      | VARCHAR2(3)   |      | Indicates whether the role was granted by the operating system (YES) or not (NO); occurs if the OS_ROLES initialization parameter is true                                                                                                       |
| COMMON          | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the role was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the role was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED       | VARCHAR2(3)   |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                              |

**① See Also**

["DBA\\_ROLE\\_PRIVS"](#)

## 7.639 USER\_RSRC\_CONSUMER\_GROUP\_PRIVS

USER\_RSRC\_CONSUMER\_GROUP\_PRIVS displays information about the resource consumer groups to which the current user is assigned. Its columns (except for GRANTEE) are the same as those in DBA\_RSRC\_CONSUMER\_GROUP\_PRIVS.

**① See Also**

["DBA\\_RSRC\\_CONSUMER\\_GROUP\\_PRIVS"](#)

## 7.640 USER\_RSRC\_MANAGER\_SYSTEM\_PRIVS

USER\_RSRC\_MANAGER\_SYSTEM\_PRIVS displays information about the users who are granted system privileges for the DBMS\_RESOURCE\_MANAGER package. Its columns (except for GRANTEE) are the same as those in DBA\_RSRC\_MANAGER\_SYSTEM\_PRIVS.

**① See Also**

["DBA\\_RSRC\\_MANAGER\\_SYSTEM\\_PRIVS"](#)

## 7.641 USER\_RULE\_SET\_RULES

USER\_RULE\_SET\_RULES describes the rules in the rule sets owned by the current user. Its columns (except for RULE\_SET\_OWNER) are the same as those in ALL\_RULE\_SET\_RULES.

**① See Also**

["ALL\\_RULE\\_SET\\_RULES"](#)

## 7.642 USER\_RULE\_SETS

USER\_RULE\_SETS describes the rule sets owned by the current user. Its columns (except for RULE\_SET\_OWNER) are the same as those in ALL\_RULE\_SETS.

**① See Also**

["ALL\\_RULE\\_SETS"](#)

## 7.643 USER\_RULES

USER\_RULES describes the rules owned by the current user. Its columns (except for RULE\_OWNER) are the same as those in ALL\_RULES.

### ① See Also

["ALL\\_RULES"](#)

## 7.644 USER\_SCHEDULER\_CHAIN\_RULES

USER\_SCHEDULER\_CHAIN\_RULES displays information about the rules for the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_CHAIN\_RULES.

### ① See Also

["ALL\\_SCHEDULER\\_CHAIN\\_RULES"](#)

## 7.645 USER\_SCHEDULER\_CHAIN\_STEPS

USER\_SCHEDULER\_CHAIN\_STEPS displays information about the defined steps of the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_CHAIN\_STEPS.

### ① See Also

["ALL\\_SCHEDULER\\_CHAIN\\_STEPS"](#)

## 7.646 USER\_SCHEDULER\_CHAINS

USER\_SCHEDULER\_CHAINS displays information about the chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_CHAINS.

### ① See Also

["ALL\\_SCHEDULER\\_CHAINS"](#)

## 7.647 USER\_SCHEDULER\_CREDENTIALS

USER\_SCHEDULER\_CREDENTIALS displays information about the credentials owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_CREDENTIALS.

### 📘 Note

This view is deprecated in favor of the USER\_CREDENTIALS view. Oracle recommends that you use USER\_CREDENTIALS instead. USER\_SCHEDULER\_CREDENTIALS is retained for backward compatibility only.

### 📘 See Also

- ["USER\\_CREDENTIALS"](#)
- ["ALL\\_SCHEDULER\\_CREDENTIALS"](#)

## 7.648 USER\_SCHEDULER\_DB\_DESTS

USER\_SCHEDULER\_DB\_DESTS displays information about the destination objects owned by the current user pointing to remote databases. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_DB\_DESTS.

### 📘 See Also

["ALL\\_SCHEDULER\\_DB\\_DESTS"](#)

## 7.649 USER\_SCHEDULER\_DESTS

USER\_SCHEDULER\_DESTS displays information about the destination objects for jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_DESTS.

### 📘 See Also

["ALL\\_SCHEDULER\\_DESTS"](#)

## 7.650 USER\_SCHEDULER\_FILE\_WATCHERS

USER\_SCHEDULER\_FILE\_WATCHERS displays information about the Scheduler file watch requests owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_FILE\_WATCHERS.

### ① See Also

["ALL\\_SCHEDULER\\_FILE\\_WATCHERS"](#)

## 7.651 USER\_SCHEDULER\_GROUP\_MEMBERS

USER\_SCHEDULER\_GROUP\_MEMBERS displays information about the members of the Scheduler object groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_GROUP\_MEMBERS.

### ① See Also

["ALL\\_SCHEDULER\\_GROUP\\_MEMBERS"](#)

## 7.652 USER\_SCHEDULER\_GROUPS

USER\_SCHEDULER\_GROUPS displays information about the Scheduler object groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_GROUPS.

### ① See Also

["ALL\\_SCHEDULER\\_GROUPS"](#)

## 7.653 USER\_SCHEDULER\_INCOMPAT\_MEMBER

USER\_SCHEDULER\_INCOMPAT\_MEMBER displays all Scheduler incompatibility resource objects members owned by the current user. Its columns are the same as those in ALL\_SCHEDULER\_INCOMPAT\_MEMBER.

### ① See Also

["ALL\\_SCHEDULER\\_INCOMPAT\\_MEMBER"](#)

## 7.654 USER\_SCHEDULER\_INCOMPATS

USER\_SCHEDULER\_INCOMPATS displays all Scheduler incompatibility resource objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_INCOMPATS.

### ① See Also

["ALL\\_SCHEDULER\\_INCOMPATS"](#)

## 7.655 USER\_SCHEDULER\_JOB\_ARGS

USER\_SCHEDULER\_JOB\_ARGS displays information about the arguments of the Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_JOB\_ARGS.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_ARGS"](#)

## 7.656 USER\_SCHEDULER\_JOB\_DESTS

USER\_SCHEDULER\_JOB\_DESTS displays information about the state of the jobs owned by the current user at each of their destinations. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_JOB\_DESTS.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_DESTS"](#)

## 7.657 USER\_SCHEDULER\_JOB\_LOG

USER\_SCHEDULER\_JOB\_LOG displays log information for the Scheduler jobs owned by the current user. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_LOG.

### ① See Also

["ALL\\_SCHEDULER\\_JOB\\_LOG"](#)

## 7.658 USER\_SCHEDULER\_JOB\_RUN\_DETAILS

USER\_SCHEDULER\_JOB\_RUN\_DETAILS displays log run details for the Scheduler jobs owned by the current user. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_RUN\_DETAILS.

 **See Also**

["ALL\\_SCHEDULER\\_JOB\\_RUN\\_DETAILS"](#)

## 7.659 USER\_SCHEDULER\_JOBS

USER\_SCHEDULER\_JOBS displays information about the Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_JOBS.

 **See Also**

["ALL\\_SCHEDULER\\_JOBS"](#)

## 7.660 USER\_SCHEDULER\_NOTIFICATIONS

USER\_SCHEDULER\_NOTIFICATIONS displays information about the E-mail notifications for the jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_NOTIFICATIONS.

 **See Also**

["ALL\\_SCHEDULER\\_NOTIFICATIONS"](#)

## 7.661 USER\_SCHEDULER\_PROGRAM\_ARGS

USER\_SCHEDULER\_PROGRAM\_ARGS displays information about the arguments of the Scheduler programs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_PROGRAM\_ARGS.

 **See Also**

["ALL\\_SCHEDULER\\_PROGRAM\\_ARGS"](#)

## 7.662 USER\_SCHEDULER\_PROGRAMS

USER\_SCHEDULER\_PROGRAMS displays information about the Scheduler programs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_PROGRAMS.

### ① See Also

["ALL\\_SCHEDULER\\_PROGRAMS"](#)

## 7.663 USER\_SCHEDULER\_REMOTE\_JOBSTATE

USER\_SCHEDULER\_REMOTE\_JOBSTATE displays information about the state of the jobs owned by the current user at remote databases. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_REMOTE\_JOBSTATE.

### ① See Also

["ALL\\_SCHEDULER\\_REMOTE\\_JOBSTATE"](#)

## 7.664 USER\_SCHEDULER\_RESOURCES

USER\_SCHEDULER\_RESOURCES displays all scheduler resource objects in the database from the schema of the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_RESOURCES.

### ① See Also

["ALL\\_SCHEDULER\\_RESOURCES"](#)

## 7.665 USER\_SCHEDULER\_RSC\_CONSTRAINTS

USER\_SCHEDULER\_RSC\_CONSTRAINTS lists all Oracle Scheduler resource constraint members owned by the current user. Its columns are the same as those in ALL\_SCHEDULER\_RSC\_CONSTRAINTS.

### ① See Also

["ALL\\_SCHEDULER\\_RSC\\_CONSTRAINTS"](#)

## 7.666 USER\_SCHEDULER\_RUNNING\_CHAINS

USER\_SCHEDULER\_RUNNING\_CHAINS displays information about the chain steps of the running chains owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_RUNNING\_CHAINS.

### ① See Also

["ALL\\_SCHEDULER\\_RUNNING\\_CHAINS"](#)

## 7.667 USER\_SCHEDULER\_RUNNING\_JOBS

USER\_SCHEDULER\_RUNNING\_JOBS displays information about the running Scheduler jobs owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_RUNNING\_JOBS.

### ① See Also

["ALL\\_SCHEDULER\\_RUNNING\\_JOBS"](#)

## 7.668 USER\_SCHEDULER\_SCHEDULES

USER\_SCHEDULER\_SCHEDULES displays information about the Scheduler schedules owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SCHEDULER\_SCHEDULES.

### ① See Also

["ALL\\_SCHEDULER\\_SCHEDULES"](#)

## 7.669 USER\_SEC\_RELEVANT\_COLS

USER\_SEC\_RELEVANT\_COLS describes the security relevant columns of the security policies for the tables and views owned by the current user. Its columns (except for OBJECT\_OWNER) are the same as those in ALL\_SEC\_RELEVANT\_COLS.

### ① See Also

["ALL\\_SEC\\_RELEVANT\\_COLS"](#)

## 7.670 USER\_SECONDARY\_OBJECTS

USER\_SECONDARY\_OBJECTS provides information about secondary objects associated with domain indexes owned by the current user. Its columns are the same as those in ALL\_SECONDARY\_OBJECTS.

This view is only relevant in the context of domain indexes.

### ① See Also

["ALL\\_SECONDARY\\_OBJECTS"](#)

## 7.671 USER\_SEGMENTS

USER\_SEGMENTS describes the storage allocated for the segments owned by the current user's objects. Its columns (except for OWNER, HEADER\_FILE, HEADER\_BLOCK, and RELATIVE\_FNO) are the same as those in DBA\_SEGMENTS.

### ① See Also

["DBA\\_SEGMENTS"](#)

## 7.672 USER\_SEQUENCES

USER\_SEQUENCES describes all sequences owned by the current user. Its columns are the same as those in ALL\_SEQUENCES.

### ① See Also

["ALL\\_SEQUENCES"](#)

## 7.673 USER\_SODA\_COLLECTIONS

USER\_SODA\_COLLECTIONS describes the Simple Oracle Document Access (SODA) collections owned by the current user. Its columns (except for OWNER) are the same as those in DBA\_SODA\_COLLECTIONS.

### ① Note

The USER\_SODA\_COLLECTIONS view is available in on-premises Oracle databases and Oracle Autonomous Database. However, the DBA\_SODA\_COLLECTIONS view is available only in Oracle Autonomous Database.

**① See Also**

["DBA\\_SODA\\_COLLECTIONS"](#)

## 7.674 USER\_SOURCE

USER\_SOURCE describes the text source of the stored objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SOURCE.

**① See Also**

["ALL\\_SOURCE"](#)

## 7.675 USER\_SOURCE\_AE

USER\_SOURCE\_AE describes the text source of the stored objects (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SOURCE\_AE.

**① See Also**

["ALL\\_SOURCE\\_AE"](#)

## 7.676 USER\_SQL\_TRANSLATION\_PROFILES

USER\_SQL\_TRANSLATION\_PROFILES describes all SQL translation profiles owned by the user. Its columns (except for OWNER) are the same as those in ALL\_SQL\_TRANSLATION\_PROFILES.

**① See Also**

["ALL\\_SQL\\_TRANSLATION\\_PROFILES"](#)

## 7.677 USER\_SQL\_TRANSLATIONS

USER\_SQL\_TRANSLATIONS describes all SQL translations owned by the user. Its columns (except for OWNER) are the same as those in ALL\_SQL\_TRANSLATIONS.

**① See Also**

["ALL\\_SQL\\_TRANSLATIONS"](#)

## 7.678 USER\_SQLJ\_TYPE\_ATTRS

USER\_SQLJ\_TYPE\_ATTRS describes the attributes of the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SQLJ\_TYPE\_ATTRS.

### ① See Also

["ALL\\_SQLJ\\_TYPE\\_ATTRS"](#)

## 7.679 USER\_SQLJ\_TYPE\_METHODS

USER\_SQLJ\_TYPE\_METHODS describes the methods of the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SQLJ\_TYPE\_METHODS.

### ① See Also

["ALL\\_SQLJ\\_TYPE\\_METHODS"](#)

## 7.680 USER\_SQLJ\_TYPES

USER\_SQLJ\_TYPES describes the SQLJ object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SQLJ\_TYPES.

### ① See Also

["ALL\\_SQLJ\\_TYPES"](#)

## 7.681 USER\_SQLSET

USER\_SQLSET displays information about the SQL tuning sets owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SQLSET.

### ① See Also

["ALL\\_SQLSET"](#)

## 7.682 USER\_SQLSET\_BINDS

USER\_SQLSET\_BINDS displays the bind values associated with the SQL tuning sets owned by the current user. Its columns (except for SQLSET\_OWNER) are the same as those in ALL\_SQLSET\_BINDS.

### ① See Also

["ALL\\_SQLSET\\_BINDS"](#)

## 7.683 USER\_SQLSET\_PLANS

USER\_SQLSET\_PLANS describes captured plans for statements in the SQL tuning sets owned by the current user. Its columns (except for SQLSET\_OWNER) are the same as those in ALL\_SQLSET\_PLANS.

### ① See Also

["ALL\\_SQLSET\\_PLANS"](#)

## 7.684 USER\_SQLSET\_REFERENCES

USER\_SQLSET\_REFERENCES describes whether or not the SQL tuning sets owned by the current user are active. Its columns (except for SQLSET\_OWNER) are the same as those in ALL\_SQLSET\_REFERENCES.

### ① See Also

["ALL\\_SQLSET\\_REFERENCES"](#)

## 7.685 USER\_SQLSET\_STATEMENTS

USER\_SQLSET\_STATEMENTS displays information about the SQL statements, along with their statistics, that form the SQL tuning sets owned by the current user. Its columns (except for SQLSET\_OWNER) are the same as those in ALL\_SQLSET\_STATEMENTS.

### ① See Also

["ALL\\_SQLSET\\_STATEMENTS"](#)

## 7.686 USER\_SQLTUNE\_BINDS

USER\_SQLTUNE\_BINDS displays the bind values associated with the tuned SQL statements owned by the current user. Its columns are the same as those in DBA\_SQLTUNE\_BINDS.

### ① See Also

["DBA\\_SQLTUNE\\_BINDS"](#)

## 7.687 USER\_SQLTUNE\_PLANS

USER\_SQLTUNE\_PLANS displays information about the execution plans generated for the SQL statements owned by the current user during a SQL tuning session. Its columns are the same as those in DBA\_SQLTUNE\_PLANS.

### ① See Also

["DBA\\_SQLTUNE\\_PLANS"](#)

## 7.688 USER\_SQLTUNE\_RATIONALE\_PLAN

USER\_SQLTUNE\_RATIONALE\_PLAN displays the association between rationales and operations in the execution plan of the SQL statements owned by the current user. Its columns are the same as those in DBA\_SQLTUNE\_RATIONALE\_PLAN.

### ① See Also

["DBA\\_SQLTUNE\\_RATIONALE\\_PLAN"](#)

## 7.689 USER\_SQLTUNE\_STATISTICS

USER\_SQLTUNE\_STATISTICS displays statistics associated with the SQL statements owned by the current user. Its columns are the same as those in DBA\_SQLTUNE\_STATISTICS.

### ① See Also

["DBA\\_SQLTUNE\\_STATISTICS"](#)

## 7.690 USER\_SR\_GRP\_STATUS

USER\_SR\_GRP\_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS.

### ① See Also

["DBA\\_SR\\_GRP\\_STATUS"](#)

## 7.691 USER\_SR\_GRP\_STATUS\_ALL

USER\_SR\_GRP\_STATUS\_ALL provides information on the refresh operations on the synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS\_ALL.

### ① See Also

["DBA\\_SR\\_GRP\\_STATUS\\_ALL"](#)

## 7.692 USER\_SR\_OBJ

USER\_SR\_OBJ provides information on the objects currently registered for synchronous refresh for current groups for the current user. Its columns are the same as those in DBA\_SR\_OBJ.

### ① See Also

["DBA\\_SR\\_OBJ"](#)

## 7.693 USER\_SR\_OBJ\_ALL

USER\_SR\_OBJ\_ALL provides information on the objects registered for synchronous refresh for current and defunct groups for the current user. Its columns are the same as those in DBA\_SR\_OBJ\_ALL.

### ① See Also

["DBA\\_SR\\_OBJ\\_ALL"](#)

## 7.694 USER\_SR\_OBJ\_STATUS

USER\_SR\_OBJ\_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_OBJ\_STATUS.

### ① See Also

["DBA\\_SR\\_OBJ\\_STATUS"](#)

## 7.695 USER\_SR\_OBJ\_STATUS\_ALL

USER\_SR\_OBJ\_STATUS\_ALL provides information on the status of objects registered for synchronous refresh in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_OBJ\_STATUS\_ALL.

### ① See Also

["DBA\\_SR\\_OBJ\\_STATUS\\_ALL"](#)

## 7.696 USER\_SR\_PARTN\_OPS

USER\_SR\_PARTN\_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh belonging to the current user. Its columns are the same as those in DBA\_SR\_PARTN\_OPS.

### ① See Also

["DBA\\_SR\\_PARTN\\_OPS"](#)

## 7.697 USER\_SR\_STLOG\_EXCEPTIONS

USER\_SR\_STLOG\_EXCEPTIONS provides information on the exceptions in the staging logs for the tables belonging to the current user processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG. Its columns are the same as those in DBA\_SR\_STLOG\_EXCEPTIONS.

### ① See Also

["DBA\\_SR\\_STLOG\\_EXCEPTIONS"](#)

## 7.698 USER\_SR\_STLOG\_STATS

USER\_SR\_STLOG\_STATS provides information on the statistics in the staging logs for the tables belonging to the current user processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG. Its columns are the same as those in DBA\_SR\_STLOG\_STATS.

### ① See Also

["DBA\\_SR\\_STLOG\\_STATS"](#)

## 7.699 USER\_STAT\_EXTENSIONS

USER\_STAT\_EXTENSIONS displays information about the optimizer statistics extensions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_STAT\_EXTENSIONS.

### ① See Also

["ALL\\_STAT\\_EXTENSIONS"](#)

## 7.700 USER\_STATEMENTS

USER\_STATEMENTS SQL statements in stored PL/SQL objects accessible to the user. Its columns (except for OWNER) are the same as those in ALL\_STATEMENTS.

### ① See Also

["ALL\\_STATEMENTS"](#)

## 7.701 USER\_STORED\_SETTINGS

USER\_STORED\_SETTINGS lists information about the persistent parameter settings for stored PL/SQL units, but only shows information about PL/SQL units owned by the current user.

USER\_STORED\_SETTINGS does not display the OWNER column. The rest of its columns are the same as those in ALL\_STORED\_SETTINGS.

### ① See Also

["ALL\\_STORED\\_SETTINGS"](#)

## 7.702 USER\_SUBPART\_COL\_STATISTICS

USER\_SUBPART\_COL\_STATISTICS provides column statistics and histogram information for subpartitions of subpartitioned objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SUBPART\_COL\_STATISTICS.

### ① See Also

["ALL\\_SUBPART\\_COL\\_STATISTICS"](#)

## 7.703 USER\_SUBPART\_HISTOGRAMS

USER\_SUBPART\_HISTOGRAMS lists actual histogram data (end-points per histogram) for histograms on table subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_SUBPART\_HISTOGRAMS.

### ① See Also

["ALL\\_SUBPART\\_HISTOGRAMS"](#)

## 7.704 USER\_SUBPART\_KEY\_COLUMNS

USER\_SUBPART\_KEY\_COLUMNS lists subpartitioning key columns for composite-partitioned tables (and local indexes on composite-partitioned tables) owned by the current user. Its columns are the same as those in ALL\_SUBPART\_KEY\_COLUMNS.

### ① See Also

["ALL\\_SUBPART\\_KEY\\_COLUMNS"](#)

## 7.705 USER\_SUBPARTITION\_TEMPLATES

USER\_SUBPARTITION\_TEMPLATES describes the subpartition templates owned by the current user. Its columns (except for USER\_NAME) are the same as those in ALL\_SUBPARTITION\_TEMPLATES.

### ① See Also

["ALL\\_SUBPARTITION\\_TEMPLATES"](#)

## 7.706 USER\_SUBSCR\_REGISTRATIONS

USER\_SUBSCR\_REGISTRATIONS displays information about the subscription registrations owned by the current user. Its columns are the same as those in DBA\_SUBSCR\_REGISTRATIONS.

### ① See Also

["DBA\\_SUBSCR\\_REGISTRATIONS"](#)

## 7.707 USER\_SYNONYMS

USER\_SYNONYMS describes the private synonyms (synonyms owned by the current user). Its columns (except for OWNER) are the same as those in ALL\_SYNONYMS.

### ① See Also

["ALL\\_SYNONYMS"](#)

## 7.708 USER\_SYS\_PRIVS

USER\_SYS\_PRIVS describes system privileges granted to the current user.

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                                            |
|--------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME     | VARCHAR2(128) |      | Name of the user, or PUBLIC                                                                                                                                                                                                                            |
| PRIVILEGE    | VARCHAR2(40)  |      | System privilege                                                                                                                                                                                                                                       |
| ADMIN_OPTION | VARCHAR2(3)   |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO)                                                                                                                                                                                |
| COMMON       | VARCHAR2(3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED    | VARCHAR2(3)   |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                     |

## 7.709 USER\_TAB\_COL\_STAT\_MODELS

USER\_TAB\_COL\_STAT\_MODELS describes real-time statistics models for all tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_COL\_STAT\_MODELS.

Real-time statistics models use machine learning algorithms to predict the number of distinct values (NDV) for table columns.

### Note

This view is available starting with Oracle Database 21c.

### See Also

["ALL\\_TAB\\_COL\\_STAT\\_MODELS"](#)

## 7.710 USER\_TAB\_COL\_STATISTICS

USER\_TAB\_COL\_STATISTICS contains column statistics and histogram information extracted from USER\_TAB\_COLUMNS.

Its columns (except for OWNER) are the same as those in ALL\_TAB\_COL\_STATISTICS.

### See Also

- ["USER\\_TAB\\_COLUMNS"](#)
- ["ALL\\_TAB\\_COL\\_STATISTICS"](#)

## 7.711 USER\_TAB\_COLS

USER\_TAB\_COLS describes the columns of the tables, views, and clusters owned by the current user.

Its columns (except for OWNER) are the same as those in ALL\_TAB\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

This view differs from USER\_TAB\_COLUMNS in that system-generated hidden columns are not filtered out.

**① See Also**

- ["ALL\\_TAB\\_COLS"](#)
- ["USER\\_TAB\\_COLUMNS"](#)
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_STATS package

## 7.712 USER\_TAB\_COLUMNS

USER\_TAB\_COLUMNS describes the columns of the tables, views, and clusters owned by the current user.

Its columns (except for OWNER) are the same as those in ALL\_TAB\_COLUMNS.

To gather statistics for this view, use the DBMS\_STATS package.

This view filters out system-generated hidden columns. The USER\_TAB\_COLS view does not filter out system-generated hidden columns.

**① See Also**

- ["ALL\\_TAB\\_COLUMNS"](#)
- ["USER\\_TAB\\_COLS"](#)
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_STATS package

## 7.713 USER\_TAB\_COMMENTS

USER\_TAB\_COMMENTS displays comments on the tables and views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_COMMENTS.

**① See Also**

- ["ALL\\_TAB\\_COMMENTS"](#)

## 7.714 USER\_TAB\_HISTGRM\_PENDING\_STATS

USER\_TAB\_HISTGRM\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_HISTGRM\_PENDING\_STATS.

**① See Also**

- ["ALL\\_TAB\\_HISTGRM\\_PENDING\\_STATS"](#)

## 7.715 USER\_TAB\_HISTOGRAMS

USER\_TAB\_HISTOGRAMS describes histograms on columns of tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_HISTOGRAMS.

### ① See Also

["ALL\\_TAB\\_HISTOGRAMS"](#)

## 7.716 USER\_TAB\_IDENTITY\_COLS

USER\_TAB\_IDENTITY\_COLS describes all table identity columns. Its columns (except for OWNER) are the same as those in ALL\_TAB\_IDENTITY\_COLS.

### ① See Also

["ALL\\_TAB\\_IDENTITY\\_COLS"](#)

## 7.717 USER\_TAB\_MODIFICATIONS

USER\_TAB\_MODIFICATIONS describes modifications to all tables owned by the current user that have been modified since the last time statistics were gathered on the tables. Its columns are the same as those in ALL\_TAB\_MODIFICATIONS.

### ① Note

For performance reasons, Oracle Database does not populate this view immediately when the actual modifications occur.

### ① See Also

["ALL\\_TAB\\_MODIFICATIONS"](#)

## 7.718 USER\_TAB\_PARTITIONS

USER\_TAB\_PARTITIONS describes partition-level partitioning information, partition storage parameters, and partition statistics generated by the DBMS\_STATS package for all partitions owned by the current user.

Its columns are the same as those in ALL\_TAB\_PARTITIONS.

**① See Also**

["ALL\\_TAB\\_PARTITIONS"](#)

## 7.719 USER\_TAB\_PENDING\_STATS

USER\_TAB\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_PENDING\_STATS.

**① See Also**

["ALL\\_TAB\\_PENDING\\_STATS"](#)

## 7.720 USER\_TAB\_PRIVS

USER\_TAB\_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee. Its columns are the same as those in DBA\_TAB\_PRIVS.

**① See Also**

["DBA\\_TAB\\_PRIVS"](#)

## 7.721 USER\_TAB\_PRIVS\_MADE

USER\_TAB\_PRIVS\_MADE describes the object grants for which the current user is the object owner. Its columns (except for OWNER) are the same as those in ALL\_TAB\_PRIVS\_MADE.

**① See Also**

["ALL\\_TAB\\_PRIVS\\_MADE"](#)

## 7.722 USER\_TAB\_PRIVS\_RECD

USER\_TAB\_PRIVS\_RECD describes the object grants for which the current user is the grantee. Its columns (except for GRANTEE) are the same as those in ALL\_TAB\_PRIVS\_RECD.

**① See Also**

["ALL\\_TAB\\_PRIVS\\_RECD"](#)

## 7.723 USER\_TAB\_STAT\_PREFS

USER\_TAB\_STAT\_PREFS displays information about statistics preferences for the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_STAT\_PREFS.

**① See Also**

["ALL\\_TAB\\_STAT\\_PREFS"](#)

## 7.724 USER\_TAB\_STATISTICS

USER\_TAB\_STATISTICS displays optimizer statistics for the tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_STATISTICS.

**① See Also**

["ALL\\_TAB\\_STATISTICS"](#)

## 7.725 USER\_TAB\_STATS\_HISTORY

USER\_TAB\_STATS\_HISTORY provides a history of table statistics modifications for all tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TAB\_STATS\_HISTORY.

**① See Also**

["ALL\\_TAB\\_STATS\\_HISTORY"](#)

## 7.726 USER\_TAB\_SUBPARTITIONS

USER\_TAB\_SUBPARTITIONS describes, for each table subpartition owned by the current user, the subpartition name, name of the table and partition to which it belongs, and its storage attributes. Its columns are the same as those in ALL\_TAB\_SUBPARTITIONS.

**① See Also**

["ALL\\_TAB\\_SUBPARTITIONS"](#)

## 7.727 USER\_TABLES

USER\_TABLES describes the relational tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TABLES.

To gather statistics for this view, use the DBMS\_STATS package.

### ① See Also

["ALL\\_TABLES"](#)

## 7.728 USER\_TABLESPACES

USER\_TABLESPACES describes the tablespaces accessible to the current user. Its columns (except for PLUGGED\_IN) are the same as those in DBA\_TABLESPACES.

### ① See Also

["DBA\\_TABLESPACES"](#)

## 7.729 USER\_TRANSFORMATIONS

USER\_TRANSFORMATIONS displays information about the transformations owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TRANSFORMATIONS.

### ① See Also

["ALL\\_TRANSFORMATIONS"](#)

## 7.730 USER\_TRIGGER\_COLS

USER\_TRIGGER\_COLS describes the use of columns in the triggers owned by the current user and in triggers on tables owned by the current user. Its columns are the same as those in ALL\_TRIGGER\_COLS.

### ① See Also

["ALL\\_TRIGGER\\_COLS"](#)

## 7.731 USER\_TRIGGER\_ORDERING

USER\_TRIGGER\_ORDERING describes the triggers owned by the current user that have FOLLOWS or PRECEDES ordering. Its columns (except for TRIGGER\_OWNER) are the same as those in ALL\_TRIGGER\_ORDERING.

### ① See Also

["ALL\\_TRIGGER\\_ORDERING"](#)

## 7.732 USER\_TRIGGERS

USER\_TRIGGERS describes the triggers owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TRIGGERS.

### ① See Also

["ALL\\_TRIGGERS"](#)

## 7.733 USER\_TRIGGERS\_AE

USER\_TRIGGERS\_AE describes the triggers (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TRIGGERS\_AE.

### ① See Also

["ALL\\_TRIGGERS\\_AE"](#)

## 7.734 USER\_TS\_QUOTAS

USER\_TS\_QUOTAS contains information about tablespace quotas for the current user. Its columns (except for USERNAME) the same as those in DBA\_TS\_QUOTAS.

### ① See Also

["DBA\\_TS\\_QUOTAS"](#)

## 7.735 USER\_TSTZ\_TAB\_COLS

USER\_TSTZ\_TAB\_COLS displays information about the columns of the tables owned by the current user, which have columns defined on `TIMESTAMP WITH TIME ZONE` data types or object types containing attributes of `TIMESTAMP WITH TIME ZONE` data types.

Its columns (except for `OWNER`, `COLUMN_NAME`, `NESTED`, `VIRTUAL_COLUMN`, `SCALAR_COLUMN`, and `UNUSED_COLUMN`) are the same as those in `ALL_TSTZ_TAB_COLS`.

### ① See Also

"[ALL\\_TSTZ\\_TAB\\_COLS](#)"

## 7.736 USER\_TSTZ\_TABLES

USER\_TSTZ\_TABLES displays information about the tables owned by the current user, which have columns defined on `TIMESTAMP WITH TIME ZONE` data types or object types containing attributes of `TIMESTAMP WITH TIME ZONE` data types.

Its columns (except for `OWNER`) are the same as those in `ALL_TSTZ_TABLES`.

### ① See Also

"[ALL\\_TSTZ\\_TABLES](#)"

## 7.737 USER\_TUNE\_MVIEW

USER\_TUNE\_MVIEW displays the result of executing the `DBMS_ADVISOR.TUNE_MVIEW` procedure. Its columns (except for `OWNER`) are the same as those in `DBA_TUNE_MVIEW`.

### ① See Also

"[DBA\\_TUNE\\_MVIEW](#)"

## 7.738 USER\_TYPE\_ATTRS

USER\_TYPE\_ATTRS describes the attributes of the object types owned by the current user. Its columns (except for `OWNER` and `CHAR_USED`) are the same as those in `ALL_TYPE_ATTRS`.

### ① See Also

"[ALL\\_TYPE\\_ATTRS](#)"

## 7.739 USER\_TYPE\_METHODS

USER\_TYPE\_METHODS describes the methods of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TYPE\_METHODS.

**① See Also**

["ALL\\_TYPE\\_METHODS"](#)

## 7.740 USER\_TYPE\_VERSIONS

USER\_TYPE\_VERSIONS describes the versions of the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TYPE\_VERSIONS.

**① See Also**

["ALL\\_TYPE\\_VERSIONS"](#)

## 7.741 USER\_TYPES

USER\_TYPES describes the object types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_TYPES.

**① See Also**

["ALL\\_TYPES"](#)

## 7.742 USER\_UNUSED\_COL\_TABS

USER\_UNUSED\_COL\_TABS describes the tables owned by the current user that contain unused columns. Its columns (except for OWNER) are the same as those in ALL\_UNUSED\_COL\_TABS.

**① See Also**

["ALL\\_UNUSED\\_COL\\_TABS"](#)

## 7.743 USER\_UPDATABLE\_COLUMNS

USER\_UPDATABLE\_COLUMNS describes columns in a join view that can be updated by the current user, subject to appropriate privileges. Its columns are the same as those in ALL\_UPDATABLE\_COLUMNS.

### See Also

- ["ALL\\_UPDATABLE\\_COLUMNS"](#)
- *Oracle Database Concepts* for information on updatable join views

## 7.744 USER\_USERS

USER\_USERS describes the current user.

| Column   | Datatype      | NULL     | Description           |
|----------|---------------|----------|-----------------------|
| USERNAME | VARCHAR2(128) | NOT NULL | Name of the user      |
| USER_ID  | NUMBER        | NOT NULL | ID number of the user |

| Column         | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Possible values</p> <ul style="list-style-type: none"> <li>• YES if a user is common</li> <li>• NO if a user is local (not common)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ORACLE_MAINTAINED           | VARCHAR2(1)    |          | Denotes whether the user was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A user for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| INHERITED                   | VARCHAR2(3)    |          | Indicates whether the user definition was inherited from another container (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column                                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEFAULT_COLLATION                        | VARCHAR2(100) |      | Default collation for the user's schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IMPLICIT                                 | VARCHAR2(3)   |      | Indicates whether this user is a common user created by an implicit application (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ALL_SHARD                                | VARCHAR2(3)   |      | <p>In a sharded database, the value in this column indicates whether the user was created with shard DDL enabled. The possible values are:</p> <ul style="list-style-type: none"> <li>• YES: The user was created with shard DDL enabled. The user exists on all shards and the shard catalog.</li> <li>• NO: The user was created without shard DDL enabled. The user exists only in the database in which the user was created.</li> </ul> <p>In a non-sharded database, the value in this column is always NO.</p> |
| EXTERNAL_SHARD <sup>1</sup>              | VARCHAR2(3)   |      | <p>In a federated sharded database, the value in this column indicates whether the user is an external shard user (YES) or not (NO).</p> <p>In other types of databases, the value in this column is always NO.</p>                                                                                                                                                                                                                                                                                                   |
| PASSWORD_CHANGE_DATE                     | DATE          |      | <p>Date on which the user's password was last set</p> <p>This column is populated only when the value of the AUTHENTICATION_TYPE column is PASSWORD. Otherwise, this column is null.</p>                                                                                                                                                                                                                                                                                                                              |
| MANDATORY_PROFILE_VIOLATION <sup>1</sup> | VARCHAR2(3)   |      | <p>If the value in this column is YES, then the user account password violates the mandatory profile password complexity requirements and must be changed before the grace period expires.</p> <p>Otherwise, the value in this column is NO.</p>                                                                                                                                                                                                                                                                      |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 7.745 USER\_USTATS

USER\_USTATS describes the user-defined statistics collected on the tables and indexes owned by the current user. Its columns are the same as those in ALL\_USTATS.

#### ① See Also

- ["ALL\\_USTATS"](#)

## 7.746 USER\_VARRAYS

USER\_VARRAYS describes the varrays owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_VARRAYS.

 **See Also**

["ALL\\_VARRAYS"](#)

## 7.747 USER\_VIEWS

USER\_VIEWS describes the views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_VIEWS.

 **See Also**

["ALL\\_VIEWS"](#)

## 7.748 USER\_VIEWS\_AE

USER\_VIEWS\_AE describes the views (across all editions) owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_VIEWS\_AE.

 **See Also**

["ALL\\_VIEWS\\_AE"](#)

## 7.749 USER\_WALLET\_ACES

USER\_WALLET\_ACES describes the status of access control entries for the current user to access wallets through PL/SQL network utility packages.

Its columns (except for ACE\_ORDER, START\_DATE, END\_DATE, GRANT\_TYPE, INVERTED\_PRINCIPAL, PRINCIPAL, PRINCIPAL\_TYPE, and STATUS) are the same as those in DBA\_WALLET\_ACES.

 **See Also**

["DBA\\_WALLET\\_ACES"](#)

## 7.750 USER\_WARNING\_SETTINGS

USER\_WARNING\_SETTINGS displays information about the warning parameter settings for the objects owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_WARNING\_SETTINGS.

### ① See Also

["ALL\\_WARNING\\_SETTINGS"](#)

## 7.751 USER\_XML\_INDEXES

USER\_XML\_INDEXES describes the XML indexes owned by the current user. Its columns (except for INDEX\_OWNER) are the same as those in ALL\_XML\_INDEXES.

### ① See Also

["ALL\\_XML\\_INDEXES"](#)

## 7.752 USER\_XML\_NESTED\_TABLES

USER\_XML\_NESTED\_TABLES describes all the tables and their corresponding nested tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_NESTED\_TABLES.

### ① See Also

["ALL\\_XML\\_NESTED\\_TABLES"](#)

## 7.753 USER\_XML\_OUT\_OF\_LINE\_TABLES

USER\_XML\_OUT\_OF\_LINE\_TABLES describes all the out of line tables connected to a given root table for the same schema owned by the current user. Its columns (except for TABLE\_OWNER) are the same as those in ALL\_XML\_OUT\_OF\_LINE\_TABLES.

### ① See Also

["ALL\\_XML\\_OUT\\_OF\\_LINE\\_TABLES"](#)

## 7.754 USER\_XML\_SCHEMA\_ATTRIBUTES

USER\_XML\_SCHEMA\_ATTRIBUTES describes all the attributes and their properties owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_ATTRIBUTES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_ATTRIBUTES"](#)

## 7.755 USER\_XML\_SCHEMA\_COMPLEX\_TYPES

USER\_XML\_SCHEMA\_COMPLEX\_TYPES describes all complex types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_COMPLEX\_TYPES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_COMPLEX\\_TYPES"](#)

## 7.756 USER\_XML\_SCHEMA\_ELEMENTS

USER\_XML\_SCHEMA\_ELEMENTS describes all the elements and their properties owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_ELEMENTS.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_ELEMENTS"](#)

## 7.757 USER\_XML\_SCHEMA\_NAMESPACES

USER\_XML\_SCHEMA\_NAMESPACES describes all the available namespaces owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_NAMESPACES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_NAMESPACES"](#)

## 7.758 USER\_XML\_SCHEMA\_SIMPLE\_TYPES

USER\_XML\_SCHEMA\_SIMPLE\_TYPES describes all simple types owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_SIMPLE\_TYPES.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SIMPLE\\_TYPES"](#)

## 7.759 USER\_XML\_SCHEMA\_SUBSTGRP\_HEAD

USER\_XML\_SCHEMA\_SUBSTGRP\_HEAD describes the heads of substitution groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_SUBSTGRP\_HEAD.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SUBSTGRP\\_HEAD"](#)

## 7.760 USER\_XML\_SCHEMA\_SUBSTGRP\_MBRS

USER\_XML\_SCHEMA\_SUBSTGRP\_MBRS describes all members of substitution groups owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMA\_SUBSTGRP\_MBRS.

### ① See Also

["ALL\\_XML\\_SCHEMA\\_SUBSTGRP\\_MBRS"](#)

## 7.761 USER\_XML\_SCHEMAS

USER\_XML\_SCHEMAS describes the registered XML schemas owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_SCHEMAS.

### ① See Also

["ALL\\_XML\\_SCHEMAS"](#)

## 7.762 USER\_XML\_TAB\_COLS

USER\_XML\_TAB\_COLS describes the columns of the XML tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_TAB\_COLS.

### ① See Also

["ALL\\_XML\\_TAB\\_COLS"](#)

## 7.763 USER\_XML\_TABLES

USER\_XML\_TABLES describes the XML tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_TABLES.

### ① See Also

["ALL\\_XML\\_TABLES"](#)

## 7.764 USER\_XML\_VIEW\_COLS

USER\_XML\_VIEW\_COLS describes the columns of the XML views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_VIEW\_COLS.

### ① See Also

["ALL\\_XML\\_VIEW\\_COLS"](#)

## 7.765 USER\_XML\_VIEWS

USER\_XML\_VIEWS describes the XML views owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XML\_VIEWS.

### ① See Also

["ALL\\_XML\\_VIEWS"](#)

## 7.766 USER\_XTERNAL\_LOC\_PARTITIONS

USER\_XTERNAL\_LOC\_PARTITIONS describes partition-level locations owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XTERNAL\_LOC\_PARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_LOC\\_PARTITIONS"](#)

## 7.767 USER\_XTERNAL\_LOC\_SUBPARTITIONS

USER\_XTERNAL\_LOC\_SUBPARTITIONS describes subpartition-level locations owned by the current user. Its columns (except for TABLE\_OWNER) are the same as those in ALL\_XTERNAL\_LOC\_SUBPARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_LOC\\_SUBPARTITIONS"](#)

## 7.768 USER\_XTERNAL\_PART\_TABLES

USER\_XTERNAL\_PART\_TABLES describes object-level information for partitioned external tables owned by the current user. Its columns (except for OWNER) are the same as those in ALL\_XTERNAL\_PART\_TABLES.

### ① See Also

["ALL\\_XTERNAL\\_PART\\_TABLES"](#)

## 7.769 USER\_XTERNAL\_TAB\_PARTITIONS

USER\_XTERNAL\_TAB\_PARTITIONS describes partition-level information for partitioned external tables owned by the current user. Its columns (except for TABLE\_OWNER) are the same as those in ALL\_XTERNAL\_TAB\_PARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_TAB\\_PARTITIONS"](#)

## 7.770 USER\_XTERNAL\_TAB\_SUBPARTITIONS

USER\_XTERNAL\_TAB\_SUBPARTITIONS describes subpartition-level information for partitioned external tables owned by the current user. Its columns (except for TABLE\_OWNER) are the same as those in ALL\_XTERNAL\_TAB\_SUBPARTITIONS.

### ① See Also

["ALL\\_XTERNAL\\_TAB\\_SUBPARTITIONS"](#)

## 7.771 USER\_ZONEMAP\_MEASURES

USER\_ZONEMAP\_MEASURES describes the measures for all the zone maps owned by the user. Its columns are the same as those in ALL\_ZONEMAP\_MEASURES.

### ① Note

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

### ① See Also

- ["ALL\\_ZONEMAP\\_MEASURES"](#)
- *Oracle Database Data Warehousing Guide* for more information about zone maps

## 7.772 USER\_ZONEMAPS

USER\_ZONEMAPS describes the zone maps owned by the user. Its columns are the same as those in ALL\_ZONEMAPS.

### ① Note

This view is intended for use with Oracle Exadata release 12.1.2.1.1 or later.

### ① See Also

- ["ALL\\_ZONEMAPS"](#)
- *Oracle Database Data Warehousing Guide* for more information about zone maps

# Part III

## Dynamic Performance Views

This part describes the dynamic performance views, which are often referred to as V\$ views.

This part contains the following chapters:

- [Dynamic Performance \(V\\$\) Views: V\\$ACCESS to V\\$HVMaster\\_Info](#)
- [Dynamic Performance \(V\\$\) Views: V\\$IM\\_COLUMN\\_LEVEL to V\\$RULE\\_SET\\_Aggregate\\_STATS](#)
- [Dynamic Performance \(V\\$\) Views: V\\$Scheduler\\_Running\\_Jobs to V\\$ZONEMAP\\_USAGE\\_STATS](#)

### Note

Oracle also maintains tables and views that change only when a change is made to the data dictionary. These **static** tables and views are described in [Static Data Dictionary Views](#).

### Note

A multitenant container database is the only supported architecture in Oracle Database 21c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

# 8

## Dynamic Performance (V\$) Views: V\$ACCESS to V\$HVMMASTER\_INFO

This chapter describes the first set (in alphabetical order) of dynamic performance views.

The remaining dynamic performance views appear in alphabetical order in [Dynamic Performance \(V\\$\) Views: V\\$IM\\_COLUMN\\_LEVEL to V\\$RULE\\_SET\\_AGGREGATE\\_STATS](#) through [Dynamic Performance \(V\\$\) Views: V\\$SCHEDULER\\_RUNNING\\_JOBS to V\\$ZONEMAP\\_USAGE\\_STATS](#).

This chapter contains the following topics:

- [About Dynamic Performance Views](#)
- [Oracle Exadata Database Machine Views](#)
- [Dynamic Performance View Descriptions](#)

### 8.1 About Dynamic Performance Views

Oracle contains a set of underlying views that are maintained by the database server and accessible to the database administrator user SYS. These views are called **dynamic performance views** because they are continuously updated while a database is open and in use, and their contents relate primarily to performance.

Although these views appear to be regular database tables, they are not. These views provide data on internal disk structures and memory structures. You can select from these views, but you can never update or alter them.

#### ① Note

- You can query the dynamic performance views to extract information from them. However, only simple queries are supported. If sorts, joins, GROUP BY clauses and the like are needed, then you should copy the information from each V\$ view into a table (for example, using a CREATE TABLE ... AS SELECT statement), and then query from those tables.
- Because the information in the V\$ views is dynamic, read consistency is not guaranteed for SELECT operations on these views.

The catalog.sql script contains definitions of the views and public synonyms for the dynamic performance views. You must run catalog.sql to create these views and synonyms. After installation, only user SYS or anyone with SYSDBA privilege has access to the dynamic performance tables. See *Oracle Database Administrator's Guide* for more information about running catalog.sql.

## 8.1.1 V\$ Views

The actual dynamic performance views are identified by the prefix V\_\$. Public synonyms for these views have the prefix V\$. Database administrators and other users should access only the V\$ objects, not the V\_ \$ objects.

The dynamic performance views are used by Oracle Enterprise Manager, which is the primary interface for accessing information about system performance. After an instance is started, the V\$ views that read from memory are accessible. Views that read data from disk require that the database be mounted, and some require that the database be open.

V\$ views are CONTAINER\_DATA objects. When a user connected to the root queries a V\$ view, the query results will depend on the CONTAINER\_DATA attribute for users for the view. The CONTAINER\_DATA clause of the SQL ALTER USER statement is used to set and modify users' CONTAINER\_DATA attribute.

V\$ views can return data from different containers in a CDB when queried from the root container. These objects will implicitly convert data to the character set of the root container (AL32UTF8) and then return the result to the user. Some character sets may have character expansion (more bytes needed to represent a character) when converted to AL32UTF8, so there may be data truncation if the view column width is not able to accommodate data from a given PDB.

- *Oracle Database SQL Language Reference* for more information about the CONTAINER\_DATA clause for the SQL ALTER USER statement

## 8.1.2 GV\$ Views

For almost every V\$ view described in this chapter, Oracle has a corresponding GV\$ (global V\$) view. In Oracle Real Application Clusters, querying a GV\$ view retrieves the V\$ view information from all qualified instances. In addition to the V\$ information, each GV\$ view contains an extra column named INST\_ID of data type NUMBER. The INST\_ID column displays the instance number from which the associated V\$ view information was obtained. The INST\_ID column can be used as a filter to retrieve V\$ information from a subset of available instances. For example, the following query retrieves the information from the V\$LOCK view on instances 2 and 5:

```
SQL> SELECT * FROM GV$LOCK WHERE INST_ID = 2 OR INST_ID = 5;
```

GV\$ views are CONTAINER\_DATA objects. When a user connected to the root queries a GV\$ view, the query results will depend on the CONTAINER\_DATA attribute for users for the view. The CONTAINER\_DATA clause of the SQL ALTER USER statement is used to set and modify users' CONTAINER\_DATA attribute.

GV\$ views can return data from different containers in a CDB when queried from the root container. These objects will implicitly convert data to the character set of the root container (AL32UTF8) and then return the result to the user. Some character sets may have character expansion (more bytes needed to represent a character) when converted to AL32UTF8, so there may be data truncation if the view column width is not able to accommodate data from a given PDB.

## 8.2 Oracle Exadata Database Machine Views

Descriptions of Oracle Exadata Database Machine views are not provided in this manual.

See *Oracle Exadata System Software User's Guide* for descriptions of Oracle Exadata Database Machine views.

#### ① Note

Oracle Exadata Database Machine view names begin with V\$CELL.

## 8.3 Dynamic Performance View Descriptions

The remainder of this chapter describes the dynamic performance views in alphabetical order.

## 8.4 V\$ACCESS

V\$ACCESS displays information about locks that are currently imposed on library cache objects.

The locks are imposed to ensure that they are not aged out of the library cache while they are required for SQL execution.

| Column | Datatype       | Description                                |
|--------|----------------|--------------------------------------------|
| SID    | NUMBER         | Session number that is accessing an object |
| OWNER  | VARCHAR2(64)   | Owner of the object                        |
| OBJECT | VARCHAR2(1000) | Name of the object                         |
| TYPE   | VARCHAR2(64)   | Type identifier for the object             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.5 V\$ACTIVE\_INSTANCES

V\$ACTIVE\_INSTANCES displays the mapping between instance names and instance numbers for all instances that have the database currently mounted.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_NUMBER | NUMBER        | Instance number                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| INST_NAME   | VARCHAR2(256) | Instance name                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.6 V\$ACTIVE\_SERVICES

V\$ACTIVE\_SERVICES displays information about the active services in the database.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                          |
|--------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_ID         | NUMBER        | Service ID                                                                                                                                                                                                                                                                                           |
| NAME               | VARCHAR2(64)  | Name of the service                                                                                                                                                                                                                                                                                  |
| NAME_HASH          | NUMBER        | Service name hash                                                                                                                                                                                                                                                                                    |
| NETWORK_NAME       | VARCHAR2(512) | Network name                                                                                                                                                                                                                                                                                         |
| CREATION_DATE      | DATE          | Creation date                                                                                                                                                                                                                                                                                        |
| CREATION_DATE_HASH | NUMBER        | Creation date hash                                                                                                                                                                                                                                                                                   |
| GOAL               | VARCHAR2(12)  | Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice: <ul style="list-style-type: none"> <li>NONE</li> <li>SERVICE_TIME - Connections are balanced by response time</li> <li>THROUGHPUT - Connections are balanced by throughput</li> </ul> |

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DTP                       | VARCHAR2(1)   | Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to Y (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values: <ul style="list-style-type: none"> <li>Y - YES</li> <li>N - NO</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| BLOCKED                   | CHAR(2)       | Indicates whether a service on the specified instance is blocked from accepting new connections altogether (YES) or not (NO). If a service is blocked, then all connections will be directed to other instances (if any) that are hosting the desired service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| AQ_HA_NOTIFICATION        | VARCHAR2(3)   | Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLB_GOAL                  | VARCHAR2(5)   | Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed: <ul style="list-style-type: none"> <li>LONG</li> <li>SHORT</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| COMMIT_OUTCOME            | VARCHAR2(3)   | For Transaction Guard, indicates whether the database service associated with the user session has the COMMIT_OUTCOME service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time.<br>When COMMIT_OUTCOME = YES: <ul style="list-style-type: none"> <li>Transaction Guard manages the commit status for all supported transaction types. The outcome of a COMMIT transaction is known. If there is an outage, the application can use DBMS_APP_CONT.GET_LTXID_OUTCOME to return a reliable status for the last in-flight work.</li> <li>A logical transaction ID (LTXID) is set for each user session at login and at each successful commit.</li> </ul> <b>See Also:</b> For information about preserving the commit outcome, see <i>Oracle Database Development Guide</i> . For information about logical transaction IDs, see <i>Oracle Database Development Guide</i> |
| RETENTION_TIME            | NUMBER        | For Transaction Guard, when COMMIT_OUTCOME = YES, this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REPLAY_INITIATION_TIMEOUT | NUMBER        | For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a transaction when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SESSION_STATE_CONSISTENCY | VARCHAR2(128) | Describes how non-transactional is changed during a request. This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of DYNAMIC should be set. Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.                                                                                                                                                                                                                                                                                                                                                                                             |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL                  | VARCHAR2(3)   | Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values: <ul style="list-style-type: none"> <li>• YES: Indicates the service is global</li> <li>• NO: Indicates the service is not global</li> </ul>                                                                                                                                                                                                                             |
| CON_NAME                | VARCHAR2(128) | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SQL_TRANSLATION_PROFILE | VARCHAR2(261) | A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.                                                                                                                                                                                                                                                                                                                                                                     |
| MAX_LAG_TIME            | VARCHAR2(128) | The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.                                                                                                                                                                                                                                                                                                                                                                                              |
| STOP_OPTION             | VARCHAR2(128) | Stop option for sessions of this service for planned maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FAILOVER_RESTORE        | VARCHAR2(128) | Indicates whether sessions restore their commonly used session state (such as NLS and schema settings) when they are failed over. Possible values: <ul style="list-style-type: none"> <li>• AUTO - Sessions restore their commonly used session state when they are failed over with Transparent Application Continuity</li> <li>• LEVEL1 - Sessions restore their commonly used session state when they are failed over with Application Continuity</li> <li>• NONE - Sessions do not restore their commonly used session state when they are failed over</li> </ul> |
| DRAIN_TIMEOUT           | NUMBER        | Number of seconds to wait for sessions to be drained                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TABLE_FAMILY_ID         | NUMBER        | Sharded table family ID associated with the service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PLACEMENT_TEMPLATE      | VARCHAR2(64)  | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| COMMIT_OUTCOME_FASTPATH | VARCHAR2(3)   | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                  | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                 |

## 8.7 V\$ACTIVE\_SESS\_POOL\_MTH

V\$ACTIVE\_SESS\_POOL\_MTH displays available active session pool resource allocation methods.

| Column | Datatype     | Description                                                |
|--------|--------------|------------------------------------------------------------|
| NAME   | VARCHAR2(40) | Name of the active session pool resource allocation method |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.8 V\$ACTIVE\_SESSION\_HISTORY

V\$ACTIVE\_SESSION\_HISTORY displays sampled session activity in the database.

It contains snapshots of active database sessions taken once a second. A database session is considered active if it was on the CPU or was waiting for an event that didn't belong to the Idle wait class. Refer to the V\$EVENT\_NAME view for more information on wait classes.

This view contains one row for each active session per sample and returns the latest session sample rows first. A majority of the columns describing the session in the active session history are present in the V\$SESSION view.

| Column           | Datatype     | Description                                                                                                                                                                           |
|------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLE_ID        | NUMBER       | ID of the sample                                                                                                                                                                      |
| SAMPLE_TIME      | TIMESTAMP(3) | Time at which the sample was taken                                                                                                                                                    |
| SAMPLE_TIME_UTC  | TIMESTAMP(3) | Time at which the sample was taken in UTC (Coordinated Universal Time) time zone                                                                                                      |
| USECS_PER_ROW    | NUMBER       | Time in microseconds since the last sample was taken                                                                                                                                  |
| IS_AWR_SAMPLE    | VARCHAR2(1)  | Indicates whether this sample has been flushed or will be flushed to the Automatic Workload Repository (DBA_HIST_ACTIVE_SESS_HISTORY) (Y) or not (N)                                  |
| SESSION_ID       | NUMBER       | Session identifier; maps to V\$SESSION.SID                                                                                                                                            |
| SESSION_SERIAL#  | NUMBER       | Session serial number (used to uniquely identify a session's objects); maps to V\$SESSION.SERIAL#                                                                                     |
| SESSION_TYPE     | VARCHAR2(10) | Session type: <ul style="list-style-type: none"> <li>FOREGROUND</li> <li>BACKGROUND</li> </ul>                                                                                        |
| FLAGS            | NUMBER       | Reserved for future use                                                                                                                                                               |
| USER_ID          | NUMBER       | Oracle user identifier; maps to V\$SESSION.USER#                                                                                                                                      |
| SQL_ID           | VARCHAR2(13) | SQL identifier of the SQL statement that the session was executing at the time of sampling                                                                                            |
| IS_SQLID_CURRENT | VARCHAR2(1)  | Indicates whether the SQL identifier in the SQL_ID column is being executed (Y) or not (N)                                                                                            |
| SQL_CHILD_NUMBER | NUMBER       | Child number of the SQL statement that the session was executing at the time of sampling                                                                                              |
| SQL_OPCODE       | NUMBER       | Indicates what phase of operation the SQL statement was in; maps to V\$SESSION.COMMAND<br><b>See Also:</b> " <a href="#">V\$SESSION</a> " for information on interpreting this column |
| SQL_OPNAME       | VARCHAR2(64) | SQL command name                                                                                                                                                                      |

| Column                     | Datatype     | Description                                                                                                                                                                                                              |
|----------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FORCE_MATCHING_SIGNATURE   | NUMBER       | Signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                                                                                         |
| TOP_LEVEL_SQL_ID           | VARCHAR2(13) | SQL identifier of the top level SQL statement                                                                                                                                                                            |
| TOP_LEVEL_SQL_OPCODE       | NUMBER       | Indicates what phase of operation the top level SQL statement was in                                                                                                                                                     |
| SQL_ADAPTIVE_PLAN_RESOLVED | NUMBER       | Indicates whether the SQL plan of the sampled database session is a resolved adaptive plan or not                                                                                                                        |
| SQL_FULL_PLAN_HASH_VALUE   | NUMBER       | Numerical representation of the complete SQL plan for the cursor being executed by this session                                                                                                                          |
| SQL_PLAN_HASH_VALUE        | NUMBER       | Numeric representation of the SQL plan for the cursor. This information might not be available for all session samples. V\$SESSION does not contain this information.                                                    |
| SQL_PLAN_LINE_ID           | NUMBER       | SQL plan line ID                                                                                                                                                                                                         |
| SQL_PLAN_OPERATION         | VARCHAR2(30) | Plan operation name                                                                                                                                                                                                      |
| SQL_PLAN_OPTIONS           | VARCHAR2(30) | Plan operation options                                                                                                                                                                                                   |
| SQL_EXEC_ID                | NUMBER       | SQL execution identifier                                                                                                                                                                                                 |
| SQL_EXEC_START             | DATE         | Time when the execution of the SQL started                                                                                                                                                                               |
| PLSQL_ENTRY_OBJECT_ID      | NUMBER       | Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.OBJECT_ID.                                                                             |
| PLSQL_ENTRY_SUBPROGRAM_ID  | NUMBER       | Subprogram ID of the top-most PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.DATA_OBJECT_ID.                                                                                                                        |
| PLSQL_OBJECT_ID            | NUMBER       | Object ID of the currently executing PL/SQL subprogram. Maps to DBA_OBJECTS.OBJECT_ID.                                                                                                                                   |
| PLSQL_SUBPROGRAM_ID        | NUMBER       | Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL. Maps to DBA_OBJECTS.DATA_OBJECT_ID.                                                                                                       |
| QC_INSTANCE_ID             | NUMBER       | Query coordinator instance ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                                                             |
| QC_SESSION_ID              | NUMBER       | Query coordinator session ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                                                              |
| QC_SESSION_SERIAL#         | NUMBER       | Query coordinator session serial number. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                                                   |
| PX_FLAGS                   | NUMBER       | Reserved for internal use                                                                                                                                                                                                |
| EVENT                      | VARCHAR2(64) | If SESSION_STATE = WAITING, then the event for which the session was waiting for at the time of sampling.<br>If SESSION_STATE = ON CPU, then this column is NULL.<br><b>See Also:</b> <a href="#">Oracle Wait Events</a> |
| EVENT_ID                   | NUMBER       | Identifier of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.                                                        |
| EVENT#                     | NUMBER       | Number of the resource or event for which the session is waiting or for which the session last waited. Interpretation is similar to that of the EVENT column.                                                            |
| SEQ#                       | NUMBER       | Sequence number that uniquely identifies the wait (incremented for each wait)                                                                                                                                            |
| P1TEXT                     | VARCHAR2(64) | Text of the first additional parameter                                                                                                                                                                                   |

| Column                   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| P2                       | NUMBER       | Second additional parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| P3TEXT                   | VARCHAR2(64) | Text of the third additional parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| P3                       | NUMBER       | Third additional parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WAIT_CLASS               | VARCHAR2(64) | Wait class name of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS.                                                                                                                                                                                                                                                                                                                                                         |
| WAIT_CLASS_ID            | NUMBER       | Wait class identifier of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS_ID.                                                                                                                                                                                                                                                                                                                                                |
| WAIT_TIME                | NUMBER       | Total wait time for the event for which the session last waited if the session was on the CPU when sampled; 0 if the session was waiting at the time of sampling<br><b>Note:</b> Whether or not WAIT_TIME = 0 is what is useful to find the SESSION_STATE at the time of sampling, rather than the actual value of WAIT_TIME itself. Maps to V\$SESSION.WAIT_TIME.                                                                                                                                                                    |
| SESSION_STATE            | VARCHAR2(7)  | Session state: <ul style="list-style-type: none"> <li>• WAITING</li> <li>• ON CPU</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED              | NUMBER       | If SESSION_STATE = WAITING, then the time that the session actually spent waiting for that event (in microseconds). This column is set for waits that were in progress at the time the sample was taken.<br><br>If a wait event lasted for more than a second and was caught waiting in more than one session sample row, then the actual time spent waiting for that wait event will be populated in the last of those session sample rows. At any given time, this information will not be available for the latest session sample. |
| BLOCKING_SESSION_STATUS  | VARCHAR2(11) | Status of the blocking session: <ul style="list-style-type: none"> <li>• VALID</li> <li>• NO HOLDER</li> <li>• GLOBAL</li> <li>• NOT IN WAIT</li> <li>• UNKNOWN</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |
| BLOCKING_SESSION         | NUMBER       | Session identifier of the blocking session. Populated only if the blocker is on the same instance and the session was waiting for enqueue or a "buffer busy" wait. Maps to V\$SESSION.BLOCKING_SESSION.                                                                                                                                                                                                                                                                                                                               |
| BLOCKING_SESSION_SERIAL# | NUMBER       | Serial number of the blocking session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCKING_INST_ID         | NUMBER       | Instance number of the blocker shown in BLOCKING_SESSION                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| BLOCKING_HANGCHAIN_INFO  | VARCHAR2(1)  | Indicates whether the information about BLOCKING_SESSION comes from the hang chain (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CURRENT_OBJ#             | NUMBER       | Object ID of the object that the session is referencing. This information is only available if the session was waiting for application, cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_OBJ#.                                                                                                                                                                                                                                                                                                             |
| CURRENT_FILE#            | NUMBER       | File number of the file containing the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_FILE#.                                                                                                                                                                                                                                                                                                    |

| Column                  | Datatype     | Description                                                                                                                                                                                            |
|-------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURRENT_BLOCK#          | NUMBER       | ID of the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_BLOCK#. |
| CURRENT_ROW#            | NUMBER       | Row identifier that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_ROW#.    |
| TOP_LEVEL_CALL#         | NUMBER       | Oracle top level call number                                                                                                                                                                           |
| TOP_LEVEL_CALL_NAME     | VARCHAR2(64) | Oracle top level call name                                                                                                                                                                             |
| CONSUMER_GROUP_ID       | NUMBER       | Consumer group ID                                                                                                                                                                                      |
| XID                     | RAW(8)       | Transaction ID that the session was working on at the time of sampling. V\$SESSION does not contain this information.                                                                                  |
| REMOTE_INSTANCE#        | NUMBER       | Remote instance identifier that will serve the block that this session is waiting for. This information is only available if the session was waiting for cluster events.                               |
| TIME_MODEL              | NUMBER       | Time model information                                                                                                                                                                                 |
| IN_CONNECTION_MGMT      | VARCHAR2(1)  | Indicates whether the session was doing connection management at the time of sampling (Y) or not (N)                                                                                                   |
| IN_PARSE                | VARCHAR2(1)  | Indicates whether the session was parsing at the time of sampling (Y) or not (N)                                                                                                                       |
| IN_HARD_PARSE           | VARCHAR2(1)  | Indicates whether the session was hard parsing at the time of sampling (Y) or not (N)                                                                                                                  |
| IN_SQL_EXECUTION        | VARCHAR2(1)  | Indicates whether the session was executing SQL statements at the time of sampling (Y) or not (N)                                                                                                      |
| IN_PLSQL_EXECUTION      | VARCHAR2(1)  | Indicates whether the session was executing PL/SQL at the time of sampling (Y) or not (N)                                                                                                              |
| IN_PLSQL_RPC            | VARCHAR2(1)  | Indicates whether the session was executing inbound PL/SQL RPC calls at the time of sampling (Y) or not (N)                                                                                            |
| IN_PLSQL_COMPILATION    | VARCHAR2(1)  | Indicates whether the session was compiling PL/SQL at the time of sampling (Y) or not (N)                                                                                                              |
| IN_JAVA_EXECUTION       | VARCHAR2(1)  | Indicates whether the session was executing Java at the time of sampling (Y) or not (N)                                                                                                                |
| IN_BIND                 | VARCHAR2(1)  | Indicates whether the session was doing bind operations at the time of sampling (Y) or not (N)                                                                                                         |
| IN_CURSOR_CLOSE         | VARCHAR2(1)  | Indicates whether the session was closing a cursor at the time of sampling (Y) or not (N)                                                                                                              |
| IN_SEQUENCE_LOAD        | VARCHAR2(1)  | Indicates whether the session is loading in sequence (in sequence load code) (Y) or not (N)                                                                                                            |
| IN_INMEMORY_QUERY       | VARCHAR2(1)  | Indicates whether the session was querying the In-Memory Column Store (IM column store) at the time of sampling (Y) or not (N)                                                                         |
| IN_INMEMORY_POPULATE    | VARCHAR2(1)  | Indicates whether the session was populating the IM column store at the time of sampling (Y) or not (N)                                                                                                |
| IN_INMEMORY_PREPOPULATE | VARCHAR2(1)  | Indicates whether the session was prepopulating the IM column store at the time of sampling (Y) or not (N)                                                                                             |
| IN_INMEMORY_REPOPULATE  | VARCHAR2(1)  | Indicates whether the session was repopulating the IM column store at the time of sampling (Y) or not (N)                                                                                              |
| IN_INMEMORY_TREPOPULATE | VARCHAR2(1)  | Indicates whether the session was trickle repopulating the IM column store at the time of sampling (Y) or not (N)                                                                                      |

| Column                      | Datatype     | Description                                                                                                                                                             |
|-----------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IN_TABLESPACE_ENCRYPTION    | VARCHAR2(1)  | Indicates whether encryption or decryption of a tablespace occurred at the time of sampling (Y) or not (N)                                                              |
| CAPTURE_OVERHEAD            | VARCHAR2(1)  | Indicates whether the session is executing capture code (Y) or not (N)                                                                                                  |
| REPLAY_OVERHEAD             | VARCHAR2(1)  | Indicates whether the session is executing replay code (Y) or not (N)                                                                                                   |
| IS_CAPTURED                 | VARCHAR2(1)  | Indicates whether the session is being captured (Y) or not (N)                                                                                                          |
| IS_REPLAYED                 | VARCHAR2(1)  | Indicates whether the session is being replayed (Y) or not (N)                                                                                                          |
| IS_REPLAY_SYNC_TOKEN_HOLDER | VARCHAR2(1)  | Indicates whether the session is holding a synchronization token (Y) or not (N) during workload replay                                                                  |
| SERVICE_HASH                | NUMBER       | Hash that identifies the Service; maps to V\$ACTIVE_SERVICES.NAME_HASH                                                                                                  |
| PROGRAM                     | VARCHAR2(84) | Name of the operating system program                                                                                                                                    |
| MODULE                      | VARCHAR2(64) | Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure                                                                     |
| ACTION                      | VARCHAR2(64) | Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure                                                                     |
| CLIENT_ID                   | VARCHAR2(64) | Client identifier of the session; maps to V\$SESSION.CLIENT_IDENTIFIER                                                                                                  |
| MACHINE                     | VARCHAR2(64) | Client's operating system machine name                                                                                                                                  |
| PORT                        | NUMBER       | Client port number                                                                                                                                                      |
| ECID                        | VARCHAR2(64) | Execution context identifier (sent by Application Server)                                                                                                               |
| DBREPLAY_FILE_ID            | NUMBER       | If the session is being captured or replayed, then DBREPLAY_FILE_ID is the file ID for the workload capture or workload replay; otherwise it is NULL.                   |
| DBREPLAY_CALL_COUNTER       | NUMBER       | If the session is being captured or replayed, then DBREPLAY_CALL_COUNTER is the call counter of the user call that is being captured or replayed; otherwise it is NULL. |
| TM_DELTA_TIME               | NUMBER       | Time interval (in microseconds) over which TM_DELTA_CPU_TIME and TM_DELTA_DB_TIME are accumulated                                                                       |
| TM_DELTA_CPU_TIME           | NUMBER       | Amount of time this session spent on CPU over the last TM_DELTA_TIME microseconds                                                                                       |
| TM_DELTA_DB_TIME            | NUMBER       | Amount of time spent by this session in database calls over the last TM_DELTA_TIME microseconds                                                                         |
| DELTA_TIME                  | NUMBER       | Time interval (in microseconds) since the last time this session was sampled or created, over which the next five statistics are accumulated                            |
| DELTA_READ_IO_REQUESTS      | NUMBER       | Number of read I/O requests made by this session over the last DELTA_TIME microseconds                                                                                  |
| DELTA_WRITE_IO_REQUESTS     | NUMBER       | Number of write I/O requests made by this session over the last DELTA_TIME microseconds                                                                                 |
| DELTA_READ_IO_BYTES         | NUMBER       | Number of I/O bytes read by this session over the last DELTA_TIME microseconds                                                                                          |
| DELTA_WRITE_IO_BYTES        | NUMBER       | Number of I/O bytes written by this session over the last DELTA_TIME microseconds                                                                                       |
| DELTA_INTERCONNECT_IO_BYTES | NUMBER       | Number of I/O bytes sent over the I/O interconnect over the last DELTA_TIME microseconds                                                                                |
| DELTA_READ_MEM_BYTES        | NUMBER       | Number of read bytes through the buffer cache                                                                                                                           |
| PGA_ALLOCATED               | NUMBER       | Amount of PGA memory (in bytes) consumed by this session at the time this sample was taken                                                                              |

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TEMP_SPACE_ALLOCATED | NUMBER       | Amount of TEMP memory (in bytes) consumed by this session at the time this sample was taken                                                                                                                                                                                                                                                                                                                                                     |
| CON_DBID             | NUMBER       | The database ID of the pluggable database (PDB)                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| DBOP_NAME            | VARCHAR2(30) | Database operation name. If the type is SQL, the DBOP_NAME will be NULL.                                                                                                                                                                                                                                                                                                                                                                        |
| DBOP_EXEC_ID         | NUMBER       | Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.                                                                                                                                                                                                                                                                                                                           |

## 8.9 V\$ACTIVITY\_MVIEW

V\$ACTIVITY\_MVIEW describes the materialized view activity snapshots that are currently being taken by the Object Activity Tracking System (OATS).

Each row in this view represents one in-progress activity snapshot and describes the materialized view activity that has occurred so far during the snapshot interval.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MVIEW_NAME  | VARCHAR2(128) | Name of the materialized view for which the activity snapshot is being taken                                                                                                                                                                                                                                                 |
| MVIEW_OWNER | VARCHAR2(128) | Owner of the materialized view for which the activity snapshot is being taken                                                                                                                                                                                                                                                |
| USER_CLASS  | VARCHAR2(7)   | Indicates whether the activity was performed by the RDBMS (SYS) or by a user (NON-SYS)                                                                                                                                                                                                                                       |
| COMPILES    | NUMBER        | Number of times the materialized view was compiled<br>This number includes: <ul style="list-style-type: none"> <li>• Explicit compiles performed with the SQL statement ALTER MATERIALIZED VIEW ... COMPILE</li> <li>• Automatic compiles that occurred because the structure of an underlying base table changed</li> </ul> |

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REWRITES_TEXTMATCH     | NUMBER   | Number of query rewrites that used the text match rewrite method                                                                                                                                                                                                                                                                                                                                                                                      |
| REWRITES_GENERAL       | NUMBER   | Number of query rewrites that used general rewrite methods                                                                                                                                                                                                                                                                                                                                                                                            |
| REWRITES_PARTIAL       | NUMBER   | Number of query rewrites that occurred when the view was partially stale<br>This number includes: <ul style="list-style-type: none"> <li>• UNION ALL operations involving rewritten queries that had one branch with the materialized view and the other branch with its underlying base tables (partial rewrites)</li> <li>• Single query block rewrites of the materialized view that involved a join back to its underlying base table</li> </ul>  |
| REWRITES_DELTA         | NUMBER   | Number of query rewrites that used stale data in the materialized view plus the delta information stored in the materialized view logs                                                                                                                                                                                                                                                                                                                |
| REWRITES_PCT           | NUMBER   | Number of partition change tracking (PCT) rewrites                                                                                                                                                                                                                                                                                                                                                                                                    |
| REWRITES_HINTED        | NUMBER   | Number of query rewrites that occurred because the materialized view was eligible for query rewrite and the SELECT statement contained the REWRITE hint with the name of the materialized view specified in the hint                                                                                                                                                                                                                                  |
| NOREWRITES_HINTED      | NUMBER   | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NOREWRITES_STALE       | NUMBER   | Number of query executions that did not use query rewrite because the materialized view was eligible for query rewrite, but stale                                                                                                                                                                                                                                                                                                                     |
| REFRESHES_ON_DEMAND    | NUMBER   | Number of ON DEMAND refreshes<br>This type of refresh is performed on materialized views that use the ON DEMAND refresh mode, which instructs the database to refresh the materialized view only when a manual refresh is launched by one of the three DBMS_MVIEW refresh procedures.                                                                                                                                                                 |
| REFRESHES_ON_COMMIT    | NUMBER   | Number of ON COMMIT refreshes<br>This type of refresh is performed on materialized views that use the ON COMMIT refresh mode, which instructs the database to refresh the materialized view whenever the database commits a transaction that operates on a master table of the materialized view.                                                                                                                                                     |
| REFRESHES_ON_STATEMENT | NUMBER   | Number of ON STATEMENT refreshes<br>This type of refresh is performed on materialized views that use the ON STATEMENT refresh mode, which instructs the database to perform an automatic refresh of the materialized view every time a DML operation is performed on any of the view's base tables.                                                                                                                                                   |
| REFRESHES_SCHEDULED    | NUMBER   | Number of scheduled refreshes                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REFRESHES_AUTOMATIC    | NUMBER   | Number of automatic refreshes                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REFRESHES_FAST         | NUMBER   | Number of incremental refreshes                                                                                                                                                                                                                                                                                                                                                                                                                       |
| REFRESHES_COMPLETE     | NUMBER   | Number of full refreshes                                                                                                                                                                                                                                                                                                                                                                                                                              |
| REFRESHES_PCT          | NUMBER   | Number of partition change tracking (PCT) refreshes                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

The counts in this view are approximate in order to keep system overhead low. Also, there are database activities, such as statistics collection, query compilation, and query optimization, that may cause the counts to be different than expected or to vary slightly across successive queries.

**Note**

This view is available starting with Oracle Database 21c.

## 8.10 V\$ACTIVITY\_TABLE

V\$ACTIVITY\_TABLE describes the table activity snapshots that are currently being taken by the Object Activity Tracking System (OATS).

Each row in this view represents one in-progress activity snapshot and describes the table activity that has occurred so far during the snapshot interval.

| Column                   | Datatype      | Description                                                                               |
|--------------------------|---------------|-------------------------------------------------------------------------------------------|
| TABLE_NAME               | VARCHAR2(128) | Name of the table for which the activity snapshot is being taken                          |
| TABLE_OWNER              | VARCHAR2(128) | Owner of the table for which the activity snapshot is being taken                         |
| USER_CLASS               | VARCHAR2      | Reserved for future use                                                                   |
| SCANS                    | NUMBER        | Number of table scans                                                                     |
| LOADS                    | NUMBER        | Number of table loads                                                                     |
| LOAD_ROWS                | NUMBER        | Number of rows that were loaded into the table                                            |
| INSERT_ROWS              | NUMBER        | Number of rows that were inserted into the table                                          |
| DELETE_ROWS              | NUMBER        | Number of rows that were deleted from the table                                           |
| UPDATE_ROWS              | NUMBER        | Number of table rows that were updated                                                    |
| TRUNCATES                | NUMBER        | Number of table truncations                                                               |
| TRUNCATED_ROWS           | NUMBER        | Number of table rows that were deleted due to table truncations                           |
| PARTITION_TRUNCATES      | NUMBER        | Number of table partition or subpartition truncations                                     |
| PARTITION_TRUNCATED_ROWS | NUMBER        | Number of table rows that were deleted due to table partition or subpartition truncations |
| PARTITION_CREATES        | NUMBER        | Number of table partitions or subpartitions that were created                             |
| PARTITION_DROPS          | NUMBER        | Number of table partition or subpartition drops                                           |
| PARTITION_DROPS_ROWS     | NUMBER        | Number of table rows that were dropped due to table partition or subpartition drops       |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARTITION_MOVES          | NUMBER   | Number of table partition or subpartition moves                                                                                                                                                                                                                                                                                                                                                                                                        |
| PARTITION_MOVES_ROWS     | NUMBER   | Number of table rows that were moved due to table partition or subpartition moves                                                                                                                                                                                                                                                                                                                                                                      |
| PARTITION_SPLITS         | NUMBER   | Number of table partition or subpartition splits                                                                                                                                                                                                                                                                                                                                                                                                       |
| PARTITION_SPLITS_ROWS    | NUMBER   | Number of table rows that were split due to table partition or subpartition splits                                                                                                                                                                                                                                                                                                                                                                     |
| PARTITION_MERGES         | NUMBER   | Number of table partition or subpartition merges                                                                                                                                                                                                                                                                                                                                                                                                       |
| PARTITION_MERGES_ROWS    | NUMBER   | Number of table rows that were merged due to table partition or subpartition merges                                                                                                                                                                                                                                                                                                                                                                    |
| PARTITION_COALESCE       | NUMBER   | Number of table partition or subpartition coalesces                                                                                                                                                                                                                                                                                                                                                                                                    |
| PARTITION_COALESCE_ROWS  | NUMBER   | Number of table rows that were redistributed due to table partition or subpartition coalesces                                                                                                                                                                                                                                                                                                                                                          |
| PARTITION_EXCHANGES      | NUMBER   | Number of table partition or subpartition exchanges                                                                                                                                                                                                                                                                                                                                                                                                    |
| PARTITION_EXCHANGES_ROWS | NUMBER   | Number of table rows that were exchanged due to table partition or subpartition exchanges                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                   | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

The counts in this view are approximate in order to keep system overhead low. Also, there are database activities, such as statistics collection, query compilation, and query optimization, that may cause the counts to be different than expected or to vary slightly across successive queries.

**Note**

This view does not contain information related to temporary tables or external tables.

**Note**

This view is available starting with Oracle Database 21c.

| TARGET_DESC      | VARCHAR2(32)  | Description of the target of the advisor                                                                                                                                                                                                                                                                                                                                                                                                    |
| SOFAR            | NUMBER        | Amount of work done so far                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TOTALWORK        | NUMBER        | Total work to be done                                                                                                                                                                                                                                                                                                                                                                                                                       |
| UNITS            | VARCHAR2(32)  | Units that the work is measured in                                                                                                                                                                                                                                                                                                                                                                                                          |
| BENEFIT_SOFAR    | NUMBER        | Benefit obtained so far                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BENEFIT_MAX      | NUMBER        | Estimate of maximum benefit that could be obtained                                                                                                                                                                                                                                                                                                                                                                                          |
| FINDINGS         | NUMBER        | Number of findings so far                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RECOMMENDATIONS  | NUMBER        | Number of recommendations so far                                                                                                                                                                                                                                                                                                                                                                                                            |
| TIME_REMAINING   | NUMBER        | Estimate of time remaining for the completion of the task (in seconds)                                                                                                                                                                                                                                                                                                                                                                      |
| START_TIME       | DATE          | Start time of the task                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_UPDATE_TIME | DATE          | Last time progress was posted                                                                                                                                                                                                                                                                                                                                                                                                               |
| ELAPSED_SECONDS  | NUMBER        | Elapsed time so far                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ADVISOR_METRIC1  | NUMBER        | Value of the advisor-specific metric                                                                                                                                                                                                                                                                                                                                                                                                        |
| METRIC1_DESC     | VARCHAR2(64)  | Description of the advisor-specific metric                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXECUTION_TYPE   | VARCHAR2(64)  | Type of the last execution. This information is optional for single-execution tasks.                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.12 V\$ALERT\_TYPES

V\$ALERT\_TYPES displays information about server alert types.

| Column      | Datatype     | Description            |
|-------------|--------------|------------------------|
| REASON_ID   | NUMBER       | ID of the alert reason |
| OBJECT_TYPE | VARCHAR2(64) | Object type            |

| Column                   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE                     | VARCHAR2(9)  | Alert type: <ul style="list-style-type: none"> <li>Stateful</li> <li>Stateless</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| GROUP_NAME               | VARCHAR2(64) | Group name                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SCOPE                    | VARCHAR2(8)  | Scope: <ul style="list-style-type: none"> <li>Database</li> <li>Instance</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |
| INTERNAL_METRIC_CATEGORY | VARCHAR2(64) | Internal metric category                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTERNAL_METRIC_NAME     | VARCHAR2(64) | Internal metric name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.13 V\$ALL\_ACTIVE\_SESSION\_HISTORY

V\$ALL\_ACTIVE\_SESSION\_HISTORY displays sampled session activity in the database.

### ① Note

V\$ALL\_ACTIVE\_SESSION\_HISTORY allows application developers to view their own session activity. It is similar to the V\$ACTIVE\_SESSION\_HISTORY view, with the following exception:

- When queried by a user with the SYSDBA privilege, the V\$ALL\_ACTIVE\_SESSION\_HISTORY view displays the same data as the V\$ACTIVE\_SESSION\_HISTORY view.
- When queried by any other user, the V\$ALL\_ACTIVE\_SESSION\_HISTORY view displays only data about sessions owned by that user.

See also "[V\\$ACTIVE\\_SESSION\\_HISTORY](#)"

| Column          | Datatype     | Description                                                                                                                                          |
|-----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLE_ID       | NUMBER       | ID of the sample                                                                                                                                     |
| SAMPLE_TIME     | TIMESTAMP(3) | Time at which the sample was taken                                                                                                                   |
| SAMPLE_TIME_UTC | TIMESTAMP(3) | Time at which the sample was taken in UTC (Coordinated Universal Time) time zone                                                                     |
| USECS_PER_ROW   | NUMBER       | Time in microseconds since the last sample was taken                                                                                                 |
| IS_AWR_SAMPLE   | VARCHAR2(1)  | Indicates whether this sample has been flushed or will be flushed to the Automatic Workload Repository (DBA_HIST_ACTIVE_SESS_HISTORY) (Y) or not (N) |
| SESSION_ID      | NUMBER       | Session identifier; maps to V\$SESSION.SID                                                                                                           |

| Column                        | Datatype     | Description                                                                                                                                                                           |
|-------------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_SERIAL#               | NUMBER       | Session serial number (used to uniquely identify a session's objects); maps to V\$SESSION.SERIAL#                                                                                     |
| SESSION_TYPE                  | VARCHAR2(10) | Session type: <ul style="list-style-type: none"> <li>• FOREGROUND</li> <li>• BACKGROUND</li> </ul>                                                                                    |
| FLAGS                         | NUMBER       | Reserved for future use                                                                                                                                                               |
| USER_ID                       | NUMBER       | Oracle user identifier; maps to V\$SESSION.USER#                                                                                                                                      |
| SQL_ID                        | VARCHAR2(13) | SQL identifier of the SQL statement that the session was executing at the time of sampling                                                                                            |
| IS_SQLID_CURRENT              | VARCHAR2(1)  | Indicates whether the SQL identifier in the SQL_ID column is being executed (Y) or not (N)                                                                                            |
| SQL_CHILD_NUMBER              | NUMBER       | Child number of the SQL statement that the session was executing at the time of sampling                                                                                              |
| SQL_OPCODE                    | NUMBER       | Indicates what phase of operation the SQL statement was in; maps to V\$SESSION.COMMAND<br><b>See Also:</b> " <a href="#">V\$SESSION</a> " for information on interpreting this column |
| SQL_OPNAME                    | VARCHAR2(64) | SQL command name                                                                                                                                                                      |
| FORCE_MATCHING_SIGNATURE      | NUMBER       | Signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                                                      |
| TOP_LEVEL_SQL_ID              | VARCHAR2(13) | SQL identifier of the top level SQL statement                                                                                                                                         |
| TOP_LEVEL_SQL_OPCODE          | NUMBER       | Indicates what phase of operation the top level SQL statement was in                                                                                                                  |
| SQL_ADAPTIVE_PLAN_RESOLVED    | NUMBER       | Indicates whether the SQL plan of the sampled database session is a resolved adaptive plan or not                                                                                     |
| SQL_FULL_PLAN_HASH_VALUE      | NUMBER       | Numerical representation of the complete SQL plan for the cursor being executed by this session                                                                                       |
| SQL_PLAN_HASH_VALUE           | NUMBER       | Numeric representation of the SQL plan for the cursor. This information might not be available for all session samples. V\$SESSION does not contain this information.                 |
| SQL_PLAN_LINE_ID              | NUMBER       | SQL plan line ID                                                                                                                                                                      |
| SQL_PLAN_OPERATION            | VARCHAR2(30) | Plan operation name                                                                                                                                                                   |
| SQL_PLAN_OPTIONS              | VARCHAR2(30) | Plan operation options                                                                                                                                                                |
| SQL_EXEC_ID                   | NUMBER       | SQL execution identifier                                                                                                                                                              |
| SQL_EXEC_START                | DATE         | Time when the execution of the SQL started                                                                                                                                            |
| PLSQL_ENTRY_OBJECT_ID         | NUMBER       | Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.OBJECT_ID.                                          |
| PLSQL_ENTRY_SUBPROGRAM_ID     | NUMBER       | Subprogram ID of the top-most PL/SQL subprogram on the stack. Maps to DBA_OBJECTS.DATA_OBJECT_ID.                                                                                     |
| PLSQL_OBJECT_ID               | NUMBER       | Object ID of the currently executing PL/SQL subprogram. Maps to DBA_OBJECTS.OBJECT_ID.                                                                                                |
| PLSQL_SUBPROGRAM_ID           | NUMBER       | Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL. Maps to DBA_OBJECTS.DATA_OBJECT_ID.                                                                    |
| PLSQL_CURRENT_ENTRY_OBJECT_ID | NUMBER       | Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL.                                                                                                        |
| QC_INSTANCE_ID                | NUMBER       | Query coordinator instance ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                          |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QC_SESSION_ID      | NUMBER       | Query coordinator session ID. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                                                                                                                                                                                                                                                                                                                                                                           |
| QC_SESSION_SERIAL# | NUMBER       | Query coordinator session serial number. This information is only available if the sampled session is a parallel query worker. For all other sessions, the value is 0.                                                                                                                                                                                                                                                                                                                                                                |

| WAIT_CLASS         | VARCHAR2(64) | Wait class name of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS.                                                                                                                                                                                                                                                                                                                                                         |
| WAIT_CLASS_ID      | NUMBER       | Wait class identifier of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the EVENT column. Maps to V\$SESSION.WAIT_CLASS_ID.                                                                                                                                                                                                                                                                                                                                                |
| WAIT_TIME          | NUMBER       | Total wait time for the event for which the session last waited if the session was on the CPU when sampled; 0 if the session was waiting at the time of sampling<br><br><b>Note:</b> Whether or not WAIT_TIME = 0 is what is useful to find the SESSION_STATE at the time of sampling, rather than the actual value of WAIT_TIME itself. Maps to V\$SESSION.WAIT_TIME.                                                                                                                                                                |
| SESSION_STATE      | VARCHAR2(7)  | Session state: <ul style="list-style-type: none"> <li>• WAITING</li> <li>• ON CPU</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED        | NUMBER       | If SESSION_STATE = WAITING, then the time that the session actually spent waiting for that event (in microseconds). This column is set for waits that were in progress at the time the sample was taken.<br><br>If a wait event lasted for more than a second and was caught waiting in more than one session sample row, then the actual time spent waiting for that wait event will be populated in the last of those session sample rows. At any given time, this information will not be available for the latest session sample. |

| Column                   | Datatype     | Description                                                                                                                                                                                                                        |
|--------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BLOCKING_SESSION_STATUS  | VARCHAR2(11) | Status of the blocking session: <ul style="list-style-type: none"> <li>• VALID</li> <li>• NO HOLDER</li> <li>• GLOBAL</li> <li>• NOT IN WAIT</li> <li>• UNKNOWN</li> </ul>                                                         |
| BLOCKING_SESSION         | NUMBER       | Session identifier of the blocking session. Populated only if the blocker is on the same instance and the session was waiting for enqueues or a "buffer busy" wait. Maps to V\$SESSION.BLOCKING_SESSION.                           |
| BLOCKING_SESSION_SERIAL# | NUMBER       | Serial number of the blocking session                                                                                                                                                                                              |
| BLOCKING_INST_ID         | NUMBER       | Instance number of the blocker shown in BLOCKING_SESSION                                                                                                                                                                           |
| BLOCKING_HANGCHAIN_INFO  | VARCHAR2(1)  | Indicates whether the information about BLOCKING_SESSION comes from the hang chain (Y) or not (N)                                                                                                                                  |
| CURRENT_OBJ#             | NUMBER       | Object ID of the object that the session is referencing. This information is only available if the session was waiting for application, cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_OBJ#.          |
| CURRENT_FILE#            | NUMBER       | File number of the file containing the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_FILE#. |
| CURRENT_BLOCK#           | NUMBER       | ID of the block that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_BLOCK#.                             |
| CURRENT_ROW#             | NUMBER       | Row identifier that the session is referencing. This information is only available if the session was waiting for cluster, concurrency, and user I/O wait events. Maps to V\$SESSION.ROW_WAIT_ROW#.                                |
| TOP_LEVEL_CALL#          | NUMBER       | Oracle top level call number                                                                                                                                                                                                       |
| TOP_LEVEL_CALL_NAME      | VARCHAR2(64) | Oracle top level call name                                                                                                                                                                                                         |
| CONSUMER_GROUP_ID        | NUMBER       | Consumer group ID                                                                                                                                                                                                                  |
| XID                      | RAW(8)       | Transaction ID that the session was working on at the time of sampling. V\$SESSION does not contain this information.                                                                                                              |
| REMOTE_INSTANCE#         | NUMBER       | Remote instance identifier that will serve the block that this session is waiting for. This information is only available if the session was waiting for cluster events.                                                           |
| TIME_MODEL               | NUMBER       | Time model information                                                                                                                                                                                                             |
| IN_CONNECTION_MGMT       | VARCHAR2(1)  | Indicates whether the session was doing connection management at the time of sampling (Y) or not (N)                                                                                                                               |
| IN_PARSE                 | VARCHAR2(1)  | Indicates whether the session was parsing at the time of sampling (Y) or not (N)                                                                                                                                                   |
| IN_HARD_PARSE            | VARCHAR2(1)  | Indicates whether the session was hard parsing at the time of sampling (Y) or not (N)                                                                                                                                              |
| IN_SQL_EXECUTION         | VARCHAR2(1)  | Indicates whether the session was executing SQL statements at the time of sampling (Y) or not (N)                                                                                                                                  |
| IN_PLSQL_EXECUTION       | VARCHAR2(1)  | Indicates whether the session was executing PL/SQL at the time of sampling (Y) or not (N)                                                                                                                                          |
| IN_PLSQL_RPC             | VARCHAR2(1)  | Indicates whether the session was executing inbound PL/SQL RPC calls at the time of sampling (Y) or not (N)                                                                                                                        |

| Column                      | Datatype     | Description                                                                                                                                                             |
|-----------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IN_PLSQL_COMPILATION        | VARCHAR2(1)  | Indicates whether the session was compiling PL/SQL at the time of sampling (Y) or not (N)                                                                               |
| IN_JAVA_EXECUTION           | VARCHAR2(1)  | Indicates whether the session was executing Java at the time of sampling (Y) or not (N)                                                                                 |
| IN_BIND                     | VARCHAR2(1)  | Indicates whether the session was doing bind operations at the time of sampling (Y) or not (N)                                                                          |
| IN_CURSOR_CLOSE             | VARCHAR2(1)  | Indicates whether the session was closing a cursor at the time of sampling (Y) or not (N)                                                                               |
| IN_SEQUENCE_LOAD            | VARCHAR2(1)  | Indicates whether the session is loading in sequence (in sequence load code) (Y) or not (N)                                                                             |
| IN_INMEMORY_QUERY           | VARCHAR2(1)  | Indicates whether the session was querying the In-Memory Column Store (IM column store) at the time of sampling (Y) or not (N)                                          |
| IN_INMEMORY_POPULATE        | VARCHAR2(1)  | Indicates whether the session was populating the IM column store at the time of sampling (Y) or not (N)                                                                 |
| IN_INMEMORY_PREPOPULATE     | VARCHAR2(1)  | Indicates whether the session was prepopulating the IM column store at the time of sampling (Y) or not (N)                                                              |
| IN_INMEMORY_REPOPULATE      | VARCHAR2(1)  | Indicates whether the session was repopulating the IM column store at the time of sampling (Y) or not (N)                                                               |
| IN_INMEMORY_TREPOPULATE     | VARCHAR2(1)  | Indicates whether the session was trickle repopulating the IM column store at the time of sampling (Y) or not (N)                                                       |
| IN_TABLESPACE_ENCRYPTION    | VARCHAR2(1)  | Indicates whether encryption or decryption of a tablespace occurred at the time of sampling (Y) or not (N)                                                              |
| CAPTURE_OVERHEAD            | VARCHAR2(1)  | Indicates whether the session is executing capture code (Y) or not (N)                                                                                                  |
| REPLAY_OVERHEAD             | VARCHAR2(1)  | Indicates whether the session is executing replay code (Y) or not (N)                                                                                                   |
| IS_CAPTURED                 | VARCHAR2(1)  | Indicates whether the session is being captured (Y) or not (N)                                                                                                          |
| IS_REPLAYED                 | VARCHAR2(1)  | Indicates whether the session is being replayed (Y) or not (N)                                                                                                          |
| IS_REPLAY_SYNC_TOKEN_HOLDER | VARCHAR2(1)  | Indicates whether the session is holding a synchronization token (Y) or not (N) during workload replay                                                                  |
| SERVICE_HASH                | NUMBER       | Hash that identifies the Service; maps to V\$ACTIVE_SERVICES.NAME_HASH                                                                                                  |
| PROGRAM                     | VARCHAR2(84) | Name of the operating system program                                                                                                                                    |
| MODULE                      | VARCHAR2(64) | Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure                                                                     |
| ACTION                      | VARCHAR2(64) | Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure                                                                     |
| CLIENT_ID                   | VARCHAR2(64) | Client identifier of the session; maps to V\$SESSION.CLIENT_IDENTIFIER                                                                                                  |
| MACHINE                     | VARCHAR2(64) | Client's operating system machine name                                                                                                                                  |
| PORT                        | NUMBER       | Client port number                                                                                                                                                      |
| ECID                        | VARCHAR2(64) | Execution context identifier (sent by Application Server)                                                                                                               |
| DBREPLAY_FILE_ID            | NUMBER       | If the session is being captured or replayed, then DBREPLAY_FILE_ID is the file ID for the workload capture or workload replay; otherwise it is NULL.                   |
| DBREPLAY_CALL_COUNTER       | NUMBER       | If the session is being captured or replayed, then DBREPLAY_CALL_COUNTER is the call counter of the user call that is being captured or replayed; otherwise it is NULL. |

| Column                      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TM_DELTA_TIME               | NUMBER       | Time interval (in microseconds) over which TM_DELTA_CPU_TIME and TM_DELTA_DB_TIME are accumulated                                                                                                                                                                                                                                                                                                                                                     |
| TM_DELTA_CPU_TIME           | NUMBER       | Amount of time this session spent on CPU over the last TM_DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                                     |
| TM_DELTA_DB_TIME            | NUMBER       | Amount of time spent by this session in database calls over the last TM_DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                       |
| DELTA_TIME                  | NUMBER       | Time interval (in microseconds) since the last time this session was sampled or created, over which the next five statistics are accumulated                                                                                                                                                                                                                                                                                                          |
| DELTA_READ_IO_REQUESTS      | NUMBER       | Number of read I/O requests made by this session over the last DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                                |
| DELTA_WRITE_IO_REQUESTS     | NUMBER       | Number of write I/O requests made by this session over the last DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                               |
| DELTA_READ_IO_BYTES         | NUMBER       | Number of I/O bytes read by this session over the last DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                                        |
| DELTA_WRITE_IO_BYTES        | NUMBER       | Number of I/O bytes written by this session over the last DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                                     |
| DELTA_INTERCONNECT_IO_BYTES | NUMBER       | Number of I/O bytes sent over the I/O interconnect over the last DELTA_TIME microseconds                                                                                                                                                                                                                                                                                                                                                              |
| DELTA_READ_MEM_BYTES        | NUMBER       | Number of read bytes through the buffer cache                                                                                                                                                                                                                                                                                                                                                                                                         |
| PGA_ALLOCATED               | NUMBER       | Amount of PGA memory (in bytes) consumed by this session at the time this sample was taken                                                                                                                                                                                                                                                                                                                                                            |
| TEMP_SPACE_ALLOCATED        | NUMBER       | Amount of TEMP memory (in bytes) consumed by this session at the time this sample was taken                                                                                                                                                                                                                                                                                                                                                           |
| CON_DBID                    | NUMBER       | The database ID of the pluggable database (PDB)                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| DBOP_NAME                   | VARCHAR2(30) | Database operation name. If the type is SQL, the DBOP_NAME will be NULL.                                                                                                                                                                                                                                                                                                                                                                              |
| DBOP_EXEC_ID                | NUMBER       | Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.                                                                                                                                                                                                                                                                                                                                 |

## 8.14 V\$ALL\_SQL\_MONITOR

V\$ALL\_SQL\_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

### Note

V\$ALL\_SQL\_MONITOR allows application developers to view information about their own SQL statements. It is similar to the V\$SQL\_MONITOR view, with the following exception:

- When queried by a user with the SYSDBA privilege, the V\$ALL\_SQL\_MONITOR view displays the same data as the V\$SQL\_MONITOR view.
- When queried by any other user, the V\$ALL\_SQL\_MONITOR view displays data only about SQL statements that were executed in sessions owned by that user.

See also "[V\\$SQL\\_MONITOR](#)"

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY                       | NUMBER        | Artificial join key to efficiently join V\$ALL_SQL_MONITOR with its corresponding plan level monitoring statistics stored in V\$ALL_SQL_PLAN_MONITOR                                                                                                                                                                                                                                                                                                                          |
| REPORT_ID                 | NUMBER        | Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity                                                                                                                                                                                                                                                                                                                                                                           |
| STATUS                    | VARCHAR2(19)  | SQL execution status: <ul style="list-style-type: none"> <li>• QUEUED - SQL statement is queued</li> <li>• EXECUTING - SQL statement is still executing</li> <li>• DONE (ERROR) - Execution terminated with an error</li> <li>• DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>• DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>• DONE - Execution terminated (parallel execution)</li> </ul> |
| USER#                     | NUMBER        | User ID of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                               |
| USERNAME                  | VARCHAR2(128) | User name of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                             |
| MODULE                    | VARCHAR2(64)  | Name of the executing module when sampled, as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure                                                                                                                                                                                                                                                                                                                                                                           |
| ACTION                    | VARCHAR2(64)  | Name of the executing action when sampled, as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure                                                                                                                                                                                                                                                                                                                                                                           |
| SERVICE_NAME              | VARCHAR2(64)  | Service name of the user session                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CLIENT_IDENTIFIER         | VARCHAR2(64)  | Client identifier from the user session                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CLIENT_INFO               | VARCHAR2(64)  | Client information for the user session                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PROGRAM                   | VARCHAR2(84)  | Name of the operating system program that issued the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                            |
| PLSQL_ENTRY_OBJECT_ID     | NUMBER        | Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                                                                                                                                                  |
| PLSQL_ENTRY_SUBPROGRAM_ID | NUMBER        | Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                                                                                                                                              |
| PLSQL_OBJECT_ID           | NUMBER        | Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLSQL_OWNER_ID           | NUMBER         | ID of the owner of the currently executing PL/SQL subprogram; NULL if executing SQL                                                                                                                                                                                                                                                                |
| PLSQL_SUBPROGRAM_ID      | NUMBER         | Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL                                                                                                                                                                                                                                                                      |
| FIRST_REFRESH_TIME       | DATE           | Time when monitoring of the SQL statement started, generally a few seconds after execution start time                                                                                                                                                                                                                                              |
| LAST_REFRESH_TIME        | DATE           | Time when statistics in V\$SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.                                                                                                                                                                                       |
| REFRESH_COUNT            | NUMBER         | Number of times V\$SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)                                                                                                                                                                                                                        |
| DBOP_EXEC_ID             | NUMBER         | Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.                                                                                                                                                                                                                              |
| DBOP_NAME                | VARCHAR2(30)   | Database operation name. If the type is SQL, the DBOP_NAME will be NULL.                                                                                                                                                                                                                                                                           |
| SID                      | NUMBER         | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                |
| PROCESS_NAME             | VARCHAR2(5)    | Process name identifier executing (or having executed) the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)                                                                                                                                                                    |
| SQL_ID                   | VARCHAR2(13)   | SQL identifier of the statement being monitored                                                                                                                                                                                                                                                                                                    |
| SQL_TEXT                 | VARCHAR2(2000) | Up to the first 2000 characters of the text of the SQL being monitored                                                                                                                                                                                                                                                                             |
| IS_FULL_SQLTEXT          | VARCHAR2(1)    | Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)                                                                                                                                                                                                                                                                       |
| SQL_EXEC_START           | DATE           | Time when the execution started                                                                                                                                                                                                                                                                                                                    |
| SQL_EXEC_ID              | NUMBER         | Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.                                                                                                                                          |
| SQL_PLAN_HASH_VALUE      | NUMBER         | SQL plan hash value                                                                                                                                                                                                                                                                                                                                |
| SQL_FULL_PLAN_HASH_VALUE | NUMBER         | Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| EXACT_MATCHING_SIGNATURE | NUMBER         | Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.                                                                                                                                                                                             |
| FORCE_MATCHING_SIGNATURE | NUMBER         | Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds                                                                                                                                                                                                                                                                |
| SQL_CHILD_ADDRESS        | RAW(8)         | Address of the child cursor (can be used with SQL_ID to join with V\$SQL)                                                                                                                                                                                                                                                                          |
| SESSION_SERIAL#          | NUMBER         | Session serial number executing the statement being monitored                                                                                                                                                                                                                                                                                      |
| PX_IS_CROSS_INSTANCE     | VARCHAR2(1)    | Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)                                                                                                                                                                                                                                                          |
| PX_MAXDOP                | NUMBER         | Maximum degree of parallelism for any plan operation executed on behalf of the monitored SQL                                                                                                                                                                                                                                                       |
| PX_MAXDOP_INSTANCES      | NUMBER         | Number of database instances touched at the maximum degree of parallelism                                                                                                                                                                                                                                                                          |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                |
|-------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PX_SERVERS_REQUESTED    | NUMBER        | Total number of parallel execution servers requested to execute the monitored SQL                                                                                                                                                                                                          |
| PX_SERVERS_ALLOCATED    | NUMBER        | Actual number of parallel execution servers allocated to execute the query                                                                                                                                                                                                                 |
| PX_SERVER#              | NUMBER        | Logical parallel execution server process number executing (or having executed) the statement being monitored; NULL if this monitoring entry is not associated with an execution server. This is a logical number within the parallel server set (see SERVER# in V\$PX_SESSION).           |
| PX_SERVER_GROUP         | NUMBER        | Logical parallel execution server group number to which PX_SERVER# belongs (see SERVER_GROUP in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server. This value is generally 1 unless the SQL statement has one or more parallel sub-queries. |
| PX_SERVER_SET           | NUMBER        | Number (1 or 2) of the logical set of parallel execution servers to which PX_SERVER# belongs (see SERVER_SET in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server                                                                           |
| PX_QCINST_ID            | NUMBER        | Instance identifier where the parallel execution coordinator runs; NULL if PX_SERVER# is NULL                                                                                                                                                                                              |
| PX_QCSID                | NUMBER        | Session identifier for the parallel execution coordinator; NULL if PX_SERVER# is NULL                                                                                                                                                                                                      |
| ERROR_NUMBER            | VARCHAR2(40)  | Error number encountered in case a SQL fails to execute successfully (for example, 932 in case of ORA-00932)                                                                                                                                                                               |
| ERROR_FACILITY          | VARCHAR2(4)   | Error facility in case a SQL fails to execute successfully (for example, ORA in case of ORA-00932)                                                                                                                                                                                         |
| ERROR_MESSAGE           | VARCHAR2(256) | Detailed error message displayed corresponding to the error number and error facility when a SQL fails to execute successfully                                                                                                                                                             |
| BINDS_XML               | CLOB          | Information about bind variables used with the SQL, such as name, position, value, data type, and so on (stored in XML format)                                                                                                                                                             |
| OTHER_XML               | CLOB          | Additional information about SQL execution stored in XML format                                                                                                                                                                                                                            |
| ELAPSED_TIME            | NUMBER        | Elapsed time (in microseconds); updated as the statement executes                                                                                                                                                                                                                          |
| QUEUING_TIME            | NUMBER        | Duration of time (in microseconds) spent by SQL in the statement queue                                                                                                                                                                                                                     |
| CPU_TIME                | NUMBER        | CPU time (in microseconds); updated as the statement executes                                                                                                                                                                                                                              |
| FETCHES                 | NUMBER        | Number of fetches associated with the SQL statement; updated as the statement executes                                                                                                                                                                                                     |
| BUFFER_GETS             | NUMBER        | Number of buffer get operations; updated as the statement executes                                                                                                                                                                                                                         |
| DISK_READS              | NUMBER        | Number of disk reads; updated as the statement executes                                                                                                                                                                                                                                    |
| DIRECT_WRITES           | NUMBER        | Number of direct writes; updated as the statement executes                                                                                                                                                                                                                                 |
| IO_INTERCONNECT_BYTES   | NUMBER        | Number of I/O bytes exchanged between Oracle Database and the storage system                                                                                                                                                                                                               |
| PHYSICAL_READ_REQUESTS  | NUMBER        | Number of physical read I/O requests issued by the monitored SQL                                                                                                                                                                                                                           |
| PHYSICAL_READ_BYTES     | NUMBER        | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                       |
| PHYSICAL_WRITE_REQUESTS | NUMBER        | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                          |
| PHYSICAL_WRITE_BYTES    | NUMBER        | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                      |
| APPLICATION_WAIT_TIME   | NUMBER        | Application wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                 |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONCURRENCY_WAIT_TIME | NUMBER        | Concurrency wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                      |
| CLUSTER_WAIT_TIME     | NUMBER        | Cluster wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                          |
| USER_IO_WAIT_TIME     | NUMBER        | User I/O Wait Time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                         |
| PLSQL_EXEC_TIME       | NUMBER        | PL/SQL execution time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                      |
| JAVA_EXEC_TIME        | NUMBER        | Java execution time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                        |
| RM_LAST_ACTION        | VARCHAR2(48)  | The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> <li>CANCEL_SQL</li> <li>KILL_SESSION</li> <li>LOG_ONLY</li> <li>SWITCH TO &lt;CG NAME&gt;</li> </ul> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group. |
| RM_LAST_ACTION_REASON | VARCHAR2(128) | The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> <li>SWITCH_CPU_TIME</li> <li>SWITCH_IO_REQS</li> <li>SWITCH_IO_MBS</li> <li>SWITCH_ELAPSED_TIME</li> <li>SWITCH_IO_LOGICAL</li> </ul>                                                                                                                                                     |
| RM_LAST_ACTION_TIME   | DATE          | The time of the most recent action that was taken on this SQL operation by Resource Manager                                                                                                                                                                                                                                                                                                                                                                     |
| RM_CONSUMER_GROUP     | VARCHAR2(128) | The current consumer group for this SQL operation                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                 |
| CON_NAME              | VARCHAR2(128) | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                                     |
| ECID                  | VARCHAR2(64)  | Execution context identifier (sent by Application Server)                                                                                                                                                                                                                                                                                                                                                                                                       |
| IS_ADAPTIVE_PLAN      | VARCHAR2(1)   | Indicates whether the statistics are from an adaptive plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                                      |
| IS_FINAL_PLAN         | VARCHAR2(1)   | Indicates whether the statistics are from the final plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                                        |
| IN_DBOP_NAME          | VARCHAR2(30)  | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP                                                                                                                                                                                                                                                                                                 |
| IN_DBOP_EXEC_ID       | NUMBER        | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO                                                                                                                                                                                                                                                                                          |

| Column                         | Datatype      | Description                                                                                                                                                                                                                                       |
|--------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER        | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                            |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER        | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                             |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER        | Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| CURRENT_USER#                  | NUMBER        | Unique number identifying the current user                                                                                                                                                                                                        |
| CURRENT_USERNAME               | VARCHAR2(128) | Username for the current user                                                                                                                                                                                                                     |

## 8.15 V\$ALL\_SQL\_PLAN\_MONITOR

V\$ALL\_SQL\_PLAN\_MONITOR displays plan level monitoring statistics for each SQL statement found in V\$ALL\_SQL\_MONITOR.

### Note

V\$ALL\_SQL\_PLAN\_MONITOR allows application developers to view statistics about their own SQL statements. It is similar to the V\$SQL\_PLAN\_MONITOR view, with the following exception:

- When queried by a user with the SYSDBA privilege, the V\$ALL\_SQL\_PLAN\_MONITOR view displays the same data as the V\$SQL\_PLAN\_MONITOR view.
- When queried by any other user, the V\$ALL\_SQL\_PLAN\_MONITOR view displays data only about SQL statements that were executed in sessions owned by that user.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| KEY    | NUMBER   | Foreign key to efficiently join V\$ALL_SQL_PLAN_MONITOR with V\$ALL_SQL_MONITOR (see V\$ALL_SQL_MONITOR)                                                                                                                                                                                                                                                                                                                                              |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS               | VARCHAR2(19)  | SQL execution status: <ul style="list-style-type: none"> <li>EXECUTING - SQL statement is still executing</li> <li>DONE (ERROR) - Execution terminated with an error</li> <li>DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>DONE - Execution terminated (parallel execution)</li> </ul> |
| FIRST_REFRESH_TIME   | DATE          | Time when monitoring of the SQL statement started                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_REFRESH_TIME    | DATE          | Time when statistics were last updated for the SQL statement                                                                                                                                                                                                                                                                                                                                                            |
| FIRST_CHANGE_TIME    | DATE          | First time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                         |
| LAST_CHANGE_TIME     | DATE          | Last time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                          |
| REFRESH_COUNT        | NUMBER        | Number of times statistics have been refreshed                                                                                                                                                                                                                                                                                                                                                                          |
| SID                  | NUMBER        | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                                                                                     |
| PROCESS_NAME         | VARCHAR2(5)   | Process name identifier                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_ID               | VARCHAR2(13)  | SQL identifier                                                                                                                                                                                                                                                                                                                                                                                                          |
| SQL_EXEC_START       | DATE          | Time when the execution started                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_EXEC_ID          | NUMBER        | Execution identifier                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_PLAN_HASH_VALUE  | NUMBER        | SQL plan hash value                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_CHILD_ADDRESS    | RAW(8)        | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| PLAN_PARENT_ID       | NUMBER        | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                                                                                                                                                                           |
| PLAN_LINE_ID         | NUMBER        | Plan line number for the entry                                                                                                                                                                                                                                                                                                                                                                                          |
| PLAN_OPERATION       | VARCHAR2(30)  | Plan operation name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                  |
| PLAN_OPTIONS         | VARCHAR2(30)  | Plan option name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                     |
| PLAN_OBJECT_OWNER    | VARCHAR2(128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                                                                                                      |
| PLAN_OBJECT_NAME     | VARCHAR2(128) | Name of the table or index                                                                                                                                                                                                                                                                                                                                                                                              |
| PLAN_OBJECT_TYPE     | VARCHAR2(80)  | Type of the object                                                                                                                                                                                                                                                                                                                                                                                                      |
| PLAN_DEPTH           | NUMBER        | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.                                                                                                                                                                       |
| PLAN_POSITION        | NUMBER        | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                                                                                                                                                                                                     |
| PLAN_COST            | NUMBER        | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                        |
| PLAN_CARDINALITY     | NUMBER        | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                                                                                                                                                                                                  |
| PLAN_BYTES           | NUMBER        | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                                                                                                                                                                                                 |
| PLAN_TIME            | NUMBER        | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                   |
| PLAN_PARTITION_START | VARCHAR2(256) | Start partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                       |
| PLAN_PARTITION_STOP  | VARCHAR2(256) | Stop partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                        |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLAN_CPU_COST           | NUMBER   | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_IO_COST            | NUMBER   | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_TEMP_SPACE         | NUMBER   | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                              |
| STARTS                  | NUMBER   | Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).                                                                                                                                                                                                                                               |
| OUTPUT_ROWS             | NUMBER   | Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen. |
| IO_INTERCONNECT_BYTES   | NUMBER   | Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_READ_REQUESTS  | NUMBER   | Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                    |
| PHYSICAL_READ_BYTES     | NUMBER   | Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                                |
| PHYSICAL_WRITE_REQUESTS | NUMBER   | Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                   |
| PHYSICAL_WRITE_BYTES    | NUMBER   | Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                               |
| WORKAREA_MEM            | NUMBER   | Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.                                                                                                                                                                                                                                                     |
| WORKAREA_MAX_MEM        | NUMBER   | Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement.                                                                                                                                                                                                                     |
| WORKAREA_TEMPSEG        | NUMBER   | Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished                                                                                                                                                                                                                                                                                              |
| WORKAREA_MAX_TEMPSEG    | NUMBER   | Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.                                                                                                                                                                                                                        |
| OTHERSTAT_GROUP_ID      | NUMBER   | Plan line statistic group identifier (see GROUP_ID column in V\$SQL_MONITOR_STATNAME)                                                                                                                                                                                                                                                                                                                                                                              |
| OTHERSTAT_1_ID          | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line                                                                                                                                                                                                                                                                                                                                                           |
| OTHERSTAT_1_TYPE        | NUMBER   | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OTHERSTAT_1_VALUE       | NUMBER   | Value of statistic number 1 of that plan line                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column             | Datatype | Description                                                                                               |
|--------------------|----------|-----------------------------------------------------------------------------------------------------------|

| OTHER_XML               | CLOB     | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>• Name of the schema against which the query was parsed</li> <li>• Release number of the Oracle Database that produced the explain plan</li> <li>• Hash value associated with the execution plan</li> <li>• Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>• Indication of whether or not dynamic statistics were used to produce the plan</li> <li>• The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> </ul> |
| PLAN_OPERATION_INACTIVE | NUMBER   | Indicates whether this plan operation was part of the final resolved plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 8.16 V\$AQ

V\$AQ displays statistics for the queues in the database.

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QID             | NUMBER   | Unique queue identifier                                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAITING         | NUMBER   | Number of messages in the queue in the state 'WAITING'                                                                                                                                                                                                                                                                                                                                                                                            |
| READY           | NUMBER   | Number of messages in the queue in the state 'READY'                                                                                                                                                                                                                                                                                                                                                                                              |
| EXPIRED         | NUMBER   | Number of messages in the queue the state 'EXPIRED'                                                                                                                                                                                                                                                                                                                                                                                               |
| AVERAGE_MSG_AGE | NUMBER   | Average age of the messages in the queue'                                                                                                                                                                                                                                                                                                                                                                                                         |
| TOTAL_WAIT      | NUMBER   | Total wait time of all 'READY' messages in the queue                                                                                                                                                                                                                                                                                                                                                                                              |
| AVERAGE_WAIT    | NUMBER   | Average wait time of 'READY' messages in the queue                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.18 V\$AQ\_BMAP\_NONDUR\_SUBSCRIBERS

V\$AQ\_BMAP\_NONDUR\_SUBSCRIBERS can be used to get the available bit positions. The view is queried to get the free bit position during creation of a non-durable subscriber.

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 8.19 V\$AQ\_CROSS\_INSTANCE\_JOBS

V\$AQ\_CROSS\_INSTANCE\_JOBS describes each of the cross process jobs.

Each job serves to forward messages for a shard from a source instance to a destination instance for a set of subscribers of a sharded queue.

**Note**

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column      | Datatype      | Description                        |
|-------------|---------------|------------------------------------|
| JOB_ID      | NUMBER        | Job ID within this coordinator     |
| SCHEMA_NAME | VARCHAR2(128) | Source schema of the job           |
| QUEUE_NAME  | VARCHAR2(128) | Source queue name of the cross job |
| SHARD_ID    | NUMBER        | Source shard ID                    |

| Column                  | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 8.21 V\$AQ\_IPC\_MSG\_STATS

V\$AQ\_IPC\_MSG\_STATS displays the statistics of each IPC message class, such as the total number of invocations of a message class, total pending message/processed message count, and last failure related data. Information like total processed message count, average pending time/average processing time gives a real-time outline of AQ IPC background state.

| Column                  | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.23 V\$AQ\_JOB\_COORDINATOR

V\$AQ\_JOB\_COORDINATOR lists performance statistics per coordinator, for every AQ coordinator controlled by the Oracle Database Advanced Queuing primary coordinator.

| Column           | Datatype     | Description                                                                                                                                          |
|------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| COORDINATOR_ID   | NUMBER       | ID of the coordinator                                                                                                                                |
| PROCESS_ID       | VARCHAR2(24) | Operating system process ID of the coordinator                                                                                                       |
| PROCESS_NAME     | VARCHAR2(48) | Operating system process name of the coordinator                                                                                                     |
| JOB_NAME         | VARCHAR2(32) | Name of the job handled                                                                                                                              |
| JOB_TYPE         | NUMBER       | Type of job handled                                                                                                                                  |
| SERVER_COUNT     | NUMBER       | Number of servers active                                                                                                                             |
| MAX_SERVER_COUNT | NUMBER       | Maximum server fanout achieved                                                                                                                       |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 8.24 V\$AQ\_MESSAGE\_CACHE

V\$AQ\_MESSAGE\_CACHE provides performance statistics of the message cache for sharded queues at the subshard level in the instance.

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID          | NUMBER       | Queue ID                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SHARD_ID          | NUMBER       | Shard ID                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PRIORITY          | NUMBER       | Priority of the subshard for dequeue, range 0-9                                                                                                                                                                                                                                                                                                                                                                                                 |
| SUBSHARD_ID       | NUMBER       | Subshard ID in the shard                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PARTITION_ID      | NUMBER       | Partition id for the particular subshard                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_MSGS          | NUMBER       | Maximum number of messages of subshard                                                                                                                                                                                                                                                                                                                                                                                                          |
| ENQUEUED_MSGS     | NUMBER       | Number of messages enqueued for the subshard                                                                                                                                                                                                                                                                                                                                                                                                    |
| MSGS_MADE_EXPIRED | NUMBER       | Number of messages made expired                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CHUNK_SIZE        | NUMBER       | The size of the memory chunk for storing messages                                                                                                                                                                                                                                                                                                                                                                                               |
| NUM_CHUNKS        | NUMBER       | Number of chunks for the subshard                                                                                                                                                                                                                                                                                                                                                                                                               |
| NUM_FREE_CHUNKS   | NUMBER       | Number of free chunks for the subshard                                                                                                                                                                                                                                                                                                                                                                                                          |
| USED_MEMORY_SIZE  | NUMBER       | Total estimated size of memory in use (in bytes) for the subshard                                                                                                                                                                                                                                                                                                                                                                               |
| STATE             | VARCHAR2(13) | Subshard state. Possible values: <ul style="list-style-type: none"> <li>CACHED (in memory)</li> <li>UNCACHED (on disk)</li> <li>UNCACHED_FREE</li> <li>CACHED_FREE</li> <li>UNKNOWN</li> </ul>                                                                                                                                                                                                                                                  |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.25 V\$AQ\_MESSAGE\_CACHE\_ADVICE

V\$AQ\_MESSAGE\_CACHE\_ADVICE shows simulated metrics for a range of potential message cache sizes. This view assists in cache sizing by providing information in the form of metrics as described below.

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column                  | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| AVG_SUBSHARD_SIZE       | NUMBER      | Simulated average number of messages per cached subshard                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| AVG_SUBSHARD_MEMORY     | NUMBER      | Simulated average memory per cached subshard (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AVG_EVICTION_TIME       | NUMBER      | Simulated average time to evict a cached subshard (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AVG_UNEVICTION_TIME     | NUMBER      | Simulated average time to unevict a cached subshard (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| FLAGS                   | NUMBER      | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SIMULATION_TIME         | NUMBER      | Amount of time that was simulated for (in minutes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.26 V\$AQ\_MESSAGE\_CACHE\_STAT

V\$AQ\_MESSAGE\_CACHE\_STAT displays statistics about memory management for sharded queues in the Streams pool within the System Global Area (SGA). Sharded queues use the Streams pool in units of subshards. Thus, columns of this view shows statistics at subshard level. This view shows statistics across all sharded queues.

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column           | Datatype | Description                                                                                                                       |
|------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| NUM_EVICTED      | NUMBER   | Number of evicted subshards across all sharded queues                                                                             |
| NUM_PREFETCHED   | NUMBER   | Number of subshards pre-fetched by AQ background process                                                                          |
| NUM_UNEVICTED    | NUMBER   | Number of subshards un-evicted by foreground process (like dequeue process)                                                       |
| NUM_UNCACHED     | NUMBER   | Number of subshards stored as uncached                                                                                            |
| NUM_TRACKED      | NUMBER   | Number of subshards which are actively tracking dequeue rates                                                                     |
| NUM_CACHED       | NUMBER   | Number of subshards stored as cached                                                                                              |
| MAX_SUBSH_SIZE   | NUMBER   | Maximum subshard size seen till now, in terms of number of messages per subshard                                                  |
| MIN_SUBSH_SIZE   | NUMBER   | Minimum subshard size seen till now, in terms of number of messages per subshard                                                  |
| MEAN_SUBSH_SIZE  | NUMBER   | Mean subshard size seen till now, in terms of number of messages per subshard                                                     |
| AVG_EVICTED_RATE | NUMBER   | Average number subshards evicted per second                                                                                       |
| AVG_LOAD_RATE    | NUMBER   | Average number of subshards pre-fetched or un-evicted per second                                                                  |
| AVG_EVICTED_TIME | NUMBER   | Average time taken to evict one subshard (in milliseconds)                                                                        |
| AVG_LOAD_TIME    | NUMBER   | Average time taken to un-evict one subshard (in milliseconds)                                                                     |
| AVG_MISS_RATIO   | NUMBER   | Average ratio of number of foreground un-evictions versus background pre-fetch                                                    |
| AVG_THRASH_RATIO | NUMBER   | Average ratio of number of subshard pre-fetched by background without dequeue attempt versus total number of subshards prefetched |

| Column                            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MANDATORY_AFF_SWITCH_ATT<br>EMPTS | NUMBER   | An affinity switch is a change in dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were attempted across all instances. Populated at the smallest instance id only. |
| OPTIONAL_AFF_SWITCH_ATT<br>EMPTS  | NUMBER   | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were attempted across all instances. Populated at the smallest instance id only.                                                                                         |
| MIN_EVICT_PERCENT                 | NUMBER   | Percentage of streams_pool memory beyond which sharded queue subshard eviction is triggered                                                                                                                                                                                                                                                                                                                                                         |
| LAST_AVG_CACHED_HORIZON           | NUMBER   | Last average number of cached subshards seen in sharded queue memory manager horizon                                                                                                                                                                                                                                                                                                                                                                |
| LAST_AVG_MEMORY_HORIZON           | NUMBER   | Last average memory of cached subshards seen in sharded queue memory manager horizon                                                                                                                                                                                                                                                                                                                                                                |
| LAST_AVG_SUBSHARD_HORIZO<br>N     | NUMBER   | Last average number of subshards seen in sharded queue memory manager horizon                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_LEEWAY_SHIFT                 | NUMBER   | Internal leeway for memory threshold                                                                                                                                                                                                                                                                                                                                                                                                                |
| AVG_OPTTIME_DRIFT                 | NUMBER   | Average drift of opt_time for all subshards. A drift is defined as a difference between opt_time as set on a subshard and the actual time at which subshard is first dequeued after prefetch/uneviction.                                                                                                                                                                                                                                            |
| NUM_THRESHOLD_DRIFT               | NUMBER   | Number of times drift value has gone over threshold time. A typical threshold time can be horizon_time/2.                                                                                                                                                                                                                                                                                                                                           |
| MAX_OPT_TIME_DRIFT                | NUMBER   | Maximum drift till now                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MIN_OPT_TIME_DRIFT                | NUMBER   | Minimum drift till now                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AVG_OPT_TIME_ERROR                | NUMBER   | An opt_time error occurs when a cached subshard is unevicted by a foreground process (instead of being prefetched by the aq background). Thus, opt_time error is the difference between the actual opt_time set for a sharded queue subshard and the absolute time at which foreground unevicts the same subshard. This column represents average time of this error.                                                                               |
| MAX_OPT_TIME_ERROR                | NUMBER   | Maximum opt_time error                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MIN_OPT_TIME_ERROR                | NUMBER   | Minimum opt_time error                                                                                                                                                                                                                                                                                                                                                                                                                              |
| NUM_FG_RELOADED                   | NUMBER   | Number of subshards reloaded from disk into message cache by foreground processes                                                                                                                                                                                                                                                                                                                                                                   |
| NUM_PRERELOADED                   | NUMBER   | Number of subshards reloaded from disk into message cache in advance by background processes                                                                                                                                                                                                                                                                                                                                                        |
| AVG_RELOAD_TIME                   | NUMBER   | Average time to reload a subshard from disk into message cache (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>             |

## 8.27 V\$AQ\_NONDUR\_REGISTRATIONS

V\$AQ\_NONDUR\_REGISTRATIONS provides information about non-durable subscriptions.

## 8.28 V\$AQ\_NONDUR\_SUBSCRIBER

V\$AQ\_NONDUR\_SUBSCRIBER provides information about the non-durable subscriptions on sharded queues.

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

## 8.29 V\$AQ\_NONDUR\_SUBSCRIBER\_LWM

V\$AQ\_NONDUR\_SUBSCRIBER\_LWM projects the low watermarks (LWMs) of non-durable subscribers in a sharded queue. The LWM of a non-durable subscriber is a combination of shard, priority and LWM (subshard).

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 8.30 V\$AQ\_NOTIFICATION\_CLIENTS

V\$AQ\_NOTIFICATION\_CLIENTS displays performance statistics for secure OCI client connections.

| Column             | Datatype     | Description                                                                                                                                                                                   |
|--------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_ID          | VARCHAR2(29) | Internally generated client ID for secure notification clients                                                                                                                                |
| EMON_ID            | NUMBER       | Emon ID serving the client                                                                                                                                                                    |
| NOTIFICATION_STATE | NUMBER       | Notification state: <ul style="list-style-type: none"><li>ACTIVE – Sending notification</li><li>WAIT_FOR_ACK – Waiting for client acknowledgment</li><li>INACTIVE - Idle connection</li></ul> |
| NUM_MESSAGE_SENT   | NUMBER       | Number of messages sent on the connection                                                                                                                                                     |

| Column               | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_BYTES_SENT       | NUMBER                      | Number of bytes sent on the connection                                                                                                                                                                                                                                                                                                                                                                                                          |
| NUM_MESSAGE_RECEIVED | NUMBER                      | Number of messages successfully received by the client                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_SEND_TIME       | TIMESTAMP(3) WITH TIME_ZONE | Time when the last message was sent on the connection                                                                                                                                                                                                                                                                                                                                                                                           |
| LAST_RECEIVE_TIME    | TIMESTAMP(3) WITH TIME_ZONE | Time when the last message was received over the connection                                                                                                                                                                                                                                                                                                                                                                                     |
| CONNECT_TIME         | TIMESTAMP(3) WITH TIME_ZONE | Time at which the client connected                                                                                                                                                                                                                                                                                                                                                                                                              |
| DISCONNECT_TIME      | TIMESTAMP(3) WITH TIME_ZONE | Time at which the client disconnected                                                                                                                                                                                                                                                                                                                                                                                                           |
| LAST_ERROR           | NUMBER                      | The last error that occurred on the client connection                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID               | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.31 V\$AQ\_PARTITION\_STATS

V\$AQ\_PARTITION\_STATS displays usage statistics for the queue partition cache and the dequeue log partition cache.

#### ① Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column          | Datatype      | Description                                                                                      |
|-----------------|---------------|--------------------------------------------------------------------------------------------------|
| INST_ID         | NUMBER        | Current instance ID                                                                              |
| QUEUE_ID        | NUMBER        | Queue ID                                                                                         |
| QUEUE_TABLE_ID  | NUMBER        | Queue table object ID                                                                            |
| QUEUE_SCHEMA    | VARCHAR2(128) | Queue schema name                                                                                |
| QUEUE_NAME      | VARCHAR2(128) | Queue name                                                                                       |
| PT_TUNED_SIZ_QT | NUMBER        | Current tuned size of the queue partition cache, expressed in number of partition cache elements |

| Column                 | Datatype | Description                                                                                                                                                                                                                       |
|------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PT_CACHED_PTNS_QT      | NUMBER   | Current number of cached partitions in the queue partition cache                                                                                                                                                                  |
| PT_OVER_CACHED_PTNS_QT | NUMBER   | Current number of over-cached partitions in the queue partition cache, that is, the number of cached partitions whose partition cache elements exceed the current tuned size of the queue partition cache                         |
| PT_TOTAL_UPTUNE_QT     | NUMBER   | Total amount of space added to the queue partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements                                                                        |
| PT_NO_OF_UPTUNES_QT    | NUMBER   | Total number of times a tune-up was triggered on the queue partition cache, since the cache was initialized                                                                                                                       |
| PT_TOTAL_DOWNTUNE_QT   | NUMBER   | Total amount of space removed from the queue partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements                                                                  |
| PT_NO_OF_DOWNTUNES_QT  | NUMBER   | Total number of times a tune-down was triggered on the queue partition cache, since the cache was initialized                                                                                                                     |
| PT_CACHE_MISS_QT       | NUMBER   | Total number of cache misses during partition lookups on the queue partition cache                                                                                                                                                |
| PT_CACHE_HIT_QT        | NUMBER   | Total number of cache hits during partition lookups on the queue partition cache                                                                                                                                                  |
| PT_TOTAL_CACH_GET_QT   | NUMBER   | Total number of successful fetches from the queue partition cache                                                                                                                                                                 |
| PT_TOTAL_CACH_PUT_QT   | NUMBER   | Total number of caching operations that occurred on the queue partition cache                                                                                                                                                     |
| PT_UNBOUNDINGS_QT      | NUMBER   | Total number of times queue partitions were unbounded                                                                                                                                                                             |
| PT_TUNED_SIZ_DQ        | NUMBER   | Current tuned size of the dequeue log partition cache, expressed in number of partition cache elements                                                                                                                            |
| PT_CACHED_PTNS_DQ      | NUMBER   | Current number of cached partitions in the dequeue log partition cache                                                                                                                                                            |
| PT_OVER_CACHED_PTNS_DQ | NUMBER   | Current number of over-cached partitions in the dequeue log partition cache, that is, the number of cached dequeue log partitions whose partition cache elements exceed the current tuned size of the dequeue log partition cache |
| PT_TOTAL_UPTUNE_DQ     | NUMBER   | Total amount of space added to the dequeue log partition cache due to tune-ups, since the cache was initialized, expressed in number of partition cache elements                                                                  |
| PT_NO_OF_UPTUNES_DQ    | NUMBER   | Total number of times a tune-up was triggered on the dequeue log partition cache, since the cache was initialized                                                                                                                 |
| PT_TOTAL_DOWNTUNE_DQ   | NUMBER   | Total amount of space removed from the dequeue log partition cache due to tune-downs, since the cache was initialized, expressed in number of partition cache elements                                                            |
| PT_NO_OF_DOWNTUNES_DQ  | NUMBER   | Total number of times a tune-down was triggered on the dequeue log partition cache, since the cache was initialized                                                                                                               |
| PT_CACHE_MISS_DQ       | NUMBER   | Total number of cache misses during partition lookups on the dequeue log partition cache                                                                                                                                          |
| PT_CACHE_HIT_DQ        | NUMBER   | Total number of cache hits during partition lookups on the dequeue log partition cache                                                                                                                                            |
| PT_TOTAL_CACH_GET_DQ   | NUMBER   | Total number of successful fetches from the dequeue log partition cache                                                                                                                                                           |
| PT_TOTAL_CACH_PUT_DQ   | NUMBER   | Total number of caching operations that occurred on the dequeue log partition cache                                                                                                                                               |
| PT_UNBOUNDINGS_DQ      | NUMBER   | Total number of times dequeue log partitions were unbounded                                                                                                                                                                       |

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| TRUNC_PARTITION_DQLOG  | NUMBER   | Total number of truncated and recycled dequeue log partitions                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.32 V\$AQ\_REMOTE\_DEQUEUE\_AFFINITY

V\$AQ\_REMOTE\_DEQUEUE\_AFFINITY lists the dequeue affinity instance of the subscribers not dequeuing locally from the shard's owner instance. Cross instance message forwarding is used for these subscribers.

### Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column             | Datatype      | Description                                                                          |

| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.33 V\$AQ\_SERVER\_POOL

V\$AQ\_SERVER\_POOL lists performance statistics for all the servers in the pool.

| Column                  | Datatype     | Description                                                                                                                                          |
|-------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| COORDINATOR_ID          | NUMBER       | ID of the coordinator                                                                                                                                |
| COORDINATOR_INSTANCE_ID | NUMBER       | Instance of the coordinator                                                                                                                          |
| PROCESS_ID              | VARCHAR2(24) | Operating system process ID of the server                                                                                                            |
| PROCESS_NAME            | VARCHAR2(48) | Operating system process name of the server                                                                                                          |
| JOB_NAME                | VARCHAR2(32) | Name of the job handled                                                                                                                              |
| POOL_STATE              | VARCHAR2(20) | State of the pool: <ul style="list-style-type: none"> <li>• REMOTE</li> <li>• IDLE</li> <li>• ACTIVE</li> </ul>                                      |
| CON_ID                  | NUMBER       | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 8.34 V\$AQ\_SHARDED\_SUBSCRIBER\_STAT

V\$AQ\_SHARDED\_SUBSCRIBER\_STAT displays basic statistical information about the subscribers of sharded queues. There is one row per queue per shard per subscriber.

### ① Note

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID                       | NUMBER   | Queue identifier                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SUBSCRIBER_ID                  | NUMBER   | Subscriber identifier                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SHARD_ID                       | NUMBER   | Shard identifier                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PRIORITY                       | NUMBER   | Priority value of the shard                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MSG_SN                         | NUMBER   | Message serial number                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DEQUEUE_SUBSHARD               | NUMBER   | Last known dequeue position in this shard                                                                                                                                                                                                                                                                                                                                                                                                             |
| ENQUEUED_MSGS                  | NUMBER   | Number of enqueued messages                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DEQUEUED_MSGS                  | NUMBER   | Number of dequeued messages                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_DEQUEUE_TIME           | NUMBER   | Amount of time spent performing dequeues (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                 |
| CPU_DEQUEUE_TIME               | NUMBER   | Actual amount of CPU time spent performing dequeues (in seconds)                                                                                                                                                                                                                                                                                                                                                                                      |
| DEQUEUE_RATE                   | NUMBER   | Number of messages dequeued per second                                                                                                                                                                                                                                                                                                                                                                                                                |
| DEQUEUE_POSITION <sup>1</sup>  | RAW(16)  | Message ID at the dequeue position of the subscriber in this shard<br>A NULL value indicates that either the shard is empty or no dequeues have been done on this shard.                                                                                                                                                                                                                                                                              |
| TIME_SINCE_LAST_DEQUEUE        | NUMBER   | Time since last dequeue activity (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                         |
| ESTD_TIME_TO_DRAIN             | NUMBER   | Estimated amount of time to drain the shard (in seconds) with current enqueue and dequeue rates. Null, if the enqueue rate is greater than the dequeue rate.                                                                                                                                                                                                                                                                                          |
| ESTD_TIME_TO_DRAIN_NO_ENQ      | NUMBER   | Estimated amount of time to drain the shard (in seconds) with no new enqueues                                                                                                                                                                                                                                                                                                                                                                         |
| MESSAGE_LATENCY_1 <sup>1</sup> | NUMBER   | Message latency within the last 5 minutes (in milliseconds). Null if no message is consumed or it is delay dequeue.                                                                                                                                                                                                                                                                                                                                   |
| MESSAGE_LATENCY_2 <sup>1</sup> | NUMBER   | Message latency within the last 1 hour (in milliseconds). Null if no message is consumed or it is delay dequeue.                                                                                                                                                                                                                                                                                                                                      |
| MESSAGE_LATENCY_3 <sup>1</sup> | NUMBER   | Message latency within the last 5 hours (in milliseconds). Null if no message is consumed or it is delay dequeue.                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 8.35 V\$AQ\_SUBSCRIBER\_LOAD

V\$AQ\_SUBSCRIBER\_LOAD describes the load of all subscribers of sharded queues in terms of latency at every instance in an Oracle RAC environment.

Latency denotes the predicted amount of time (in seconds) required from the current time to drain all the messages for that subscriber at each respective instance. The latency calculation considers past enqueue/dequeue rates and future enqueue/dequeue rates based on history.

**Note**

AQ sharded queues are deprecated in Oracle Database 21c. Oracle recommends that you instead use Transactional Event Queues (TEQs) for higher throughput and better performance.

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID               | NUMBER        | Queue ID                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| QUEUE_SCHEMA           | VARCHAR2(128) | Queue schema                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| QUEUE_NAME             | VARCHAR2(128) | Queue name                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SUBSCRIBER_ID          | NUMBER        | Subscriber ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SUBSCRIBER_NAME        | VARCHAR2(128) | Subscriber name                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LATENCY_STATE          | VARCHAR2(8)   | Possible values: <ul style="list-style-type: none"> <li>FINITE - The subscriber will be able to dequeue all the messages in a finite amount of time</li> <li>INFINITE - The subscriber's dequeue rate may not catch up to the enqueue rate</li> <li>UNKNOWN - Latency is not yet known</li> </ul>                                                                                                                                               |
| LATENCY                | NUMBER        | Latency (in seconds). Valid only when LATENCY_STATE is FINITE.                                                                                                                                                                                                                                                                                                                                                                                  |
| DEQUEUE_REQUESTS       | NUMBER        | Approximate number of dequeue requests noted recently                                                                                                                                                                                                                                                                                                                                                                                           |
| ACTIVE_SHARDS          | NUMBER        | Number of queue shards that have messages for this subscriber                                                                                                                                                                                                                                                                                                                                                                                   |
| ACTIVE_LISTENER        | VARCHAR2(5)   | Indicates whether the subscriber is actively listening at this instance for messages (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                      |
| DEQUEUE_SESSIONS       | NUMBER        | Displays the number of active dequeue sessions for this subscriber                                                                                                                                                                                                                                                                                                                                                                              |
| FLAGS                  | NUMBER        | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MANDATORY_AFF_SWITCHES | NUMBER        | An affinity switch is a change in the dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this subscriber.           |
| OPTIONAL_AFF_SWITCHES  | NUMBER        | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this subscriber.                                                                                                       |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP#        | NUMBER      | Log file group number                                                                                                                                                                                                                                                                                                                                                                                                                       |
| THREAD#       | NUMBER      | Log file thread number                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SEQUENCE#     | NUMBER      | Log file sequence number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ISCURRENT     | VARCHAR2(3) | This is the current online redo log                                                                                                                                                                                                                                                                                                                                                                                                         |
| CURRENT       | VARCHAR2(3) | This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ISCURRENT.                                                                                                                                                                                                                                                                                                      |
| FIRST_CHANGE# | NUMBER      | First SCN stored in the current log                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.37 V\$ARCHIVE\_DEST

V\$ARCHIVE\_DEST displays, for the current instance, all of the destinations in the Data Guard configuration, including each destination's current value, mode, and status.

| Column    | Datatype      | Description                                            |
|-----------|---------------|--------------------------------------------------------|
| DEST_ID   | NUMBER        | Log archive destination parameter identifier (1 to 31) |
| DEST_NAME | VARCHAR2(256) | Log archive destination parameter name                 |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS       | VARCHAR2(9)   | Identifies the current status of the destination: <ul style="list-style-type: none"> <li>• VALID - Initialized and available</li> <li>• INACTIVE - No destination information</li> <li>• DEFERRED - Manually disabled by the user</li> <li>• ERROR - Error during open or copy</li> <li>• DISABLED - Disabled after error</li> <li>• BAD PARAM - Parameter has errors</li> <li>• ALTERNATE - Destination is available as an alternate</li> <li>• FULL - Exceeded quota size for the destination</li> </ul> |
| BINDING      | VARCHAR2(9)   | Specifies how failure will affect the archival operation: <ul style="list-style-type: none"> <li>• MANDATORY - Successful archival is required</li> <li>• OPTIONAL - Successful archival is not required (depends on LOG_ARCHIVE_MIN_SUCCEED_DEST)</li> </ul>                                                                                                                                                                                                                                              |
| NAME_SPACE   | VARCHAR2(7)   | Identifies the scope of parameter setting: <ul style="list-style-type: none"> <li>• SYSTEM - System definition</li> <li>• SESSION - Session definition</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| TARGET       | VARCHAR2(7)   | For a primary database, this column specifies whether the archive destination is local or remote to the primary database: <ul style="list-style-type: none"> <li>• PRIMARY - local</li> <li>• STANDBY - remote</li> </ul> For a standby database, this column specifies whether the archive destination is local or remote to the standby database: <ul style="list-style-type: none"> <li>• LOCAL - local</li> <li>• REMOTE - remote</li> </ul>                                                           |
| ARCHIVER     | VARCHAR2(10)  | Identifies the archiver process relative to the database where the query is issued: <ul style="list-style-type: none"> <li>• ARCn</li> <li>• FOREGROUND</li> <li>• LGWR</li> <li>• RFS</li> </ul>                                                                                                                                                                                                                                                                                                          |
| SCHEDULE     | VARCHAR2(8)   | Indicates whether the archival of this destination is INACTIVE, PENDING, ACTIVE, or LATENT                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DESTINATION  | VARCHAR2(256) | Specifies the location where the archived redo logs are to be archived                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| LOG_SEQUENCE | NUMBER        | Identifies the sequence number of the last archived redo log to be archived                                                                                                                                                                                                                                                                                                                                                                                                                                |
| REOPEN_SECS  | NUMBER        | Identifies the retry time (in seconds) after error                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DELAY_MINS   | NUMBER        | Identifies the delay interval (in minutes) before the archived redo log is automatically applied to a standby database                                                                                                                                                                                                                                                                                                                                                                                     |
| NET_TIMEOUT  | NUMBER        | Number of seconds the log writer process will wait for status from the network server of a network operation issued by the log writer process                                                                                                                                                                                                                                                                                                                                                              |
| PROCESS      | VARCHAR2(10)  | Identifies the archiver process relative to the primary database, even if the query is issued on the standby database: <ul style="list-style-type: none"> <li>• ARCn</li> <li>• FOREGROUND</li> <li>• LGWR</li> </ul>                                                                                                                                                                                                                                                                                      |
| REGISTER     | VARCHAR2(3)   | Indicates whether the archived redo log is registered in the remote destination control file (YES) or not (NO). If the archived redo log is registered, it is available to log apply services.                                                                                                                                                                                                                                                                                                             |
| FAIL_DATE    | DATE          | Date and time of last error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| VALID_ROLE     | VARCHAR2(12) | Database role or roles that are valid for the destination: <ul style="list-style-type: none"> <li>PRIMARY_ROLE</li> <li>STANDBY_ROLE</li> <li>ALL_ROLES</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                 |
| DB_UNIQUE_NAME | VARCHAR2(30) | Unique database name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VERIFY         | VARCHAR2(3)  | Indicates whether the value of the VERIFY attribute on the LOG_ARCHIVE_DEST_ <i>n</i> parameter is verified (YES) or not verified (NO)                                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPRESSION    | VARCHAR2(7)  | Indicates whether network compression is ENABLED or DISABLED, or whether the ZLIB or LZ0 algorithm is in use. These values correspond to the values accepted by the COMPRESSION attribute for the database initialization parameter LOG_ARCHIVE_DEST_ <i>n</i> . The possible values include: <ul style="list-style-type: none"> <li>DISABLE: Compression is disabled.</li> <li>ENABLE: Compression is enabled. The ZLIB compression algorithm is used.</li> <li>ZLIB: ZLIB compression is used.</li> <li>LZ0: LZ0 compression is used.</li> </ul> |
| APPLIED_SCN    | NUMBER       | For a destination that corresponds to a physical or logical standby database, the SCN of the last applied redo. For a destination that corresponds to a snapshot standby database, the SCN of the last redo applied before conversion to a snapshot standby database. This column is only valid for enabled and active standby database destinations on a primary or cascading standby database.                                                                                                                                                   |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                    |
| ENCRYPTION     | VARCHAR2(7)  | Indicates whether encryption of the redo stream sent to Zero Data Loss Recovery Appliance (Recovery Appliance) is enabled (ENABLED) or not (DISABLED)                                                                                                                                                                                                                                                                                                                                                                                              |

## 8.38 V\$ARCHIVE\_DEST\_STATUS

V\$ARCHIVE\_DEST\_STATUS displays run time and configuration information for the archived redo log destinations.

The information in this view does not persist across an instance shutdown.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEST_ID       | NUMBER        | Identifies the log archive destination parameter (1 to 31)                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DEST_NAME     | VARCHAR2(256) | Log archive destination parameter name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| STATUS        | VARCHAR2(9)   | Current status of the destination: <ul style="list-style-type: none"> <li>• ALTERNATE - Destination is in an alternate state</li> <li>• BAD PARAM - Parameter has errors</li> <li>• DEFERRED - Manually disabled by the user</li> <li>• DISABLED - Disabled after error</li> <li>• ERROR - Error during open or copy</li> <li>• FULL - Exceeded quota size for the destination</li> <li>• IDLE - Destination is idle</li> <li>• INACTIVE - No destination information</li> <li>• VALID - Initialized and available</li> </ul> |
| TYPE          | VARCHAR2(16)  | Type of archival destination database: <ul style="list-style-type: none"> <li>• BACKUP APPLIANCE - Backup appliance</li> <li>• CROSS-INSTANCE - An instance of the primary</li> <li>• DOWNSTREAM - Streams downstream capture database</li> <li>• FAR SYNC - Far Sync Instance</li> <li>• LOCAL - Local to primary database</li> <li>• LOGICAL - Logical standby</li> <li>• PHYSICAL - Physical standby</li> <li>• SNAPSHOT - Snapshot standby database</li> </ul>                                                            |
| DATABASE_MODE | VARCHAR2(15)  | Current mode of the archival destination database: <ul style="list-style-type: none"> <li>• STARTED - Instance started, not mounted</li> <li>• MOUNTED - Mounted</li> <li>• MOUNTED-STANDBY - Mounted standby</li> <li>• OPEN - Open read/write</li> <li>• OPEN_READ-ONLY - Open read-only</li> </ul>                                                                                                                                                                                                                         |

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

It may be possible to resolve the gap by fetching the missing redo from another destination.</li> <li>LOG SWITCH GAP - Destination has not yet received all of the redo from the previous log file.</li> <li>NO GAP - Destination does not have a redo gap.</li> <li>RESOLVABLE GAP - Destination has a redo gap that can be automatically resolved by fetching the missing redo from this database.</li> <li>UNRESOLVABLE GAP - Destination has a redo gap that cannot be automatically resolved by fetching the missing redo from this database and there are no other destinations from which redo can be fetched.</li> </ul>                                                                                                                                                                                                                       |
| CON_ID                 | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 8.39 V\$ARCHIVE\_GAP

V\$ARCHIVE\_GAP displays information about archive gaps on a standby database. This view can be used to find out the current archive gap that is blocking recovery for the current recovery incarnation.

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| THREAD#        | NUMBER   | Thread number of the missing archived redo log files. The number is 1 for a single instance. For Oracle Real Application Clusters, this column will contain different numbers.                                                                                                                                                                                                                                                                  |
| LOW_SEQUENCE#  | NUMBER   | Lowest sequence number of the log files received on the standby system                                                                                                                                                                                                                                                                                                                                                                          |
| HIGH_SEQUENCE# | NUMBER   | Highest sequence number of the log files received on the standby system                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.40 V\$ARCHIVE\_PROCESSES

V\$ARCHIVE\_PROCESSES displays the state of the various ARCH processes for the instance.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROCESS      | NUMBER       | Identifier for the ARCH process for the instance, numbered from 0-9                                                                                                                                                                                                                                                                                                                                                                             |
| STATUS       | VARCHAR2(10) | Status of the ARCH process, displayed as a keyword. Possible values are: STOPPED, SCHEDULED, STARTING, ACTIVE, STOPPING, and TERMINATED.                                                                                                                                                                                                                                                                                                        |
| LOG_SEQUENCE | NUMBER       | This is the online redo log sequence number currently being archived, if STATE="BUSY"                                                                                                                                                                                                                                                                                                                                                           |
| STATE        | VARCHAR2(4)  | This is the current state of the ARCH process, displayed as a keyword. Possible keywords are IDLE or BUSY.                                                                                                                                                                                                                                                                                                                                      |
| ROLES        | VARCHAR2(36) | The list of roles assigned to the archive process. The roles include: HEART_BEAT, NO_FAL, NO_SRL, CLEAR_LOGS                                                                                                                                                                                                                                                                                                                                    |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.41 V\$ARCHIVED\_LOG

V\$ARCHIVED\_LOG displays archived log information from the control file, including archive log names.

An archive log record is inserted after the online redo log is successfully archived or cleared (name column is NULL if the log was cleared). If the log is archived twice, there will be two archived log records with the same THREAD#, SEQUENCE#, and FIRST\_CHANGE#, but with a different name. An archive log record is also inserted when an archive log is restored from a backup set or a copy and whenever a copy of a log is made with the RMAN COPY command.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                   |
|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER        | Archived log record ID                                                                                                                                                                                                                                                                        |
| STAMP             | NUMBER        | Archived log record stamp                                                                                                                                                                                                                                                                     |
| NAME              | VARCHAR2(513) | Archived log file name. If set to NULL, either the log file was cleared before it was archived or an RMAN backup command with the "delete input" option was executed to back up archivelog all (RMAN> backup archivelog all delete input;).                                                   |
| DEST_ID           | NUMBER        | Original destination from which the archive log was generated. The value is 0 if the destination identifier is not available.                                                                                                                                                                 |
| THREAD#           | NUMBER        | Redo thread number                                                                                                                                                                                                                                                                            |
| SEQUENCE#         | NUMBER        | Redo log sequence number                                                                                                                                                                                                                                                                      |
| RESETLOGS_CHANGE# | NUMBER        | Resetlogs change number of the database when the log was written                                                                                                                                                                                                                              |
| RESETLOGS_TIME    | DATE          | Resetlogs time of the database when the log was written                                                                                                                                                                                                                                       |
| RESETLOGS_ID      | NUMBER        | Resetlogs identifier associated with the archived redo log                                                                                                                                                                                                                                    |
| FIRST_CHANGE#     | NUMBER        | First change number in the archived log                                                                                                                                                                                                                                                       |
| FIRST_TIME        | DATE          | Timestamp of the first change                                                                                                                                                                                                                                                                 |
| NEXT_CHANGE#      | NUMBER        | First change in the next log                                                                                                                                                                                                                                                                  |
| NEXT_TIME         | DATE          | Timestamp of the next change                                                                                                                                                                                                                                                                  |
| BLOCKS            | NUMBER        | Size of the archived log (in blocks)                                                                                                                                                                                                                                                          |
| BLOCK_SIZE        | NUMBER        | Redo log block size. This is the logical block size of the archived log, which is the same as the logical block size of the online log from which the archived log was copied. The online log logical block size is a platform-specific value that is not adjustable by the user.             |
| CREATOR           | VARCHAR2(7)   | Creator of the archivelog: <ul style="list-style-type: none"> <li>• ARCH - Archiver process</li> <li>• FGRD - Foreground process</li> <li>• RMAN - Recovery Manager</li> <li>• SRMN - RMAN at standby</li> <li>• LGWR - Logwriter process</li> </ul>                                          |
| REGISTRAR         | VARCHAR2(7)   | Registrar of the entry: <ul style="list-style-type: none"> <li>• RFS - Remote File Server process</li> <li>• ARCH - Archiver process</li> <li>• FGRD - Foreground process</li> <li>• RMAN - Recovery manager</li> <li>• SRMN - RMAN at standby</li> <li>• LGWR - Logwriter process</li> </ul> |
| STANDBY_DEST      | VARCHAR2(3)   | Indicates whether the entry is an archivelog destination (YES) or not (NO)                                                                                                                                                                                                                    |
| ARCHIVED          | VARCHAR2(3)   | Indicates whether the online redo log was archived (YES) or whether RMAN only inspected the log and created a record for future application of redo logs during recovery (NO).                                                                                                                |

**① Note**

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

## 8.43 V\$ASM\_ACFSAUTORESIZE

V\$ASM\_ACFSAUTORESIZE displays the auto-resize settings for each mounted Oracle ACFS file system.

| Column           | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FS_NAME          | VARCHAR2(1024) | Full path name of the Oracle ACFS file system mount point                                                                                                                                                                                                                                                                                                                                                                                         |
| RESIZE_INCREMENT | NUMBER         | Auto-resize increment (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                              |
| RESIZE_MAXIMUM   | NUMBER         | Auto-resize maximum (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID           | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.44 V\$ASM\_ACFSREPL

V\$ASM\_ACFSREPL displays information for Oracle ACFS file systems that are initialized for replication.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                  |
|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FSNAME      | VARCHAR2(1024) | File system mount point (foreign key to V\$ASM_FILESYSTEM)                                                                                                                                                                                                                   |
| VOLDEV      | VARCHAR2(256)  | Name of the Oracle ADVM device                                                                                                                                                                                                                                               |
| SITE        | VARCHAR2(7)    | Replication site role: <ul style="list-style-type: none"> <li>PRIMARY - File system is initialized as a primary</li> <li>STANDBY - File system is initialized as a standby</li> </ul>                                                                                        |
| LAG         | VARCHAR2(128)  | Amount of time standby is behind primary in hours:minutes:seconds (primary only)                                                                                                                                                                                             |
| STATUS      | VARCHAR2(12)   | Replication primary or standby status: <ul style="list-style-type: none"> <li>ONLINE - Replication is initialized and processing real-time changes</li> <li>PAUSED - The primary is not sending logs to the standby or the standby is not applying logged changes</li> </ul> |
| INITSTATUS  | VARCHAR2(11)   | This column is not maintained.                                                                                                                                                                                                                                               |
| DIRSSCAN    | NUMBER         | This column is not maintained.                                                                                                                                                                                                                                               |
| PERCENT     | NUMBER         | This column is not maintained.                                                                                                                                                                                                                                               |
| LASTSYNC    | DATE           | Time of last apply on the standby site (standby only)                                                                                                                                                                                                                        |
| CRSRUN      | NUMBER         | Number of Cluster Ready Services replication daemons currently running                                                                                                                                                                                                       |
| CRSTOTAL    | NUMBER         | Number of Cluster Ready Services replication daemons expected to be running                                                                                                                                                                                                  |
| PMNTPT      | VARCHAR2(1024) | Replication primary site mount point                                                                                                                                                                                                                                         |
| SMNTPT      | VARCHAR2(1024) | Replication standby site mount point                                                                                                                                                                                                                                         |
| PSVCNAME    | VARCHAR2(1024) | This column is not maintained.                                                                                                                                                                                                                                               |
| SSVCNAME    | VARCHAR2(1024) | This column is not maintained.                                                                                                                                                                                                                                               |
| PHOST       | VARCHAR2(1024) | A replication primary cluster host name                                                                                                                                                                                                                                      |
| SHOST       | VARCHAR2(1024) | A replication standby cluster host name                                                                                                                                                                                                                                      |
| REMALIAS    | VARCHAR2(4000) | This column is not maintained.                                                                                                                                                                                                                                               |
| TAGS        | NUMBER         | TRUE (1) if replicating tagged files                                                                                                                                                                                                                                         |
| COMPRESSION | VARCHAR2(3)    | This column is not maintained.                                                                                                                                                                                                                                               |
| DBGVLV      | NUMBER         | Replication trace log debug level                                                                                                                                                                                                                                            |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> <p>For this view, the value is always 0.</p> |

#### Note

For Oracle ASM releases 12.2 or later, this view contains records only for storage locations that are file systems (and not for storage locations that are snapshots). The following columns in this view are no longer maintained: INITSTATUS, DIRSCAN, PERCENT, PSVCNAME, SSVNAME, REMALIAS, and COMPRESSION.

#### See Also

- *Oracle Automatic Storage Management Administrator's Guide* for more information about Oracle Advanced Cluster File System (Oracle ACFS)
- *Oracle Automatic Storage Management Administrator's Guide* for additional information about using views to display Oracle Advanced Cluster File System (Oracle ACFS) and Oracle ASM Dynamic Volume Manager (Oracle ADVM) information

#### Note

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

## 8.45 V\$ASM\_ACFISREPLTAG

V\$ASM\_ACFISREPLTAG displays replicated tag information for Oracle ACFS file systems that are initialized for replication.

| Column | Datatype       | Description                                                |
|--------|----------------|------------------------------------------------------------|
| FSNAME | VARCHAR2(1024) | File system mount point (foreign key to V\$ASM_FILESYSTEM) |
| VOLDEV | VARCHAR2(256)  | Name of the Oracle ADVM device                             |
| TAG    | VARCHAR2(32)   | Tag name that is being replicated                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

### Note

This view only contains records for Oracle ASM releases prior to Oracle Database 12c Release 2 (12.2.0.1). To display Oracle ACFS replication information for Oracle Database 12c Release 2 (12.2.0.1) or higher, use the `acfsutil repl info` command.

### See Also

### Note

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

## 8.46 V\$ASM\_ACFSSNAPSHOTS

V\$ASM\_ACFSSNAPSHOTS displays snapshot information for every mounted Oracle ACFS.

| Column      | Datatype       | Description                                                          |
|-------------|----------------|----------------------------------------------------------------------|
| FS_NAME     | VARCHAR2(1024) | File system mount point (foreign key to V\$ASM_FILESYSTEM)           |
| VOL_DEVICE  | VARCHAR2(256)  | Name of the Oracle ADVM device                                       |
| SNAP_NAME   | VARCHAR2(1024) | Name of the snapshot                                                 |
| CREATE_TIME | DATE           | Time when the snapshot was created                                   |
| TYPE        | VARCHAR2(2)    | Snapshot type. Possible types are read-only (RO) or read/write (RW). |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARENT             | VARCHAR2(1024) | Parent name used to create the snapshot. If the snapshot was created using the mount point as a base, parent name will be NULL. If the snapshot was created using an existing snapshot as the base, the parent name will be the name of the snapshot passed to the <code>acfsutil snap create -p</code> operation.                                                                                                                                                                          |
| LINK               | VARCHAR2(1024) | If link has been set, the path of the link. If unset, NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ADDITIONAL_STORAGE | NUMBER         | Equivalent to "storage added to snapshot" output                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| QUOTA              | NUMBER         | Value of quota. If unset, NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| REPL               | VARCHAR2(5)    | Indicates whether the snapshot is being used for replication (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATE              | VARCHAR2(14)   | The state of the snapshot: <ul style="list-style-type: none"> <li>• AVAILABLE - Default</li> <li>• DELETE_WAITING - Maps to "delete waiting for last close"</li> <li>• DELETE_IN_PROGRESS - Maps to "delete in progress"</li> </ul>                                                                                                                                                                                                                                                         |
| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

### ① Note

To display information about Oracle ACFS file systems or volumes that are located on nodes in an Oracle Flex ASM configuration, you must connect to the Oracle ASM proxy instance instead of the local Oracle ASM instance. For information about Oracle Flex ASM, refer to *Oracle Automatic Storage Management Administrator's Guide*.

## 8.47 V\$ASM\_ACFSTAG

V\$ASM\_ACFSTAG displays every file or directory that has a tag and its tag name for every mounted Oracle ACFS.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TAG_NAME  | VARCHAR2(32)   | Tag name on file or directory                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FS_NAME   | VARCHAR2(1024) | File system mount point                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PATH_NAME | VARCHAR2(4096) | Complete file path name                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID    | NUMBER         | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

## 8.48 V\$ASM\_ACFSVOLUMES

V\$ASM\_ACFSVOLUMES displays information about mounted Oracle ACFS volumes, correlated with V\$ASM\_FILESYSTEM.

| Column      | Datatype       | Description                                                                                  |
|-------------|----------------|----------------------------------------------------------------------------------------------|
| FS_NAME     | VARCHAR2(1024) | File system mount point (foreign key to V\$ASM_FILESYSTEM)                                   |
| VOL_DEVICE  | VARCHAR2(256)  | Name of the Oracle ADVM device                                                               |
| VOL_LABEL   | VARCHAR2(64)   | Volume label (optional name) assigned through mkfs/acfsformat; NULL if no name exists        |
| PRIMARY_VOL | VARCHAR2(5)    | Indicates whether the volume is the primary volume for the file system (TRUE) or not (FALSE) |
| TOTAL_MB    | NUMBER         | Size of the volume device (in megabytes)                                                     |
| FREE_MB     | NUMBER         | Available space on the volume device (in megabytes)                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

## 8.49 V\$ASM\_ALIAS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_ALIAS displays one row for every alias present in every disk group mounted by the Oracle ASM instance.

| Column            | Datatype     | Description                                                                                                                                                                  |
|-------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2(70) | Oracle ASM alias or alias directory name                                                                                                                                     |
| GROUP_NUMBER      | NUMBER       | Owning disk group number of the alias (foreign key to the V\$ASM_DISKGROUP view)                                                                                             |
| FILE_NUMBER       | NUMBER       | Oracle ASM file number of the alias (foreign key to the V\$ASM_FILE view)                                                                                                    |
| FILE_INCARNATION  | NUMBER       | Oracle ASM file incarnation number for the alias                                                                                                                             |
| ALIAS_INDEX       | NUMBER       | Alias entry number for the alias                                                                                                                                             |
| ALIAS_INCARNATION | NUMBER       | Incarnation number for the parent of the alias                                                                                                                               |
| PARENT_INDEX      | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and an alias entry number in the low-order 24 bits (number of the directory containing the alias) |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REFERENCE_INDEX | NUMBER      | A 32-bit number consisting of a disk group number in the high-order 8 bits and an alias entry number in the low-order 24 bits (number of the directory describing the current entry)                                                                                                                                                                                                                                                                                                                |
| ALIAS_DIRECTORY | VARCHAR2(1) | Indicates whether the alias is to a directory (Y) or to an Oracle ASM file (N)                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SYSTEM_CREATED  | VARCHAR2(1) | Indicates whether the alias is system created (Y) or user created (N)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

## 8.50 V\$ASM\_ATTRIBUTE

V\$ASM\_ATTRIBUTE displays one row for each attribute defined. In addition to attributes specified by CREATE DISKGROUP and ALTER DISKGROUP statements, the view may show other attributes that are created automatically.

Note that attributes are only displayed for disk groups where COMPATIBLE.ASM is set to 11.1 or higher.

| Column                | Datatype      | Description                                                                     |
|-----------------------|---------------|---------------------------------------------------------------------------------|
| NAME                  | VARCHAR2(256) | Full name of the attribute                                                      |
| VALUE                 | VARCHAR2(256) | Value of the attribute                                                          |
| GROUP_NUMBER          | NUMBER        | Number of the disk group in which this attribute exists (composite primary key) |
| ATTRIBUTE_INDEX       | NUMBER        | Number of this attribute in the disk group (composite primary key)              |
| ATTRIBUTE_INCARNATION | NUMBER        | Incarnation number for this attribute (composite primary key)                   |
| READ_ONLY             | VARCHAR2(7)   | Indicates whether the attribute is read-only (Y) or not (N)                     |
| SYSTEM_CREATED        | VARCHAR2(7)   | Indicates whether this is a system-created attribute (Y) or not (N)             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

### Note

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 8.51 V\$ASM\_AUDIT\_CLEANUP\_JOBS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_AUDIT\_CLEANUP\_JOBS displays information about the configured audit trail purge jobs.

In a database instance, V\$ASM\_AUDIT\_CLEANUP\_JOBS displays no rows.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_NAME      | VARCHAR2(64) | Name of the audit trail purge job                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| JOB_STATUS    | VARCHAR2(64) | Current status of the audit trail purge job (ENABLED) or (DISABLED)                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AUDIT_TRAIL   | VARCHAR2(64) | Audit trail for which the audit trail purge job is configured: OS AUDIT TRAIL and UNIFIED AUDIT TRAIL                                                                                                                                                                                                                                                                                                                                                                                               |
| JOB_FREQUENCY | NUMBER       | Frequency at which the audit trail purge job runs                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| USE_TIMESTAMP | VARCHAR2(64) | Indicates whether the audit trail purge job is configured to use the last archive timestamp (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID        | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

# 8.52 V\$ASM\_AUDIT\_CONFIG\_PARAMS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_AUDIT\_CONFIG\_PARAMS displays information about the currently configured audit trail properties that are used by the DBMS\_AUDIT\_MGMT package.

In a database instance, V\$ASM\_AUDIT\_CONFIG\_PARAMS displays no rows.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# 8.53 V\$ASM\_AUDIT\_LAST\_ARCH\_TS

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_AUDIT\_LAST\_ARCH\_TS displays information about the last archive timestamps set for audit trail cleanup or purges.

In a database instance, V\$ASM\_AUDIT\_LAST\_ARCH\_TS displays no rows.

| Column          | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIT_TRAIL     | VARCHAR2(64)                | Audit trail for which the last archive timestamp applies: OS AUDIT TRAIL and UNIFIED AUDIT TRAIL                                                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_ARCHIVE_TS | TIMESTAMP(6) WITH TIME_ZONE | Timestamp of the last audit file that has been archived                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID          | NUMBER                      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

## 8.54 V\$ASM\_CLIENT

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_CLIENT identifies databases using disk groups managed by the Oracle ASM instance.

In a database instance, V\$ASM\_CLIENT displays information about the Oracle ASM instance if the database has any open Oracle ASM files.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER  | NUMBER       | <p>Number of the disk group being used by the database instance (foreign key to the V\$ASM_DISKGROUP view). When a client is connected to an Oracle ASM instance, but is not currently using any disk groups, V\$ASM_CLIENT.GROUP_NUMBER contains 0.</p> <p>When the Cluster Ready Services Daemon (CRSD) or Cluster Synchronization Services (OCSSD) connects to the Oracle ASM instance, this will represent the number of the disk group used for their OCR and voting files respectively.</p> |
| INSTANCE_NAME | VARCHAR2(64) | <p>Identifier for the database instance client</p> <p>When CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance, this will contain the node name where CRSD or OCSSD is running.</p>                                                                                                                                                                                                                                                                           |
| DB_NAME       | VARCHAR2(8)  | <p>Unique database name of the database client instance</p> <p>When CRSD has opened the Oracle Cluster Registry (OCR) file in the disk group mounted by the Oracle ASM instance, DB_NAME will contain _OCR.</p> <p>When OCSSD has opened the voting file in the disk group mounted by the Oracle ASM instance, DB_NAME will contain _CSS.</p>                                                                                                                                                     |
| CLUSTER_NAME  | VARCHAR2(31) | Name of the cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS             | VARCHAR2(12) | <p>Status of the client connection:</p> <ul style="list-style-type: none"> <li>CONNECTED - Database instance client has an active connection to the Oracle ASM instance</li> <li>DISCONNECTED - Database instance client normally ended its connection to the Oracle ASM instance</li> <li>BROKEN - Connection with the database instance client terminated in a nonstandard way</li> </ul> <p>When CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance, it will report Connected as status.</p> |
| SOFTWARE_VERSION   | VARCHAR2(60) | Software version number of the database or Oracle ASM instance for the selected disk group connection                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPATIBLE_VERSION | VARCHAR2(60) | <p>Compatibility setting of the database or Oracle ASM instance for the selected disk group connection</p> <p>The value will be - when CRSD or OCSSD has opened its files in the disk group mounted by the Oracle ASM instance.</p>                                                                                                                                                                                                                                                                                                  |
| CON_ID             | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p>                                  |

**Note**

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 8.56 V\$ASM\_DISK

V\$ASM\_DISK displays one row for every disk discovered by the Oracle Automatic Storage Management (Oracle ASM) instance, including disks that are not part of any disk group.

| Column         | Datatype | Description                                                                                                                                              |
|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER   | Number of the disk group containing the disk (foreign key to the V\$ASM_DISKGROUP view)                                                                  |
| DISK_NUMBER    | NUMBER   | Number assigned to the disk within its disk group                                                                                                        |
| COMPOUND_INDEX | NUMBER   | A 32-bit number consisting of a disk group number in the high-order 8 bits and a disk number in the low-order 24 bits (for efficient access to the view) |
| INCARNATION    | NUMBER   | Incarnation number for the disk                                                                                                                          |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MOUNT_STATUS  | VARCHAR2(7)  | <p>Per-instance status of the disk relative to group mounts:</p> <ul style="list-style-type: none"> <li>MISSING - Oracle ASM metadata indicates that the disk is known to be part of the Oracle ASM disk group but no disk in the storage system was found with the indicated name</li> <li>CLOSED - Disk is present in the storage system but is not being accessed by Oracle ASM</li> <li>OPENED - Disk is present in the storage system and is being accessed by Oracle ASM. This is the normal state for disks in a database instance which are part of a disk group being actively used by the instance.</li> <li>CACHED - Disk is present in the storage system and is part of a disk group being accessed by the Oracle ASM instance. This is the normal state for disks in an Oracle ASM instance which are part of a mounted disk group.</li> <li>IGNORED - Disk is present in the system but is ignored by Oracle ASM because of one of the following: <ul style="list-style-type: none"> <li>The disk is detected by the system library but is ignored because an Oracle ASM library discovered the same disk</li> <li>Oracle ASM has determined that the membership claimed by the disk header is no longer valid</li> </ul> </li> <li>CLOSING - Oracle ASM is in the process of closing this disk</li> </ul>                                                                                       |
| HEADER_STATUS | VARCHAR2(12) | <p>Per-instance status of the disk as seen by discovery:</p> <ul style="list-style-type: none"> <li>UNKNOWN - Oracle ASM disk header has not been read</li> <li>CANDIDATE - Disk is not part of a disk group and may be added to a disk group with the ALTER DISKGROUP statement</li> <li>INCOMPATIBLE - Version number in the disk header is not compatible with the Oracle ASM software version</li> <li>PROVISIONED - Disk is not part of a disk group and may be added to a disk group with the ALTER DISKGROUP statement. The PROVISIONED header status is different from the CANDIDATE header status in that PROVISIONED implies that an additional platform-specific action has been taken by an administrator to make the disk available for Oracle ASM.</li> <li>MEMBER - Disk is a member of an existing disk group. No attempt should be made to add the disk to a different disk group. The ALTER DISKGROUP statement will reject such an addition unless overridden with the FORCE option.</li> <li>FORMER - Disk was once part of a disk group but has been dropped cleanly from the group. It may be added to a new disk group with the ALTER DISKGROUP statement.</li> <li>CONFLICT - Oracle ASM disk was not mounted due to a conflict</li> <li>FOREIGN - Disk contains data created by an Oracle product other than Oracle ASM. This includes data files, logfiles, and OCR disks.</li> </ul> |
| MODE_STATUS   | VARCHAR2(7)  | <p>Global status about which kinds of I/O requests are allowed to the disk:</p> <ul style="list-style-type: none"> <li>ONLINE - Disk is online and operating normally. Reads and writes are attempted when the disk is mounted. Reads are attempted as part of disk discovery.</li> <li>OFFLINE - Disk is offline and access to data is not permitted. Reads and writes are not attempted. An offline disk remains logically part of its disk group.</li> <li>SYNCING - Disk is offline for reads, but online for writes. Oracle ASM is resyncing stale data on the disk. See V\$ASM_OPERATION to view resync progress.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                     | VARCHAR2(8)   | Global state of the disk with respect to the disk group: <ul style="list-style-type: none"> <li>UNKNOWN - Oracle ASM disk state is not known (typically the disk is not mounted)</li> <li>NORMAL - Disk is online and operating normally</li> <li>ADDING - Disk is being added to a disk group, and is pending validation by all instances that have the disk group mounted</li> <li>DROPPING - Disk has been manually taken offline and space allocation or data access for the disk halts. Rebalancing will commence to relocate data off the disks to other disks in the disk group. Upon completion of the rebalance, the disk is expelled from the group.</li> <li>HUNG - Disk drop operation cannot continue because there is insufficient space to relocate the data from the disk being dropped</li> <li>FORCING - Disk is being removed from the disk group without attempting to offload its data. The data will be recovered from redundant copies, where possible.</li> </ul> |
| REDUNDANCY                | VARCHAR2(7)   | Hardware redundancy of the disk: <ul style="list-style-type: none"> <li>UNKNOWN</li> <li>UNPROT</li> <li>MIRROR</li> <li>PARITY</li> </ul> <b>Note:</b> This column is valid only if an ASMLIB is present that supports returning hardware redundancy information. This column is not related to the redundancy of the disk group of which the disk is a member.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LIBRARY                   | VARCHAR2(64)  | Name of the library that discovered the disk                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OS_MB                     | NUMBER        | Size of the disk (in megabytes) as reported by the host operating system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| CON_ID                 | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p>                                                                                                                                                                                                                                                                     |
| THIN_PROVISION_CAPABLE | VARCHAR2(1)  | Indicates whether the disk supports Storage Thin Provisioning (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DATA_INTEGRITY_CAPABLE | VARCHAR2(1)  | Indicates whether the disk supports the Data Integrity feature (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SITE_NAME              | VARCHAR2(30) | The name of the site to which the specific disk belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SITE_GUID              | VARCHAR2(33) | The GUID for the site to which the specific disk belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| FAILGROUP_LABEL        | VARCHAR2(30) | This is the suggested name for the failure group to which the disk belongs, as returned by discovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SITE_LABEL             | VARCHAR2(30) | This is the suggested name for the site to which the disk belongs, as returned by discovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SITE_STATUS            | VARCHAR2(11) | <p>This column is populated only for disks in Oracle ASM extended disk groups. The site status is computed after every Partnership and Status Table (PST) refresh or when the PST is read from disks into memory. The possible states include:</p> <ul style="list-style-type: none"> <li>UNKNOWN: This is the state before any checks have been performed.</li> <li>UNAVAILABLE: This is the state when all the disks in the site are offline.</li> <li>COMPROMISED: The state when enough disks or PST copies are offline, such that the site can no longer provide data availability.</li> <li>AVAILABLE: The state when there is enough redundancy within the site to provide data availability in case another site becomes compromised or unavailable.</li> </ul> |

<sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the individual values for the HOT\_USED\_MB and COLD\_USED\_MB columns are not meaningful. However, the sum of the HOT\_USED\_MB and COLD\_USED\_MB values represents the total number of used megabytes on the disk. Also, the HOT\_READS, HOT\_WRITES, HOT\_BYTES\_READ, and HOT\_BYTES\_WRITTEN columns are no longer meaningful and always return 0, and the COLD\_READS, COLD\_WRITES, COLD\_BYTES\_READ, and COLD\_BYTES\_WRITTEN columns return statistics for the entire disk.

#### Note

The GROUP\_NUMBER and DISK\_NUMBER columns will only be valid if the disk is part of a disk group which is currently mounted by the instance. Otherwise, GROUP\_NUMBER will be 0, and DISK\_NUMBER will be a unique value with respect to the other disks that also have a group number of 0.

**Note**

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

**Note**

This view performs disk discovery every time it is queried. Because performing disk discovery is very resource intensive, Oracle recommends against using this view for monitoring scripts. Instead, use the less expensive view [V\\$ASM\\_DISK\\_STAT](#).

## 8.57 V\$ASM\_DISK\_IOSTAT

V\$ASM\_DISK\_IOSTAT displays information about disk I/O statistics for each Oracle Automatic Storage Management (Oracle ASM) client.

If this view is queried from the database instance, only the rows for that instance are shown.

| Column        | Datatype     | Description                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTNAME      | VARCHAR2(64) | Identifier for the DB/ADVM instance client                                                                                                      |
| DBNAME        | VARCHAR2(8)  | Unique database name (DB_UNIQUE_NAME)                                                                                                           |
| CLUSTERNAME   | VARCHAR2(31) | Name of the cluster                                                                                                                             |
| GROUP_NUMBER  | NUMBER       | Number of the disk group containing the disk                                                                                                    |
| DISK_NUMBER   | NUMBER       | Number assigned to the disk within its disk group                                                                                               |
| FAILGROUP     | VARCHAR2(30) | Name of the failure group to which the disk belongs                                                                                             |
| SITE_NAME     | VARCHAR2(30) | This is the name of the site to which the disk belongs                                                                                          |
| READS         | NUMBER       | Total number of I/O read requests for the disk                                                                                                  |
| WRITES        | NUMBER       | Total number of I/O write requests for the disk                                                                                                 |
| READ_ERRS     | NUMBER       | Total number of failed I/O read requests for the disk                                                                                           |
| WRITE_ERRS    | NUMBER       | Total number of failed I/O write requests for the disk                                                                                          |
| READ_TIMEOUT  | NUMBER       | Number of read I/Os that are timed out                                                                                                          |
| WRITE_TIMEOUT | NUMBER       | Number of write I/Os that are timed out                                                                                                         |
| READ_TIME     | NUMBER       | Total I/O time (in seconds) for read requests for the disk if the TIMED_STATISTICS initialization parameter is set to TRUE (0 if set to FALSE). |
| WRITE_TIME    | NUMBER       | Total I/O time (in seconds) for write requests for the disk if the TIMED_STATISTICS initialization parameter is set to TRUE (0 if set to FALSE) |
| BYTES_READ    | NUMBER       | Total number of bytes read from the disk                                                                                                        |

| Column                          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| COLD_BYTES_READ <sup>1</sup>    | NUMBER   | Number of bytes read from the disk                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COLD_BYTES_WRITTEN <sup>1</sup> | NUMBER   | Number of bytes written to the disk                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                          | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

<sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the HOT\_READS, HOT\_WRITES, HOT\_BYTES\_READ, and HOT\_BYTES\_WRITTEN columns are no longer meaningful and always return 0, and the COLD\_READS, COLD\_WRITES, COLD\_BYTES\_READ, and COLD\_BYTES\_WRITTEN columns return statistics for the entire disk.

#### Note

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 8.58 V\$ASM\_DISK\_STAT

V\$ASM\_DISK\_STAT displays performance statistics in the same way that V\$ASM\_DISK does, but without performing discovery of new disks

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disks that are new to the system.

The columns for V\$ASM\_DISK\_STAT are the same as those for V\$ASM\_DISK.

**Note**

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

["V\\$ASM\\_DISK"](#)

## 8.59 V\$ASM\_DISKGROUP

V\$ASM\_DISKGROUP displays one row for every Oracle Automatic Storage Management (Oracle ASM) disk group discovered by the Oracle ASM instance on the node.

| GROUP_NUMBER         | NUMBER       | Cluster-wide number assigned to the disk group (primary key)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| NAME                 | VARCHAR2(30) | Name of the disk group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SECTOR_SIZE          | NUMBER       | Physical block size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LOGICAL_SECTOR_SIZE  | NUMBER       | <p>This column represents the logical sector size value of the disk group in bytes. This is the smallest possible I/O that can be done in this disk group. Any I/O smaller than the logical sector size will cause an assert in the code.</p> <p>If the value of the LOGICAL_SECTOR_SIZE column is 512, while the value in the SECTOR_SIZE column is 4096, then the disk group supports 512 sector size emulation. This means that I/O operations can be both 512 or 4096 aligned. For example, this means that you can have redo log files with a file block size of 512 bytes in this disk group that can be both read and written to, as well as create new redo log files with a file block size of 4096 bytes.</p>                                                                                                                                                                                                                                      |
| BLOCK_SIZE           | NUMBER       | Oracle ASM metadata block size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| HOT_USED_MB <sup>1</sup>  | NUMBER       | Number of used megabytes in the hot region                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COLD_USED_MB <sup>1</sup> | NUMBER       | Number of used megabytes in the cold region                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| REQUIRED_MIRROR_FREE_MB   | NUMBER       | Amount of space that is required to be available in a given disk group in order to restore redundancy after one or more disk failures. The amount of space displayed in this column takes mirroring effects into account.                                                                                                                                                                                                                                                                   |
| USABLE_FILE_MB            | NUMBER       | Amount of free space that can be safely utilized taking mirroring into account and yet be able to restore redundancy after a disk failure                                                                                                                                                                                                                                                                                                                                                   |
| OFFLINE_DISKS             | NUMBER       | Number of disks in the disk group that are currently offline                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPATIBILITY             | VARCHAR2(60) | Minimum software version required for an Oracle ASM instance to mount this disk group                                                                                                                                                                                                                                                                                                                                                                                                       |
| DATABASE_COMPATIBILITY    | VARCHAR2(60) | Minimum software version required for a database instance to use files in this disk group                                                                                                                                                                                                                                                                                                                                                                                                   |
| VOTING_FILES              | VARCHAR2(1)  | Indicates whether the disk contains voting files (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

<sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the individual values for the HOT\_USED\_MB and COLD\_USED\_MB columns are not meaningful. However, the sum of the HOT\_USED\_MB and COLD\_USED\_MB values represents the total number of used megabytes in the disk group.

#### Note

The GROUP\_NUMBER, TOTAL\_MB, and FREE\_MB columns are only meaningful if the disk group is mounted by the instance. Otherwise, their values will be 0.

#### Note

This view performs disk discovery every time it is queried. Because performing disk discovery is very resource intensive, Oracle recommends against using this view for monitoring scripts. Instead, use the less expensive view [V\\$ASM\\_DISKGROUP\\_STAT](#).

## 8.60 V\$ASM\_DISKGROUP\_STAT

V\$ASM\_DISKGROUP\_STAT displays performance statistics in the same way that V\$ASM\_DISKGROUP does, but without performing discovery of new disk groups.

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disk groups that are new to the system.

The columns for V\$ASM\_DISKGROUP\_STAT are the same as those for V\$ASM\_DISKGROUP.

**① See Also**

["V\\$ASM\\_DISKGROUP"](#)

## 8.61 V\$ASM\_ESTIMATE

V\$ASM\_ESTIMATE displays an estimate of the work involved in execution plans for Oracle Automatic Storage Management (Oracle ASM) disk group rebalance and resync operations.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 8.62 V\$ASM\_FILE

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_FILE displays one row for each file in each disk group mounted by the Oracle ASM instance.

For example, if there are three disk groups and five files in each, fifteen rows are displayed (unless the query is qualified with a WHERE clause).

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER      | NUMBER       | Number of the disk group containing the file (composite primary key)                                                                                                                                                                                                                                                                                                                        |
| FILE_NUMBER       | NUMBER       | Number of the file within the disk group (composite primary key)                                                                                                                                                                                                                                                                                                                            |
| COMPOUND_INDEX    | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and a file number in the low-order 24 bits (for efficient access to the view)                                                                                                                                                                                                                                    |
| INCARNATION       | NUMBER       | Incarnation number for the file (composite primary key)                                                                                                                                                                                                                                                                                                                                     |
| BLOCK_SIZE        | NUMBER       | Block size of the file (in bytes)                                                                                                                                                                                                                                                                                                                                                           |
| BLOCKS            | NUMBER       | Number of blocks in the file                                                                                                                                                                                                                                                                                                                                                                |
| BYTES             | NUMBER       | Number of bytes in the file                                                                                                                                                                                                                                                                                                                                                                 |
| SPACE             | NUMBER       | Number of bytes allocated to the file                                                                                                                                                                                                                                                                                                                                                       |
| TYPE              | VARCHAR2(64) | Type of the file. Possible values are as follows: <ul style="list-style-type: none"> <li>• ARCHIVELOG</li> <li>• AUTOBACKUP</li> <li>• BACKUPSET</li> <li>• CHANGETRACKING</li> <li>• CONTROLFILE</li> <li>• DATAFILE</li> <li>• DATAGUARDCONFIG</li> <li>• DUMPSET</li> <li>• FLASHBACK</li> <li>• ONLINELOG</li> <li>• PARAMETERFILE</li> <li>• TEMPFILE</li> <li>• XTRANSPORT</li> </ul> |
| REDUNDANCY        | VARCHAR2(6)  | Redundancy of the file: <ul style="list-style-type: none"> <li>• HIGH</li> <li>• MIRROR</li> <li>• PARITY</li> <li>• UNPROT</li> </ul>                                                                                                                                                                                                                                                      |
| STRIPED           | VARCHAR2(6)  | Indicates how the file is striped: <ul style="list-style-type: none"> <li>• FINE</li> <li>• COARSE</li> </ul>                                                                                                                                                                                                                                                                               |
| CREATION_DATE     | DATE         | Date on which the file was created                                                                                                                                                                                                                                                                                                                                                          |
| MODIFICATION_DATE | DATE         | Date of the last open/close for writing, rounded back to the nearest hour                                                                                                                                                                                                                                                                                                                   |

| Column                          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REDUNDANCY_LOWERED              | VARCHAR2(1)  | Indicates whether a file has lower redundancy than what was expected (Y) or not (N). Redundancy is said to have been lowered for a file when one or more data extents in that file are not mirrored at the level specified by the administrator. In case of unprotected files, data extents could be missing altogether. Another possible value for this column is (U), which means that it is unknown.<br>This column is deprecated, and it always displays a value of U.                  |
| PERMISSIONS                     | VARCHAR2(16) | Access permissions of the file, in order of user, group, and other                                                                                                                                                                                                                                                                                                                                                                                                                          |
| USER_NUMBER                     | NUMBER       | User number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| USER_INCARNATION                | NUMBER       | Incarnation number of the user                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| USERGROUP_NUMBER                | NUMBER       | User group number                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| USERGROUP_INCARNATION           | NUMBER       | Incarnation number of the user group                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PRIMARY_REGION <sup>1</sup>     | VARCHAR2(4)  | Region used for allocating primary extents: <ul style="list-style-type: none"> <li>• HOT</li> <li>• COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

| COLD_WRITES <sup>1</sup>        | NUMBER       | Number of writes to the file                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COLD_BYTES_READ <sup>1</sup>    | NUMBER       | Number of bytes read from the file                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| COLD_BYTES_WRITTEN <sup>1</sup> | NUMBER       | Number of bytes written to the file                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FILEGROUP_NUMBER                | NUMBER       | Shows the number of the associated file group                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FILEGROUP_INCARNATION           | NUMBER       | The incarnation number for the file group the file belongs to in a flex redundancy disk group                                                                                                                                                                                                                                                                                                                                                                                               |
| REMIRROR                        | VARCHAR2(1)  | This column has the value Y when rebalance is needed for the file after a redundancy change in a flex redundancy disk group, N otherwise. A redundancy change can occur when the file is moved to a file group with a different redundancy, or when the redundancy property of the file group is changed. After rebalance is run for the file, the value changes to N.                                                                                                                      |
| PARENT_FILNUM                   | NUMBER       | For internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARENT_FILNUMINC                | NUMBER       | For internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

- <sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the PRIMARY\_REGION and MIRROR\_REGION columns are no longer meaningful. Also, the HOT\_READS, HOT\_WRITES, HOT\_BYTES\_READ, and HOT\_BYTES\_WRITTEN columns are no longer meaningful and always return 0, and the COLD\_READS, COLD\_WRITES, COLD\_BYTES\_READ, and COLD\_BYTES\_WRITTEN columns return statistics for the entire file.

## 8.63 V\$ASM\_FILEGROUP

V\$ASM\_FILEGROUP describes the properties of the Oracle Automatic Storage Management (Oracle ASM) File Groups.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP displays one row for every File Group present in every Disk Group mounted by the Oracle ASM instance. File Groups are only displayed for Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

### ① Note

There will not be an entry for the default File Group.

## 8.64 V\$ASM\_FILEGROUP\_FILE

V\$ASM\_FILEGROUP\_FILE lists all the Oracle Automatic Storage Management (Oracle ASM) files associated with each File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP\_FILE will display one row for every file associated with a File Group contained in every Disk Group mounted by the instance.

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.65 V\$ASM\_FILEGROUP\_PROPERTY

V\$ASM\_FILEGROUP\_PROPERTY describes all the properties of every Oracle Automatic Storage Management (Oracle ASM) File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP\_PROPERTY will display one row for every property of every file type of every File Group contained in every Disk Group mounted by the instance.

File Group properties are only displayed for File Groups on Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

① Note

There will not be an entry for the default File Group.

| Column           | Datatype | Description                                                                                                                                                  |
|------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER     | NUMBER   | Number of the Disk Group in which this File Group exists (composite primary key)                                                                             |
| FILEGROUP_NUMBER | NUMBER   | Number associated to the File Group within its Disk Group (composite primary key)                                                                            |
| COMPOUND_INDEX   | NUMBER   | A 32-bit number consisting of a Disk Group number in the high-order 8 bits and a Property Number in the low-order 24 bits (for efficient access to the view) |
| PROPERTY_INDEX   | NUMBER   | Number of this property in the Disk Group for the File Group (composite primary key)                                                                         |
| INCARNATION      | NUMBER   | Incarnation number for this property (composite primary key)                                                                                                 |

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_TYPE | VARCHAR2(30)  | Type of file the property will be applied to: <ul style="list-style-type: none"> <li>• ARCHIVELOG</li> <li>• ASMPARAMETERFILE</li> <li>• ASMVDRL</li> <li>• ASMVOL</li> <li>• AUDIT_SPILLFILES</li> <li>• AUTOBACKUP</li> <li>• BACKUPSET</li> <li>• CHANGETRACKING</li> <li>• CONTAINER</li> <li>• CONTROLFILE</li> <li>• DATAFILE</li> <li>• DATAGUARDCONFIG</li> <li>• DUMPSET</li> <li>• FLASHBACK</li> <li>• FLASHFILE</li> <li>• KEY_STORE</li> <li>• OCRBACKUP</li> <li>• OCRFILE</li> <li>• ONLINELOG</li> <li>• PARAMETERFILE</li> <li>• TEMPFILE</li> <li>• VOTINGFILE</li> <li>• XTRANSPORT</li> </ul> |
| NAME      | VARCHAR2(64)  | The value can be NULL for properties with a File Group granularity.<br>Full name of the property. Possible values: <ul style="list-style-type: none"> <li>• COMPATIBLE.CLIENT</li> <li>• DBCLONE_STATUS</li> <li>• OWNER</li> <li>• PARENT_FILEGROUP_NUMBER</li> <li>• POWER_LIMIT</li> <li>• PRIORITY</li> <li>• REDUNDANCY</li> <li>• STRIPING</li> <li>• USER_GROUP</li> </ul>                                                                                                                                                                                                                                 |
| VALUE     | VARCHAR2(256) | Value of the property<br>See <i>Oracle Automatic Storage Management Administrator's Guide</i> for information about file group property values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| FS_NAME                | VARCHAR2(1024) | Mount point (primary key)                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AVAILABLE_TIME         | DATE           | Mount time or the time that the file system became available again; NULL if the file system is not available                                                                                                                                                                                                                                                                                                                                                                            |
| BLOCK_SIZE             | NUMBER         | File system block size (in kilobytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATE                  | VARCHAR2(13)   | File system status:: <ul style="list-style-type: none"> <li>NOT AVAILABLE</li> <li>AVAILABLE</li> <li>OFFLINE - Either the Oracle ASM instance is down, the disk group has been forced dismounted, or less commonly, a metadata I/O failure occurred or serious metadata corruption was detected. In the case of a metadata I/O failure, the file system is also marked as corrupt. An offline file system can only be unmounted; other attempts at access result in errors.</li> </ul> |
| CORRUPT                | VARCHAR2(5)    | Indicates whether the file system needs the fixer (fsck, acfschkdsk) to be run (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                    |
| NUM_VOL                | NUMBER         | Number of volumes in the file system                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TOTAL_SIZE             | NUMBER         | Total capacity of the file system (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_FREE             | NUMBER         | Total free space in the file system (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL_SNAP_SPACE_USAGE | NUMBER         | Total space used by snapshots (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| REPLSTATE              | VARCHAR2(7)    | Replication status: <ul style="list-style-type: none"> <li>NO REPL - Replication is not initialized</li> <li>PRIMARY - File system is initialized for replication as a primary</li> <li>STANDBY - File system is initialized for replication as a standby</li> </ul>                                                                                                                                                                                                                    |
| RESIZE_STATE           | VARCHAR2(5)    | Possible resize states: <ul style="list-style-type: none"> <li>NONE - AutoResize not configured</li> <li>AUTO - Equivalent to AutoResizeEnabled flag</li> <li>ERROR - Equivalent to AutoResizeError flag</li> </ul>                                                                                                                                                                                                                                                                     |
| COMPRESS_STATE         | VARCHAR2(7)    | Compression status of the file system. Possible values: <ul style="list-style-type: none"> <li>DISABLED - Compression is not active</li> <li>ENABLED - Compression is active</li> <li>PARTIAL - Compression is disabled, but the file system may contain compressed files</li> </ul>                                                                                                                                                                                                    |
| FROZEN_STATE           | VARCHAR2(5)    | Indicates whether the filesystem is frozen (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ACFS_COMPATIBILITY     | VARCHAR2(60)   | Oracle Release streams where Oracle ACFS has shipped                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| METADATA_BLOCK_SIZE    | NUMBER         | Metadata block size of the file system. Possible values: <ul style="list-style-type: none"> <li>512</li> <li>4096</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> <p>For this view, the value is always 0.</p> |

## 8.67 V\$ASM\_OPERATION

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_OPERATION displays one row for every active Oracle ASM long running operation executing in the Oracle ASM instance.

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER | NUMBER   | Disk group number (primary key). This is the foreign key to the V\$ASM_DISKGROUP view.                                                                                                                                                                                                                                                                                            |
| OPERATION    | CHAR(5)  | <p>Type of the operation:</p> <ul style="list-style-type: none"><li>• REBAL - Rebalance pending for this group. The disk group is rebalancing.</li><li>• REMIRROR - Remirror is pending for this group.</li><li>• SCRUB - Scrubbing is pending for this group.</li></ul> <p>Starting with Oracle Database 12c, new queries should use the PASS column instead of this column.</p> |

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PASS        | VARCHAR2(9)  | <p>Type of the operation:</p> <ul style="list-style-type: none"> <li>• COMPACT - Oracle ASM is moving user data closer together, which improves performance by reducing seek distance</li> <li>• PREPARE - Completing work corresponding to the prepare SQL operation. This phase is enabled only for FLEX or EXTENDED redundancy disk groups and COMPATIBLE.ASM must be set to 12.2 or higher.</li> <li>• REBALANCE - Rebalance pending for this group. The disk group is rebalancing.</li> <li>• REBUILD - Restoring the redundancy of forcing disks. Forcing disks are those disks that have been dropped with the FORCE option.</li> <li>• RESILVER - This value appears in Oracle Exadata environments when WriteBack FlashCache is enabled</li> <li>• RESYNC - Resync operation in progress to bring one or more Oracle ASM disks online</li> <li>• SCRUBBING - The disk group is scrubbing.</li> </ul> <p>Starting with Oracle Database 12c, new queries should use this column instead of the OPERATION column.</p> |
| STATE       | VARCHAR2(4)  | <p>State of the operation:</p> <ul style="list-style-type: none"> <li>• WAIT - No operations running for the group</li> <li>• EST - An estimate is computed on the amount of work to be done for the rebalance</li> <li>• RUN - Operation running for the group</li> <li>• REAP - Operation is being run down</li> <li>• DONE - Displayed for a pass that is complete</li> <li>• ERRS - Operation halted by errors</li> </ul> <p>Estimates are computed in parallel in the background while the work is being executed. Thus, the transition from the EST to the RUN state may be extremely fast.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| POWER       | NUMBER       | Power requested for the operation as specified by the ASM_POWER_LIMIT initialization parameter or command syntax. Or, power requested for the operation as specified by the power option of the scrubbing SQL syntax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| USED_QUOTA_MB     | NUMBER       | Used quota of the quota group in GB                                                                                                                                                                                                                                                                                                                                                                                                                    |
| QUOTA_LIMIT_MB    | NUMBER       | Quota limit (capacity) of the quota group in GB                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID            | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.69 V\$ASM\_TEMPLATE

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance.

In a database instance, V\$ASM\_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance with which the database instance communicates.

| Column                      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER                | NUMBER       | Owning disk group number (foreign key to the V\$ASM_DISKGROUP view)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ENTRY_NUMBER                | NUMBER       | Template number (primary key)                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REDUNDANCY                  | VARCHAR2(6)  | Redundancy of the template: <ul style="list-style-type: none"> <li>HIGH</li> <li>MIRROR</li> <li>PARITY</li> <li>UNPROT</li> </ul>                                                                                                                                                                                                                                                                                                                                                    |
| STRIPE                      | VARCHAR2(6)  | Indicates how the template is striped: <ul style="list-style-type: none"> <li>FINE</li> <li>COARSE</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |
| SYSTEM                      | VARCHAR2(1)  | Indicates whether the template is a system template (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME                        | VARCHAR2(30) | Name of the template                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PRIMARY_REGION <sup>1</sup> | VARCHAR2(4)  | Region used for allocating primary extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| MIRROR_REGION <sup>1</sup>  | VARCHAR2(4)  | Region for allocating mirrored extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

<sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the PRIMARY\_REGION and MIRROR\_REGION columns are no longer meaningful.

### Note

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

# 8.70 V\$ASM\_USER

V\$ASM\_USER displays the effective operating system user names of connected database instances and of file owners.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER        | Oracle ASM disk group number                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| USER_NUMBER    | NUMBER        | Oracle ASM internal unique user number                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPOUND_INDEX | NUMBER        | A 32-bit number consisting of a disk group number in the high-order 8 bits and a user number in the low-order 24 bits (for efficient access to the view)                                                                                                                                                                                                                                                                                                            |
| INCARNATION    | NUMBER        | Incarnation number of the user                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CLUSTER_ID     | VARCHAR2(128) | Oracle ASM cluster ID. The CLUSTER_ID and OS_NAME pair can be used to uniquely identify a user.                                                                                                                                                                                                                                                                                                                                                                     |
| OS_ID          | VARCHAR2(128) | Operating system user ID                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OS_NAME        | VARCHAR2(33)  | Operating system user name                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li>n: Where n is the applicable container ID for the rows containing data</li></ul> For this view, the value is always 0. |

① Note

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 8.72 V\$ASM\_USERGROUP\_MEMBER

V\$ASM\_USERGROUP\_MEMBER displays the members for each Oracle Automatic Storage Management (Oracle ASM) File Access Control group.

| Column                | Datatype | Description                                 |
|-----------------------|----------|---------------------------------------------|
| GROUP_NUMBER          | NUMBER   | Oracle ASM disk group number                |
| MEMBER_NUMBER         | NUMBER   | Number of the user group member             |
| MEMBER_INCARNATION    | NUMBER   | Incarnation number of the user group member |
| USERGROUP_NUMBER      | NUMBER   | User group number                           |
| USERGROUP_INCARNATION | NUMBER   | Incarnation number of the user group        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

### Note

In an Oracle Database instance, this view returns 0 rows when queried from a PDB.

## 8.73 V\$ASM\_VOLUME

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_VOLUME displays information about each Oracle ADVM volume.

| Column         | Datatype     | Description                                                                                                                                                |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER       | Cluster-wide number assigned to the disk group (composite primary key)                                                                                     |
| VOLUME_NAME    | VARCHAR2(30) | Name of the volume                                                                                                                                         |
| COMPOUND_INDEX | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view) |
| SIZE_MB        | NUMBER       | Size of the volume (in megabytes)                                                                                                                          |
| VOLUME_NUMBER  | NUMBER       | Number of the Volume within the disk group (composite primary key)                                                                                         |
| REDUNDANCY     | VARCHAR2(6)  | <p>Redundancy type for the volume:</p> <ul style="list-style-type: none"> <li>UNPROT</li> <li>HIGH</li> <li>MIRROR</li> </ul>                              |
| STRIPE_COLUMNS | NUMBER       | Number of columns in a stripe set                                                                                                                          |
| STRIPE_WIDTH_K | NUMBER       | Stripe width of the volume (in kilobytes)                                                                                                                  |
| STATE          | VARCHAR2(8)  | Indicates whether the volume is enabled (ENABLED), disabled (DISABLED), or remote (REMOTE)                                                                 |
| FILE_NUMBER    | NUMBER       | Volume file number                                                                                                                                         |
| INCARNATION    | NUMBER       | Volume file incarnation number                                                                                                                             |

| Column                      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRL_FILE_NUMBER             | NUMBER         | Volume Dirty Region Logging (DRL) file used for mirrored volumes                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RESIZE_UNIT_MB              | NUMBER         | Volume allocation unit (in megabytes) that a volume can be created                                                                                                                                                                                                                                                                                                                                                                                                                    |
| USAGE                       | VARCHAR2(30)   | Optional usage string for the volume                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VOLUME_DEVICE               | VARCHAR2(256)  | OSD path for the volume device                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MOUNTPATH                   | VARCHAR2(1024) | Optional mount path string for the volume                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PRIMARY_REGION <sup>1</sup> | VARCHAR2(4)    | Region used for allocating primary extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| MIRROR_REGION <sup>1</sup>  | VARCHAR2(4)    | Region used for allocating mirrored extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

<sup>1</sup> Intelligent Data Placement is desupported starting with Oracle Database 21c. As a result, the PRIMARY\_REGION and MIRROR\_REGION columns are no longer meaningful.

## 8.74 V\$ASM\_VOLUME\_STAT

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_VOLUME\_STAT displays information about statistics for each Oracle ADVM volume.

| Column         | Datatype     | Description                                                                                                                                                |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER       | Cluster-wide number assigned to the disk group (composite primary key)                                                                                     |
| VOLUME_NAME    | VARCHAR2(30) | Name of the volume                                                                                                                                         |
| COMPOUND_INDEX | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view) |
| VOLUME_NUMBER  | NUMBER       | Number of the Volume within the disk group (composite primary key)                                                                                         |
| READS          | NUMBER       | Total number of read requests for this volume                                                                                                              |
| WRITES         | NUMBER       | Total number of write requests for this volume                                                                                                             |
| READ_ERRS      | NUMBER       | Total number of failed read I/O operations for this volume                                                                                                 |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRITE_ERRS    | NUMBER   | Total number of failed write I/O operations for this volume                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| READ_TIME     | NUMBER   | Total I/O time (in seconds) for read requests for this volume                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WRITE_TIME    | NUMBER   | Total I/O time (in seconds) for write requests for this volume                                                                                                                                                                                                                                                                                                                                                                                                                              |
| BYTES_READ    | NUMBER   | Total number of bytes read for this volume                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BYTES_WRITTEN | NUMBER   | Total number of bytes written for this volume                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 8.75 V\$AUTHPOOL\_STATS

V\$AUTHPOOL\_STATS displays statistics for the authentication pool. This pool authenticates user connections when client applications connect to Database Resident Connection Pooling (DRCP).

| Column      | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_SRVS    | NUMBER   | Total number of servers in the authentication pool                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NUM_BUSY    | NUMBER   | Number of busy servers in the authentication pool                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NUM_FREE    | NUMBER   | Number of free servers in the authentication pool                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NUM_WAITERS | NUMBER   | Number of connections waiting for a server in the authentication pool to become available                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID      | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.76 V\$AW\_AGGREGATE\_OP

V\$AW\_AGGREGATE\_OP displays the aggregation operators available in analytic workspaces. You can use this view in an application to provide a list of choices.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2(14) | Keyword for the aggregation operator                                                                                                                                                                                                                                                                                                                                                                                                        |
| LONGNAME       | VARCHAR2(30) | Descriptive name for the operator                                                                                                                                                                                                                                                                                                                                                                                                           |
| DEFAULT_WEIGHT | NUMBER       | Default weight factor for weighted operators                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.77 V\$AW\_ALLOCATE\_OP

V\$AW\_ALLOCATE\_OP displays the allocation operators available in analytic workspaces. You can use this view in an application to provide a list of choices.

| Column   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | VARCHAR2(14) | Keyword for the allocation operator                                                                                                                                                                                                                                                                                                                                                                                                         |
| LONGNAME | VARCHAR2(30) | Descriptive name for the operator                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.78 V\$AW\_CALC

V\$AW\_CALC reports on the effectiveness of various caches used by Oracle OLAP during dynamic aggregation.

| Column     | Datatype | Description                                  |
|------------|----------|----------------------------------------------|
| SESSION_ID | NUMBER   | A unique numeric identifier for the session. |

| Column                 | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGGREGATE_CACHE_HITS   | NUMBER       | The number of times a dimension member is found in the aggregate cache (a hit).<br>The number of hits for run-time aggregation can be increased by fetching data across the dense dimension                                                                                                                                                                                                                                                     |
| AGGREGATE_CACHE_MISSES | NUMBER       | The number of times a dimension member is not found in the aggregate cache and must be read from disk (a miss).                                                                                                                                                                                                                                                                                                                                 |
| SESSION_CACHE_HITS     | NUMBER       | The number of times the data is found in the session cache (a hit).                                                                                                                                                                                                                                                                                                                                                                             |
| SESSION_CACHE_MISSES   | NUMBER       | The number of times the data is not found in the session cache (a miss).                                                                                                                                                                                                                                                                                                                                                                        |
| POOL_HITS              | NUMBER       | The number of times the data is found in a page in the OLAP page pool (a hit).                                                                                                                                                                                                                                                                                                                                                                  |
| POOL_MISSES            | NUMBER       | The number of times the data is not found in the OLAP page pool (a miss).                                                                                                                                                                                                                                                                                                                                                                       |
| POOL_NEW_PAGES         | NUMBER       | The number of newly created pages in the OLAP page pool that have not yet been written to the workspace LOB.                                                                                                                                                                                                                                                                                                                                    |
| POOL_RECLAIMED_PAGES   | NUMBER       | The number of previously unused pages that have been recycled with new data.                                                                                                                                                                                                                                                                                                                                                                    |
| CACHE_WRITES           | NUMBER       | The number of times the data from the OLAP page pool has been written to the database cache.                                                                                                                                                                                                                                                                                                                                                    |
| POOL_SIZE              | NUMBER       | The number of kilobytes in the OLAP page pool.                                                                                                                                                                                                                                                                                                                                                                                                  |
| CURR_DML_COMMAND       | VARCHAR2(64) | The command currently being executed.                                                                                                                                                                                                                                                                                                                                                                                                           |
| PREV_DML_COMMAND       | VARCHAR2(64) | The command most recently completed.                                                                                                                                                                                                                                                                                                                                                                                                            |
| AGGR_FUNC_LOGICAL_NA   | NUMBER       | The number of times the aggregation engine returns a logical NA because the AGGINDEX option is on and the composite tuple does not exist.                                                                                                                                                                                                                                                                                                       |
| AGGR_FUNC_PRECOMPUTE   | NUMBER       | The number of times the aggregation engine finds a value in a position that it was called to calculate.                                                                                                                                                                                                                                                                                                                                         |
| AGGR_FUNC_CALCS        | NUMBER       | The number of times the aggregation engine calculates a parent value based on the values of its children.                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                 | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.79 V\$AW\_LONGOPS

V\$AW\_LONGOPS displays status information about active SQL cursors initiated in an analytic workspace.

| Column      | Datatype     | Description                                                                                                                   |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID  | NUMBER       | Identifier for the session in which the fetch is executing. This table can be joined with V\$SESSION to obtain the user name. |
| CURSOR_NAME | VARCHAR2(64) | Name assigned to the cursor                                                                                                   |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMAND          | VARCHAR2(17)  | Command that is actively fetching data from relational tables: <ul style="list-style-type: none"> <li>• QUERY</li> <li>• FETCH</li> <li>• IMPORT</li> <li>• EXECUTE</li> <li>• UPDATE</li> <li>• SOLVE</li> <li>• CLEAR</li> <li>• LOAD CUBE</li> <li>• LOAD DIMENSION</li> <li>• DIMENSION COMPILE</li> </ul>                                                                                                                                        |
| STATUS           | VARCHAR2(9)   | Status of the current operation: <ul style="list-style-type: none"> <li>• EXECUTING - Command has begun executing</li> <li>• FETCHING - Data is being fetched into the analytic workspace</li> <li>• FINISHED - Command has finished executing. This status appears very briefly before the record disappears from the table.</li> </ul>                                                                                                              |
| ROWS_PROCESSED   | NUMBER        | Number of rows already inserted, updated, or deleted                                                                                                                                                                                                                                                                                                                                                                                                  |
| SEQ_NUMBER       | NUMBER        | Sequence number in the Cube Build log                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_ID           | VARCHAR2(13)  | SQL ID of the statement                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TARGET           | VARCHAR2(64)  | Operated object name                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TARGET_DESC      | VARCHAR2(64)  | A brief description of the operated object                                                                                                                                                                                                                                                                                                                                                                                                            |
| START_TIME       | DATE          | Time the command started executing                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_UPDATE_TIME | DATE          | Last updated time                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ELAPSED_SECONDS  | NUMBER        | Number of seconds between START_TIME and LAST_UPDATE_TIME                                                                                                                                                                                                                                                                                                                                                                                             |

| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.80 V\$AW\_OLAP

V\$AW\_OLAP provides a record of active sessions and their use with analytic workspaces.

A row is generated whenever an analytic workspace is created or attached. The first row for a session is created when the first command is issued. It identifies the SYS.EXPRESS workspace,

which is attached automatically to each session. Rows related to a particular analytic workspace are deleted when the workspace is detached from the session or the session ends.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID           | NUMBER       | A unique numeric identifier for a session                                                                                                                                                                                                                                                                                                                                                                                                       |
| AW_NUMBER            | NUMBER       | A unique numeric identifier for an analytic workspace. To get the name of the analytic workspace, join this column to the AW_NUMBER column of the USER_AWS view or to the AWSEQ# column of the AW\$ table.                                                                                                                                                                                                                                      |
| ATTACH_MODE          | VARCHAR2(10) | READ ONLY or READ WRITE                                                                                                                                                                                                                                                                                                                                                                                                                         |
| GENERATION           | NUMBER       | The generation of an analytic workspace. Each UPDATE creates a new generation. Sessions attaching the same workspace between UPDATE commands share the same generation.                                                                                                                                                                                                                                                                         |
| TEMP_SPACE_PAGES     | NUMBER       | The number of pages stored in temporary segments for the analytic workspace.                                                                                                                                                                                                                                                                                                                                                                    |
| TEMP_SPACE_READS     | NUMBER       | The number of times data has been read from a temporary segment and not from the page pool.                                                                                                                                                                                                                                                                                                                                                     |
| LOB_READS            | NUMBER       | The number of times data has been read from the table where the analytic workspace is stored (the permanent LOB).                                                                                                                                                                                                                                                                                                                               |
| POOL_CHANGED_PAGES   | NUMBER       | The number of pages in the page pool that have been modified in this analytic workspace.                                                                                                                                                                                                                                                                                                                                                        |
| POOL_UNCHANGED_PAGES | NUMBER       | The number of pages in the page pool that have not been modified in this analytic workspace.                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.81 V\$AW\_SESSION\_INFO

V\$AW\_SESSION\_INFO provides information about each active session.

A transaction is a single exchange between a client session and Oracle OLAP. Multiple commands can execute within a single transaction.

| Column            | Datatype     | Description                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID        | NUMBER       | A unique numeric identifier for a session                                                                                                       |
| CLIENT_TYPE       | VARCHAR2(64) | OLAP                                                                                                                                            |
| SESSION_STATE     | VARCHAR2(64) | TRANSACTIONING, NOT_TRANSACTIONING, EXCEPTION_HANDLING, CONSTRUCTING, CONSTRUCTED, DECONSTRUCTING, or DECONSTRUCTED                             |
| SESSION_HANDLE    | NUMBER       | The session identifier                                                                                                                          |
| USERID            | VARCHAR2(64) | The database user name under which the session opened                                                                                           |
| TOTAL_TRANSACTION | NUMBER       | The total number of transactions executed within the session; this number provides a general indication of the level of activity in the session |

| Column                       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRANSACTION_TIME             | NUMBER   | The elapsed time in milliseconds of the mostly recently completed transaction                                                                                                                                                                                                                                                                                                                                                                          |
| TOTAL_TRANSACTION_TIME       | NUMBER   | The total elapsed time in milliseconds in which transactions were being executed                                                                                                                                                                                                                                                                                                                                                                       |
| AVERAGE_TRANSACTION_TIME     | NUMBER   | The average elapsed time in milliseconds to complete a transaction                                                                                                                                                                                                                                                                                                                                                                                     |
| TRANSACTION_CPU_TIME         | NUMBER   | The total CPU time in milliseconds used to complete the most recent transaction                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_TRANSACTION_CPU_TIME   | NUMBER   | The total CPU time used to execute all transactions in this session; this total does not include transactions that are currently in progress                                                                                                                                                                                                                                                                                                           |
| AVERAGE_TRANSACTION_CPU_TIME | NUMBER   | The average CPU time to complete a transaction; this average does not include transactions that are currently in progress                                                                                                                                                                                                                                                                                                                              |
| CON_ID                       | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.82 V\$BACKUP

V\$BACKUP displays the backup status of all online data files.

| Column  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| CON_ID  | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.83 V\$BACKUP\_ARCHIVELOG\_DETAILS

V\$BACKUP\_ARCHIVELOG\_DETAILS contains information about all restorable archive logs.

It will include all archived logs backed up in a backup set or proxy copies.

| FILESIZE          | NUMBER         | File size                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| COMPRESSION_RATIO | NUMBER         | The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                           |
| FILESIZE_DISPLAY  | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on                                                                                                                                                                                                                                                                                            |
| CON_ID            | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.84 V\$BACKUP\_ARCHIVELOG\_SUMMARY

V\$BACKUP\_ARCHIVELOG\_SUMMARY provides archive log summary information based on archive logs in the backup set or on proxy copies.

| Column                    | Datatype | Description                                    |
|---------------------------|----------|------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER   | Number of files backed up                      |
| NUM_DISTINCT_FILES_BACKED | NUMBER   | Number of distinct archive log files backed up |
| MIN_FIRST_CHANGE#         | NUMBER   | Lowest SCN range value                         |
| MAX_NEXT_CHANGE#          | NUMBER   | Highest SCN range value                        |
| MIN_FIRST_TIME            | DATE     | Lowest SCN range time                          |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_NEXT_TIME        | DATE           | Highest SCN range time                                                                                                                                                                                                                                                                                                                                                                                                                          |
| INPUT_BYTES          | NUMBER         | Total input bytes read                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OUTPUT_BYTES         | NUMBER         | Output size of backups                                                                                                                                                                                                                                                                                                                                                                                                                          |
| COMPRESSION_RATIO    | NUMBER         | The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                           |
| INPUT_BYTES_DISPLAY  | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                                                                                                                                                                                                                                                                              |
| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.85 V\$BACKUP\_ASYNC\_IO

V\$BACKUP\_ASYNC\_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece. This data is not stored persistently, and is not preserved when the instance is re-started.

| Column            | Datatype      | Description                                                                                                          |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------|
| SID               | NUMBER        | Oracle SID of the session doing the backup or restore                                                                |
| SERIAL            | NUMBER        | Use count for the SID doing the backup or restore                                                                    |
| USE_COUNT         | NUMBER        | A counter that can be used to identify rows from different backup sets                                               |
| RMAN_STATUS_RECID | NUMBER        | Owning V\$RMAN_STATUS record ID                                                                                      |
| RMAN_STATUS_STAMP | NUMBER        | Owning V\$RMAN_STATUS record stamp                                                                                   |
| DEVICE_TYPE       | VARCHAR2(17)  | Device type where the file is located                                                                                |
| TYPE              | VARCHAR2(9)   | INPUT, OUTPUT, or AGGREGATE                                                                                          |
| STATUS            | VARCHAR2(11)  | NOT STARTED, IN PROGRESS, or FINISHED                                                                                |
| FILENAME          | VARCHAR2(513) | Name of the backup file being read or written                                                                        |
| SET_COUNT         | NUMBER        | Set count of the backup set being read or written                                                                    |
| SET_STAMP         | NUMBER        | Set stamp of the backup set being read or written                                                                    |
| BUFFER_SIZE       | NUMBER        | Size of the buffers being used to read/write the file, in bytes                                                      |
| BUFFER_COUNT      | NUMBER        | Number of buffers being used to read/write the file                                                                  |
| TOTAL_BYTES       | NUMBER        | Total number of bytes that will be read or written for the file, if known. If not known, this column will be null    |
| OPEN_TIME         | DATE          | Time the file was opened. If TYPE='AGGREGATE', then this is the time that the first file in the aggregate was opened |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLOSE_TIME                 | DATE     | Time the file was closed. If TYPE='AGGREGATE', then this is the time that the last file in the aggregate was closed                                                                                                                                                                                                                                                                                                                             |
| ELAPSED_TIME               | NUMBER   | Time, in hundredths of a second, that the file was open                                                                                                                                                                                                                                                                                                                                                                                         |
| MAXOPENFILES               | NUMBER   | Number of concurrently open DISK files. This value is only present in rows where TYPE='AGGREGATE'.                                                                                                                                                                                                                                                                                                                                              |
| BYTES                      | NUMBER   | Number of bytes read or written so far                                                                                                                                                                                                                                                                                                                                                                                                          |
| EFFECTIVE_BYTES_PER_SECOND | NUMBER   | I/O rate that was achieved with this device during this backup                                                                                                                                                                                                                                                                                                                                                                                  |
| IO_COUNT                   | NUMBER   | Number of I/Os that were performed to this file                                                                                                                                                                                                                                                                                                                                                                                                 |
| READY                      | NUMBER   | Number of asynchronous requests for which a buffer was immediately ready for use                                                                                                                                                                                                                                                                                                                                                                |
| SHORT_WAITS                | NUMBER   | Number of times that a buffer was not immediately available, but a buffer became available after doing a nonblocking poll for I/O completion                                                                                                                                                                                                                                                                                                    |
| SHORT_WAIT_TIME_TOTAL      | NUMBER   | Total time, in hundredths of a second, taken by nonblocking polls for I/O completion                                                                                                                                                                                                                                                                                                                                                            |
| SHORT_WAIT_TIME_MAX        | NUMBER   | Maximum time taken for a nonblocking poll for I/O completion, in hundredths of a second                                                                                                                                                                                                                                                                                                                                                         |
| LONG_WAITS                 | NUMBER   | The number of times that a buffer was not immediately available, and only became available after a blocking wait was issued                                                                                                                                                                                                                                                                                                                     |
| LONG_WAIT_TIME_TOTAL       | NUMBER   | The total time, in hundredths of a second, taken by blocking waits for I/O completion                                                                                                                                                                                                                                                                                                                                                           |
| LONG_WAIT_TIME_MAX         | NUMBER   | The maximum time taken for a blocking wait for I/O completion, in hundredths of a second                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.86 V\$BACKUP\_CONTROLFILE\_DETAILS

V\$BACKUP\_CONTROLFILE\_DETAILS contains information about restorable control files.

It will include all the control files backed up in the backup set, image copies, and proxy copies.

| Column        | Datatype | Description                                                                 |
|---------------|----------|-----------------------------------------------------------------------------|
| BTYPE         | CHAR(9)  | Backup type container. Possible values are BACKUPSET, IMAGECOPY, PROXYCOPY. |
| BTYPE_KEY     | NUMBER   | Unique identifier for the backup type, either BS_KEY or COPY_KEY.           |
| SESSION_KEY   | NUMBER   | Session identifier                                                          |
| SESSION_RECID | NUMBER   | Session recid                                                               |
| SESSION_STAMP | NUMBER   | Session stamp                                                               |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| FILESIZE           | NUMBER         | File size, in bytes, for the output of backing up this control file                                                                                                                                                                                                                                                                                                                                                                                   |
| COMPRESSION_RATIO  | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                                |
| FILESIZE_DISPLAY   | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on                                                                                                                                                                                                                                                                                                  |
| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.87 V\$BACKUP\_CONTROLFILE\_SUMMARY

V\$BACKUP\_CONTROLFILE\_SUMMARY provides control file summary information, based on either a backup set of files, image copies, or proxy copies.

| Column                    | Datatype       | Description                                                                                                                                                                            |
|---------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER         | Number of files backed up for specific criteria                                                                                                                                        |
| NUM_DISTINCT_FILES_BACKED | NUMBER         | Number of distinct files backed up                                                                                                                                                     |
| MIN_CHECKPOINT_CHANGE#    | NUMBER         | Minimum checkpoint change number of the data file for specified criteria                                                                                                               |
| MAX_CHECKPOINT_CHANGE#    | NUMBER         | Maximum checkpoint change number of the data file for specified criteria                                                                                                               |
| MIN_CHECKPOINT_TIME       | DATE           | Minimum checkpoint time of the data file for specified criteria                                                                                                                        |
| MAX_CHECKPOINT_TIME       | DATE           | Maximum checkpoint time of the data file for specified criteria                                                                                                                        |
| INPUT_BYTES               | NUMBER         | Total input bytes of files read                                                                                                                                                        |
| OUTPUT_BYTES              | NUMBER         | Total output bytes written                                                                                                                                                             |
| COMPRESSION_RATIO         | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |
| INPUT_BYTES_DISPLAY       | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                    |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.88 V\$BACKUP\_COPY\_DETAILS

V\$BACKUP\_COPY\_DETAILS contains information about all available control file and data file copies.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                          |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY           | NUMBER        | Session identifier                                                                                                                                                                                                                                                   |
| SESSION_RECID         | NUMBER        | Session recid                                                                                                                                                                                                                                                        |
| SESSION_STAMP         | NUMBER        | Session stamp                                                                                                                                                                                                                                                        |
| COPY_KEY              | NUMBER        | Unique identifier for this data file or control file copy                                                                                                                                                                                                            |
| FILE#                 | NUMBER        | Absolute data file number                                                                                                                                                                                                                                            |
| NAME                  | VARCHAR2(513) | File name of the data file copy. The maximum length of the name is dependent on your operating system.                                                                                                                                                               |
| TAG                   | VARCHAR2(32)  | Data file copy tag                                                                                                                                                                                                                                                   |
| CREATION_CHANGE#      | NUMBER        | Data file creation change number                                                                                                                                                                                                                                     |
| CREATION_TIME         | DATE          | Data file creation timestamp                                                                                                                                                                                                                                         |
| CHECKPOINT_CHANGE#    | NUMBER        | Checkpoint change number of the data file when the copy was made                                                                                                                                                                                                     |
| CHECKPOINT_TIME       | DATE          | Checkpoint timestamp of the data file when the copy was made                                                                                                                                                                                                         |
| MARKED_CORRUPT        | NUMBER        | Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation.                                                                 |
| OUTPUT_BYTES          | NUMBER        | Total output bytes written                                                                                                                                                                                                                                           |
| COMPLETION_TIME       | DATE          | Time when the copy was completed                                                                                                                                                                                                                                     |
| CONTROLFILE_TYPE      | VARCHAR2(1)   | Type of control file. B indicates normal copies. S indicates standby copies.                                                                                                                                                                                         |
| KEEP                  | VARCHAR2(3)   | (YES NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                                                                                         |
| KEEP_UNTIL            | DATE          | If specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                                                                                       |
| KEEP_OPTIONS          | VARCHAR2(11)  | Lists additional retention options for this backup set. Possible values are: <ul style="list-style-type: none"> <li>LOGS - The logs needed to recover this backup set are kept</li> <li>NOLONGS - The logs needed to recover this backup set are not kept</li> </ul> |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                   |
| SPARSE_BACKUP         | VARCHAR2(3)   | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                               |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Size of backup set to display                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.89 V\$BACKUP\_COPY\_SUMMARY

V\$BACKUP\_COPY\_SUMMARY provides summary information for the output data file and control file copy.

| Column                 | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_COPIES             | NUMBER         | Number of copies created                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NUM_DISTINCT_COPIES    | NUMBER         | Number of distinct copies (that contain data files with different checkpoints)                                                                                                                                                                                                                                                                                                                                                                  |
| MIN_CHECKPOINT_CHANGE# | NUMBER         | Minimum checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                                   |

| CON_ID                 | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.90 V\$BACKUP\_CORRUPTION

V\$BACKUP\_CORRUPTION displays information about corrupt block ranges in data file backups from the control file.

Note that corruptions are not tolerated in the control file and archived redo log backups.

| Column    | Datatype | Description                    |
|-----------|----------|--------------------------------|
| RECID     | NUMBER   | Backup corruption record ID    |
| STAMP     | NUMBER   | Backup corruption record stamp |
| SET_STAMP | NUMBER   | Backup set stamp               |
| SET_COUNT | NUMBER   | Backup set count               |

| Column             | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| BLOCKS             | NUMBER      | Number of corrupted blocks found starting with BLOCK#                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CORRUPTION_CHANGE# | NUMBER      | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MARKED_CORRUPT     | VARCHAR2(3) | Indicates whether this corruption was not previously detected by the Oracle Database (YES) or the Oracle Database had already discovered this corrupt block and marked it as corrupt (NO). Note that when a corrupt block is encountered in a backup, and was not already marked corrupt by the Oracle Database, then the backup process does not mark the block as corrupt in the production data file. Thus, this field may be YES for the same block in more than one backup set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CORRUPTION_TYPE    | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>• ALL ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>• FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>• CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>• CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>• LOGICAL - Block is logically corrupt</li> <li>• NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)</li> </ul> |
| CON_ID             | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.91 V\$BACKUP\_DATAFILE

V\$BACKUP\_DATAFILE displays information about control files and data files in backup sets from the control file.

| Column    | Datatype | Description                   |
|-----------|----------|-------------------------------|
| RECID     | NUMBER   | Backup data file record ID    |
| STAMP     | NUMBER   | Backup data file record stamp |
| SET_STAMP | NUMBER   | Backup set stamp              |
| SET_COUNT | NUMBER   | Backup set count              |

| Column                 | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#                  | NUMBER      | Data file number; set to 0 for control file                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATION_CHANGE#       | NUMBER      | Creation system change number (SCN) of the data file                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| CONTROLFILE_TYPE       | VARCHAR2(1) | B - Normal copies<br>S - Standby copies                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| USED_CHANGE_TRACKING   | VARCHAR2(3) | Indicates whether change tracking data was used to accelerate this incremental backup (YES) or whether change tracking data was not used (NO)                                                                                                                                                                                                                                                                                                                                                                   |
| BLOCKS_READ            | NUMBER      | Number of blocks that were scanned while taking this backup. If this was an incremental backup, and change tracking was used to optimize the backup, then the value of this column will be smaller than DATAFILE_BLOCKS. Otherwise, the value of this column will be the same as DATAFILE_BLOCKS. Even when change tracking data is used, the value of this column may be larger than BLOCKS, because the data read by change tracking is further refined during the process of creating an incremental backup. |
| USED_OPTIMIZATION      | VARCHAR2(3) | Indicates whether backup optimization was applied (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FOREIGN_DBID           | NUMBER      | Foreign DBID of the database from which this data file was transported. The value is 0 if the file backed up is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                    |
| PLUGGED_READONLY       | VARCHAR2(3) | YES if this is a backup of a transported read-only foreign file; otherwise NO.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLUGIN_CHANGE#         | NUMBER      | SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                               |

| Column                   | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLUGIN_RESETLOGS_CHANGE# | NUMBER      | The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                |
| PLUGIN_RESETLOGS_TIME    | DATE        | The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                               |
| SECTION_SIZE             | NUMBER      | Specifies the number of blocks in each section of a multisection backup. Value is 0 for whole file backups.                                                                                                                                                                                                                                                                                                                                     |
| UNDO_OPTIMIZED           | VARCHAR2(3) | Indicates whether undo blocks were ignored when creating the backup data file (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                 |
| BLOCKS_SKIPPED_IN_CELL   | NUMBER      | Number of blocks that were not backed up because they were skipped by the Exadata cell<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                            |
| CON_ID                   | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| BACKED_BY_PDB            | VARCHAR2(3) | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>YES: The backup was taken when connected to the PDB</li> <li>NO: The backup was taken when connected to the root container</li> </ul>                                                                                                                                 |
| SPARSE_BACKUP            | VARCHAR2(3) | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                          |
| GUID                     | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                           |

## 8.92 V\$BACKUP\_DATAFILE\_DETAILS

V\$BACKUP\_DATAFILE\_DETAILS contains information about restorable data files.

It will include all data files backed in the backup set, image copies, and proxy copies.

| Column        | Datatype | Description                                                                                           |
|---------------|----------|-------------------------------------------------------------------------------------------------------|
| BTYPE         | CHAR(9)  | Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.                          |
| BTYPE_KEY     | NUMBER   | Unique identifier for the backup type. For BACKUPSET, it is BS_KEY.                                   |
| SESSION_KEY   | NUMBER   | Session identifier                                                                                    |
| SESSION_RECID | NUMBER   | Session record ID                                                                                     |
| SESSION_STAMP | NUMBER   | Session stamp                                                                                         |
| ID1           | NUMBER   | If BACKUPSET, it contains SET_STAMP.<br>If IMAGECOPY or PROXYCOPY, it is RECID from the control file. |
| ID2           | NUMBER   | If BACKUPSET, it contains SET_COUNT.<br>If IMAGECOPY or PROXYCOPY, it is STAMP.                       |

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#               | NUMBER         | File number                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| FILESIZE            | NUMBER         | File size, in bytes                                                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPRESSION_RATIO   | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                              |
| SPARSE_BACKUP       | VARCHAR2(3)    | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                          |
| TS#                 | NUMBER         | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TSNAME              | VARCHAR2(30)   | Tablespace name                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| FILESIZE_DISPLAY    | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on                                                                                                                                                                                                                                                                                            |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.93 V\$BACKUP\_DATAFILE\_SUMMARY

V\$BACKUP\_DATAFILE\_SUMMARY provides summary information for a specific criteria set, based on a backup job, a time range applicable to jobs, or a specific data file).

| Column                    | Datatype | Description                                                              |
|---------------------------|----------|--------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER   | Number of files backed up for specified criteria                         |
| NUM_DISTINCT_FILES_BACKED | NUMBER   | Number of distinct files backed up                                       |
| NUM_DISTINCT_TS_BACKED    | NUMBER   | Number of distinct tablespaces backed up                                 |
| MIN_CHECKPOINT_CHANGE#    | NUMBER   | Minimum checkpoint change number of the data file for specified criteria |
| MAX_CHECKPOINT_CHANGE#    | NUMBER   | Maximum checkpoint change number of the data file for specified criteria |
| MIN_CHECKPOINT_TIME       | DATE     | Minimum checkpoint time of the data file for specified criteria          |
| MAX_CHECKPOINT_TIME       | DATE     | Maximum checkpoint time of the data file for specified criteria          |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INPUT_BYTES          | NUMBER         | Total input bytes of files read                                                                                                                                                                                                                                                                                                                                                                                                                       |

| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.94 V\$BACKUP\_DEVICE

V\$BACKUP\_DEVICE displays information about supported backup devices.

If a device type does not support named devices, then one row with the device type and a null device name is returned for that device type. If a device type supports named devices then one row is returned for each available device of that type. The special device type DISK is not returned by this view because it is always available.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEVICE_TYPE | VARCHAR2(17)  | Type of the backup device                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DEVICE_NAME | VARCHAR2(513) | Name of the backup device                                                                                                                                                                                                                                                                                                                                                                                                                             |

This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.95 V\$BACKUP\_FILES

V\$BACKUP\_FILES displays information about all RMAN backups (both image copies and backup sets) and archived logs.

This view simulates the LIST BACKUP and LIST COPY RMAN commands. This view requires that the database be set using the DBMS\_RCVMAN.SETDATABASE procedure.

| Column | Datatype | Description                |
|--------|----------|----------------------------|
| PKEY   | NUMBER   | Primary key for the backup |

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BACKUP_TYPE     | VARCHAR2(32)   | Type of the backup: <ul style="list-style-type: none"> <li>• BACKUP SET</li> <li>• COPY</li> <li>• PROXY COPY</li> </ul>                                                                                                                                                                                                                   |
| FILE_TYPE       | VARCHAR2(32)   | Type of the file: <ul style="list-style-type: none"> <li>• DATAFILE</li> <li>• CONTROLFILE</li> <li>• SPFILE</li> <li>• REDO LOG</li> <li>• ARCHIVED LOG</li> <li>• COPY (for an image copy backup)</li> <li>• PIECE (for a backup piece)</li> </ul>                                                                                       |
| KEEP            | VARCHAR2(3)    | Indicates whether the backup has a retention policy different from the value for CONFIGURE RETENTION POLICY (YES) or not (NO)                                                                                                                                                                                                              |
| KEEP_UNTIL      | DATE           | If the KEEP UNTIL TIME clause of the BACKUP command was specified, then this column shows the date after which the backup becomes obsolete. If the column is null and KEEP_OPTIONS is not null, the backup never becomes obsolete.                                                                                                         |
| KEEP_OPTIONS    | VARCHAR2(13)   | KEEP options for the backup: <ul style="list-style-type: none"> <li>• LOGS - RMAN keeps the logs needed to recover the backup</li> <li>• NOLOGS - RMAN does not keep the logs needed to recover the backup</li> </ul> If this column is null, then the backup has no KEEP options and will be made obsolete based on the retention policy. |
| STATUS          | VARCHAR2(16)   | Status of the backup: <ul style="list-style-type: none"> <li>• AVAILABLE</li> <li>• UNAVAILABLE</li> <li>• EXPIRED</li> <li>• OTHER</li> </ul>                                                                                                                                                                                             |
| FNAME           | VARCHAR2(1024) | Name of the file                                                                                                                                                                                                                                                                                                                           |
| TAG             | VARCHAR2(32)   | Tag of the piece, copy, or proxy copy                                                                                                                                                                                                                                                                                                      |
| MEDIA           | VARCHAR2(80)   | Media ID of the piece or proxy copy                                                                                                                                                                                                                                                                                                        |
| RECID           | NUMBER         | Recid of the record in the control file                                                                                                                                                                                                                                                                                                    |
| STAMP           | NUMBER         | Stamp of the record in the control file                                                                                                                                                                                                                                                                                                    |
| DEVICE_TYPE     | VARCHAR2(255)  | Type of media device that stores the backup                                                                                                                                                                                                                                                                                                |
| BLOCK_SIZE      | NUMBER         | Block size for the backup (in bytes)                                                                                                                                                                                                                                                                                                       |
| COMPLETION_TIME | DATE           | Time when the backup completed                                                                                                                                                                                                                                                                                                             |
| COMPRESSED      | VARCHAR2(3)    | Indicates whether the backup piece is compressed (YES) or not (NO); valid only if FILE_TYPE is PIECE. Image copies cannot be compressed.                                                                                                                                                                                                   |
| OBSOLETE        | VARCHAR2(3)    | Indicates whether the backup piece or copy is obsolete (YES) or not (NO); valid only if FILE_TYPE is PIECE or COPY                                                                                                                                                                                                                         |
| BYTES           | NUMBER         | Size of the file (in bytes)                                                                                                                                                                                                                                                                                                                |
| BS_KEY          | NUMBER         | Primary key of the backup set (valid only if BACKUP_TYPE is BACKUP SET)                                                                                                                                                                                                                                                                    |
| BS_COUNT        | NUMBER         | Count of the backup set from the control file record (valid only if BACKUP_TYPE is BACKUP SET)                                                                                                                                                                                                                                             |

| RL_FIRST_TIME        | DATE     | Time when the Oracle Database switched into the redo log (valid only if FILE_TYPE is REDO LOG)                                                                                                                                                                                                                                                                                                                                                  |
| RL_NEXT_CHANGE#      | NUMBER   | First SCN of the next redo log in the thread (valid only if FILE_TYPE is REDO LOG)                                                                                                                                                                                                                                                                                                                                                              |
| RL_NEXT_TIME         | DATE     | First timestamp of the next redo log in the thread (valid only if FILE_TYPE is REDO LOG)                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.96 V\$BACKUP\_NONLOGGED

V\$BACKUP\_NONLOGGED displays information about nonlogged block ranges in data file backups, recorded in the control file.

| Column            | Datatype | Description                                                                                                    |
|-------------------|----------|----------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER   | Nologged backup record ID                                                                                      |
| STAMP             | NUMBER   | Nonlogged backup record stamp                                                                                  |
| SET_STAMP         | NUMBER   | Backup set stamp                                                                                               |
| SET_COUNT         | NUMBER   | Backup set count                                                                                               |
| PIECE#            | NUMBER   | Backup piece that contains the range of nonlogged blocks                                                       |
| FILE#             | NUMBER   | Absolute file number of the data file that contains this range of nonlogged blocks                             |
| BLOCK#            | NUMBER   | Block number of the first nonlogged block in the range of nologged blocks                                      |
| BLOCKS            | NUMBER   | Number of nonlogged blocks found starting with BLOCK#                                                          |
| NONLOGGED_CHANGE# | NUMBER   | The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.                     |
| NONLOGGED_TIME    | VARCHAR2 | The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.                                               |
| RESETLOGS_CHANGE# | VARCHAR2 | The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown. |

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESETLOGS_TIME | VARCHAR2 | The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                  |
| OBJECT#        | VARCHAR2 | The object ID this range belongs to. If this field is NULL, the object number is unknown.                                                                                                                                                                                                                                                                                                                                                       |
| REASON         | CHAR(7)  | The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.                                                                                                                                                                                                                          |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.97 V\$BACKUP\_PIECE

V\$BACKUP\_PIECE displays information about backup pieces from the control file. Each backup set consists of one or more backup pieces.

| Column      | Datatype      | Description                                                                                                                                                     |
|-------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID       | NUMBER        | Backup piece record ID                                                                                                                                          |
| STAMP       | NUMBER        | Backup piece record stamp                                                                                                                                       |
| SET_STAMP   | NUMBER        | Backup set stamp                                                                                                                                                |
| SET_COUNT   | NUMBER        | Backup set count                                                                                                                                                |
| PIECE#      | NUMBER        | Backup piece number (1-N)                                                                                                                                       |
| COPY#       | NUMBER        | Indicates the copy number for backup pieces created with duplex enabled. 1 if the backup piece is not duplexed.                                                 |
| DEVICE_TYPE | VARCHAR2(17)  | Type of the device on which the backup piece resides. Set to DISK for backup sets on disk.<br><b>See Also:</b> V\$BACKUP_DEVICE                                 |
| HANDLE      | VARCHAR2(513) | Backup piece handle identifies the backup piece on restore                                                                                                      |
| COMMENTS    | VARCHAR2(64)  | Comment returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only; not needed for restore. |
| MEDIA       | VARCHAR2(65)  | Name of the media on which the backup piece resides. This value is informational only; not needed for restore.                                                  |
| MEDIA_POOL  | NUMBER        | The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.                   |
| CONCUR      | VARCHAR2(3)   | (YES   NO) Indicates whether the piece on a media that can be accessed concurrently                                                                             |
| TAG         | VARCHAR2(32)  | Backup piece tag. The tag is specified at backup set level, but stored at piece level.                                                                          |
| STATUS      | VARCHAR2(1)   | Indicates the status of the piece: A (available), D (deleted), or X (expired)                                                                                   |

| Column                | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START_TIME            | DATE        | Starting time                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| COMPLETION_TIME       | DATE        | Completion time                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ELAPSED_SECONDS       | NUMBER      | Number of elapsed seconds                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DELETED               | VARCHAR2(3) | (YES/NO) NO indicates that the file still exists. YES indicates the file no longer exists because it has been deleted.                                                                                                                                                                                                                                                                                                                          |
| BYTES                 | NUMBER      | Size of the backup piece (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                             |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3) | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                              |
| RMAN_STATUS_RECID     | NUMBER      | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RMAN_STATUS_STAMP     | NUMBER      | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPRESSED            | VARCHAR2(3) | Indicates whether the backup piece is compressed (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                              |
| BACKED_BY_VSS         | VARCHAR2(3) | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                                                                                                                                                                                                                                                       |
| ENCRYPTED             | VARCHAR2(3) | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                                                                                                                                                                                                                                                                                    |
| BACKED_BY_OSB         | VARCHAR2(3) | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                                                                                                                                                                                                                                                       |
| FOR_XTTS              | VARCHAR2(3) | Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> <li>YES: This is a cross platform backup piece.</li> <li>NO: This is not a cross platform backup piece.</li> </ul>                                                                                                                                                                                                                                  |
| SAME_ENDIAN           | VARCHAR2(3) | If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                                                                                                                                                                                                                                                         |
| CON_ID                | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| GUID                  | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                           |

## 8.98 V\$BACKUP\_PIECE\_DETAILS

V\$BACKUP\_PIECE\_DETAILS displays information about all available backup pieces.

| Column        | Datatype | Description            |
|---------------|----------|------------------------|
| SESSION_KEY   | NUMBER   | Session identifier     |
| SESSION_RECID | NUMBER   | Session recid          |
| SESSION_STAMP | NUMBER   | Session stamp          |
| BS_KEY        | NUMBER   | Backup set identifier  |
| BP_KEY        | NUMBER   | Backup piece key       |
| RECID         | NUMBER   | Backup piece record ID |

| Column                | Datatype      | Description                                                                                                                                                                                                        |
|-----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAMP                 | NUMBER        | Backup piece record stamp                                                                                                                                                                                          |
| SET_STAMP             | NUMBER        | Backup set stamp                                                                                                                                                                                                   |
| SET_COUNT             | NUMBER        | Backup set count                                                                                                                                                                                                   |
| PIECE#                | NUMBER        | Backup piece number (1-N)                                                                                                                                                                                          |
| COPY#                 | NUMBER        | Indicates the copy number for backup pieces created with duplex enabled. The value is 1 if the backup piece is not duplexed.                                                                                       |
| DEVICE_TYPE           | VARCHAR2(17)  | Type of device on which the backup piece resides. Set to DISK for backup sets on disk.                                                                                                                             |
| HANDLE                | VARCHAR2(513) | Backup piece handle identifies the backup piece on restore                                                                                                                                                         |
| COMMENTS              | VARCHAR2(64)  | Comments returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only. It is not needed for restore.                                             |
| MEDIA                 | VARCHAR2(65)  | Name of the media on which the backup piece resides. This value is informational only. It is not needed for restore.                                                                                               |
| MEDIA_POOL            | NUMBER        | The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.                                                                      |
| CONCUR                | VARCHAR2(3)   | (YES NO) indicates whether or not the piece is on a media that can be accessed concurrently                                                                                                                        |
| TAG                   | VARCHAR2(32)  | Backup piece tag. The tag is specified at backup set level, but stored at piece level.                                                                                                                             |
| STATUS                | VARCHAR2(1)   | Indicates the status of the piece: A (available), D (deleted), or X (expired)                                                                                                                                      |
| START_TIME            | DATE          | Starting time                                                                                                                                                                                                      |
| COMPLETION_TIME       | DATE          | Completion time                                                                                                                                                                                                    |
| ELAPSED_SECONDS       | NUMBER        | Number of elapsed seconds                                                                                                                                                                                          |
| DELETED               | VARCHAR2(3)   | N0 indicates that the file still exists. YES indicates that the file no longer exists because it has been deleted.                                                                                                 |
| BYTES                 | NUMBER        | Size of the backup piece, in bytes                                                                                                                                                                                 |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether or not the file was created in the fast recovery area (YES) or not (NO)                                                                                                                          |
| RMAN_STATUS_RECID     | NUMBER        | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                    |
| RMAN_STATUS_STAMP     | NUMBER        | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                                 |
| COMPRESSED            | VARCHAR2(3)   | Indicates whether the backup piece is compressed (YES) or not (NO)                                                                                                                                                 |
| BACKED_BY_VSS         | VARCHAR2(3)   | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                          |
| ENCRYPTED             | VARCHAR2(3)   | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                                                       |
| BACKED_BY_OS          | VARCHAR2(3)   | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                          |
| FOR_XTTS              | VARCHAR2(3)   | Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> <li>• YES: This is a cross platform backup piece.</li> <li>• NO: This is not a cross platform backup piece.</li> </ul> |
| SAME_ENDIAN           | VARCHAR2(3)   | If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                            |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| PIECES_PER_SET     | NUMBER         | Number of backup pieces per set                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SIZE_BYTES_DISPLAY | VARCHAR2(4000) | Size (in bytes) of the backup piece to display                                                                                                                                                                                                                                                                                                                                                                                                        |

## 8.99 V\$BACKUP\_REDOLOG

V\$BACKUP\_REDOLOG displays information about archived logs in backup sets from the control file.

Note that online redo logs cannot be backed up directly; they must be archived first to disk and then backed up. An archive log backup set can contain one or more archived logs.

| Column            | Datatype    | Description                                                                                                                |
|-------------------|-------------|----------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER      | Record ID for this row; it is an integer that identifies this row                                                          |
| STAMP             | NUMBER      | Timestamp used with RECID to uniquely identify this row                                                                    |
| SET_STAMP         | NUMBER      | One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set                             |
| SET_COUNT         | NUMBER      | One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set                             |
| THREAD#           | NUMBER      | Thread number for the log                                                                                                  |
| SEQUENCE#         | NUMBER      | Log sequence number                                                                                                        |
| RESETLOGS_CHANGE# | NUMBER      | Change number of the last resetlogs before the log was written                                                             |
| RESETLOGS_TIME    | DATE        | Change time of the last resetlogs before the log was written. These will be the same for all logs in a backup set.         |
| FIRST_CHANGE#     | NUMBER      | SCN when the log was switched into. The redo in the log is at this SCN and greater.                                        |
| FIRST_TIME        | DATE        | Time allocated when the log was switched into                                                                              |
| NEXT_CHANGE#      | NUMBER      | SCN when the next log in this thread was switched into. The redo in the log is below this SCN.                             |
| NEXT_TIME         | DATE        | Time when the next log in this thread was switched into                                                                    |
| BLOCKS            | NUMBER      | Size of the log in logical blocks including the header block                                                               |
| BLOCK_SIZE        | NUMBER      | Size of the log blocks in bytes                                                                                            |
| TERMINAL          | VARCHAR2(3) | Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO) |
| SECTION_SIZE      | NUMBER      | Number of blocks in each section of a multisection log. The value is 0 for whole file logs.                                |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.100 V\$BACKUP\_SET

V\$BACKUP\_SET displays information about backup sets from the control file.

A backup set record is inserted after the backup set is successfully completed.

| Column               | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID                | NUMBER      | Backup set record ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| STAMP                | NUMBER      | Backup set record stamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SET_STAMP            | NUMBER      | <p>Backup set stamp. The backup set stamp and count uniquely identify the backup set.</p> <p>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION.</p>                                                                                                                                                                                                                                 |
| SET_COUNT            | NUMBER      | <p>Backup set count. The backup set count is incremented by one every time a new backup set is started (if the backup set is never completed the number is "lost"). If the control file is re-created then the count is reset to 1. Therefore the count must be used with the stamp to uniquely identify a backup set.</p> <p>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION</p> |
| BACKUP_TYPE          | VARCHAR2(1) | Type of files that are in this backup. If the backup contains archived redo logs, the value is L. If this is a data file full backup, the value is D. If this is an incremental backup, the value is I.                                                                                                                                                                                                                                                                                               |
| CONTROLFILE_INCLUDED | VARCHAR2(3) | <p>Provides information about the control file in the backup set:</p> <ul style="list-style-type: none"> <li>YES: The control file included is a primary control file.</li> <li>SBY: The control file included is a standby control file.</li> <li>N0: A control file is not included.</li> </ul>                                                                                                                                                                                                     |
| INCREMENTAL_LEVEL    | NUMBER      | Location where this backup set fits into the database's backup strategy. Set to NULL for full datafile, archivelog, controlfile, and spfile backups, set to 0 for incremental level 0 datafile backups, and set to 1 for incremental level 1 datafile backups.                                                                                                                                                                                                                                        |
| PIECES               | NUMBER      | Number of distinct backup pieces in the backup set                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| START_TIME           | DATE        | Starting time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| COMPLETION_TIME      | DATE        | Time that this backup set completed                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ELAPSED_SECONDS      | NUMBER      | The number of elapsed seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| BLOCK_SIZE           | NUMBER      | Block size of the backup set                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INPUT_FILE_SCAN_ONLY | VARCHAR2(3)  | YES indicates no actual backup is performed, but the data files are read. NO indicates a normal backup is performed.                                                                                                                                                                                                                                                                                                              |
| KEEP                 | VARCHAR2(3)  | (YES/NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                                                                                                                                                                                                                                                      |
| KEEP_UNTIL           | DATE         | If KEEP_UNTIL_TIME is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                                                                                                                                                                                                                                 |
| KEEP_OPTIONS         | VARCHAR2(11) | Lists additional retention options for this backup set. Possible values are:<br>LOGS - The logs need to recover this backup are kept<br>NOLOGS - The logs needed to recover this backup will not be kept<br>BACKUP_LOGS - An archive log backup exists to support this backup set                                                                                                                                                 |
| MULTI_SECTION        | VARCHAR2(3)  | Indicates whether or not this backup set is a multi-section backup. Valid values are YES and NO. A multi-section backup is a backup in which multiple backup pieces are produced independently in parallel by multiple channels.                                                                                                                                                                                                  |
| FOR_XTTS             | VARCHAR2(3)  | Indicates whether this is a cross platform backup set: <ul style="list-style-type: none"> <li>YES: This is a cross platform backup set.</li> <li>NO: This is not a cross platform backup set.</li> </ul>                                                                                                                                                                                                                          |
| SAME_ENDIAN          | VARCHAR2(3)  | If the value of FOR_XTTS is YES, then this column indicates whether the backup set has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                                                                                                                                                                                                                                             |
| INC_DMPFILE          | VARCHAR2(3)  | If the value of FOR_XTTS is YES, then this column indicates whether the backup set includes a Data Pump export file of the backed up data files (YES) or not (NO), otherwise NULL.                                                                                                                                                                                                                                                |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| GUID                 | RAW(16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                             |

## 8.101 V\$BACKUP\_SET\_DETAILS

V\$BACKUP\_SET\_DETAILS provides detailed information about the backup set.

This view will contain an extra row for each backup session that invokes BACKUP BACKUPSET (that is, creates new copies for the same backup set or copies backup set information from disk to tape). However, the remaining values of other columns belong to the complete backup set.

| Column        | Datatype | Description                                      |
|---------------|----------|--------------------------------------------------|
| SESSION_KEY   | NUMBER   | Session identifier                               |
| SESSION_RECID | NUMBER   | Identifies the job, together with SESSION_STAMP. |
| SESSION_STAMP | NUMBER   | Identifies the job, together with SESSION_RECID  |

| Column                         | Datatype       | Description                                                                                                                                                                            |
|--------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BS_KEY                         | NUMBER         | Backup set identifier                                                                                                                                                                  |
| RECID                          | NUMBER         | RECID from V\$BACKUP_SET record                                                                                                                                                        |
| STAMP                          | NUMBER         | Stamp from V\$BACKUP_SET record                                                                                                                                                        |
| SET_STAMP                      | NUMBER         | Backup set stamp                                                                                                                                                                       |
| SET_COUNT                      | NUMBER         | Backup count number                                                                                                                                                                    |
| BACKUP_TYPE                    | VARCHAR2(1)    | Type of backup (same as in V\$BACKUP_SET)                                                                                                                                              |
| CONTROLFILE_INCLUDED           | VARCHAR2(3)    | Control file included in backup set (same as in V\$BACKUP_SET)                                                                                                                         |
| INCREMENTAL_LEVEL              | NUMBER         | Incremental level (same as in V\$BACKUP_SET)                                                                                                                                           |
| PIECES                         | NUMBER         | Number of pieces (same as in V\$BACKUP_SET)                                                                                                                                            |
| START_TIME                     | DATE           | Start time of the backup set (same as in V\$BACKUP_SET)                                                                                                                                |
| COMPLETION_TIME                | DATE           | Completion time of the backup set (same as in V\$BACKUP_SET)                                                                                                                           |
| ELAPSED_SECONDS                | NUMBER         | Time taken for backup set creation (same as in V\$BACKUP_SET)                                                                                                                          |
| BLOCK_SIZE                     | NUMBER         | Block size (same as in V\$BACKUP_SET)                                                                                                                                                  |
| KEEP                           | VARCHAR2(3)    | Keep value (same as in V\$BACKUP_SET)                                                                                                                                                  |
| KEEP_UNTIL                     | DATE           | Keep Until time (same as in V\$BACKUP_SET)                                                                                                                                             |
| KEEP_OPTIONS                   | VARCHAR2(11)   | Keep options (same as in V\$BACKUP_SET)                                                                                                                                                |
| DEVICE_TYPE                    | VARCHAR2(17)   | Type of device. If the backup set exists on more than one device type, an * is indicated here.                                                                                         |
| COMPRESSED                     | VARCHAR2(3)    | YES, if backup is compressed                                                                                                                                                           |
| NUM_COPIES                     | NUMBER         | Number of identical copies                                                                                                                                                             |
| OUTPUT_BYTES                   | NUMBER         | Size of the backup set                                                                                                                                                                 |
| ORIGINAL_INPUT_BYTES           | NUMBER         | Amount of data backed up when the backup set was created                                                                                                                               |
| COMPRESSION_RATIO              | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |
| STATUS                         | CHAR(1)        | The status of the backup set. It is always A (all backup pieces available), because this view only reflects available backup sets.                                                     |
| ORIGINAL_INPRATE_BYTES         | NUMBER         | Number of bytes read per second when backup set was initially created                                                                                                                  |
| OUTPUT_RATE_BYTES              | NUMBER         | Number of bytes written per second when the backup set was initially created                                                                                                           |
| ORIGINAL_INPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Input rate to display                                                                                                                                                                  |
| OUTPUT_BYTES_DISPLAY           | VARCHAR2(4000) | Size of backup set to display                                                                                                                                                          |
| ORIGINAL_INPRATE_BYTES_DISPLAY | VARCHAR2(4000) | Input rate per second for display                                                                                                                                                      |
| OUTPUT_RATE_BYTES_DISPLAY      | VARCHAR2(4000) | Output rate per second for display                                                                                                                                                     |
| TIME_TAKEN_DISPLAY             | VARCHAR2(4000) | Elapsed time in hh:mm:ss format                                                                                                                                                        |
| ENCRYPTED                      | VARCHAR2(3)    | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                           |
| BACKED_BY_OSB                  | VARCHAR2(3)    | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| ORIGINAL_INPUT_BYTES           | NUMBER         | Number of input bytes when backup sets were created                                                                                                                                                                                                                                                                                                                                                                                                    |
| ORIGINAL_INPRATE_BYTES         | NUMBER         | Average input rate                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT_RATE_BYTES              | NUMBER         | Average output rate                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMPRESSION_RATIO              | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                                 |
| ORIGINAL_INPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY           | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ORIGINAL_INPRATE_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for input rate                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OUTPUT_RATE_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output rate                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                         | NUMBER         | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.103 V\$BACKUP\_SPFILE

V\$BACKUP\_SPFILE displays information about server parameter files in backup sets from the control file.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| MODIFICATION_TIME | DATE         | Time when the SPFILE was last modified (this also includes creation time)                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES             | NUMBER       | Size of the SPFILE (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| COMPLETION_TIME   | DATE         | Time when the backup of the SPFILE completed                                                                                                                                                                                                                                                                                                                                                                                                    |
| DB_UNIQUE_NAME    | VARCHAR2(30) | Unique database name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| GUID              | RAW(16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                           |

## 8.104 V\$BACKUP\_SPFILE\_DETAILS

V\$BACKUP\_SPFILE\_DETAILS displays information about all restorable SP files backed up in the backup set.

| Column            | Datatype       | Description                                                                                                                                          |
|-------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY       | NUMBER         | Session identifier                                                                                                                                   |
| SESSION_RECID     | NUMBER         | Session recid                                                                                                                                        |
| SESSION_STAMP     | NUMBER         | Session stamp                                                                                                                                        |
| BS_KEY            | NUMBER         | Unique backup set identifier                                                                                                                         |
| SET_STAMP         | NUMBER         | Backup set stamp                                                                                                                                     |
| SET_COUNT         | NUMBER         | Backup set count                                                                                                                                     |
| MODIFICATION_TIME | DATE           | Time the backup set was modified                                                                                                                     |
| FILESIZE          | NUMBER         | Size, in bytes, of the SPFILE that was backed up                                                                                                     |
| FILESIZE_DISPLAY  | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.105 V\$BACKUP\_SPFILE\_SUMMARY

V\$BACKUP\_SPFILE\_SUMMARY provides summary information for input SP file, based on either a backup job or time range applicable to jobs.

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER         | Number of files backed up                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NUM_DISTINCT_FILES_BACKED | NUMBER         | Number of distinct SP files backed up (with modification timestamp)                                                                                                                                                                                                                                                                                                                                                                             |
| MIN_MODIFICATION_TIME     | DATE           | Minimum modification time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MAX_MODIFICATION_TIME     | DATE           | Maximum modification time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| INPUT_BYTES               | NUMBER         | Total input bytes for all SP files backed up                                                                                                                                                                                                                                                                                                                                                                                                    |
| INPUT_BYTES_DISPLAY       | VARCHAR2(4000) | Displayable format for all input bytes                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID                    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.106 V\$BACKUP\_SYNC\_IO

V\$BACKUP\_SYNC\_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece. This data is not stored persistently, and is not preserved when the instance is re-started.

| Column            | Datatype | Description                                                            |
|-------------------|----------|------------------------------------------------------------------------|
| SID               | NUMBER   | The Oracle SID of the session doing the backup or restore              |
| SERIAL            | NUMBER   | The use count for the SID doing the backup or restore                  |
| USE_COUNT         | NUMBER   | A counter that can be used to identify rows from different backup sets |
| RMAN_STATUS_RECID | NUMBER   | Owning V\$RMAN_STATUS record ID                                        |
| RMAN_STATUS_STAMP | NUMBER   | Owning V\$RMAN_STATUS record stamp                                     |

| BUFFER_SIZE                | NUMBER        | The size of the buffers being used to read/write this file, in bytes                                                                                                                                                                                                                                                                                                                                                                                   |
| BUFFER_COUNT               | NUMBER        | The number of buffers being used to read/write this file                                                                                                                                                                                                                                                                                                                                                                                               |
| TOTAL_BYTES                | NUMBER        | The total number of bytes that will be read or written for this file, if known. If not known, this column will be null.                                                                                                                                                                                                                                                                                                                                |
| OPEN_TIME                  | DATE          | The time this file was opened. If TYPE='AGGREGATE', then this is the time that the first file in the aggregate was opened.                                                                                                                                                                                                                                                                                                                             |
| CLOSE_TIME                 | DATE          | The time this file was closed. If TYPE='AGGREGATE', then this is the time that the last file in the aggregate was closed.                                                                                                                                                                                                                                                                                                                              |
| ELAPSED_TIME               | NUMBER        | The time, in hundredths of a second, that the file was open                                                                                                                                                                                                                                                                                                                                                                                            |
| MAXOPENFILES               | NUMBER        | The number of concurrently open DISK files. This value is only present in rows where TYPE='AGGREGATE'.                                                                                                                                                                                                                                                                                                                                                 |
| BYTES                      | NUMBER        | The number of bytes read or written so far                                                                                                                                                                                                                                                                                                                                                                                                             |
| EFFECTIVE_BYTES_PER_SECOND | NUMBER        | The I/O rate that was achieved with this device during this backup                                                                                                                                                                                                                                                                                                                                                                                     |
| IO_COUNT                   | NUMBER        | The number of I/Os that were performed to this file                                                                                                                                                                                                                                                                                                                                                                                                    |
| IO_TIME_TOTAL              | NUMBER        | The total time, in hundredths of a second, taken to do I/O for this file                                                                                                                                                                                                                                                                                                                                                                               |
| IO_TIME_MAX                | NUMBER        | The maximum time taken for a single I/O request                                                                                                                                                                                                                                                                                                                                                                                                        |
| DISCRETE_BYTES_PER_SECOND  | NUMBER        | The average transfer rate for this file                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID                     | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.107 V\$BGPROCESS

V\$BGPROCESS displays information about the background processes.

| Column      | Datatype     | Description                           |
|-------------|--------------|---------------------------------------|
| PADDR       | RAW(4   8)   | Address of the process state object   |
| PSERIAL#    | NUMBER       | Process state object serial number    |
| NAME        | VARCHAR2(5)  | Name of this background process       |
| DESCRIPTION | VARCHAR2(64) | Description of the background process |

| Column   | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR    | NUMBER      | Error encountered                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TYPE     | VARCHAR2(5) | This column has a value of SLAVE for all background worker processes, otherwise it is null.                                                                                                                                                                                                                                                                                                                                                           |
| PRIORITY | VARCHAR2(8) | Lists the current priority with which the process is running. This column has string values based on the operating system. On Linux, the values that can appear in this column are: <ul style="list-style-type: none"> <li>• TS: Time sharing</li> <li>• RT: Real time priority</li> </ul>                                                                                                                                                            |
| CON_ID   | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.108 V\$BH

V\$BH displays the status and number of pings for every buffer in the SGA. This is an Oracle Real Application Clusters view.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#         | NUMBER       | Data file identifier number (to find the file name, query DBA_DATA_FILES or V\$DBFILE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| BLOCK#        | NUMBER       | Block number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| CELL_FLASH_CACHE   | VARCHAR2(7) | Cell flash cache hint to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                           |
| CON_ID             | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.109 V\$BLOCK\_CHANGE\_TRACKING

V\$BLOCK\_CHANGE\_TRACKING displays the status of block change tracking for the database.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS   | VARCHAR2(10)  | Status of block change tracking in the database: <ul style="list-style-type: none"> <li>DISABLED - Block change tracking is disabled</li> <li>TRANSITION - Block change tracking is in the process of transitioning between the enabled and disabled states. The TRANSITION state should usually never be observed, because it only exists while enabling or disabling block change tracking. This state might be observed if the instance crashed while enabling or disabling block change tracking, in which case it will be cleaned up automatically the next time that the database is opened.</li> <li>ENABLED - Block change tracking is enabled</li> </ul> |
| FILENAME | VARCHAR2(513) | Name of the block change tracking file for the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BYTES    | NUMBER        | Size of the block change tracking file (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                   |

## 8.110 V\$BLOCKING\_QUIESCE

V\$BLOCKING\_QUIESCE indicates if a session is blocking, or would block, a quiesce operation.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID    | NUMBER   | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.111 V\$BT\_SCAN\_CACHE

V\$BT\_SCAN\_CACHE shows the parameters and status of the big table cache section.

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BT_CACHE_ALLOC   | NUMBER   | Current ratio of the big table cache section to the buffer cache                                                                                                                                                                                                                                                                                                                                                                                |
| BT_CACHE_TARGET  | NUMBER   | Target ratio of the big table cache section to the buffer cache                                                                                                                                                                                                                                                                                                                                                                                 |
| OBJECT_COUNT     | NUMBER   | Number of objects tracked by the big table cache section                                                                                                                                                                                                                                                                                                                                                                                        |
| MEMORY_BUF_ALLOC | NUMBER   | Number of memory buffers allocated by the big table cache section to objects                                                                                                                                                                                                                                                                                                                                                                    |
| MIN_CACHED_TEMP  | NUMBER   | Minimum temperature of any object that is allowed to be cached by the big table cache section                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.112 V\$BT\_SCAN\_OBJ\_TEMPS

V\$BT\_SCAN\_OBJ\_TEMPS shows the active objects currently tracked by the big table cache.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TS#           | NUMBER       | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                               |
| DATAOBJ#      | NUMBER       | Data object number (objd)                                                                                                                                                                                                                                                                                                                                                                                                       |
| SIZE_IN_BLKs  | NUMBER       | Size of the object being scanned on this instance, in blocks                                                                                                                                                                                                                                                                                                                                                                    |
| TEMPERATURE   | NUMBER       | Temperature of this object                                                                                                                                                                                                                                                                                                                                                                                                      |
| POLICY        | VARCHAR2(10) | Caching policy of this object. Possible values: <ul style="list-style-type: none"> <li>MEM_ONLY: This object will be fully cached in memory.</li> <li>MEM_PART: This object will be partially cached in memory and some portion will remain on disk and will not be cached.</li> <li>DISK: this object will not be cached in memory or flash for the scan at all.</li> <li>INVALID: The caching policy is not valid.</li> </ul> |
| CACHED_IN_MEM | NUMBER       | The number of blocks that are cached/allocated in memory for this object                                                                                                                                                                                                                                                                                                                                                        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.113 V\$BUFFER\_POOL

V\$BUFFER\_POOL displays information about all buffer pools available for the instance.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                            |
|----------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID             | NUMBER       | Buffer pool identifier number                                                                                                                                                                                                                                                                          |
| NAME           | VARCHAR2(20) | Name of the buffer pool: <ul style="list-style-type: none"> <li>DEFAULT</li> <li>KEEP</li> <li>RECYCLE</li> </ul> <p><b>Note:</b> Currently, KEEP and RECYCLE pools only exist for the standard block size. All nonstandard block size pools are DEFAULT.</p>                                          |
| BLOCK_SIZE     | NUMBER       | Block size (in bytes) for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.                                                                                                                                      |
| RESIZE_STATE   | VARCHAR2(10) | Current state of the resize operation: <p>STATIC - Not being resized</p> <p>ALLOCATING - Memory is being allocated (can be canceled by the user)</p> <p>ACTIVATING - New buffers are being created (user cannot cancel)</p> <p>SHRINKING - Buffers are being deleted (can be canceled by the user)</p> |
| CURRENT_SIZE   | NUMBER       | Present size of the sub-cache (in megabytes)                                                                                                                                                                                                                                                           |
| BUFFERS        | NUMBER       | Current instantaneous number of buffers                                                                                                                                                                                                                                                                |
| TARGET_SIZE    | NUMBER       | If a resize is in progress (state is not STATIC), records new target size (in megabytes). If the pool is STATIC, the value in this column is the same as the current size of the pool.                                                                                                                 |
| TARGET_BUFFERS | NUMBER       | If a resize is in progress, records new target size in terms of buffers. Otherwise, the value in this column is the same as the current number of buffers.                                                                                                                                             |
| PREV_SIZE      | NUMBER       | Previous buffer pool size. If the buffer pool has never been resized, the previous size is zero.                                                                                                                                                                                                       |
| PREV_BUFFERS   | NUMBER       | Previous number of buffers in the buffer pool. Value is zero if the buffer pool has never been resized.                                                                                                                                                                                                |

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LO_BNUM   | NUMBER   | Obsolete column                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 8.114 V\$BUFFER\_POOL\_STATISTICS

V\$BUFFER\_POOL\_STATISTICS displays statistics about all buffer pools available for the instance.

| Column                  | Datatype     | Description                                                                                                                                                       |
|-------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | NUMBER       | Buffer pool identifier number                                                                                                                                     |
| NAME                    | VARCHAR2(20) | Name of the buffer pool                                                                                                                                           |
| BLOCK_SIZE              | NUMBER       | Block size (in bytes) for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768. |
| SET_MSIZE               | NUMBER       | Buffer pool maximum set size                                                                                                                                      |
| CNUM_REPL               | NUMBER       | Number of buffers on replacement list                                                                                                                             |
| CNUM_WRITE              | NUMBER       | Number of buffers on write list                                                                                                                                   |
| CNUM_SET                | NUMBER       | Number of buffers in set                                                                                                                                          |
| BUF_GOT                 | NUMBER       | Number of buffers gotten by the set                                                                                                                               |
| SUM_WRITE               | NUMBER       | Number of buffers written by the set                                                                                                                              |
| SUM_SCAN                | NUMBER       | Number of buffers scanned in the set                                                                                                                              |
| FREE_BUFFER_WAIT        | NUMBER       | Free buffer wait statistic                                                                                                                                        |
| WRITE_COMPLETE_WAIT     | NUMBER       | Write complete wait statistic                                                                                                                                     |
| BUFFER_BUSY_WAIT        | NUMBER       | Buffer busy wait statistic                                                                                                                                        |
| FREE_BUFFER_INSPECTED   | NUMBER       | Free buffer inspected statistic                                                                                                                                   |
| DIRTY_BUFFERS_INSPECTED | NUMBER       | Dirty buffers inspected statistic                                                                                                                                 |
| DB_BLOCK_CHANGE         | NUMBER       | Database blocks changed statistic                                                                                                                                 |
| DB_BLOCK_GETS           | NUMBER       | Database blocks gotten statistic                                                                                                                                  |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONSISTENT_GETS | NUMBER   | Consistent gets statistic                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_READS  | NUMBER   | Physical reads statistic                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_WRITES | NUMBER   | Physical writes statistic                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.115 V\$BUFFERED\_PUBLISHERS

V\$BUFFERED\_PUBLISHERS displays information about all buffered publishers in the instance.

There is one row per queue per sender. The values are reset to zero when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype       | Description                                                                                                                                      |
|----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID             | NUMBER         | Identifier for the queue                                                                                                                         |
| QUEUE_SCHEMA         | VARCHAR2(128)  | Owner of the queue                                                                                                                               |
| QUEUE_NAME           | VARCHAR2(128)  | Name of the queue                                                                                                                                |
| SENDER_NAME          | VARCHAR2(128)  | Name of the agent enqueueing the message (the Streams name assigned for a capture process)                                                       |
| SENDER_ADDRESS       | VARCHAR2(1024) | Queue name and database name of the source (last propagating) queue; database name is not specified if the source queue is in the local database |
| SENDER_PROTOCOL      | NUMBER         | Protocol used by the sender's address                                                                                                            |
| NUM_MSGS             | NUMBER         | Current number of messages that have yet to be dequeued from the buffer queue                                                                    |
| CNUM_MSGS            | NUMBER         | Cumulative total number of messages enqueued into the buffered queue since the database last started                                             |
| LAST_ENQUEUED_MSG    | NUMBER         | Most recently enqueued message identifier                                                                                                        |
| UNBROWSED_MSGS       | NUMBER         | Number of messages that have been enqueued but not browsed                                                                                       |
| OVERSPILLED_MSGS     | NUMBER         | Number of messages that have been spilled but not browsed                                                                                        |
| MEMORY_USAGE         | NUMBER         | Percentage of the Streams pool that is being used (or 0 if there is no Streams pool)                                                             |
| ELAPSED_ENQUEUE_TIME | NUMBER         | Total time spent in enqueue (in hundredths of a second)                                                                                          |
| ENQUEUE_CPU_TIME     | NUMBER         | Total CPU time for enqueue (in hundredths of a second)                                                                                           |

| Column            | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_ENQUEUE_TIME | TIMESTAMP(3) WITH TIME ZONE | Last message enqueue time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PUBLISHER_STATE   | VARCHAR2(59)                | State of the publisher: <ul style="list-style-type: none"> <li>IN FLOW CONTROL: TOO MANY UNBROWSED MESSAGES</li> <li>IN FLOW CONTROL: OVERSPILLED MESSAGES</li> <li>IN FLOW CONTROL: INSUFFICIENT MEMORY AND UNBROWSED MESSAGES</li> <li>PUBLISHING MESSAGES - Normal</li> </ul>                                                                                                                                                                |
| CON_ID            | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.116 V\$BUFFERED\_QUEUES

V\$BUFFERED\_QUEUES displays information about all buffered queues in the instance. There is one row per queue.

| Column                       | Datatype      | Description                                                                                                          |
|------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID                     | NUMBER        | Identifier for the queue                                                                                             |
| QUEUE_SCHEMA                 | VARCHAR2(128) | Owner of the queue                                                                                                   |

| STARTUP_TIME                 | DATE          | Startup time                                                                                                         |
| NUM_MSGS                     | NUMBER        | Total number of messages currently in the buffered queue                                                             |
| SPILL_MSGS                   | NUMBER        | Current number of overflow messages spilled to disk from the buffered queue                                          |
| CNUM_MSGS                    | NUMBER        | Cumulative total number of messages enqueued into the buffered queue since the database last started                 |
| CSPILL_MSGS                  | NUMBER        | Cumulative total number of overflow messages spilled to disk from the buffered queue since the database last started |
| EXPIRED_MSGS                 | NUMBER        | Number of expired messages                                                                                           |
| OLDEST_MSGID                 | RAW(16)       | Message ID of the oldest message                                                                                     |
| OLDEST_MSG_ENQTM             | TIMESTAMP(3)  | Enqueue time of the oldest message                                                                                   |
| QUEUE_STATE                  | VARCHAR2(25)  | Indicates whether the queue is in recovery mode (QUEUE IS IN RECOVERY MODE) or not (NORMAL)                          |
| ELAPSED_ENQUEUE_TIME         | NUMBER        | Total time spent in enqueue (in hundredths of a second)                                                              |
| ELAPSED_DEQUEUE_TIME         | NUMBER        | Total time spent in dequeue (in hundredths of a second)                                                              |
| ELAPSED_TRANSFORMATION_TIME  | NUMBER        | Total time for evaluating transformations (in hundredths of a second)                                                |
| ELAPSED_RULE_EVALUATION_TIME | NUMBER        | Total time for rule evaluations (in hundredths of a second)                                                          |

| Column            | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENQUEUE_CPU_TIME  | NUMBER                      | Total CPU time for enqueue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| DEQUEUE_CPU_TIME  | NUMBER                      | Total CPU time for dequeue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| AVG_MSG_AGE       | NUMBER                      | Average age of messages in the queue                                                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_ENQUEUE_TIME | TIMESTAMP(3) WITH TIME ZONE | Last message enqueue time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_DEQUEUE_TIME | TIMESTAMP(3) WITH TIME ZONE | Last message dequeue time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| QUEUE_SIZE        | NUMBER                      | Size of queue, which is the total number of bytes allocated for all messages and metadata                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID            | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.117 V\$BUFFERED\_SUBSCRIBERS

V\$BUFFERED\_SUBSCRIBERS displays information about the subscribers for all buffered queues in the instance. There is one row per subscriber per queue.

| Column             | Datatype       | Description                                                                                                                                              |
|--------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID           | NUMBER         | Identifier for the queue                                                                                                                                 |
| QUEUE_SCHEMA       | VARCHAR2(128)  | Owner of the queue                                                                                                                                       |
| QUEUE_NAME         | VARCHAR2(128)  | Name of the queue                                                                                                                                        |
| SUBSCRIBER_ID      | NUMBER         | Internal subscriber number (for identification)                                                                                                          |
| SUBSCRIBER_NAME    | VARCHAR2(512)  | Name of the subscriber                                                                                                                                   |
| SUBSCRIBER_ADDRESS | VARCHAR2(1024) | Address of the subscribing agent                                                                                                                         |
| PROTOCOL           | NUMBER         | Protocol of the subscribing agent                                                                                                                        |
| SUBSCRIBER_TYPE    | VARCHAR2(128)  | Type of the subscriber: <ul style="list-style-type: none"> <li>PROXY - Proxy subscriber</li> <li>SUBSCRIBER</li> </ul>                                   |
| STARTUP_TIME       | DATE           | Startup time                                                                                                                                             |
| LAST_BROWSED_SEQ   | NUMBER         | Sequence number of the most recently browsed message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_READER view)       |
| LAST_BROWSED_NUM   | NUMBER         | Internal Message number for the most recently browsed message for the subscriber                                                                         |
| LAST_DEQUEUED_SEQ  | NUMBER         | Sequence number of the most recently dequeued message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_COORDINATOR view) |
| LAST_DEQUEUED_NUM  | NUMBER         | Internal Message number for the most recently dequeued message for the subscriber                                                                        |

| Column               | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| OLDEST_MSG_ENQTM     | TIMESTAMP(3)                | Enqueue time of the oldest message                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID               | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.118 V\$CACHE

V\$CACHE displays information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

| Column | Datatype | Description                                                                            |
|--------|----------|----------------------------------------------------------------------------------------|
| FILE#  | NUMBER   | Data file identifier number (to find the file name, query DBA_DATA_FILES or V\$DBFILE) |
| BLOCK# | NUMBER   | Block number                                                                           |

## 8.120 V\$CACHE\_TRANSFER

V\$CACHE\_TRANSFER is identical to the V\$CACHE view but only displays blocks that have been pinged at least once.

This view contains information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 8.121 V\$CHUNK\_METRIC

V\$CHUNK\_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each chunk available on the database.

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME   | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                  |
| END_TIME     | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                   |
| CHUNK_ID     | NUMBER   | Chunk number (internal)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CALLSPERSEC  | NUMBER   | Number of user calls per second to the chunks                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.122 V\$CIRCUIT

V\$CIRCUIT contains information about virtual circuits, which are user connections to the database through dispatchers and servers.

| Column     | Datatype     | Description                                                                                                                                                                                                                                            |
|------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CIRCUIT    | RAW(4   8)   | Circuit address                                                                                                                                                                                                                                        |
| DISPATCHER | RAW(4   8)   | Current dispatcher process address                                                                                                                                                                                                                     |
| SERVER     | RAW(4   8)   | Current server process address                                                                                                                                                                                                                         |
| WAITER     | RAW(4   8)   | Address of the server process that is waiting for the (currently busy) circuit to become available                                                                                                                                                     |
| SADDR      | RAW(4   8)   | Address of the session bound to the circuit                                                                                                                                                                                                            |
| STATUS     | VARCHAR2(16) | Status of the circuit: <ul style="list-style-type: none"><li>BREAK - currently interrupted</li><li>EOF - about to be removed</li><li>OUTBOUND - an outward link to a remote database</li><li>NORMAL - normal circuit into the local database</li></ul> |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE        | VARCHAR2(16)  | Queue the circuit is currently on: <ul style="list-style-type: none"> <li>COMMON - on the common queue, waiting to be picked up by a server process</li> <li>DISPATCHER - waiting for the dispatcher</li> <li>SERVER - currently being serviced</li> <li>NONE - idle circuit</li> </ul>                                                                                                                                                                                                                                                                                      |
| MESSAGE0     | NUMBER        | Size in bytes of the messages in the first message buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MESSAGE1     | NUMBER        | Size in bytes of the messages in the second message buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MESSAGE2     | NUMBER        | Size in bytes of the messages in the third message buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MESSAGE3     | NUMBER        | Size in bytes of the messages in the fourth message buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MESSAGES     | NUMBER        | Total number of messages that have gone through this circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES        | NUMBER        | Total number of bytes that have gone through this circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BREAKS       | NUMBER        | Total number of breaks (interruptions) for this circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PRESENTATION | VARCHAR2(257) | Presentation protocol used by the client and server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PCIRCUIT     | RAW(4   8)    | Address of the parent circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BOUND_TIME   | NUMBER        | Time that a circuit and shared server have been bound (in centiseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| BOUND_REASON | VARCHAR2(32)  | Provides a reason (a short explanation) for why a shared server and circuit could not be unbound.<br><br>This column is empty when a circuit is not bound to a server.<br>When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request).<br>When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released). |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                              |

## 8.123 V\$CLASS\_CACHE\_TRANSFER

V\$CLASS\_CACHE\_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column                | Datatype | Description                                                     |
|-----------------------|----------|-----------------------------------------------------------------|
| CLASS                 | CHAR(10) | Block class; always data block                                  |
| X_2_NULL              | NUMBER   | Number of blocks with Exclusive-to-NULL conversions; always 0   |
| X_2_NULL_FORCED_WRITE | NUMBER   | Number of Exclusive-to-NULL forced writes; always 0             |
| X_2_NULL_FORCED_STALE | NUMBER   | Number of Exclusive-to-NULL blocks converted to CR; always 0    |
| X_2_S                 | NUMBER   | Number of blocks with Exclusive-to-Shared conversions; always 0 |

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X_2_S_FORCED_WRITE    | NUMBER   | Number of Exclusive-to-Shared forced writes; always 0                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.124 V\$CLEANUP\_PROCESS

V\$CLEANUP\_PROCESS provides information on the PMON processes.

| Column                  | Datatype    | Description                                                                                                                                                 |
|-------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                    | VARCHAR2(5) | Name of the cleanup process (PMON, CLMN, CL**)                                                                                                              |
| PADDR                   | RAW(8)      | Process pointer for the cleanup process (can join with V\$PROCESS)                                                                                          |
| SADDR                   | RAW(8)      | Session pointer for the cleanup process (can join with V\$SESSION)                                                                                          |
| STATE                   | VARCHAR2(4) | Cleanup process state: <ul style="list-style-type: none"> <li>IDLE: Not currently performing cleanup</li> <li>BUSY: Currently performing cleanup</li> </ul> |
| DEAD_IN_CLEANUP         | RAW(8)      | Pointer to the root of the tree in cleanup (can join with ROOT_ADDR in V\$DEAD_CLEANUP)                                                                     |
| CLEANUP_TIME            | NUMBER      | If STATE = BUSY, the time spent in the current cleanup attempt (in seconds). Otherwise, 0.                                                                  |
| TIME_SINCE_LAST_CLEANUP | NUMBER      | If STATE = IDLE, time since last needed to perform cleanup (in seconds). Otherwise, 0.                                                                      |
| NUM_CLEAVED             | NUMBER      | Number of trees cleaned up by the cleanup process. Increased by one every time a root tree is attempted.                                                    |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.126 V\$CLIENT\_STATS

V\$CLIENT\_STATS displays measures for all sessions that are active for the client identifier per instance.

The statistics available in this view are a subset of those available in V\$SESSTAT and V\$SESS\_TIME\_MODEL.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 8.127 V\$CLONEDFILE

V\$CLONEDFILE provides CloneDB file information.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAPSHOTFILENAME | VARCHAR2(513) | Snapshot file name. This file is the snapshot file from the snapshot database. The snapshot file is also sometimes referred to as the srcfile.                                                                                                                                                                                                                                                                                                    |
| CLONEFILENAME    | VARCHAR2(513) | CloneDB file name. This file is the cloned file (of the snapshot file) which resides in the current (cloned database). The cloned file is sometimes referred to as the destfile.                                                                                                                                                                                                                                                                  |
| SNAPSHOTBLKREAD  | NUMBER        | Number of blocks reads to the snapshot file                                                                                                                                                                                                                                                                                                                                                                                                       |
| SNAPSHOTREQUEST  | NUMBER        | Number of read requests to the snapshot file                                                                                                                                                                                                                                                                                                                                                                                                      |
| FILENUMBER       | NUMBER        | File number of the cloned file                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| BLOCKS_ALLOCATED | NUMBER        | Amount of space allocated in blocks in the file system. This is less than or equal to the actual file size.                                                                                                                                                                                                                                                                                                                                       |

### Note

When this view is queried in an Oracle Database environment, rows are returned for every opened file, even those without a parent file backing them (in those cases the column is empty/NULL).

In an Oracle ASM environment, rows are returned for files that an Oracle ASM instance has mounted in disk groups only if those files are children (a clonefile) of a parent snapshot file.

## 8.128 V\$CLUSTER\_INTERCONNECTS

V\$CLUSTER\_INTERCONNECTS displays one or more interconnects that are being used for cluster communication.

| Column     | Datatype     | Description                             |
|------------|--------------|-----------------------------------------|
| NAME       | VARCHAR2(15) | Name of the interconnect (such as eth0) |
| IP_ADDRESS | VARCHAR2(64) | IP address of the interconnect          |

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_PUBLIC | VARCHAR2(3)  | <p>If the value is YES, the interface is known to the public.</p> <p>If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only.</p> <p>If the value is empty, it is unknown whether the interface is public or private.</p> <p>Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR).</p> |
| SOURCE    | VARCHAR2(31) | <p>Indicates where this interface was picked up from:</p> <ul style="list-style-type: none"> <li>Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR</li> <li>Operating-system dependent software - Oracle Database automatically detects this</li> <li>CLUSTER_INTERCONNECTS parameter - This initialization parameter was set</li> </ul>                                                                                                                                                                                               |
| CON_ID    | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                |

## 8.129 V\$CODE Clause

V\$CODE Clause contains the supported clause names and parameter names for the Oracle Data Vault ALTER SYSTEM and ALTER SESSION commands.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CODE_ID#       | NUMBER        | <p>The OCT code ID:</p> <ul style="list-style-type: none"> <li>42: For ALTER SESSION</li> <li>49: For ALTER SYSTEM</li> </ul>                                                                                                                                                                                                                                                                                                                          |
| CLAUSE_ID#     | NUMBER        | Clause ID                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CLAUSE_NAME    | VARCHAR2(100) | The clause name that is supported by the Oracle Data Vault command rule (for example, SET or ADVICE)                                                                                                                                                                                                                                                                                                                                                   |
| PARAMETER_NAME | VARCHAR2(100) | The parameter name that is supported by the Oracle Data Vault command rule. For example, for ALTER SYSTEM SET EVENTS, EVENTS is the parameter.                                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.130 V\$CON\_EVENT\_HISTOGRAM\_MICRO

V\$CON\_EVENT\_HISTOGRAM\_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis for a container, in microseconds. The histogram has buckets of time intervals from < 1 us, < 2 us, < 4 us, < 8 us, ... < 2<sup>31</sup> us, < 2<sup>32</sup> us, and >= 2<sup>32</sup> us.

The histogram will not be filled unless the TIMED\_STATISTICS initialization parameter is set to true.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                                                             |
| WAIT_TIME_FORMAT | VARCHAR2(30) | A human readable time string which is converted from WAIT_TIME_MICRO. When WAIT_TIME_MICRO < 1 millisecond, WAIT_TIME_FORMAT is shown in microseconds. When WAIT_TIME_MICRO < 1 second, WAIT_TIME_FORMAT is shown in milliseconds. When WAIT_TIME_MICRO < 1 minute, WAIT_TIME_FORMAT is shown in seconds. When WAIT_TIME_MICRO > 1 minute, WAIT_TIME_FORMAT is shown in minutes and seconds.                                  |
| WAIT_TIME_MICRO  | NUMBER       | Amount of time the bucket represents (in microseconds). If the duration = num, then this column represents waits of duration < num that are not included in any smaller bucket.                                                                                                                                                                                                                                               |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                      |
| LAST_UPDATE_TIME | VARCHAR2(73) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                     |
| CON_ID           | NUMBER       | When queried from a non-CDB, the wait event data in that instance are returned, and the CON_ID value is 0.<br><br>When queried from the root of a CDB, the wait event data in every container is returned, and the CON_ID value indicates the container to which the wait event data belong.<br><br>When queried from a PDB, wait event data in that PDB are returned, and the CON_ID value is the container ID for that PDB. |

## 8.131 V\$CON\_SYS\_TIME\_MODEL

V\$CON\_SYS\_TIME\_MODEL displays the systemwide accumulated times for various operations for the container from which it is queried.

The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

| Column  | Datatype | Description                                 |
|---------|----------|---------------------------------------------|
| STAT_ID | NUMBER   | Statistic identifier for the time statistic |

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_NAME | VARCHAR2(64) | Name of the statistic (see <a href="#">Table 10-1</a> )                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VALUE     | NUMBER       | Amount of time (in microseconds) that the system has spent in this operation                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID    | NUMBER       | <p>When queried from a non-CDB, the accumulated times for operations in that instance are returned, and the CON_ID value is 0.</p> <p>When queried from the root of a CDB, accumulated times for operations in every container are returned, and the CON_ID value indicates the container to which the times belong.</p> <p>When queried from a PDB, accumulated times for operations in that PDB are returned, and the CON_ID value is the container ID for that PDB.</p> |

## 8.132 V\$CON\_SYSMETRIC

V\$CON\_SYSMETRIC displays the system metric values captured for the most current time interval for the PDB long duration (60-second) system metrics.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 8.134 V\$CON\_SYSMETRIC\_SUMMARY

V\$CON\_SYSMETRIC\_SUMMARY displays a summary of all system metric values for the PDB long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

| Column       | Datatype     | Description                               |
|--------------|--------------|-------------------------------------------|
| BEGIN_TIME   | DATE         | Begin time of the interval                |
| END_TIME     | DATE         | End time of the interval                  |
| INTSIZE_CSEC | NUMBER       | Interval size (in hundredths of a second) |
| GROUP_ID     | NUMBER       | Metric group ID                           |
| METRIC_ID    | NUMBER       | Metric ID                                 |
| METRIC_NAME  | VARCHAR2(64) | Metric name                               |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_INTERVAL       | NUMBER       | Number of intervals observed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MAXVAL             | NUMBER       | Maximum value observed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.135 V\$CON\_SYSSTAT

V\$CON\_SYSSTAT displays system statistics, including OLAP kernel statistics for the container from which it is queried. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype     | Description                                                                                                                                                                                                               |

## 8.136 V\$CON\_SYSTEM\_EVENT

V\$CON\_SYSTEM\_EVENT displays information on total waits for an event in a container.

Note that the TIME\_WAITED and AVERAGE\_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED\_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

| WAIT_CLASS           | VARCHAR2(64) | Name of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID               | NUMBER       | When queried from a non-CDB, the wait event data in that instance are returned, and the CON_ID value is 0.<br><br>When queried from the root of a CDB, the wait event data in every container is returned, and the CON_ID value indicates the container to which the wait event data belong.<br><br>When queried from a PDB, wait event data in that PDB are returned, and the CON_ID value is the container ID for that PDB. |

## 8.137 V\$CON\_SYSTEM\_WAIT\_CLASS

V\$CON\_SYSTEM\_WAIT\_CLASS displays the time totals for each registered wait class in a container.

| Column            | Datatype     | Description                                                                                       |
|-------------------|--------------|---------------------------------------------------------------------------------------------------|
| WAIT_CLASS_ID     | NUMBER       | Identifier of the wait class                                                                      |
| WAIT_CLASS#       | NUMBER       | Number of the wait class                                                                          |
| WAIT_CLASS        | VARCHAR2(64) | Name of the wait class                                                                            |
| TOTAL_WAITS       | NUMBER       | Total number of waits from this wait class                                                        |
| TIME_WAITED       | NUMBER       | Total amount of time spent in waits from this wait class (in hundredths of a second)              |
| TIME_WAITED_MICRO | NUMBER       | Total amount of time spent in waits from this wait class (in microseconds)                        |
| CPU               | NUMBER       | Total amount of CPU time consumed while implementing waits from this wait class (in microseconds) |
| TOTAL_WAITS_FG    | NUMBER       | Total number of waits from this wait class, from foreground sessions                              |

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_WAITED_FG       | NUMBER   | Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                           |
| TIME_WAITED_MICRO_FG | NUMBER   | Total amount of time spent in waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                     |
| CPU_FG               | NUMBER   | Total amount of CPU time consumed while implementing waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID               | NUMBER   | <p>When queried from a non-CDB, time totals for each registered wait class in that instance are returned, and the CON_ID value is 0.</p> <p>When queried from the root of a CDB, time totals for each registered wait class in every container is returned, and the CON_ID value indicates the container to which the time total belong.</p> <p>When queried from a PDB, time totals for each registered wait class in that PDB are returned, and the CON_ID value is the container ID for that PDB.</p> |

## 8.138 V\$CONFIGURED\_INTERCONNECTS

V\$CONFIGURED\_INTERCONNECTS displays all the interconnects that Oracle is aware of. This view attempts to answer the question of where Oracle found the information about a specific interconnect.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(15) | Name of the interconnect (such as eth0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IP_ADDRESS | VARCHAR2(64) | IP address of the interconnect                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IS_PUBLIC  | VARCHAR2(3)  | <p>If the value is YES, the interface is known to the public.</p> <p>If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only.</p> <p>If the value is empty, it is unknown whether the interface is public or private.</p> <p>Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR).</p> |
| SOURCE     | VARCHAR2(31) | <p>Indicates where this interface was picked up from:</p> <ul style="list-style-type: none"> <li>Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR</li> <li>Operating-system dependent software - Oracle Database automatically detects this</li> <li>CLUSTER_INTERCONNECTS parameter - This initialization parameter was set</li> </ul>                                                                                                                                                                                               |
| CON_ID     | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                |

## 8.139 V\$CONTAINER\_TOPOLOGY

V\$CONTAINER\_TOPOLOGY displays information about the containers associated with the current instance.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER     | NUMBER        | Instance number, as specified by the INSTANCE_NUMBER initialization parameter for the database in which the container resides                                                                                                                                                                                                                                                                                                                     |
| CON_NAME            | VARCHAR2(128) | Container name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OPEN_MODE           | VARCHAR2(10)  | Open mode for the container: <ul style="list-style-type: none"><li>• MIGRATE</li><li>• MOUNTED</li><li>• READ ONLY</li><li>• READ WRITE</li></ul>                                                                                                                                                                                                                                                                                                 |
| CPU_COUNT           | NUMBER        | CPU count, as specified by the CPU_COUNT initialization parameter for the container                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| IS_HYBRID_READ_ONLY | VARCHAR2(3)   | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Note

This view is available starting with Oracle Database 21c.

## 8.140 V\$CONTAINERS

V\$CONTAINERS displays information about PDBs and the root associated with the current instance.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| DBID   | NUMBER   | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB                                                                                                                                                                                                                                                                                                                                          |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_UID                 | NUMBER        | Unique identifier associated with the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| GUID                    | RAW(16)       | Globally unique identifier (GUID) of this PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NAME                    | VARCHAR2(128) | Name of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OPEN_MODE               | VARCHAR2(10)  | Open mode information. Possible values: <ul style="list-style-type: none"> <li>• MOUNTED</li> <li>• READ WRITE</li> <li>• READ ONLY</li> <li>• MIGRATE</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| RESTRICTED              | VARCHAR2(3)   | Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OPEN_TIME               | TIMESTAMP(3)  | Date and time when the database was last opened                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CREATE_SCN              | NUMBER        | System change number (SCN) for the creation of this PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_SIZE              | NUMBER        | If a PDB is opened, disk space (in bytes) used by the container, including both data and temp files. If a PDB is closed, will be set to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BLOCK_SIZE              | NUMBER        | The current block size for the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RECOVERY_STATUS         | VARCHAR2(26)  | Shows the recovery status for the PDB. Possible values: <ul style="list-style-type: none"> <li>• DISABLED: The PDB is offline. This is similar to all files belonging to this PDB being offline, except that all files to be added to this PDB in the future will also be offline to begin with.</li> <li>• DISABLED AUTOMATIC RECOVER: Same as DISABLED, except that standby Active Data Guard recovery will automatically attempt to spawn PDB recovery isolation for the PDB and transition the PDB into ENABLED.</li> <li>• ENABLED: The PDB is not offline at the PDB level. Individual files in the PDB may be online or offline at the file level.</li> </ul> |
| SNAPSHOT_PARENT_CON_ID  | NUMBER        | This column shows the container ID of the PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| APPLICATION_ROOT        | VARCHAR2(3)   | Indicates whether the PDB is an application root                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| APPLICATION_PDB         | VARCHAR2(3)   | Indicates whether the PDB is an application PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| APPLICATION_SEED        | VARCHAR2(3)   | Indicates whether the PDB is an application seed (an application seed is also an application PDB)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| APPLICATION_ROOT_CON_ID | NUMBER        | If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs.<br><br>If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs.<br><br>Otherwise, NULL.                                                                                                                                                                                                                                                                                                                                                                                     |
| APPLICATION_ROOT_CLONE  | VARCHAR2(3)   | Indicates whether this PDB is an application root clone (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PROXY_PDB               | VARCHAR2(3)   | Indicates whether this PDB is a proxy PDB (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOCAL_UNDO              | NUMBER        | Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none"> <li>• 1 – PDB is in local undo mode</li> <li>• 0 – PDB is in shared undo mode</li> </ul> This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| UNDO_SCN                | NUMBER        | System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo.<br><br>This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Column                      | Datatype       | Description                                                                                                                                                                                                                   |
|-----------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UNDO_TIMESTAMP              | DATE           | Date and time at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                      |
| CREATION_TIME               | DATE           | Date and time at which the PDB was created.                                                                                                                                                                                   |
| PDB_COUNT                   | NUMBER         | The number of user-created PDBs belonging to a given application root or CDB\$ROOT. For all other containers, its value is 0.                                                                                                 |
| AUDIT_FILES_SIZE            | NUMBER         | Shows the current disk space usage (in bytes) by Unified Audit files (.bin format) in the container                                                                                                                           |
| MAX_SIZE                    | NUMBER         | Shows the maximum amount of disk space (in bytes) that can be used by data and temp files in the container                                                                                                                    |
| MAX_DIAGNOSTICS_SIZE        | NUMBER         | Shows the maximum amount of disk space (in bytes) that can be used by diagnostic traces generated in the container                                                                                                            |
| MAX_AUDIT_SIZE              | NUMBER         | Shows the maximum amount of disk space (in bytes) that can be used by Unified Audit files (.bin format) in the container                                                                                                      |
| LAST_CHANGED_BY             | VARCHAR2(11)   | Indicates what type of user last changed the PDB. Possible values: <ul style="list-style-type: none"> <li>COMMON USER</li> <li>LOCAL USER</li> </ul>                                                                          |
| MEMBER_CDB                  | VARCHAR2(3)    | Indicates whether the row corresponds to a Member CDB part of the CDB Fleet (YES) or not (NO). This column is only meaningful in the Lead CDB of a CDB Fleet, which keeps track of other CDBs as containers in the CDB Fleet. |
| TENANT_ID                   | VARCHAR2(256)  | Pluggable database tenant key                                                                                                                                                                                                 |
| UPGRADE_LEVEL               | NUMBER         | For internal use only                                                                                                                                                                                                         |
| GUID_BASE64                 | VARCHAR2(30)   | The GUID of the PDB, encoded in base64                                                                                                                                                                                        |
| CLOUD_IDENTITY <sup>1</sup> | VARCHAR2(4000) | Cloud identifier for the PDB                                                                                                                                                                                                  |
| CLOSE_TIME <sup>1</sup>     | TIMESTAMP(3)   | Date and time when the database was last closed                                                                                                                                                                               |

<sup>1</sup> This column is available starting with Oracle Database 21c.

## 8.141 V\$CONTEXT

V\$CONTEXT displays set attributes in the current session.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAMESPACE | VARCHAR2(31)   | Namespace that the attribute is in                                                                                                                                                                                                                                                                                                                                                                                                              |
| ATTRIBUTE | VARCHAR2(31)   | Name of the attribute                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE     | VARCHAR2(4000) | Value of the attribute                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.142 V\$CONTROLFILE

V\$CONTROLFILE displays the names of the control files.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                | VARCHAR2(7)   | INVALID if the name cannot be determined (which should not occur); NULL if the name can be determined                                                                                                                                                                                                                                                                                                                                       |
| NAME                  | VARCHAR2(513) | Name of the control file                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                          |
| BLOCK_SIZE            | NUMBER        | Control file block size                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE_SIZE_BLKs        | NUMBER        | Control file size (in blocks)                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.143 V\$CONTROLFILE\_RECORD\_SECTION

V\$CONTROLFILE\_RECORD\_SECTION displays information about the control file record sections.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| CORRUPTION_CHANGE# | NUMBER      | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MARKED_CORRUPT     | VARCHAR2(3) | (YES   NO) If set to YES the blocks were not marked corrupted in the data file, but were detected and marked as corrupted while making the data file copy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CORRUPTION_TYPE    | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>• ALL_ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>• FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>• CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>• CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>• LOGICAL - Block is logically corrupt</li> <li>• NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)</li> </ul> |
| CON_ID             | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.145 V\$COPY\_NONLOGGED

V\$COPY\_NONLOGGED displays information about nonlogged block ranges in data file copy blocks, recorded in the control file.

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID           | NUMBER   | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RECID             | NUMBER   | Nonlogged copy record ID                                                                                                                                                                                                                                                                                                                                                                                                                        |
| STAMP             | NUMBER   | Nonlogged copy record stamp                                                                                                                                                                                                                                                                                                                                                                                                                     |
| COPY_RECID        | NUMBER   | Data file copy record ID                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COPY_STAMP        | NUMBER   | Data file copy record stamp                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE#             | NUMBER   | Absolute file number of the data file that contains this range of nonlogged blocks                                                                                                                                                                                                                                                                                                                                                              |
| BLOCK#            | NUMBER   | Block number of the first nonlogged block in the range of nologged blocks                                                                                                                                                                                                                                                                                                                                                                       |
| BLOCKS            | NUMBER   | Number of nonlogged blocks found starting with BLOCK#                                                                                                                                                                                                                                                                                                                                                                                           |
| NONLOGGED_CHANGE# | NUMBER   | The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                                      |
| NONLOGGED_TIME    | VARCHAR2 | The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.                                                                                                                                                                                                                                                                                                                                                                                |
| RESETLOGS_CHANGE# | VARCHAR2 | The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                  |
| RESETLOGS_TIME    | VARCHAR2 | The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                  |
| OBJECT#           | VARCHAR2 | The object ID this range belongs to. If this field is NULL, the object number is unknown.                                                                                                                                                                                                                                                                                                                                                       |
| REASON            | CHAR(7)  | The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.                                                                                                                                                                                                                          |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.146 V\$CORRUPT\_XID\_LIST

V\$CORRUPT\_XID\_LIST displays all corrupted XIDs.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CORRUPT_XID | VARCHAR2(256) | Name of corrupt XID                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.147 V\$CPool\_CC\_Info

V\$CPool\_CC\_Info displays information about the pool-to-connection class mapping for the Database Resident Connection Pool per instance.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL_NAME   | VARCHAR2(1024) | Name of the Database Resident Connection Pool                                                                                                                                                                                                                                                                                                                                                                                                     |
| CCLASS_NAME | VARCHAR2(1024) | Name of the connection class                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.148 V\$CPool\_CC\_Stats

V\$CPool\_CC\_Stats displays information about the connection class level statistics for the Database Resident Connection Pool per instance.

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCLASS_NAME         | VARCHAR2(1024) | Name of the connection class                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NUM_REQUESTS        | NUMBER         | Number of session requests                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NUM_HITS            | NUMBER         | Total number of times a session that matches with the request was found in the pool                                                                                                                                                                                                                                                                                                                                                               |
| NUM_MISSES          | NUMBER         | Total number of times an exact match to the request was not found in the pool and a new session had to be created                                                                                                                                                                                                                                                                                                                                 |
| NUM_WAITS           | NUMBER         | Total number of times session requests had to wait before getting served                                                                                                                                                                                                                                                                                                                                                                          |
| WAIT_TIME           | NUMBER         | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CLIENT_REQ_TIMEOUTS | NUMBER         | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NUM_AUTHENTICATIONS | NUMBER         | Total number of authentications of clients done by the pool                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note**

This view returns data only when queried from a CDB root. When queried from a PDB, this view returns 0 rows.

## 8.149 V\$CPool\_CONN\_INFO

V\$CPool\_CONN\_INFO displays connection information about each connection to the connection broker.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMON_ADDR         | RAW(4   8)     | Address of the connection broker                                                                                                                                                                                                                                                                                                                                                               |
| SESSION_ADDR      | RAW(4   8)     | Address of the session associated with the connection; NULL if the connection does not have an associated session                                                                                                                                                                                                                                                                              |
| CONNECTION_ADDR   | RAW(4   8)     | Address of the connection                                                                                                                                                                                                                                                                                                                                                                      |
| USERNAME          | VARCHAR2(1024) | Name of the user associated with the connection                                                                                                                                                                                                                                                                                                                                                |
| PROXY_USER        | VARCHAR2(1024) | Name of the proxy user                                                                                                                                                                                                                                                                                                                                                                         |
| CCLASS_NAME       | VARCHAR2(1024) | Connection class associated with the connection                                                                                                                                                                                                                                                                                                                                                |
| PURITY            | VARCHAR2(1024) | Purity used to create the connection (can be SELF or NEW)                                                                                                                                                                                                                                                                                                                                      |
| TAG               | VARCHAR2(1024) | Tag, if specified, at connection creation time                                                                                                                                                                                                                                                                                                                                                 |
| SERVICE           | VARCHAR2(64)   | TNS service name for the connection                                                                                                                                                                                                                                                                                                                                                            |
| PROCESS_ID        | VARCHAR2(24)   | Client process ID of the process which created the connection                                                                                                                                                                                                                                                                                                                                  |
| PROGRAM           | VARCHAR2(84)   | Program name of the client process which created the connection                                                                                                                                                                                                                                                                                                                                |
| MACHINE           | VARCHAR2(64)   | Machine name of the client process which created the connection                                                                                                                                                                                                                                                                                                                                |
| TERMINAL          | VARCHAR2(30)   | Terminal identifier of the client process which created the connection                                                                                                                                                                                                                                                                                                                         |
| CONNECTION_MODE   | VARCHAR2(1024) | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                      |
| CONNECTION_STATUS | VARCHAR2(10)   | Status of the connection: <ul style="list-style-type: none"> <li>NONE</li> <li>CONNECTING</li> <li>ACTIVE: A pooled server has been mapped to this connection.</li> <li>WAITING: The connection is waiting for a pooled server based on the client request.</li> <li>IDLE: No pooled server has been mapped to this connection and there is no request to map one.</li> <li>CLOSING</li> </ul> |
| CLIENT_REGID      | NUMBER         | Query cache registration ID sent by the client                                                                                                                                                                                                                                                                                                                                                 |
| CURSTATUS_TIME    | NUMBER         | Time in microseconds spent in the current state. See CONNECTION_STATUS above.                                                                                                                                                                                                                                                                                                                  |
| IDLE_TIME         | NUMBER         | Total time in IDLE state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                                  |
| ACTIVE_TIME       | NUMBER         | Total time in ACTIVE state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                                |
| WAIT_TIME         | NUMBER         | Total time in WAITING state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                               |
| THINK_TIME        | NUMBER         | Total think time for the connection assigned to the pooled server, but not doing any database activity (in microseconds)                                                                                                                                                                                                                                                                       |
| LAST_IDLE_TIME    | NUMBER         | Time in last IDLE state for this connection (in microseconds)                                                                                                                                                                                                                                                                                                                                  |
| LAST_ACTIVE_TIME  | NUMBER         | Time in last ACTIVE state for this connection (in microseconds)                                                                                                                                                                                                                                                                                                                                |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| NUM_AUTHENTICATIONS | NUMBER         | Total number of authentications of clients done by the pool                                                                                                                                                                                                                                                                                                                                                                                     |
| NUM_PURGED          | NUMBER         | Total number of sessions purged by the pool                                                                                                                                                                                                                                                                                                                                                                                                     |
| HISTORIC_MAX        | NUMBER         | Maximum size that the pool has ever reached                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

This view returns data only when queried from a CDB root. When queried from a PDB, this view returns 0 rows.

## 8.151 V\$CR\_BLOCK\_SERVER

V\$CR\_BLOCK\_SERVER displays statistics on the Global Cache Service processes (LMS) used in cache fusion.

| Column                 | Datatype | Description                                                                                                                                                               |
|------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CR_REQUESTS            | NUMBER   | Number of CR blocks served due to remote CR block requests                                                                                                                |
| CURRENT_REQUESTS       | NUMBER   | Number of current blocks served due to remote CR block requests<br>CR_REQUESTS + CURRENT_REQUESTS = global cache CR clocks served (from V\$SYSSTAT).                      |
| DATA_REQUESTS          | NUMBER   | Number of current or CR requests for data blocks                                                                                                                          |
| UNDO_REQUESTS          | NUMBER   | Number of CR requests for undo blocks                                                                                                                                     |
| TX_REQUESTS            | NUMBER   | Number of CR requests for undo segment header blocks                                                                                                                      |
| OTHER_REQUESTS         | NUMBER   | Number of CR requests for other types of blocks<br>DATA_REQUESTS + UNDO_REQUESTS + TX_REQUESTS + OTHER_REQUESTS = total number of requests handled by the LMS processes   |
| CURRENT_RESULTS        | NUMBER   | Number of requests for which no changes were rolled out of the block returned to the requesting instance                                                                  |
| PRIVATE_RESULTS        | NUMBER   | Number of requests for which changes were rolled out of the block returned to the requesting instance, and only the requesting transaction can use the resulting CR block |
| ZERO_RESULTS           | NUMBER   | Number of requests for which changes were rolled out of the block returned to the requesting instance. Only zero-XID transactions can use the block.                      |
| DISK_READ_RESULTS      | NUMBER   | Number of requests for which the requesting instance had to read the requested block from disk                                                                            |
| FAIL_RESULTS           | NUMBER   | Number of requests that failed; the requesting transaction must reissue the request                                                                                       |
| STALE                  | NUMBER   | Number of requests for which the disk read of the requested block was stale                                                                                               |
| FAIRNESS_DOWN_CONVERTS | NUMBER   | Number of times an instance receiving a request has down-converted an X lock on a block because it was not modifying the block                                            |
| FAIRNESS_CLEARS        | NUMBER   | Number of times the "fairness counter" was cleared. This counter tracks the number of times a block was modified after it was served.                                     |
| FREE_GC_ELEMENTS       | NUMBER   | Number of times a request was received from another instance and the X lock had no buffers                                                                                |
| FLUSHES                | NUMBER   | Number of times the log has been flushed by an LMS process                                                                                                                |
| FLUSHES_QUEUED         | NUMBER   | Number of flushes queued by an LMS process                                                                                                                                |
| FLUSH_QUEUE_FULL       | NUMBER   | Number of times the flush queue was full                                                                                                                                  |
| FLUSH_MAX_TIME         | NUMBER   | Maximum time for flush                                                                                                                                                    |

| Column      | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LIGHT_WORKS | NUMBER   | Number of times the light-work rule was evoked. This rule prevents the LMS processes from going to disk while responding to CR requests for data, undo, or undo segment header blocks. This rule can prevent the LMS process from completing its response to the CR request.                                                                                                                                                                    |
| ERRORS      | NUMBER   | Number of times an error was signalled by an LMS process                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID      | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.152 V\$CURRENT\_BLOCK\_SERVER

V\$CURRENT\_BLOCK\_SERVER displays statistics on the Global Cache Service processes (LMS) used in cache fusion.

| Column                  | Datatype | Description                                      |
|-------------------------|----------|--------------------------------------------------|
| PIN0                    | NUMBER   | Pins taking less than 100 microseconds           |
| PIN1                    | NUMBER   | Pins taking 100 microseconds to 1 millisecond    |
| PIN10                   | NUMBER   | Pins taking 1 to 10 milliseconds                 |
| PIN100                  | NUMBER   | Pins taking 10 to 100 milliseconds               |
| PIN1000                 | NUMBER   | Pins taking 100 to 1000 milliseconds             |
| PIN10000                | NUMBER   | Pins taking 1000 to 10000 milliseconds           |
| FLUSH0                  | NUMBER   | Flushes taking less than 100 microseconds        |
| FLUSH1                  | NUMBER   | Flushes taking 100 microseconds to 1 millisecond |
| FLUSH10                 | NUMBER   | Flushes taking 1 to 10 milliseconds              |
| FLUSH100                | NUMBER   | Flushes taking 10 to 100 milliseconds            |
| FLUSH1000               | NUMBER   | Flushes taking 100 to 1000 milliseconds          |
| FLUSH10000              | NUMBER   | Flushes taking 1000 to 10000 milliseconds        |
| WRITE1 <sup>1</sup>     | NUMBER   | Writes taking less than 1 millisecond            |
| WRITE10 <sup>1</sup>    | NUMBER   | Writes taking 1 to 10 milliseconds               |
| WRITE100 <sup>1</sup>   | NUMBER   | Writes taking 10 to 100 milliseconds             |
| WRITE1000 <sup>1</sup>  | NUMBER   | Writes taking 100 to 1000 milliseconds           |
| WRITE10000 <sup>1</sup> | NUMBER   | Writes taking 1000 to 10000 milliseconds         |
| CLEANDC                 | NUMBER   | Reserved for internal use                        |

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RCVDC   | NUMBER   | Number of lock down-converts to S (shared) caused by instance recovery                                                                                                                                                                                                                                                                                                                                                                                 |
| QUEUEDC | NUMBER   | Number of queued lock down-converts to NULL                                                                                                                                                                                                                                                                                                                                                                                                            |
| EVICTDC | NUMBER   | Number of lock down-converts to NULL caused by an SGA shrink                                                                                                                                                                                                                                                                                                                                                                                           |
| WRITEDC | NUMBER   | Number of dirty blocks in read-mostly objects which were written and the X (exclusive) lock down-converted to S (shared) locks                                                                                                                                                                                                                                                                                                                         |
| CON_ID  | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be removed in a future release.

## 8.153 V\$DATABASE

V\$DATABASE displays information about the database from the control file.

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID                    | NUMBER       | Database identifier calculated when the database is created and stored in all file headers                                                                                                                                                                                                                                                                                                                                                         |
| NAME                    | VARCHAR2(9)  | Name of the database                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CREATED                 | DATE         | Creation date of the database. If the control file was re-created using the CREATE CONTROLFILE statement, then this column displays the date that the control file was re-created.                                                                                                                                                                                                                                                                 |

| SWITCHOVER_STATUS      | VARCHAR2(20) | <p>Indicates whether switchover is allowed:</p> <ul style="list-style-type: none"> <li>• NOT ALLOWED - On a primary database, this status indicates that there are no valid and enabled standby databases. On a standby database, this status indicates that a switchover request has not been received from the primary database.</li> <li>• SESSIONS ACTIVE - The database has active sessions. On a physical standby database, the WITH SESSION SHUTDOWN SQL clause must be specified to perform a role transition while in this state. On a logical standby database, a role transition can be performed while in this state, but the role transition will not complete until all current transactions have committed.</li> <li>• SWITCHOVER PENDING - On a physical standby database, this status indicates that a switchover request has been received from the primary database and is being processed. A physical standby database cannot switch to the primary role while in this transient state.</li> <li>• SWITCHOVER LATENT - On a physical standby database, this status indicates that a switchover request was pending, but the original primary database has been switched back to the primary role.</li> <li>• TO PRIMARY - The database is ready to switch to the primary role.</li> <li>• TO STANDBY - The database is ready to switch to either the physical or logical standby role.</li> <li>• TO LOGICAL STANDBY - The database has received a data dictionary from a logical standby database and is ready to switch to the logical standby role.</li> <li>• RECOVERY NEEDED - On a physical standby database, this status indicates that additional redo must be applied before the database can switch to the primary role.</li> <li>• PREPARING SWITCHOVER - On a primary database, this status indicates that a data dictionary is being received from a logical standby database in preparation for switching to the logical standby role. On a logical standby database, this status indicates that the data dictionary has been sent to the primary database and other standby databases.</li> <li>• PREPARING DICTIONARY - On a logical standby database, this status indicates that the data dictionary is being sent to the primary database and other standby databases in preparation for switching to the primary role.</li> <li>• FAILED DESTINATION - On a primary database, this status indicates that one or more standby destinations are in an error state.</li> <li>• RESOLVABLE GAP - On a primary database, this status indicates that one or more standby databases have a redo gap that can be automatically resolved by fetching the missing redo from the primary database or from another standby database.</li> <li>• UNRESOLVABLE GAP - On a primary database, this status indicates that one or more standby databases have a redo gap that cannot be automatically resolved by fetching the missing redo from the primary database or from another standby database.</li> <li>• LOG SWITCH GAP - On a primary database, this status indicates that one or more standby databases are missing redo due to a recent log switch.</li> </ul> |

| Column                    | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| FS_FAILOVER_OBSERVER_PRE<br>SENT | VARCHAR2(7)   | Indicates whether the master observer is currently connected to the local database (YES) or not (NO)<br><br><b>Note:</b> This column is consistent throughout an Oracle RAC environment; that is, if the observer is connected to any instance, then all instances will show a value of YES.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FS_FAILOVER_OBSERVER_HOS<br>T    | VARCHAR2(512) | Machine name that is currently hosting the master observer process, if fast-start failover is enabled. If fast-start failover is not enabled, this column returns a NULL string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CONTROLFILE_CONVERTED            | VARCHAR2(3)   | Indicates whether the control file was implicitly converted from its original type during restore (YES) or not (NO)<br><br>This column will be set to YES when RMAN restores a standby control file from a backup of the control file taken at the primary database or restores a backup control file from a backup taken at the physical standby database.<br><br>This column will change to NO when the file names are fixed using information in the recovery catalog schema.                                                                                                                                                                                                                                                                                     |
| PRIMARY_DB_UNIQUE_NAME           | VARCHAR2(30)  | For any Standby database (Physical, Logical, or Snapshot), this column will contain the DB_UNIQUE_NAME of the Primary database that this Standby last received current redo from.<br><br>If this standby has not received any current redo since last being started, then this column will be null.<br><br>For a Primary database that had previously been a Standby, this column will contain the DB_UNIQUE_NAME of the last Primary that this database received current redo from while acting as a Standby.<br><br>For a Primary database that has never been a Standby, this column will be null.                                                                                                                                                                |
| SUPPLEMENTAL_LOG_DATA_PL         | VARCHAR2(3)   | Indicates whether additional information is logged in the redo log (YES) or not (NO) during invocation of procedures in Oracle-supplied packages for which procedural replication is supported.<br><br>When a value of YES appears in a CDB, it means that supplemental logging for procedural replication is enabled in all of the PDBs in the CDB.<br><br>When a value of NO appears in a CDB, query the PROCEDURAL column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether supplemental logging for procedural replication is supported in the PDB.<br><br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i> for a list of Oracle-supplied packages that are procedurally replicated to a logical standby database |
| MIN_REQUIRED_CAPTURE_CHA<br>NGE# | NUMBER        | Minimum REQUIRED_CHECKPOINT_SCN for all local capture processes on the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CDB                              | VARCHAR2(3)   | Possible values are: <ul style="list-style-type: none"> <li>• YES if the database is a CDB</li> <li>• NO if the database is not a CDB</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                |

| Column                        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PENDING_ROLE_CHANGE_TASK<br>S | VARCHAR2(512) | Tasks remaining after an Oracle Data Guard role change. Possible values: <ul style="list-style-type: none"> <li>NONE: No pending tasks remain</li> <li>NOT APPLICABLE: The database is either standby or is not a DG_CONFIG member</li> <li>BUILD_PENDING: The database was formerly a logical standby and has not yet taken a snapshot of its data dictionary into the redo stream</li> <li>SRL_ARCHIVE_PENDING: The database was formerly a logical standby and the standby redo logs associated with the earlier failover operation have not yet been archived</li> <li>ERROR: The database was formerly a logical standby and the snapshot of the dictionary failed</li> <li>UNKNOWN: The database is not open or the query failed</li> </ul> |
| CON_DBID                      | NUMBER        | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FORCE_FULL_DB_CACHING         | VARCHAR2(3)   | Indicates the status of the force full database caching feature in the database. Possible values: <ul style="list-style-type: none"> <li>YES - The database is in force full database caching mode.</li> <li>NO - The database is not in force full database caching mode.</li> </ul> <b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for information about the FORCE FULL DATABASE CACHING clause for the ALTER DATABASE statement                                                                                                                                                                                                                                                                                                |
| SUPPLEMENTAL_LOG_DATA_SR      | VARCHAR2(3)   | Indicates whether the database is enabled for subset database replication (YES) or not (NO). If the database is enabled for subset database replication, then redo overhead and feature restriction for tables without column data supplemental logging will be reduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GOLDENGATE_BLOCKING_MODE      | VARCHAR2(8)   | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 8.154 V\$DATABASE\_BLOCK\_CORRUPTION

V\$DATABASE\_BLOCK\_CORRUPTION displays information about database blocks that were corrupted after the last backup.

| Column             | Datatype | Description                                                                                        |
|--------------------|----------|----------------------------------------------------------------------------------------------------|
| FILE#              | NUMBER   | Absolute file number of the data file that contains the corrupt blocks                             |
| BLOCK#             | NUMBER   | Block number of the first corrupt block in the range of corrupted blocks                           |
| BLOCKS             | NUMBER   | Number of corrupted blocks found starting with BLOCK#                                              |
| CORRUPTION_CHANGE# | NUMBER   | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption. |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CORRUPTION_TYPE | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>ALL_ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>LOGICAL - Block is logically corrupt</li> </ul> |
| CON_ID          | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 8.155 V\$DATABASE\_INCARNATION

V\$DATABASE\_INCARNATION displays information about all database incarnations.

Oracle creates a new incarnation whenever a database is opened with the RESETLOGS option. Records about the current and immediately previous incarnation are also contained in the V\$DATABASE view.

| Column                  | Datatype    | Description                                                                                                                                                                                                  |
|-------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCARNATION#            | NUMBER      | Record ID for the branch record in the control file                                                                                                                                                          |
| RESETLOGS_CHANGE#       | NUMBER      | Resetlogs system change number (SCN) for the incarnation of the current row                                                                                                                                  |
| RESETLOGS_TIME          | DATE        | Resetlogs timestamp for the incarnation of the current row                                                                                                                                                   |
| PRIOR_RESETLOGS_CHANGE# | NUMBER      | Resetlogs SCN for the previous incarnation                                                                                                                                                                   |
| PRIOR_RESETLOGS_TIME    | DATE        | Resetlogs timestamp for the previous incarnation                                                                                                                                                             |
| STATUS                  | VARCHAR2(7) | Incarnation status: <ul style="list-style-type: none"> <li>ORPHAN - Orphan incarnation</li> <li>CURRENT - Current incarnation of the database</li> <li>PARENT - Parent of the current incarnation</li> </ul> |

| Column                         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESETLOGS_ID                   | NUMBER       | Branch ID for the incarnation of the current row (used by user-managed recovery/RMAN restore to get unique names for archived logs across incarnations)                                                                                                                                                                                                                                                                                 |
| PRIOR_INCARNATION#             | NUMBER       | Parent incarnation record ID if nonzero                                                                                                                                                                                                                                                                                                                                                                                                 |
| FLASHBACK_DATABASE_ALLOW<br>ED | VARCHAR2(26) | Indicate whether or not Flashback Database can be performed into SCNs or timestamps in the incarnation. A value of YES means that you can flashback to some point in that incarnation. A value of NO indicates that you cannot flashback into the incarnation.                                                                                                                                                                          |
| CON_ID                         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 8.156 V\$DATABASE\_KEY\_INFO

V\$DATABASE\_KEY\_INFO provides the information of the default database key used to encrypt data blocks. Oracle uses the database key to encrypt sensitive information in SYSTEM, UNDO, and TEMP tablespaces when such data has dependency from encrypted tablespaces or encrypted columns

V\$DATABASE\_KEY\_INFO reflects the database key information stored in the control file. Generally it is the same as the system tablespace key recorded in the system tablespace. If the system tablespace is encrypted, it will also appear in V\$ENCRYPTED\_TABLESPACES. If the system tablespace is not encrypted, this is the only view providing this information.

| Column              | Datatype    | Description                                                                                                                                                                                                                                   |
|---------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCRYPTIONALG       | VARCHAR2(7) | Encryption algorithm: <ul style="list-style-type: none"> <li>• NONE</li> <li>• 3DES168</li> <li>• AES128</li> <li>• AES192</li> <li>• AES256</li> </ul> AES128 is the default encryption algorithm.                                           |
| ENCRYPTEDKEY        | RAW(48)     | Encrypted version of the database key                                                                                                                                                                                                         |
| MASTERKEYID         | RAW(16)     | ID of the master key that was used to encrypt the database key                                                                                                                                                                                |
| MASTERKEY_ACTIVATED | VARCHAR2(3) | Indicates whether the master key has been set (YES) or not (NO) for this database or container in the Oracle Key Store. In other words, indicates whether Transparent Data Encryption (TDE) has been activated for this database or container |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| CHECKPOINT_TIME        | DATE          | Checkpoint timestamp of the data file when the copy was made                                                                                                                                                                                                                                          |
| ABSOLUTE_FUZZY_CHANGE# | NUMBER        | Highest change seen when the data file was copied                                                                                                                                                                                                                                                     |
| RECOVERY_FUZZY_CHANGE# | NUMBER        | Highest change written to the file by media recovery                                                                                                                                                                                                                                                  |
| RECOVERY_FUZZY_TIME    | DATE          | Timestamp of the highest change written to the file by media recovery                                                                                                                                                                                                                                 |
| ONLINE_FUZZY           | VARCHAR2(3)   | (YES NO) If set to YES, this is a copy taken using an operating system utility after a crash or offline immediate (or an invalid copy taken while data file was online and the database open). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent. |
| BACKUP_FUZZY           | VARCHAR2(3)   | (YES NO) If set to YES, this is a copy taken using the BEGIN BACKUP/END BACKUP technique. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.                                                                                                              |
| MARKED_CORRUPT         | NUMBER        | Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation.                                                                                                  |
| MEDIA_CORRUPT          | NUMBER        | Total number of media corrupt blocks. For example, blocks with checksum errors are marked media corrupt.                                                                                                                                                                                              |
| LOGICALLY_CORRUPT      | NUMBER        | Total number of logically corrupt blocks. For example, applying redo for unrecoverable operations will mark affected blocks logically corrupt.                                                                                                                                                        |
| BLOCKS                 | NUMBER        | Size of the data file copy in blocks (also the size of the data file when the copy was made)                                                                                                                                                                                                          |
| BLOCK_SIZE             | NUMBER        | Block size of the data file                                                                                                                                                                                                                                                                           |
| OLDEST_OFFLINE_RANGE   | NUMBER        | RECID of the oldest offline range record in this control file copy; 0 for data file copies                                                                                                                                                                                                            |
| DELETED                | VARCHAR2(3)   | (YES NO) If set to YES the data file copy has been deleted or overwritten                                                                                                                                                                                                                             |

| Column                   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                   | VARCHAR2(1)  | Identifies the status of this data file copy. Possible values are:<br>A - Available<br>D - Deleted<br>U - Unavailable<br>X - Expired                                                                                                                                                                                                                                                                                                            |
| COMPLETION_TIME          | DATE         | Time when the copy was completed                                                                                                                                                                                                                                                                                                                                                                                                                |
| CONTROLFILE_TYPE         | VARCHAR2(1)  | B indicates normal copies<br>S indicates standby copies                                                                                                                                                                                                                                                                                                                                                                                         |
| KEEP                     | VARCHAR2(3)  | (YES/NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                                                                                                                                                                                                                                                                    |
| KEEP_UNTIL               | DATE         | If KEEP_UNTIL is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                                                                                                                                                                                                                                                    |
| KEEP_OPTIONS             | VARCHAR2(11) | Lists additional retention options for this backup set. Possible values are:<br>LOGS - The logs need to recover this backup are kept<br>NOLOGS - The logs needed to recover this backup will not be kept                                                                                                                                                                                                                                        |
| SCANNED                  | VARCHAR2(3)  | Indicates whether RMAN scanned the file (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                       |
| IS_RECOVERY_DEST_FILE    | VARCHAR2(3)  | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                              |
| RMAN_STATUS_RECID        | NUMBER       | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RMAN_STATUS_STAMP        | NUMBER       | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                                                                                                                                                                                                                                                              |
| CONVERTED_FILE           | VARCHAR2(3)  | (YES/NO) Indicates whether or not the data file copy was created using the RMAN CONVERT command                                                                                                                                                                                                                                                                                                                                                 |
| SAME_ENDIAN              | VARCHAR2(3)  | If the value of the CONVERTED_FILE column is YES, then this column indicates whether the data file copy has the same endianness as the source data file (YES) or not (NO); otherwise NULL                                                                                                                                                                                                                                                       |
| FOREIGN_DBID             | NUMBER       | Foreign DBID from which this data file came from. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                   |
| PLUGGED_READONLY         | VARCHAR2(3)  | YES if this is a transported read-only foreign file; otherwise NO.                                                                                                                                                                                                                                                                                                                                                                              |
| PLUGIN_CHANGE#           | NUMBER       | SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                               |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER       | The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                |
| PLUGIN_RESETLOGS_TIME    | DATE         | The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                               |
| BACKED_BY_VSS            | VARCHAR2(3)  | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                                                                                                                                                                                                                                                       |
| CON_ID                   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                         |
|---------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BACKED_BY_PDB | VARCHAR2(3) | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>• YES: The backup was taken when connected to the PDB</li> <li>• NO: The backup was taken when connected to the root container</li> </ul> |
| SPARSE_BACKUP | VARCHAR2(3) | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                              |
| GUID          | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                               |

## 8.159 V\$DATAFILE\_HEADER

V\$DATAFILE\_HEADER displays data file information from the data file headers.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#              | NUMBER        | Data file number (from control file)                                                                                                                                                                                                                                                                                                                                                                  |
| STATUS             | VARCHAR2(7)   | ONLINE   OFFLINE (from control file)                                                                                                                                                                                                                                                                                                                                                                  |
| ERROR              | VARCHAR2(18)  | NULL if the data file header read and validation were successful. If the read failed then the rest of the columns are NULL. If the validation failed then the rest of columns may display invalid data. If there is an error then usually the data file must be restored from a backup before it can be recovered or used.                                                                            |
| FORMAT             | NUMBER        | Indicates the format for the header block. The possible values are 6, 7, 8, 10 or 0. <ul style="list-style-type: none"> <li>6 - indicates Oracle Version 6</li> <li>7 - indicates Oracle Version 7</li> <li>8 - indicates Oracle Version 8</li> <li>10 - indicates Oracle Version 10</li> <li>0 - indicates the format could not be determined (for example, the header could not be read)</li> </ul> |
| RECOVER            | VARCHAR2(3)   | File needs media recovery (YES   NO)                                                                                                                                                                                                                                                                                                                                                                  |
| FUZZY              | VARCHAR2(3)   | File is fuzzy (YES   NO)                                                                                                                                                                                                                                                                                                                                                                              |
| CREATION_CHANGE#   | NUMBER        | Data file creation change#                                                                                                                                                                                                                                                                                                                                                                            |
| CREATION_TIME      | DATE          | Data file creation timestamp                                                                                                                                                                                                                                                                                                                                                                          |
| TABLESPACE_NAME    | VARCHAR2(30)  | Tablespace name                                                                                                                                                                                                                                                                                                                                                                                       |
| TS#                | NUMBER        | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                     |
| RFILE#             | NUMBER        | Tablespace relative data file number                                                                                                                                                                                                                                                                                                                                                                  |

|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPACE_HEADER             | VARCHAR2(40) | Represents the block address of a space file header block of a locally managed data file                                                                                                                                                                                                                                                                                                                                                        |
| LAST_DEALLOC_CHANGE#     | VARCHAR2(16) | Last deallocated SCN                                                                                                                                                                                                                                                                                                                                                                                                                            |
| UNDO_OPT_CURRENT_CHANGE# | VARCHAR2(40) | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| IS_SPARSE                | VARCHAR2(3)  | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                          |
| ENCRYPTED                | VARCHAR2(3)  | After file encryption is completed, this column indicates whether the file is encrypted (YES) or not (NO).<br>When file encryption is still in progress, this column has a value of NO.                                                                                                                                                                                                                                                         |

## 8.160 V\$DATAGUARD\_CONFIG

V\$DATAGUARD\_CONFIG displays the unique database names defined with the DB\_UNIQUE\_NAME and LOG\_ARCHIVE\_CONFIG initialization parameters, providing a view of the Oracle Data Guard environment from any database in the configuration.

The first row of the view lists the unique database name of the current database that was specified with the DB\_UNIQUE\_NAME initialization parameter. Additional rows reflect the unique database names of the other databases in the configuration that were specified with the DG\_CONFIG keyword of the LOG\_ARCHIVE\_CONFIG initialization parameter.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_UNIQUE_NAME | VARCHAR2(30) | Unique database name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PARENT_DBUN    | VARCHAR2(30) | DB_UNIQUE_NAME of the parent database, also known as the database that supplies live redo to the destination.<br><br>For example, suppose Boston is the DB_UNIQUE_NAME of the primary database, Chicago is the DB_UNIQUE_NAME of the Far Sync Instance, and Seattle is the DB_UNIQUE_NAME of the terminal standby database. Since Boston is the primary database, it has no parent database so the PARENT_DBUN for Boston will be NULL. Since Boston services Chicago, the PARENT_DBUN of Chicago will be Boston. Since Chicago services Seattle, Chicago will be the PARENT_DBUN for Seattle. |
| DEST_ROLE      | VARCHAR2(17) | Type of archival destination database: <ul style="list-style-type: none"> <li>BACKUP APPLIANCE</li> <li>FAR SYNC STANDBY</li> <li>LOGICAL STANDBY</li> <li>PHYSICAL STANDBY</li> <li>PRIMARY DATABASE</li> <li>SNAPSHOT STANDBY</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| CURRENT_SCN    | NUMBER       | The SCN up to which the specified database has applied redo                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 8.161 V\$DATAGUARD\_PROCESS

V\$DATAGUARD\_PROCESS displays one row for each Oracle Data Guard process that is currently running.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2(5)  | <p>Name of the process whose information is being reported. Some of the possible values include:</p> <ul style="list-style-type: none"> <li>• ARCN - Archiver process</li> <li>• DTS - Data transport process</li> <li>• FAL - File/announce process</li> <li>• LGWR - Log Writer Process</li> <li>• MRP0 - Detached recovery server process</li> <li>• NSSn - SYNC Redo Transport process</li> <li>• ORA - Foreground process</li> <li>• RFS - Remote file server</li> <li>• RMI - Remote message process</li> <li>• TMON - Redo Transport Process monitor</li> <li>• TTnn - Redo Transport Worker Process</li> </ul> |
| PID    | VARCHAR2(24) | Operating system process identifier of the process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TYPE   | VARCHAR2(3)  | <p>Indicates which Oracle subsystem created the process. Possible values:</p> <ul style="list-style-type: none"> <li>• KSB</li> <li>• KSV</li> <li>• NET</li> <li>• UNK</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| APPLY  | NUMBER   | SCN at which the database has applied redo                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note**

Oracle recommends that you use this view instead of V\$MANAGED\_STANDBY.

## 8.162 V\$DATAGUARD\_STATS

V\$DATAGUARD\_STATS displays information about Oracle Data Guard metrics when queried on a target database. No rows are returned when queried on a primary database. In the descriptions in this section, the originating database that is generating the redo is either a primary database or a logical standby database.

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| DATUM_TIME | VARCHAR2(30) | Local time at the target database when the data used to compute the metric was received<br><br>The apply lag and transport lag metrics are computed based on data that is periodically received from the source database. An unchanging value in this column across multiple queries indicates that the target database is not receiving data from the source database.                                                                               |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.163 V\$DATAGUARD\_STATUS

V\$DATAGUARD\_STATUS displays messages recently written to the alert log or server process trace files that concern physical standby databases or redo transport services for all standby database types.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                       |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FACILITY    | VARCHAR2(24)  | Facility that encountered the event: <ul style="list-style-type: none"> <li>• Crash Recovery</li> <li>• Log Transport Services</li> <li>• Log Apply Services</li> <li>• Role Management Services</li> <li>• Remote File Server</li> <li>• Fetch Archive Log</li> <li>• Data Guard</li> <li>• Network Services</li> </ul>                                          |
| SEVERITY    | VARCHAR2(13)  | Severity of the event: <ul style="list-style-type: none"> <li>• Informational - Informational message</li> <li>• Warning - Warning message</li> <li>• Error - Indicates the process has failed</li> <li>• Fatal</li> <li>• Control - An expected change in state such as the start or completion of an archival, log recovery, or switchover operation</li> </ul> |
| DEST_ID     | NUMBER        | Destination ID number to which the event pertains. If the event does not pertain to a particular destination, then the value is 0.                                                                                                                                                                                                                                |
| MESSAGE_NUM | NUMBER        | A chronologically increasing number giving each event a unique number                                                                                                                                                                                                                                                                                             |

## 8.164 V\$DB\_CACHE\_ADVICE

V\$DB\_CACHE\_ADVICE contains rows that predict the number of physical reads for the cache size corresponding to each row.

The rows also compute a "physical read factor," which is the ratio of the number of estimated reads to the number of reads actually performed by the real buffer cache during the measurement interval.

|-------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                            | NUMBER       | Buffer pool identifier (ranges from 1 to 8)                                                                                                                                                                                          |
| NAME                          | VARCHAR2(20) | Buffer pool name                                                                                                                                                                                                                     |
| BLOCK_SIZE                    | NUMBER       | Block size in bytes for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.                                                                      |
| ADVICE_STATUS                 | VARCHAR2(3)  | Status of the advisory. ON indicates it is currently running; OFF indicates it is disabled (in this case the estimates are historical and calculated when last enabled).                                                             |
| SIZE_FOR_ESTIMATE             | NUMBER       | Cache size for prediction (in megabytes)                                                                                                                                                                                             |
| SIZE_FACTOR                   | NUMBER       | Size factor with respect to the current cache size                                                                                                                                                                                   |
| BUFFERS_FOR_ESTIMATE          | NUMBER       | Cache size for prediction (in terms of buffers)                                                                                                                                                                                      |
| ESTD_PHYSICAL_READ_FACTOR     | NUMBER       | Physical read factor for this cache size, which is the ratio of the number of estimated physical reads to the number of reads in the real cache. If there are no physical reads in the real cache, the value of this column is null. |
| ESTD_PHYSICAL_READS           | NUMBER       | Estimated number of physical reads for this cache size                                                                                                                                                                               |
| ESTD_PHYSICAL_READ_TIME       | NUMBER       | Estimated disk read time (in seconds)                                                                                                                                                                                                |
| ESTD_PCT_OF_DB_TIME_FOR_READS | NUMBER       | Estimated disk time as a percentage of the total time                                                                                                                                                                                |
| ESTD_CLUSTER_READS            | NUMBER       | Estimated total number of blocks foreground processes read from the global cache (Oracle Real Application Clusters only)                                                                                                             |
| ESTD_CLUSTER_READ_TIME        | NUMBER       | Estimated total amount of time, in seconds, foreground processes read from global cache (Oracle Real Application Clusters only)                                                                                                      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.165 V\$DB\_OBJECT\_CACHE

V\$DB\_OBJECT\_CACHE displays database objects that are cached in the library cache. Objects include tables, indexes, clusters, synonym definitions, PL/SQL procedures and packages, and triggers.

| Column             | Datatype       | Description                                                                                                                                               |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER              | VARCHAR2(64)   | Owner of the object                                                                                                                                       |
| NAME               | VARCHAR2(1000) | Name of the object                                                                                                                                        |
| DB_LINK            | VARCHAR2(64)   | Database link name, if any                                                                                                                                |
| NAMESPACE          | VARCHAR2(64)   | Library cache namespace of the object: TABLE/PROCEDURE, BODY, TRIGGER, INDEX, CLUSTER, OBJECT                                                             |
| TYPE               | VARCHAR2(64)   | Type of the object: INDEX, TABLE, CLUSTER, VIEW, SET, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, CLASS, OBJECT, USER, DBLINK |
| SHARABLE_MEM       | NUMBER         | Amount of sharable memory in the shared pool consumed by the object                                                                                       |
| LOADS              | NUMBER         | Number of times the object has been loaded. This count also increases when an object has been invalidated.                                                |
| EXECUTIONS         | NUMBER         | Not used<br><b>See Also:</b> " <a href="#">V\$SQLAREA</a> " to see actual execution counts                                                                |
| LOCKS              | NUMBER         | Number of users currently locking this object                                                                                                             |
| PINS               | NUMBER         | Number of users currently pinning this object                                                                                                             |
| KEPT               | VARCHAR2(3)    | (YES   NO) Depends on whether this object has been "kept" (permanently pinned in memory) with the PL/SQL procedure DBMS_SHARED_POOL.KEEP                  |
| CHILD_LATCH        | NUMBER         | Child latch number that is protecting the object. This column is obsolete and maintained for backward compatibility.                                      |
| INVALIDATIONS      | NUMBER         | Total number of times objects in the namespace were marked invalid because a dependent object was modified                                                |
| HASH_VALUE         | NUMBER         | Hash value of the object                                                                                                                                  |
| LOCK_MODE          | VARCHAR2(9)    | Current lock mode of the object                                                                                                                           |
| PIN_MODE           | VARCHAR2(9)    | Current pin mode of the object                                                                                                                            |
| STATUS             | VARCHAR2(19)   | Status of the object                                                                                                                                      |
| TIMESTAMP          | VARCHAR2(19)   | Timestamp for the specification of the object                                                                                                             |
| PREVIOUS_TIMESTAMP | VARCHAR2(19)   | Previous timestamp for the specification of the object                                                                                                    |
| LOCKED_TOTAL       | NUMBER         | Total number of times the object has been locked                                                                                                          |
| PINNED_TOTAL       | NUMBER         | Total number of times the object has been pinned                                                                                                          |

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROPERTY        | VARCHAR2(80)  | Property of the object. Possible values include HOT or HOTCOPY when the library cache hot copy feature is used using DBMS_SHARED_POOL. MARKHOT.                                                                                                                                                                                                                                                                                                 |
| FULL_HASH_VALUE | VARCHAR2(32)  | Full hash value of the object                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_NAME        | VARCHAR2(64)  | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                     |
| ADDR            | RAW(8)        | Address of the handle for this object                                                                                                                                                                                                                                                                                                                                                                                                           |
| EDITION         | VARCHAR2(138) | Edition name                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 8.166 V\$DB\_PIPES

V\$DB\_PIPES displays the pipes that are currently represented in the shared pool for this instance.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNERID   | NUMBER         | Owner ID of the owner (if this is a private pipe), else NULL                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME      | VARCHAR2(1000) | Name of the pipe (for example, SCOTT.PIPE)                                                                                                                                                                                                                                                                                                                                                                                                      |
| TYPE      | VARCHAR2(7)    | Type of the pipe: <ul style="list-style-type: none"> <li>PUBLIC</li> <li>PRIVATE</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| PIPE_SIZE | NUMBER         | Amount of memory the pipe uses<br><b>Note:</b> The value of this column may be larger than maxpipesize because of an internal algorithm.                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column   | Datatype     | Description                                                                 |
|----------|--------------|-----------------------------------------------------------------------------|
| CON_NAME | VARCHAR2(64) | Container name of the object. The value of this column is NULL in non-CDBs. |

## 8.167 V\$DB\_TRANSPORTABLE\_PLATFORM

V\$DB\_TRANSPORTABLE\_PLATFORM displays all platforms to which the database can be transported using the RMAN CONVERT DATABASE command.

The transportable database feature only supports transports of the same endian platform. Therefore, V\$DB\_TRANSPORTABLE\_PLATFORM displays fewer rows than V\$TRANSPORTABLE\_PLATFORM.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLATFORM_ID   | NUMBER        | Platform identification number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PLATFORM_NAME | VARCHAR2(101) | Platform name                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| DB_LINK               | VARCHAR2(128) | Name of the database link                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OWNER_ID              | NUMBER        | Owner of the database link UID                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOGGED_ON             | VARCHAR2(3)   | Whether the database link is currently logged on                                                                                                                                                                                                                                                                                                                                                                                                       |
| HETEROGENEOUS         | VARCHAR2(3)   | Whether the database link is heterogeneous                                                                                                                                                                                                                                                                                                                                                                                                             |
| PROTOCOL              | VARCHAR2(6)   | Communication protocol for the database link                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPEN_CURSORS          | NUMBER        | Whether there are open cursors for the database link                                                                                                                                                                                                                                                                                                                                                                                                   |
| IN_TRANSACTION        | VARCHAR2(3)   | Whether the database link is currently in a transaction                                                                                                                                                                                                                                                                                                                                                                                                |
| UPDATE_SENT           | VARCHAR2(3)   | Whether there has been an update on the database link                                                                                                                                                                                                                                                                                                                                                                                                  |
| COMMIT_POINT_STRENGTH | NUMBER        | Commit point strength of the transactions on the database link                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.170 V\$DEAD\_CLEANUP

V\$DEAD\_CLEANUP shows the terminated processes and sessions present in the instance and their cleanup status.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE             | VARCHAR2(64) | Indicates whether a row contains a DEAD PROCESS or KILLED SESSION                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PADDR            | RAW(8)       | Process pointer. Can be joined with V\$PROCESS. For a KILLED SESSION, this is the owner of the session, which can be NULL.                                                                                                                                                                                                                                                                                                                                                                                 |
| SADDR            | RAW(8)       | Session pointer. Can be joined with V\$SESSION. For a DEAD PROCESS, this is the user session.                                                                                                                                                                                                                                                                                                                                                                                                              |
| ROOT_ADDR        | RAW(8)       | Pointer to the root of the tree                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CLEANUP_OWNER    | VARCHAR2(64) | Indicates which process is responsible for cleanup of this tree: <ul style="list-style-type: none"> <li>CLEANUP PROCESS - a cleanup process is responsible</li> <li>OWNER PROCESS - the root owner is responsible</li> </ul>                                                                                                                                                                                                                                                                               |
| STATE            | VARCHAR2(64) | Cleanup state: <ul style="list-style-type: none"> <li>CLEANUP PENDING - Occurs for a DEAD PROCESS or KILLED SESSION that can be cleaned up, but PMON has not yet made an attempt</li> <li>IN PROGRESS - A cleanup attempt is currently in progress</li> <li>RESOURCES FREED - Occurs for a DEAD PROCESS or KILLED SESSION where all children have been freed, but the process or session itself is not yet freed</li> <li>PARTIAL CLEANUP - Occurs if some of the children have been cleaned up</li> </ul> |
| DEAD_TIME        | NUMBER       | Time since the DEAD PROCESS or KILLED SESSION was marked as such (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CLEANUP_ATTEMPTS | NUMBER       | Number of times PMON has attempted cleanup                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 8.171 V\$DELETED\_OBJECT

V\$DELETED\_OBJECT displays information about deleted archived logs, data file copies and backup pieces from the control file.

The only purpose of this view is to optimize the recovery catalog resync operation. When an archived log, data file copy, or backup piece is deleted, the corresponding record is marked deleted.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

For internal Oracle use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SET_STAMP    | NUMBER       | Set stamp of the deleted object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SET_COUNT    | NUMBER       | Set count of the deleted object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                       |

## 8.172 V\$DG\_BROKER\_CONFIG

V\$DG\_BROKER\_CONFIG provides a summary of an Oracle Data Guard broker configuration.

This is similar to the DGMGRL CLI's SHOW CONFIGURATION command. It provides a view of the entire Oracle Data Guard broker configuration from any database in the configuration.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATABASE           | VARCHAR2(512) | Database unique name                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CONNECT_IDENTIFIER | VARCHAR2(512) | Net connect identifier used to reach the database                                                                                                                                                                                                                                                                                                                                                                                                     |
| DATAGUARD_ROLE     | VARCHAR2(27)  | Oracle Data Guard role of the database: <ul style="list-style-type: none"> <li>• PRIMARY</li> <li>• PHYSICAL STANDBY</li> <li>• LOGICAL STANDBY</li> <li>• SNAPSHOT STANDBY</li> <li>• FAR SYNC INSTANCE</li> <li>• RECOVERY APPLIANCE</li> </ul>                                                                                                                                                                                                     |
| REDO_SOURCE        | VARCHAR(30)   | The database unique name of the redo source                                                                                                                                                                                                                                                                                                                                                                                                           |
| ENABLED            | VARCHAR2(5)   | TRUE or FALSE to denote whether or not the database is managed by Oracle Data Guard broker                                                                                                                                                                                                                                                                                                                                                            |
| STATUS             | NUMBER        | An Oracle error number denoting the database's current status                                                                                                                                                                                                                                                                                                                                                                                         |
| SEVERITY           | VARCHAR2(30)  | Severity of the Oracle error. Possible values: <ul style="list-style-type: none"> <li>• FAILURE</li> <li>• SUCCESS</li> <li>• WARNING</li> </ul>                                                                                                                                                                                                                                                                                                      |
| STATUS_MESSAGE     | VARCHAR2(256) | Error message associated with the Oracle error number in the STATUS column                                                                                                                                                                                                                                                                                                                                                                            |
| VERSION            | VARCHAR2(30)  | Version of the broker configuration                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.173 V\$DG\_BROKER\_PROPERTY

V\$DG\_BROKER\_PROPERTY displays information about Oracle Data Guard broker properties.

| Column | Datatype     | Description                                                                                                                                                                                                                      |
|--------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEMBER | VARCHAR2(31) | Broker configuration member to which the property applies<br><br>This column displays the DB_UNIQUE_NAME initialization parameter for the member. If the member role is CONFIGURATION, then the configuration name is displayed. |

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATAGUARD_ROLE | VARCHAR2(18)   | Member role: <ul style="list-style-type: none"> <li>• CONFIGURATION</li> <li>• FAR SYNC INSTANCE</li> <li>• LOGICAL STANDBY</li> <li>• PHYSICAL STANDBY</li> <li>• PRIMARY</li> <li>• RECOVERY APPLIANCE</li> <li>• SNAPSHOT STANDBY</li> </ul>                                                                                                                                                                                                       |
| PROPERTY       | VARCHAR2(31)   | Property name                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PROPERTY_TYPE  | VARCHAR2(12)   | Property type: <ul style="list-style-type: none"> <li>• CONFIGURABLE</li> <li>• MONITORABLE</li> </ul>                                                                                                                                                                                                                                                                                                                                                |
| VALUE          | VARCHAR2(4000) | Property value<br>If PROPERTY_TYPE = MONITORABLE, then this column displays (monitorable).                                                                                                                                                                                                                                                                                                                                                            |
| VALUE_TYPE     | VARCHAR2(11)   | Property value type: <ul style="list-style-type: none"> <li>• BYTE STRING</li> <li>• INTEGER</li> <li>• STRING</li> <li>• UNDEFINED</li> <li>• XML</li> </ul>                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note**

This view is available starting with Oracle Database 21c.

## 8.174 V\$DIAG\_ALERT\_EXT

V\$DIAG\_ALERT\_EXT shows the contents of the XML-based alert log in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column                | Datatype                    | Description                                                                                                            |
|-----------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------|
| ORIGINATING_TIMESTAMP | TIMESTAMP(9) WITH TIME ZONE | Date and time when the message was generated                                                                           |
| NORMALIZED_TIMESTAMP  | TIMESTAMP(9) WITH TIME ZONE | Date and time when the message originated, normalized for clock drift to the Oracle Enterprise Manager repository time |

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORGANIZATION_ID            | VARCHAR2(67)   | ID of the organization that wrote the originating component, usually the domain of the organization                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPONENT_ID               | VARCHAR2(67)   | ID of the product or component that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| HOST_ID                    | VARCHAR2(67)   | DNS hostname of originating host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| HOST_ADDRESS               | VARCHAR2(49)   | IP of other network address of the originating host for the mesaage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MESSAGE_TYPE               | NUMBER         | Type of the message, indicating that a different type of response is required. Possible values include: <ul style="list-style-type: none"> <li>1: UNKNOWN - Essentially the NULL type</li> <li>2: INCIDENT_ERROR - The program has encountered an error for some internal or unexpected reason, and it must be reported to Oracle Support</li> <li>3: ERROR - An error of some kind has occurred</li> <li>4: WARNING: An action occurred or a condition was discovered that should be reviewed and may require action</li> <li>5: NOTIFICATION: reports a normal action or event. This could be a user action such as "logon completed"</li> <li>6: TRACE: Output of a diagnostic trace</li> </ul> |
| MESSAGE_LEVEL              | NUMBER         | Level the message belongs to. Lower level values imply higher severity for errors. Possible values include: <ul style="list-style-type: none"> <li>1: CRITICAL: critical errors</li> <li>2: SEVERE: severe errors</li> <li>8: IMPORTANT: important message</li> <li>16: NORMAL: normal message</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| MESSAGE_ID                 | VARCHAR2(67)   | ID of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MESSAGE_GROUP              | VARCHAR2(67)   | Name of the group to which the message belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CLIENT_ID                  | VARCHAR2(67)   | ID of the client or security group that the message relates to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MODULE_ID                  | VARCHAR2(67)   | ID of the module that originated the message. This value is unique within a component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PROCESS_ID                 | VARCHAR2(35)   | ID of the process that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID                  | VARCHAR2(67)   | ID of the thread of the process that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| USER_ID                    | VARCHAR2(131)  | ID of the user that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INSTANCE_ID                | VARCHAR2(67)   | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| UPSTREAM_COMP_ID           | VARCHAR2(103)  | ID of a component that the originating component is working with on the upstream (client) side                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DOWNSTREAM_COMP_ID         | VARCHAR2(103)  | ID of a component that the originating component is working with on the downstream (server) side                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| EXECUTION_CONTEXT_ID       | VARCHAR2(103)  | Identifies the thread of execution that the originating component participates in                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXECUTION_CONTEXT_SEQUENCE | NUMBER         | Execution sequence of the thread that the originating component participates in                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ERROR_INSTANCE_ID          | NUMBER         | ID of the instance where error occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ERROR_INSTANCE_SEQUENCE    | NUMBER         | Instance sequence where error occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MESSAGE_TEXT               | VARCHAR2(2051) | Fully formed and localized text of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MESSAGE_ARGUMENTS          | VARCHAR2(515)  | Arguments to be bound with the generic text of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUPPLEMENTAL_ATTRIBUTES | VARCHAR2(515) | Supplemental attributes that are specific to a message. This field contains the impacts for an incident type error message.                                                                                                                                                                                                                                                                                                                     |
| SUPPLEMENTAL_DETAILS    | VARCHAR2(515) | Supplemental data that is specific to a particular program and error message required to complete the diagnosis. Similar to the extra detail referred to in DETAILED_LOCATION but short enough to simply provide in the message itself                                                                                                                                                                                                          |
| PARTITION               | NUMBER        | Segment number of physical file                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_ID               | NUMBER        | Record number for the message (this value is same as the row number)                                                                                                                                                                                                                                                                                                                                                                            |
| FILENAME                | VARCHAR2(515) | Physical file on disk                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LOG_NAME                | VARCHAR2(67)  | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PROBLEM_KEY             | VARCHAR2(553) | Describes the key for the current problem that the message is associated with                                                                                                                                                                                                                                                                                                                                                                   |
| VERSION                 | NUMBER        | ARB version number for the message                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_UID                 | NUMBER        | The unique ID of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                       |
| CONTAINER_ID            | NUMBER        | The ID of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                              |
| CONTAINER_NAME          | VARCHAR2(33)  | The name of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                  | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.175 V\$DIAG\_APP\_TRACE\_FILE

V\$DIAG\_APP\_TRACE\_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB) which contain application trace data (SQL\_TRACE or OPTIMIZER\_TRACE event data). This view also supports GV\$ global views.

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                      |
|----------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to the current ADR home                                                                                                                                                                                                                                                                                     |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                      |
| CHANGE_TIME    | TIMESTAMP(3) WITH TIME ZONE | Displays the change time timestamp of the process trace file                                                                                                                                                                                                                                                     |
| MODIFY_TIME    | TIMESTAMP(3) WITH TIME ZONE | Displays the last modification timestamp of the process trace file                                                                                                                                                                                                                                               |
| SQL_TRACE      | VARCHAR2(1)                 | Identifies if the process trace file contains SQL_TRACE data. Possible values include: <ul style="list-style-type: none"> <li>Y: This value is used when the process trace file contains SQL_TRACE event data</li> <li>N: This value indicates that the process trace does not contain SQL_TRACE data</li> </ul> |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIMIZER_TRACE | VARCHAR2(1) | Identifies if the process trace file contains OPTIMIZER_TRACE data. Possible values include: <ul style="list-style-type: none"> <li>Y: This value is used when the process trace file contains OPTIMIZER_TRACE event data</li> <li>N: This value indicates that the process trace does not contain OPTIMIZER_TRACE data</li> </ul>                                                                                                |
| CON_ID          | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 8.176 V\$DIAG\_INCIDENT

V\$DIAG\_INCIDENT contains information about all incident metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column           | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCIDENT_ID      | NUMBER                      | ID for the current incident                                                                                                                                                                                                                                                                                                                                 |
| PROBLEM_ID       | NUMBER                      | ID for the problem that the incident is associated with                                                                                                                                                                                                                                                                                                     |
| CREATE_TIME      | TIMESTAMP(9) WITH TIME ZONE | Displays the date and time when the incident was created                                                                                                                                                                                                                                                                                                    |
| CLOSE_TIME       | TIMESTAMP(9) WITH TIME ZONE | Displays the date and time when the incident was closed                                                                                                                                                                                                                                                                                                     |
| STATUS           | NUMBER                      | Describes the current status for the incident. Possible values include: <ul style="list-style-type: none"> <li>1: Incident is inflight</li> <li>2: Incident is ready</li> <li>3: Incident is tracked</li> <li>4: Incident is closed</li> <li>5: Incident data is removed</li> <li>6: Incident has been purged</li> <li>7: Incident is incomplete</li> </ul> |
| FLAGS            | NUMBER                      | For internal use only                                                                                                                                                                                                                                                                                                                                       |
| FLOOD_CONTROLLED | NUMBER                      | Describes the flood control status for the current incident. Possible values include: <ul style="list-style-type: none"> <li>0: Incident is not flood-controlled</li> <li>1: Incident is fully flood controlled (no dumps)</li> </ul>                                                                                                                       |
| ERROR_FACILITY   | VARCHAR2(12)                | Displays the error facility for the current incident                                                                                                                                                                                                                                                                                                        |
| ERROR_NUMBER     | NUMBER                      | Displays the error number for the current incident                                                                                                                                                                                                                                                                                                          |
| ERROR_ARG1       | VARCHAR2(66)                | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |
| ERROR_ARG2       | VARCHAR2(66)                | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |
| ERROR_ARG3       | VARCHAR2(66)                | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |
| ERROR_ARG4       | VARCHAR2(66)                | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| ERROR_ARG8              | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                                  |
| SIGNALLING_COMPONENT    | VARCHAR2(66) | Signalling component for the given incident                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SIGNALLING_SUBCOMPONENT | VARCHAR2(66) | Signalling sub-component for the given incident                                                                                                                                                                                                                                                                                                                                                                                                              |
| SUSPECT_COMPONENT       | VARCHAR2(66) | Displays the suspect component for the given incident                                                                                                                                                                                                                                                                                                                                                                                                        |
| SUSPECT_SUBCOMPONENT    | VARCHAR2(66) | Displays the suspect sub-component for the given incident                                                                                                                                                                                                                                                                                                                                                                                                    |
| ECID                    | VARCHAR2(66) | Execution context ID for the current incident                                                                                                                                                                                                                                                                                                                                                                                                                |
| IMPACT                  | NUMBER       | Describes the internal representation of the incident impact for the given incident                                                                                                                                                                                                                                                                                                                                                                          |
| ERROR_ARG9              | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                                  |
| ERROR_ARG10             | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                                  |
| ERROR_ARG11             | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                                  |
| ERROR_ARG12             | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_UID                 | NUMBER       | Describes the container unique ID to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.177 V\$DIAG\_INFO

V\$DIAG\_INFO describes the state of Automatic Diagnostic Repository (ADR) functionality using NAME=VALUE pairs.

| Column  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID | NUMBER       | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NAME    | VARCHAR2(64) | <p>Identifies a piece of data that reflects the state of ADR, such as whether it is enabled, where the directories and files are located, and how many ongoing issues (incidents and problems) there are.</p> <p>Possible values include:</p> <ul style="list-style-type: none"> <li>• Diag Enabled: Indicates whether ADR is enabled or not</li> <li>• ADR Base through Health Monitor: Display different directories (ADR base, ADR home, and then subdirectories within the ADR home)</li> <li>• Default Trace File: Specifies the current default trace file for the current process</li> <li>• Active Problem Count and Active Incident Count: Specify how many problems/incidents there are in this ADR that <i>either</i> happened in the last 24 hours <i>or</i> have a piece of metadata set indicating that it is a persistent error (like a disk corruption)</li> </ul> |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE  | VARCHAR2(512) | Describes the current state of the piece of data identified in the NAME column                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.178 V\$DIAG\_OPT\_TRACE\_RECORDS

V\$DIAG\_OPT\_TRACE\_RECORDS contains all optimizer trace event data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                      | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                      | Displays the top parent level of the trace record                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_TYPE    | NUMBER                      | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3) WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)              | Describes the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                     |
| SECTION_ID     | NUMBER                      | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                             |
| SECTION_NAME   | VARCHAR2(64)                | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                         |
| COMPONENT_NAME | VARCHAR2(64)                | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| OPERATION_NAME | VARCHAR2(64)                | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| FILE_NAME      | VARCHAR2(64)                | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                            |
| FUNCTION_NAME  | VARCHAR2(64)                | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                            |
| LINE_NUMBER    | NUMBER                      | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                        |
| THREAD_ID      | VARCHAR2(64)                | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                            |
| SESSION_ID     | NUMBER                      | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                     |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                 |
| SECURITY_LABEL | VARCHAR2(16) | Displays the trace record security label classification. Possible values: <ul style="list-style-type: none"> <li>• ALGORITHM</li> <li>• CONFIG</li> <li>• DATA</li> <li>• INTERNAL</li> <li>• KEYS</li> <li>• METADATA</li> <li>• NONE</li> <li>• PROGRAM</li> <li>• STATIC</li> <li>• UNKNOWN</li> </ul>                                                                                                                               |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                    |
| CONTAINER_NAME | VARCHAR2(64) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 8.179 V\$DIAG\_PROBLEM

V\$DIAG\_PROBLEM contains information about all problem metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column          | Datatype                    | Description                                                                                                    |
|-----------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|
| PROBLEM_ID      | NUMBER                      | Displays the ID for the current problem                                                                        |
| PROBLEM_KEY     | VARCHAR2(552)               | Displays the problem key for the current problem                                                               |
| FIRST_INCIDENT  | NUMBER                      | Displays the first incident ID for the current problem                                                         |
| FIRSTINC_TIME   | TIMESTAMP(9) WITH TIME ZONE | Displays the timestamp when the first incident occurred for the current problem                                |
| LAST_INCIDENT   | NUMBER                      | Displays the last incident ID for the current problem                                                          |
| LASTINC_TIME    | TIMESTAMP(9) WITH TIME ZONE | Displays the timestamp when the last incident occurred for the current problem                                 |
| IMPACT1         | NUMBER                      | Displays the first impact for the current problem                                                              |
| IMPACT2         | NUMBER                      | Displays the second impact for the current problem                                                             |
| IMPACT3         | NUMBER                      | Displays the third impact for the current problem                                                              |
| IMPACT4         | NUMBER                      | Displays the fourth impact for the current problem                                                             |
| SERVICE_REQUEST | VARCHAR2(66)                | Displays the service request number for the current problem, if a number has been entered in Support Workbench |
| BUG_NUMBER      | VARCHAR2(66)                | Displays the bug number for the current problem, if a number has been entered in Support Workbench             |

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_UID | NUMBER   | Displays the container unique ID to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.180 V\$DIAG\_SESS\_OPT\_TRACE\_RECORDS

V\$DIAG\_SESS\_OPT\_TRACE\_RECORDS contains all optimizer trace event data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                      | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                      | Displays the top parent level of the trace record                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_TYPE    | NUMBER                      | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3) WITH TIME_ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)              | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                      |
| SECTION_ID     | NUMBER                      | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                             |
| SECTION_NAME   | VARCHAR2(64)                | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                         |
| COMPONENT_NAME | VARCHAR2(64)                | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| OPERATION_NAME | VARCHAR2(64)                | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| FILE_NAME      | VARCHAR2(64)                | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                            |
| FUNCTION_NAME  | VARCHAR2(64)                | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                            |
| LINE_NUMBER    | NUMBER                      | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                        |
| THREAD_ID      | VARCHAR2(64)                | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                            |
| SESSION_ID     | NUMBER                      | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                     |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                 |
| SECURITY_LABEL | VARCHAR2(16) | Displays the trace record security label classification. Possible values: <ul style="list-style-type: none"> <li>• ALGORITHM</li> <li>• CONFIG</li> <li>• DATA</li> <li>• INTERNAL</li> <li>• KEYS</li> <li>• METADATA</li> <li>• NONE</li> <li>• PROGRAM</li> <li>• STATIC</li> <li>• UNKNOWN</li> </ul>                                                                                                                               |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                    |
| CONTAINER_NAME | VARCHAR2(64) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 8.181 V\$DIAG\_SESS\_SQL\_TRACE\_RECORDS

V\$DIAG\_SESS\_SQL\_TRACE\_RECORDS contains all SQL\_TRACE data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                      | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                      | Displays the top parent level of the trace record                                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_TYPE    | NUMBER                      | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>• 1: Regular trace record</li> <li>• 2: Freeform trace record</li> <li>• 3: Begin Section trace record</li> <li>• 4: Begin Dump trace record</li> <li>• 5: Bucket Dump Begin trace record</li> <li>• 6: Section End trace record</li> <li>• 7: Dump End trace record</li> <li>• 8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3) WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)              | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                                      |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SECTION_ID     | NUMBER       | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                                                                 |
| SECTION_NAME   | VARCHAR2(64) | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPONENT_NAME | VARCHAR2(64) | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| OPERATION_NAME | VARCHAR2(64) | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| FILE_NAME      | VARCHAR2(64) | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                                |
| FUNCTION_NAME  | VARCHAR2(64) | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                                |
| LINE_NUMBER    | NUMBER       | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                            |
| THREAD_ID      | VARCHAR2(64) | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                                |
| SESSION_ID     | NUMBER       | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                         |
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                               |
| SECURITY_LABEL | VARCHAR2(16) | Displays the trace record security label classification. Possible values: <ul style="list-style-type: none"> <li>• ALGORITHM</li> <li>• CONFIG</li> <li>• DATA</li> <li>• INTERNAL</li> <li>• KEYS</li> <li>• METADATA</li> <li>• NONE</li> <li>• PROGRAM</li> <li>• STATIC</li> <li>• UNKNOWN</li> </ul>                                                                                                                                             |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                  |
| CONTAINER_NAME | VARCHAR2(64) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.182 V\$DIAG\_SQL\_TRACE\_RECORDS

V\$DIAG\_SQL\_TRACE\_RECORDS contains all SQL\_TRACE data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype      | Description                                 |
|----------------|---------------|---------------------------------------------|
| ADR_HOME       | VARCHAR2(444) | Path to current ADR home                    |
| TRACE_FILENAME | VARCHAR2(68)  | Displays the name of the process trace file |
| RECORD_LEVEL   | NUMBER        | Displays the level of the trace record      |

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARENT_LEVEL   | NUMBER                      | Displays the top parent level of the trace record                                                                                                                                                                                                                                                                                                                                                                                                     |
| RECORD_TYPE    | NUMBER                      | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>• 1: Regular trace record</li> <li>• 2: Freeform trace record</li> <li>• 3: Begin Section trace record</li> <li>• 4: Begin Dump trace record</li> <li>• 5: Bucket Dump Begin trace record</li> <li>• 6: Section End trace record</li> <li>• 7: Dump End trace record</li> <li>• 8: Bucket Dump End trace record</li> </ul>                     |
| TIMESTAMP      | TIMESTAMP(3) WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                             |
| PAYLOAD        | VARCHAR2(4000)              | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                                                          |
| SECTION_ID     | NUMBER                      | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                                                                 |
| SECTION_NAME   | VARCHAR2(64)                | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPONENT_NAME | VARCHAR2(64)                | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| OPERATION_NAME | VARCHAR2(64)                | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| FILE_NAME      | VARCHAR2(64)                | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                                |
| FUNCTION_NAME  | VARCHAR2(64)                | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                                |
| LINE_NUMBER    | NUMBER                      | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                            |
| THREAD_ID      | VARCHAR2(64)                | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                                |
| SESSION_ID     | NUMBER                      | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                         |
| SERIAL#        | NUMBER                      | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                               |
| SECURITY_LABEL | VARCHAR2(16)                | Displays the trace record security label classification. Possible values: <ul style="list-style-type: none"> <li>• ALGORITHM</li> <li>• CONFIG</li> <li>• DATA</li> <li>• INTERNAL</li> <li>• KEYS</li> <li>• METADATA</li> <li>• NONE</li> <li>• PROGRAM</li> <li>• STATIC</li> <li>• UNKNOWN</li> </ul>                                                                                                                                             |
| CON_UID        | NUMBER                      | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                  |
| CONTAINER_NAME | VARCHAR2(64)                | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.183 V\$DIAG\_TRACE\_FILE

V\$DIAG\_TRACE\_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB). This view also supports GV\$ global views.

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to the current ADR home                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                                                     |
| CHANGE_TIME    | TIMESTAMP(3) WITH TIME ZONE | Displays the change time timestamp of the process trace file                                                                                                                                                                                                                                                                                                                                                                                    |
| MODIFY_TIME    | TIMESTAMP(3) WITH TIME ZONE | Displays the last modification timestamp of the process trace file                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID         | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.184 V\$DIAG\_TRACE\_FILE\_CONTENTS

V\$DIAG\_TRACE\_FILE\_CONTENTS contains trace data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)               | Path to the current ADR home                                                                                                                                                                                                                                                                                                                                                                                      |
| TRACE_FILENAME | VARCHAR2(68)                | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                      | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                      | Displays the top parent level of the trace record                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_TYPE    | NUMBER                      | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3) WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)              | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                      |
| SECTION_ID     | NUMBER                      | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                             |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SECTION_NAME   | VARCHAR2(64) | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPONENT_NAME | VARCHAR2(64) | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| OPERATION_NAME | VARCHAR2(64) | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| FILE_NAME      | VARCHAR2(64) | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                                |
| FUNCTION_NAME  | VARCHAR2(64) | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                                |
| LINE_NUMBER    | NUMBER       | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                            |
| THREAD_ID      | VARCHAR2(64) | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                                |
| SESSION_ID     | NUMBER       | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                         |
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                               |
| SECURITY_LABEL | VARCHAR2(16) | Displays the trace record security label classification. Possible values: <ul style="list-style-type: none"> <li>• ALGORITHM</li> <li>• CONFIG</li> <li>• DATA</li> <li>• INTERNAL</li> <li>• KEYS</li> <li>• METADATA</li> <li>• NONE</li> <li>• PROGRAM</li> <li>• STATIC</li> <li>• UNKNOWN</li> </ul>                                                                                                                                             |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                  |
| CONTAINER_NAME | VARCHAR2(64) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.185 V\$DISPATCHER

V\$DISPATCHER displays information about the dispatcher processes.

| Column  | Datatype       | Description                       |
|---------|----------------|-----------------------------------|
| NAME    | VARCHAR2(4)    | Name of the dispatcher process    |
| NETWORK | VARCHAR2(1024) | Network address of the dispatcher |
| PADDR   | RAW(4   8)     | Process address                   |

| Column    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS    | VARCHAR2(16) | Status of the dispatcher: <ul style="list-style-type: none"> <li>• WAIT - Idle</li> <li>• SEND - Sending a message</li> <li>• RECEIVE - Receiving a message</li> <li>• CONNECT - Establishing a connection</li> <li>• DISCONNECT - Handling a disconnect request</li> <li>• BREAK - Handling a break</li> <li>• TERMINATE - In the process of terminating</li> <li>• ACCEPT - Accepting connections (no further information available)</li> <li>• REFUSE - Rejecting connections (no further information available)</li> </ul> |
| ACCEPT    | VARCHAR2(3)  | Indicates whether the dispatcher is accepting new connections (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MESSAGES  | NUMBER       | Number of messages processed by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES     | NUMBER       | Size (in bytes) of messages processed by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BREAKS    | NUMBER       | Number of breaks occurring in the connection                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OWNED     | NUMBER       | Number of circuits owned by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATED   | NUMBER       | Number of circuits created by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IDLE      | NUMBER       | Total idle time for the dispatcher (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BUSY      | NUMBER       | Total busy time for the dispatcher (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CPU       | NUMBER       | Total CPU time for the dispatcher (in millionths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LISTENER  | NUMBER       | Most recent Oracle error number the dispatcher received from the listener                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CONF_INDX | NUMBER       | Zero-based index of the DISPATCHERS configuration used by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                          |

## 8.186 V\$DISPATCHER\_CONFIG

V\$DISPATCHER\_CONFIG displays information about the dispatcher configurations and their attributes.

| Column      | Datatype       | Description                                                             |
|-------------|----------------|-------------------------------------------------------------------------|
| CONF_INDX   | NUMBER         | Zero-based index of the DISPATCHERS configuration                       |
| NETWORK     | VARCHAR2(1024) | Network protocol or listening address of dispatchers (may be truncated) |
| DISPATCHERS | NUMBER         | Number of dispatchers to maintain for the configuration                 |
| CONNECTIONS | NUMBER         | Maximum number of concurrent connections per dispatcher                 |
| SESSIONS    | NUMBER         | Maximum number of concurrent sessions per dispatcher                    |

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MULTIPLEX | VARCHAR2(4)    | Indicates whether Session Multiplexing is on: <ul style="list-style-type: none"> <li>• IN</li> <li>• OUT</li> <li>• BOTH</li> <li>• OFF</li> </ul>                                                                                                                                                                                                                                                                                                    |
| LISTENER  | VARCHAR2(1200) | Listeners to register dispatchers with (may be truncated)                                                                                                                                                                                                                                                                                                                                                                                             |
| SERVICE   | VARCHAR2(512)  | Service names supported (may be truncated)                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.187 V\$DISPATCHER\_RATE

V\$DISPATCHER\_RATE displays rate statistics for a number of activities performed by the dispatcher processes.

Collected samples have an activity-specific "time-to-live" (TTL\_\* columns). Statistics are reported over the following two types of time intervals:

- Current statistics (CUR\_\* columns)

Current statistics use samples collected over the most recent time-to-live interval.

- Historical statistics (AVG\_\* and most of the MAX\_\* columns)

Historical statistics make use of all samples that are no longer current.

At the time of collection, a sample is current. After the time-to-live has elapsed, the sample becomes historical. Each type of activity has a specific scale (represented by the SCALE\_\* columns) at which the statistics are reported.

| Column              | Datatype    | Description                                                                                                                                                                                            |
|---------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                | VARCHAR2(4) | Name of the dispatcher process                                                                                                                                                                         |
| PADDR               | RAW(4   8)  | Address of the dispatcher process                                                                                                                                                                      |
| CUR_LOOP_RATE       | NUMBER      | Rate at which the dispatcher has been iterating through its dispatching loop, reported over the past TTL_L00PS, in iterations/SCALE_L00PS                                                              |
| CUR_EVENT_RATE      | NUMBER      | Rate at which the dispatcher has been processing dispatcher events, reported over the past TTL_L00PS, in events/SCALE_L00PS. Such dispatcher events include network events and shared server requests. |
| CUR_EVENTS_PER_LOOP | NUMBER      | Average number of events the dispatcher has been processing in each iteration through its dispatching loop, reported over the past TTL_L00PS, in events/iteration                                      |
| CUR_MSG_RATE        | NUMBER      | Rate at which the dispatcher has been relaying messages between clients and shared servers, reported over the past TTL_MSG, in messages/SCALE_MSG                                                      |

| Column               | Datatype | Description                                                                                                                                                                                  |
|----------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CUR_SVR_BUF_RATE     | NUMBER   | Rate at which the dispatcher has been relaying buffers to shared servers, reported over the past TTL_SVR_BUF, in messages/SCALE_SVR_BUF                                                      |
| CUR_SVR_BYTE_RATE    | NUMBER   | Rate at which the dispatcher has been relaying data to shared servers, reported over the past TTL_SVR_BUF, in bytes/SCALE_SVR_BUF                                                            |
| CUR_SVR_BYTE_PER_BUF | NUMBER   | Average number of data types in each buffer relayed to shared servers, reported over the past TTL_SVR_BUF, in bytes/buffer                                                                   |
| CUR_CLT_BUF_RATE     | NUMBER   | Rate at which the dispatcher has been relaying buffers to clients, reported over the past TTL_CLT_BUF, in buffers/SCALE_CLT_BUF                                                              |
| CUR_CLT_BYTE_RATE    | NUMBER   | Rate at which the dispatcher has been relaying data to clients, reported over the past TTL_CLT_BUF, in bytes/SCALE_CLT_BUF                                                                   |
| CUR_CLT_BYTE_PER_BUF | NUMBER   | Average number of data bytes in each buffer relayed to clients, reported over the past TTL_CLT_BUF, in bytes/buffer                                                                          |
| CUR_BUF_RATE         | NUMBER   | Rate at which the dispatcher has been relaying buffers to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF                                               |
| CUR_BYTE_RATE        | NUMBER   | Rate at which the dispatcher has been relaying data to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF                                                  |
| CUR_BYTE_PER_BUF     | NUMBER   | Average number of data bytes in each buffer relayed to either clients or shared servers, reported over the past TTL_BUF, in bytes/buffer                                                     |
| CUR_IN_CONNECT_RATE  | NUMBER   | Rate at which the dispatcher has been accepting incoming client connections, reported over the past TTL_IN_CONNECT, in connections/SCALE_IN_CONNECT                                          |
| CUR_OUT_CONNECT_RATE | NUMBER   | Rate at which the dispatcher has been establishing outbound connections, reported over the past TTL_OUT_CONNECT, in connections/SCALE_OUT_CONNECT                                            |
| CUR_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the rate at which clients have been reconnecting to the dispatcher, reported over the past TTL_RECONNECT, in reconnections/SCALE_RECONNECT                    |
| MAX_LOOP_RATE        | NUMBER   | Maximum rate at which the dispatcher has ever iterated through its dispatching loop, reported in iterations/SCALE_L00PS, over the dispatcher's lifetime excluding the past TTL_L00PS         |
| MAX_EVENT_RATE       | NUMBER   | Maximum rate at which the dispatcher has ever processed dispatcher events, reported in events/SCALE_L00PS, over the dispatcher's lifetime excluding the past TTL_L00PS                       |
| MAX_EVENTS_PER_LOOP  | NUMBER   | Maximum number of events the dispatcher has ever processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime                       |
| MAX_MSG_RATE         | NUMBER   | Maximum rate at which the dispatcher has ever relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG |
| MAX_SVR_BUF_RATE     | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF            |
| MAX_SVR_BYTE_RATE    | NUMBER   | Maximum rate at which the dispatcher has ever relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                 |
| MAX_SVR_BYTE_PER_BUF | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime                                             |

| Column               | Datatype | Description                                                                                                                                                                                                           |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_CLT_BUF_RATE     | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_CLT_BUF, over the dispatcher's life time excluding the past TTL_CLT_BUF                  |
| MAX_CLT_BYTE_RATE    | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the last TTL_CLT_BUF                                              |
| MAX_CLT_BYTE_PER_BUF | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime                                                                      |
| MAX_BUF_RATE         | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime, excluding the past TTL_BUF                          |
| MAX_BYTE_RATE        | NUMBER   | Maximum rate at which the dispatcher has ever relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                                |
| MAX_BYTE_PER_BUF     | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to either a client or a shared server, reported in bytes/buffer, over the dispatcher's lifetime                                            |
| MAX_IN_CONNECT_RATE  | NUMBER   | Maximum rate at which the dispatcher has ever accepted incoming client connections, reported in connections/SCALE_IN_CONNECT, over the dispatcher's lifetime excluding the past TTL_IN_CONNECT                        |
| MAX_OUT_CONNECT_RATE | NUMBER   | Maximum rate at which the dispatcher has ever established outbound connections, reported in connections/SCALE_OUT_CONNECT, over the dispatcher's lifetime excluding the past TTL_OUT_CONNECT                          |
| MAX_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the maximum rate at which clients have ever reconnected to this dispatcher, reported in reconnections/SCALE_RECONNECT, over the dispatcher's lifetime excluding the past TTL_RECONNECT |
| AVG_LOOP_RATE        | NUMBER   | Historical average rate at which the dispatcher has iterated through its dispatching loop, reported in iterations/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                            |
| AVG_EVENT_RATE       | NUMBER   | Historical average rate at which the dispatcher has processed dispatcher events, reported in events/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                                          |
| AVG_EVENTS_PER_LOOP  | NUMBER   | Historical average number of events the dispatcher has processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime excluding the past TTL_LOOPS             |
| AVG_MSG_RATE         | NUMBER   | Historical average rate at which the dispatcher has relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG                    |
| AVG_SVR_BUF_RATE     | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                               |
| AVG_SVR_BYTE_RATE    | NUMBER   | Historical average rate at which the dispatcher has relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                                    |
| AVG_SVR_BYTE_PER_BUF | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                              |
| AVG_CLT_BUF_RATE     | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to clients, reported in buffers/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                      |

| Column               | Datatype | Description                                                                                                                                                                                                                 |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_CLT_BYTE_RATE    | NUMBER   | Historical average rate at which the dispatcher has relayed data to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                                 |
| AVG_CLT_BYTE_PER_BUF | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to clients, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                           |
| AVG_BUF_RATE         | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                           |
| AVG_BYTE_RATE        | NUMBER   | Historical average rate at which the dispatcher has relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                                |
| AVG_BYTE_PER_BUF     | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to either clients or shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_BUF                      |
| AVG_IN_CONNECT_RATE  | NUMBER   | Historical average rate at which the dispatcher has accepted incoming client connections, reported in connections/SCALE_IN_CONNECT, over the dispatcher's lifetime excluding the past TTL_IN_CONNECT                        |
| AVG_OUT_CONNECT_RATE | NUMBER   | Historical average rate at which the dispatcher has established outbound connections, reported in connections/SCALE_OUT_CONNECT, over the dispatcher's lifetime excluding the past TTL_OUT_CONNECT                          |
| AVG_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the historical average rate at which clients have reconnected to this dispatcher, reported in reconnections/SCALE_RECONNECT, over the dispatcher's lifetime excluding the past TTL_RECONNECT |
| TTL_LOOPS            | NUMBER   | Time-to-live for "loops" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                                |
| TTL_MSG              | NUMBER   | Time-to-live for "messages" samples, reported in hundredths of a second. Default is 10 seconds.                                                                                                                             |
| TTL_SVR_BUF          | NUMBER   | Time-to-live for "buffers to servers" samples, reported in hundredths of a second. Default is 1 second.                                                                                                                     |
| TTL_CLT_BUF          | NUMBER   | Time-to-live for "buffers to clients" samples, reported in hundredths of a second. Default is 1 second.                                                                                                                     |
| TTL_BUF              | NUMBER   | Time-to-live for "buffers to clients/servers" samples, reported in hundredths of a second. Default is 1 second.                                                                                                             |
| TTL_IN_CONNECT       | NUMBER   | Time-to-live for "inbound connections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                  |
| TTL_OUT_CONNECT      | NUMBER   | Time-to-live for "outbound connections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                 |
| TTL_RECONNECT        | NUMBER   | Time-to-live for "reconnections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                        |
| SCALE_LOOPS          | NUMBER   | Scale for "loops" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                      |
| SCALE_MSG            | NUMBER   | Scale for "messages" statistics, reported in hundredths of a second. Default is 1 second.                                                                                                                                   |
| SCALE_SVR_BUF        | NUMBER   | Scale for "buffers to servers" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                      |
| SCALE_CLT_BUF        | NUMBER   | Scale for "buffers to clients" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                      |

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCALE_BUF         | NUMBER   | Scale for "buffers to clients/servers" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                                                                                                                                                                                                                                  |
| SCALE_IN_CONNECT  | NUMBER   | Scale for "inbound connections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                            |
| SCALE_OUT_CONNECT | NUMBER   | Scale for "outbound connections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                           |
| SCALE_RECONNECT   | NUMBER   | Scale for "reconnections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.188 V\$DNFS\_CHANNELS

V\$DNFS\_CHANNELS displays information about the Oracle process connections (channels) open to NFS servers.

| Column  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PNUM    | NUMBER        | Oracle process number                                                                                                                                                                                                                                                                                                                                                                                     |
| SVRNAME | VARCHAR2(255) | NFS server name                                                                                                                                                                                                                                                                                                                                                                                           |
| PATH    | VARCHAR2(255) | Network path to the NFS server specified by IP address or by name                                                                                                                                                                                                                                                                                                                                         |
| LOCAL   | VARCHAR2(255) | Local path on the database host specified by IP address or by name                                                                                                                                                                                                                                                                                                                                        |
| CH_ID   | NUMBER        | Direct NFS channel identifier                                                                                                                                                                                                                                                                                                                                                                             |
| SVR_ID  | NUMBER        | Direct NFS server identifier                                                                                                                                                                                                                                                                                                                                                                              |
| SENDS   | NUMBER        | Send operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                                    |
| RECVS   | NUMBER        | Receive operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                                 |
| PINGS   | NUMBER        | Ping operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                                    |
| SPRECO  | NUMBER        | Reconnects for the channel on the same port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to.    |
| DPRECO  | NUMBER        | Reconnects for the channel on a different port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to. |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| RDMA         | NUMBER   | Indicates whether RDMA is enabled for the channel or not. Possible values: <ul style="list-style-type: none"> <li>0: RDMA is not enabled for the channel</li> <li>1: RDMA is enabled for the channel</li> </ul>                                                                                                                                                                                                                                 |
| RDMA_CREDITS | NUMBER   | The number of RDMA credits supported by the server                                                                                                                                                                                                                                                                                                                                                                                              |
| CLIENTPORT   | NUMBER   | The client port to which the channel is bounded                                                                                                                                                                                                                                                                                                                                                                                                 |
| ACTIVE_SPEED | NUMBER   | The active speed of the HCA card present (in Gb/second)                                                                                                                                                                                                                                                                                                                                                                                         |
| PEAK_FMR     | NUMBER   | The size of fast memory registration (FMR) memory registered by the channel (in bytes)                                                                                                                                                                                                                                                                                                                                                          |
| CURRENT_FMR  | NUMBER   | The current FMR memory registered (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                    |
| FMRREG_COUNT | NUMBER   | The number of FMR memory registration calls for the channel                                                                                                                                                                                                                                                                                                                                                                                     |

**Note**

RDMA functionality is enabled only for the Exadata environment

## 8.189 V\$DNFS\_FILES

V\$DNFS\_FILES displays information about the Oracle process files open through Direct NFS.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENAME | VARCHAR2(513) | File name                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FILESIZE | NUMBER        | File Size                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PNUM     | NUMBER        | Oracle process number which opened the file                                                                                                                                                                                                                                                                                                                                                                                                     |
| SVR_ID   | NUMBER        | Direct NFS server identifier which identifies the server the file is open on                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.190 V\$DNFS\_SERVERS

V\$DNFS\_SERVERS displays information about the Direct NFS servers accessed by Direct NFS.

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID         | NUMBER         | Direct NFS server identifier                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SVRNAME    | VARCHAR2(255)  | NFS server name                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DIRNAME    | VARCHAR2(1024) | Mounted directory                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MNTPORT    | NUMBER         | NFS mount port                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| WTMAX      | NUMBER         | WTMAX exported by the NFS server                                                                                                                                                                                                                                                                                                                                                                                                                |
| RTMAX      | NUMBER         | RTMAX exported by the NFS server                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| RDMAENABLE | VARCHAR2(16)   | Indicates whether the server is RDMA enabled. Possible values: <ul style="list-style-type: none"> <li>YES: The server is RDMA enabled.</li> <li>N0: The server is not RDMA enabled.</li> </ul>                                                                                                                                                                                                                                                  |
| RDMAPORT   | NUMBER         | The port number for RDMA communications on the server. The value is always 20049.                                                                                                                                                                                                                                                                                                                                                               |
| SECURITY   | VARCHAR2(32)   | NFS RPC authentication method used for the given NFS export                                                                                                                                                                                                                                                                                                                                                                                     |

### Note

RDMA functionality is enabled only for the Exadata environment

## 8.191 V\$DNFS\_STATS

V\$DNFS\_STATS displays information about the Oracle process NFS operation statistics issued by Direct NFS.

| Column      | Datatype | Description                                           |
|-------------|----------|-------------------------------------------------------|
| PNUM        | NUMBER   | Oracle process number that statistics are relevant to |
| NFS_NULL    | NUMBER   | Null                                                  |
| NFS_GETATTR | NUMBER   | Get attributes                                        |
| NFS_SETATTR | NUMBER   | Set attributes                                        |
| NFS_LOOKUP  | NUMBER   | Lookup object                                         |
| NFS_ACCESS  | NUMBER   | Access object                                         |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NFS_READLINK    | NUMBER   | Read link                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NFS_READ        | NUMBER   | Read file                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NFS_WRITE       | NUMBER   | Write file                                                                                                                                                                                                                                                                                                                                                                                                                                      |
